Fourier Spectrum Characterizations of Clifford $H^p$ Spaces on $\mathbb{R}^{n+1}_+$ for $1 \leq p \leq \infty$

Pei Dang, Weixiong Mai and Tao Qian

Abstract

This article studies the Fourier spectrum characterization of functions in the Clifford algebra-valued Hardy spaces $H^p(\mathbb{R}^{n+1}_+)$, $1 \leq p \leq \infty$. Namely, for $f \in L^p(\mathbb{R}^n)$, Clifford algebra-valued, $f$ is further the non-tangential boundary limit of some function in $H^p(\mathbb{R}^{n+1}_+)$, $1 \leq p \leq \infty$, if and only if $\hat{f} = \chi_+ \hat{f}$, where $\chi_+(\xi) = \frac{1}{2}(1 + i\xi \xi)$, where the Fourier transformation and the above relation are suitably interpreted (for some cases in the distribution sense). These results further develop the relevant context of Alan McIntosh. As a particular case of our results, the vector-valued Clifford Hardy space functions are identical with the conjugate harmonic systems in the work of Stein and Weiss. The latter proved the corresponding results in terms of the single integral form for the cases $1 \leq p < \infty$.

Key words: Hardy space, Monogenic Function, Fourier Spectrum, Riesz Transform, Hilbert Transform, Hardy Space Projection, Clifford Algebra, Singular Integral, Conjugate Harmonic System, Harmonic Gradient

1 Introduction

The classical Paley-Wiener Theorem asserts that for a $L^2(\mathbb{R})$-function $f$, scalar-valued, it is further the non-tangential boundary limit (NTBL) of a function in the Hardy $H^2$ space in the upper half plane if and only if the Fourier transform of $f$, denoted $\hat{f}$, satisfies the relation $\hat{f} = \chi_+ \hat{f}$, where $\chi_+$ is the characteristic (indicator) function of the set $(0, \infty)$, that takes the value 1 when its argument is in $(0, \infty)$ and otherwise zero. This amounts to saying that a characteristic property of boundary limit functions of the Hardy space functions is that their Fourier transforms vanish at the negative spectra. This classical Fourier spectrum characterization of the Hardy $H^2$ space functions has been studied and

This work was supported by Macao Government FDCT 079/2016/A2, Macao Science and Technology Development Fund, MSAR. Ref. 045/2015/A2, NSFC11701597.
generalized by different authors (see, for instance, [5, 9]). Among recent studies [18] and [19] give a thorough treatment on analogous results for $L^p(\mathbb{R})$ for all $p \in [1, \infty]$. The last mentioned papers prove that if $f$ is a function in $L^p(\mathbb{R}), 1 \leq p \leq \infty$, then $f$ is the NTBL of some function in the Hardy $H^p$ space in the upper half plane if and only if the Fourier transform $\hat{f}$ satisfies the relation $(\hat{f}, \psi) = 0$ for $\psi$ being any function in the Schwartz class whose support lays in the left half of the real line. We note that for $2 < p \leq \infty$ this last statement is interpreted as that $\hat{f}$, as a distribution, is supported in $[0, \infty)$. The Fourier spectrum characterization results have implications to the Hilbert transform characterizations of the Hardy space functions, as well as to Hardy space decompositions of $L^p$ functions, the latter being through the Fourier spectrum decomposition. We note that the Hardy spaces decomposition can also be extended to the $L^p$ spaces for $0 < p < 1$ ([4]) although there do not exist spectrum decomposition results.

In higher dimensional Euclidean spaces there exist analogous results. The above mentioned Fourier spectrum, Hilbert transformations, and the Hardy space decompositions are all based on the Cauchy type complex structure associated with the underlying domain on which the Hardy space functions are defined. In $\mathbb{R}^n, n > 2$, there are two distinguished complex structures, of which one is several complex variables and the other is Clifford algebra. Both those complex structures in relation to their respective Hardy spaces are treated in [20] and [21]. The several complex variables setting corresponds to the Hardy spaces on tubes. The Clifford algebra setting corresponds to the conjugate harmonic systems. The Clifford algebra-valued Hardy spaces are treated, besides in [20] and [21], also lately in [10], [16] and [13]. The conjugate harmonic systems developed in [20] and [21] are, in fact, identical with the Clifford vector-valued Hardy spaces.

Fourier spectrum properties of Hardy spaces on tubes were first studied in [20] and [21] with the restriction on $p = 2$. Certain one-way results for $H^p(T_\Omega)$ and a partial range of the space index $p$, where $\Omega$ is an irreducible symmetric cone, were obtained in [8]. In [12] Hörmander proved some results corresponding to the type of Paley-Wiener Theorem for bandlimited functions involving entire functions in several complex variables. Fourier spectrum characterizations of the Hardy spaces on tubes for all cases $1 \leq p \leq \infty$ are systematically studied in [14].

The present paper gives the Fourier spectrum characterization for the whole range $p \in [1, \infty]$ for the Clifford algebra-valued Hardy spaces in which, as a particular case, the vector-valued case corresponds to the conjugate harmonic systems. The results on conjugate harmonic systems are restricted to the range $1 \leq p < \infty$ can be found in [21] and [20]. As given in this article there also exist Hilbert transformation eigenvalue characterizations of the Hardy spaces on higher dimensions, as well as results of the Hardy spaces decomposition.

The crucial notion with the Clifford algebra setting of the Euclidean spaces is the projection functions $\chi_\pm$ defined by

$$\chi_\pm(\xi) = \frac{1}{2} \left( 1 \pm i \frac{\xi}{|\xi|} \right)$$

and the associated generalizations of the trigonometrical exponential function

$$e^{\pm}(x, \xi) = e^{2\pi i \langle x, \xi \rangle} e^{\mp 2\pi x_0 |\xi|} \chi_\pm(\xi),$$
where \( x = x_0 + \xi \).

The purpose of this paper is to declare the morally the Fourier multiplier form of the Clifford Cauchy integral representation formula for the Clifford algebra-valued Hardy \( H^p \) functions \( F \) in the upper-half of the space \( \mathbb{R}_+^{n+1} \) for all \( p \in [1, \infty] \):

\[
F(x_0 + \xi) = \int_{\mathbb{R}^n} e^{2\pi i (\xi, \xi)} e^{-2\pi i x_0 \xi} \chi_+ (\xi) \hat{F}(\xi) d\xi.
\]

The above formula is also the Laplace transform of functions on \( \mathbb{R}^n \) in the Clifford algebra setting when the formula makes sense. We note that when \( 1 \leq p \leq 2 \), the above relation is valid in the Lebesgue integration sense, while when \( p > 2 \) the above formula is valid in the distribution sense. We will prove that, for all \( p \in [1, \infty] \), a Clifford algebra-valued \( L^p(\mathbb{R}^n) \) \( F \) satisfies \( F \in H^p(\mathbb{R}_+^{n+1}) \) (the NTBL of some monogenic Hardy space function) if and only if \( \hat{F} = \chi_+ \hat{F} \), where the multiplication between \( \chi_+ \) and the distribution \( \hat{F} \) will be precisely defined in the rest part of the paper; and \( F \in H^p(\mathbb{R}_+^{n+1}) \) if and only if \( \hat{HF} = \hat{F} \), where \( H = -\sum_{k=1}^n e_k R_k \) is the Hilbert transformation, and \( R_k, k = 1, \ldots, n \) are the Riesz transformations. For the Clifford algebra-valued Hardy spaces in the lower-half of the space \( \mathbb{R}_+^{n+1} \) we have the counterpart results \( \hat{F} = \chi_- \hat{F} \) and \( \hat{HF} = -\hat{F} \).

In [21] (see also Propositions 2.3, 2.5) the characterization by the Riesz transformations of the NTBLs of the vector-valued Hardy spaces functions, or alternatively the conjugate harmonic systems, for \( 1 \leq p < \infty \), is proved. When \( p = 2 \), the corresponding Fourier spectrum characterization of the vector-valued functions in \( H^2(\mathbb{R}_+^{n+1}) \) can be directly derived from Theorem 3.1 in [21] page 65] (see also Proposition 2.3) through the relation that \( \hat{F} = (\hat{f}_0, (R_1(f_0))^\wedge, \ldots, (R_n(f_0))^\wedge) = (\hat{f}_0, -i\frac{\partial}{\partial x_1} \hat{f}_0, \ldots, -i\frac{\partial}{\partial x_n} \hat{f}_0) \). We note that, for \( p \in [1, \infty) \), the characterization of \( F = \hat{HF} \) for \( F \) being the NTBL of some Clifford algebra-valued Hardy \( H^p \) function is proved in Gilbert and Murray’s book [10]. Our study systematically treats the Fourier multiplier aspect for the Clifford algebra-valued functions case, and for the whole index range \( 1 \leq p \leq \infty \), involving distributional and \( BMO \) functional analysis.

2 Preliminaries

2.1 \( \mathcal{H}^p \) space in terms of conjugate harmonic systems

Let \( \mathbb{R}_+^{n+1} = \{ x = (\xi, x_0) \in \mathbb{R}^{n+1}; x_0 > 0, \xi \in \mathbb{R}^n \} \), and \( u_j, 0 \leq j \leq n \), be functions defined on \( \mathbb{R}_+^{n+1} \). Suppose \( F = (u_0, u_1, \ldots, u_n) \) satisfies the generalized Cauchy-Riemann systems in \( \mathbb{R}_+^{n+1} \), i.e.,

\[
\sum_{j=0}^n \frac{\partial u_j}{\partial x_j} = 0,
\]

\[
\frac{\partial u_j}{\partial x_k} = \frac{\partial u_k}{\partial x_j}, \quad j \neq k, 0 \leq j, k \leq n.
\]

Such \( (n+1) \)-tuple \( F = (u_0, u_1, \ldots, u_n) \) is called a conjugate harmonic system ([21, 20]). For \( 0 < p < \infty \), we say that \( F \in \mathcal{H}^p(\mathbb{R}_+^{n+1}) \), the vector-valued monogenic \( p \)-Hardy space, if \( F \)
satisfies (2.1), and moreover,
\[ ||F||_p = \sup_{x_0 > 0} \left[ \int_{\mathbb{R}^n} |F(x, x_0)|^p \, dx \right]^{\frac{1}{p}} < \infty. \] (2.2)

For \( p = \infty \), we say that \( F \in \mathcal{H}^\infty(\mathbb{R}_+^{n+1}) \) if \( F \) satisfies (2.1), and
\[ ||F||_\infty = \sup\{|F(x, x_0)| : (x, x_0) \in \mathbb{R}_+^{n+1}\} < \infty. \] (2.3)

\( ||F||_p \) is a norm when \( 1 \leq p \leq \infty \), and a Hilbert space norm when \( p = 2 \) (see c.f. [21, page 220]). For \( \mathcal{H}^p(\mathbb{R}_+^{n+1}) \), the following results for harmonic functions are well-known.

**Proposition 2.1 ([21, page 78])** Let \( u(x, x_0) \) be harmonic in \( \mathbb{R}_+^{n+1} \).
One has:
(a) If \( 1 < p \leq \infty \), \( u(x, x_0) \) is the Poisson integral of an \( L^p(\mathbb{R}^n) \) function if and only if \( \sup_{x_0 > 0} ||u(x, x_0)||_p < \infty \).
(b) \( u(x, x_0) \) is the Poisson integral of a Borel measure if and only if \( \sup_{x_0 > 0} ||u(x, x_0)||_1 < \infty \).

**Proposition 2.2 ([3, Theorem 1.3, page 62])** For \( f \in L^p(\mathbb{R}^n), 1 \leq p \leq \infty \), if \( u(x, x_0) \) is the Poisson integral of \( f \), then
(a) \( u^*(x) = \sup_{|y| < \alpha x_0} |u(y, x_0)| \leq \alpha \mathcal{M}(f)(x) \), where \( \alpha > 0 \), \( \mathcal{M}(f) \) is the Hardy-Littlewood maximal function of \( f \).
(b) For almost all \( x \in \mathbb{R}^n \), one has
\[ \lim_{(y, x_0) \to (x, 0), |y| < \alpha x_0} u(y, x_0) = f(x). \]

**Proposition 2.3 ([21, page 65])** Let \( f_0 \) and \( f_1, \ldots, f_n \) belong to \( L^2(\mathbb{R}^n) \), and let their respective Poisson integrals be \( u_0(x, x_0) = P_{x_0} f_0, u_1(x, x_0) = P_{x_0} f_1, \ldots, u_n(x, x_0) = P_{x_0} f_n \). Then a necessary and sufficient condition that
\[ f_j = R_j(f_0), \ j = 1, \ldots, n, \]
is that \( (u_0, \ldots, u_n) \) satisfies the generalized Cauchy-Riemann equations ([24], where \( R_j \) is the \( j \)-th Riesz transformation, that is,
\[ f_j(x) = R_j(f_0)(x) = \lim_{\epsilon \to 0} \frac{1}{\sigma_n} \int_{|x-y| > \epsilon} \frac{x_j - y_j}{|x-y|^{n+1}} f_0(y) \, dy \] (2.4)
with \( \sigma_n = \frac{\pi^{\frac{n+1}{2}}}{\Gamma\left(\frac{n+1}{2}\right)} \).

**Proposition 2.4 ([21, page 220])** Suppose that \( F \in \mathcal{H}^p(\mathbb{R}_+^{n+1}), 1 < p < \infty \). Then there exist \( f_0, f_1, f_2, \ldots, f_n \), each in \( L^p(\mathbb{R}^n) \), so that \( u_j(x, x_0) \) is the Poisson integral of \( f_j, j = 0, \ldots, n \). Also \( f_j = R_j(f_0), R_1, R_2, \ldots, R_n \) are the Riesz transformations. Conversely, suppose \( f_0 \in L^p(\mathbb{R}^n) \), and let \( f_j = R_j(f_0) \), and \( u_j(x, x_0) \) be the Poisson integrals of \( f_j, j = 0, \ldots, n \). Then \( F = (u_0, u_1, \ldots, u_n) \in \mathcal{H}^p(\mathbb{R}_+^{n+1}) \); moreover \( ||f_0||_{L^p} \leq ||F||_p \leq A_p ||f_0||_{L^p} \).
Proposition 2.5 ([21, page 221]) Let $F \in \mathcal{H}^1(\mathbb{R}^{n+1}_+)$. Then \( \lim_{x_0 \to 0} F(\underline{x}, x_0) = F(\underline{x}) \) exists almost everywhere, as well as in the $L^1(\mathbb{R}^n)$ norm. Also
\[
\int_{\mathbb{R}^n} \sup_{x_0 > 0} |F(\underline{x}, x_0)| \, dx \leq A \sup_{x_0 > 0} \int_{\mathbb{R}^n} |F(\underline{x}, x_0)| \, dx = A \|F\|_1.
\]
Moreover, the space $\mathcal{H}^1(\mathbb{R}^{n+1})$ is naturally isomorphic with the space of $L^1(\mathbb{R}^n)$ functions $f_0$ which have the property that $R_j(f_0) \in L^1(\mathbb{R}^n), j = 1, \ldots, n$. The $\mathcal{H}^1$ norm is then equivalent with $\|f_0\|_1 + \sum_{j=1}^{n} \|R_j(f_0)\|_1$. Conversely, suppose $f_0 \in L^1(\mathbb{R}^n)$ and $R_j(f_0) \in L^1(\mathbb{R}^n), R_j(f_0) = f_j, j = 1,\ldots, n$. Then
\[
\sum_{j=0}^{n} \int_{\mathbb{R}^n} \sup_{x_0 > 0} |u_j(\underline{x}, x_0)| \, dx \leq A \sum_{j=0}^{n} \|f_j\|_{L^1},
\]
where $u_j = P_{x_0} * f_j, j = 0,\ldots, n$.

It is noted that the Riesz transformations $R_j, 1 \leq j \leq n$, defined as ([2,4]) are bounded operator from $L^p(\mathbb{R}^n)$ to $L^p(\mathbb{R}^n), 1 < p < \infty$, and weakly bounded from $L^1(\mathbb{R}^n)$ to $L^1(\mathbb{R}^n)$. When $p = \infty$, we need to revise the Riesz transforms (see e.g. [22]) $R_j, 1 \leq j \leq n$, as
\[
R_j(f_0)(\underline{x}) = \lim_{\epsilon \to 0} \frac{1}{\sigma_n} \int_{|x-y| > \epsilon} \left( \frac{x_j - y_j}{|x - y|^{n+1}} - \chi_{\{|y| > 1\}}(y) \frac{-y_j}{|y|^{n+1}} \right) f_0(y) \, dy.
\]
which are well-defined for $f_0 \in L^\infty(\mathbb{R}^n)$ up to a constant, and $\chi_{\{|y| > 1\}}$ is the characteristic function for $\{y \in \mathbb{R}^n; |y| > 1\}$. The revised Riesz transformations are bounded from $L^\infty(\mathbb{R}^n)$ to $BMO(\mathbb{R}^n)$ (Bounded Mean Oscillation space).

### 2.2 Clifford algebra-valued Hardy $H^p$ spaces

Let $e_1, \ldots, e_n$ be basic elements satisfying
\[
e_j e_k + e_k e_j = -2 \delta_{jk}, \quad j, k = 1, \ldots, n,
\]
where $\delta_{jk}$ is the Kronecker delta function. Let $\mathbb{R}^n = \{\underline{x} = x_1 e_1 + \cdots + x_n e_n; x_j \in \mathbb{R}, 1 \leq j \leq n\}$ be identical with the usual Euclidean space $\mathbb{R}^n$, and $\mathbb{R}^{n+1}_+ = \{x_0 + \underline{x}; x_0 > 0, \underline{x} \in \mathbb{R}^n\}$.

The real (complex) Clifford algebra $\mathbb{R}^{(n)}$ ($\mathbb{C}^{(n)}$) generated by $e_1, \ldots, e_n$, is the associative algebra generated by $e_1, \ldots, e_n$ over the real (complex) field $\mathbb{R}$ ($\mathbb{C}$). The elements of $\mathbb{R}^{(n)}$ ($\mathbb{C}^{(n)}$) are of the form $x = \sum_T x_T e_T$, where $T = \{1 \leq j_1 < j_2 < \cdots < j_i \leq n\}$ runs over all ordered subsets of $\{1, \ldots, n\}$, $x_T \in \mathbb{R}$ ($\mathbb{C}$) with $x_0 = x_0$, and $e_T = e_{j_1} e_{j_2} \cdots e_{j_i}$ with the identity element $e_0 = e_0 = 1$. Sc $x := x_0$ and NSc $x := x - Sc$ $x$ are respectively called the scalar part and the non-scalar part of $x$. In this paper, we denote the conjugate of $x$ in $\mathbb{C}^{(n)}$ by $\overline{x} = \sum_T x_T \overline{e}_T$, where $\overline{e}_T = \overline{e}_{j_1} \cdots \overline{e}_{j_2} \overline{e}_{j_i}$ with $\overline{e}_0 = e_0$ and $\overline{e}_j = -e_j$ for $j \neq 0$. The norm of $x \in \mathbb{C}^{(n)}$ is defined as $|x| := (Sc \overline{x} x)^{\frac{1}{2}} = (\sum_T |x_T|^2)^{\frac{1}{2}}$. Generally, a Clifford algebra is not a division algebra, unless $n = 2$, that corresponds to the algebra of quaternions. $x = x_0 + \underline{x} \in \mathbb{R}^{n+1}$ is called a vector or a para-vector, and the conjugate of a vector $x$ is
If \( x \) is a vector then \( x^{-1} = \frac{x}{|x|^2} \). For more information about Clifford algebra, we refer to [2].

A Clifford algebra-valued function \( F \) is left-monogenic (resp. right-monogenic) if

\[
DF = \left( \sum_{k=0}^{n} \partial_k e_k \right) F = 0 \quad \text{ resp. } \quad FD = F \left( \sum_{k=0}^{n} \partial_k e_k \right) = 0,
\]

where \( \partial_k = \frac{\partial}{\partial x_k} \), \( 0 \leq k \leq n \), and \( D \) is the Dirac operator. Note that \( DF DF = \Delta F = 0 \) if \( F \) is left-monogenic, which means that each component of \( F \) is harmonic. A function that is both left- and right-monogenic is called a monogenic function. Vector-valued left-monogenic functions are simultaneously right-monogenic functions, and vice-versa, and thus they are monogenic.

The Fourier transform of a function in \( L^1(\mathbb{R}^n) \) is defined as

\[
\hat{f}(\xi) = \mathcal{F}(f)(\xi) = \int_{\mathbb{R}^n} e^{-2\pi i \langle x, \xi \rangle} f(x) dx,
\]

where \( \xi = \xi_1 e_1 + \cdots + \xi_n e_n \in \mathbb{R}^n \), and the inverse Fourier transform is formally defined as

\[
g^\vee(x) = \mathcal{F}^{-1}(g)(x) = \int_{\mathbb{R}^n} e^{2\pi i \langle x, \xi \rangle} g(\xi) d\xi.
\]

We note that the Fourier transformation is linear and thus it, together with some of its properties, can be extended to Clifford algebra-valued functions. In particular, the Plancherel Theorem holds for Clifford algebra-valued functions: For Clifford algebra-valued functions \( f, g \in L^2(\mathbb{R}^n) \) there holds

\[
\int_{\mathbb{R}^n} f(x) \overline{g(x)} dx = \int_{\mathbb{R}^n} \hat{f}(\xi) \overline{\hat{g}(\xi)} d\xi.
\]

An alternative form of the Plancherel Theorem is

\[
\int_{\mathbb{R}^n} f(x) g(x) dx = \int_{\mathbb{R}^n} \hat{f}(\xi) \overline{g^\vee(\xi)} d\xi.
\]

Define, for \( x = x_0 + \xi \),

\[
e(x, \xi) = e^+(x, \xi) + e^-(x, \xi)
\]

with

\[
e^\pm(x, \xi) = e^{2\pi i \langle x, \xi \rangle} e^{\mp 2\pi x_0 |\xi|} \chi^\pm(\xi)
\]

(see e.g. [15]), where \( \chi^\pm(\xi) = \frac{1}{2} (1 \pm i \frac{\xi}{|\xi|}) \). \( \chi^\pm \) enjoy the following projection-like properties:

\[
\chi^- \chi^+ + \chi^+ \chi^- = 0, \quad \chi^2 = \chi^\pm, \quad \chi^+ + \chi^- = 1.
\]

**Definition 2.6** Let \( F(x) = \sum_T f_T(x) e_T \), where \( x = x_0 + \xi \in \mathbb{R}^{n+1}_+ \). If \( F \) is left-monogenic on \( \mathbb{R}^{n+1}_+ \) and satisfies

\[
||F||_{H^p} = \sup_{x_0 > 0} \int_{\mathbb{R}^n} |F(x_0 + \xi)|^p dx < \infty, \quad 1 \leq p < \infty,
\]

(2.6)
then we say \( F(x) \) belongs to the Hardy space \( H^p(\mathbb{R}_{n+1}^+) \). If \( F \) is left-monogenic on \( \mathbb{R}_{n+1}^+ \) and satisfies
\[
||F||_{H^\infty} = \sup_{x \in \mathbb{R}_{n+1}^+} |F(x)| < \infty,
\]
then we say \( F(x) \in H^\infty(\mathbb{R}_{n+1}^+) \).

When \( p = 2 \), the inner product of \( H^2(\mathbb{R}_{n+1}^+) \) is defined as
\[
\langle F, G \rangle = \int_{\mathbb{R}^n} \overline{G(x)} F(x) dx,
\]
where \( F(x) \) and \( G(x) \) are respectively the NTBL functions of \( F \) and \( G \). The norm of \( H^2(\mathbb{R}_{n+1}^+) \) is, in fact, equal to
\[
||F||^2_{H^2} = \text{Sc} \langle F, F \rangle.
\]

In particular, if \( F \in H^p(\mathbb{R}_{n+1}^+), 1 \leq p \leq \infty \), is a vector-valued function, i.e., \( F(x) = f_0(x) + \sum_{j=1}^n f_j(x)e_j \), then \( F \) corresponds to an element in \( H^p(\mathbb{R}_{n+1}^+) \) \([13]\). To see this, we let \( U(x_0 + \underline{x}) = u_0(x_0 + \underline{x}) - u_1(x_0 + \underline{x})e_1 - \cdots - u_n(x_0 + \underline{x})e_n \). With \( e_0 = 1 \), we have
\[
DU = \left[ \sum_{k=0}^n \partial_k e_k \right] u_0(x_0 + \underline{x}) e_0 - u_1(x_0 + \underline{x}) e_1 - \cdots - u_n(x_0 + \underline{x}) e_n
\]
\[
= \partial u_0 + \partial u_1 + \cdots + \partial u_n + \sum_{0 \leq j < k \leq n} (\partial u_j - \partial u_k) e_j e_k,
\]
which means that \( DU = 0 \) if and only if \( U \) satisfies (2.1). Thus \( H^p(\mathbb{R}_{n+1}^+) \) can be regarded as a proper subspace of \( H^p(\mathbb{R}_{n+1}^+) \).

By Propositions 2.3-2.5 we have, for \( 1 \leq p < \infty \),
\[
U(x) = u_0(x) - \sum_{j=1}^n R_j(u_0)(x)e_j.
\]

For general vector-valued \( F \in H^p(\mathbb{R}_{n+1}^+), 1 \leq p < \infty \), there holds
\[
F(x) = f_0(x) - \sum_{j=1}^n R_j(f_0)(x)e_j = (I + H)f_0(x),
\]
where the operator \( H \), the Hilbert transformation, is defined by
\[
H = -\sum_{j=1}^n R_j e_j.
\]

Note that the Fourier multiplier of \( R_j \) is \(-i\frac{\xi_j}{|\xi|} \) (see e.g. [11]), i.e.,
\[
R_j(f_0)(x) = \left(-i\frac{\xi_j}{|\xi|} \hat{f}_0(\xi) \right)^\vee(x).
\]
This implies that the Fourier multipliers of $\frac{1}{2}(I \pm H)$ are, respectively, $\chi_\pm(\xi)$.

The Cauchy integral formula in Clifford analysis may be regarded as the reproducing formula. In particular, for $F \in H^p(\mathbb{R}^{n+1}_+)$, the following reproducing formula plays an important role.

**Proposition 2.7** (see e.g. [10, 16]) For $F \in H^p(\mathbb{R}^{n+1}_+)$, $1 \leq p < \infty$, we have

$$F(x) = \int_{\mathbb{R}^n} E(x - y)F(y)dy,$$

where $E(x) = \frac{1}{2\sigma_n |x|^{n+1}}$ is the Cauchy kernel, and $F(y)$ is the NTBL function of $F$.

When $1 < p < \infty$, one has

**Proposition 2.8** (see e.g. [16]) For $f \in L^p(\mathbb{R}^n)$, $1 < p < \infty$, there exists a constant $L > 0$ such that

$$||C_{x_0}(f)||_{L^p} \leq L||f||_{L^p},$$

where

$$C_{x_0}(f)(x) = \int_{\mathbb{R}^n} E(x - y)f(y)dy, \quad x = x_0 + \underline{x}, x_0 > 0,$$

and $L$ is independent of $x_0$ and $f$. As a consequence, as a function of $x$, the function $C_{x_0}(f)(\underline{x})$ belongs to $H^p(\mathbb{R}^{n+1}_+)$. Moreover,

$$\lim_{x_0 \to 0^+} C_{x_0}(f)(\underline{x}) = \frac{1}{2}(f(\underline{x}) + Hf(\underline{x})), \quad a.e. \underline{x} \in \mathbb{R}^n.$$

There are parallel results for the lower-half of the space $\mathbb{R}^{n+1}_-$. If we apply Proposition 2.8 to the NTBL of a Hardy space function $F$, then we conclude, from the last relation, $H^2 = I$.

Let $\Psi(\mathbb{R}^n)$ be the Clifford algebra-valued Schwartz space, whose elements are given by

$$\psi(\xi) = \sum_T \psi_T(\xi)e_T,$$

where $\psi_T$ are in the Schwartz space $S(\mathbb{R}^n)$. Denote by $\Psi^\pm(\mathbb{R}^n)$ the subclasses of $\Psi(\mathbb{R}^n)$ consisting of the Clifford algebra-valued Schwartz functions of, respectively, the forms

$$\psi(\xi) = \psi(\xi)\chi_\pm(\xi),$$

where $\psi(\xi)$ takes the zero value in some neighborhood of the origin. It is easy to show that the direct sum $\Psi^+(\mathbb{R}^n) \oplus \Psi^-(\mathbb{R}^n)$ is dense in $\Psi(\mathbb{R}^n)$.

Denote by $\Psi^\pm_{\text{scalar}}(\mathbb{R}^n)$ the subclasses of $\Psi^\pm(\mathbb{R}^n)$, whose elements are of the form

$$\psi(\xi) = \tilde{\psi}_0(\xi)\chi_\pm(\xi),$$

where $\tilde{\psi}_0$ is scalar-valued.

For more information on the Clifford algebra-valued distribution theory, we refer to, e.g., [2] and [17].
3 Main Results

Our main results are as follows.

**Theorem 3.1** For \( F \in H^p(\mathbb{R}^{n+1}_+), 1 \leq p \leq \infty \), we have
\[
(\hat{F}, \psi) = (F, \hat{\psi}) = \int_{\mathbb{R}^n} \hat{\psi}(x) F(x) dx = 0,
\]
where \( \psi \in \Psi^-(\mathbb{R}^n) \).

Conversely, we have

**Theorem 3.2** Let \( F \in L^p(\mathbb{R}^n), 1 \leq p \leq \infty \). If \( (\hat{F}, \psi) = 0 \) for \( \psi \in \Psi^-(\mathbb{R}^n) \) \( \hat{F} = \chi_+ \hat{F} \) if \( 1 \leq p \leq 2 \), then \( F(x) \) is the NTBL function of some \( F(x) \in H^p(\mathbb{R}^{n+1}_+) \).

In particular, we have

**Corollary 3.3** \( F \in H^p(\mathbb{R}^{n+1}_+), 1 \leq p \leq 2 \) if and only if \( F \in L^p(\mathbb{R}^n) \) and \( \hat{F}(\xi) = \chi_+(\xi) \hat{F}(\xi) \), and
\[
F(x) = \int_{\mathbb{R}^n} e^+(x, \xi) \hat{F}(\xi) d\xi = \int_{\mathbb{R}^n} E(x - y) F(y) dy.
\]

**Remark 3.4** Theorem 3.1 and Theorem 3.2 extend Proposition 2.3 and Proposition 2.5, respectively, to the non-vector-valued Hardy spaces cases. Moreover, the sufficiency and the necessity of the result for the case \( p = \infty \) are neither proved in the vector-valued or the Clifford algebra-valued Hardy spaces in literatures.

**Proof of Theorem 3.1** We first prove the result for \( 1 < p < \infty \). Mainly using Proposition 2.7 and Proposition 2.8, we have
\[
|(F, \hat{\psi})| = \lim_{x_0 \to 0} |(F(\cdot + x_0), \hat{\psi})| = \lim_{x_0 \to 0} |(C_{x_0}(F), \hat{\psi})| \\
\leq \lim_{x_0 \to 0} |(C_{x_0}(F - G), \hat{\psi})| + \lim_{x_0 \to 0} |(C_{x_0}(G), \hat{\psi})| \\
\leq C_n \lim_{x_0 \to 0} |(C_{x_0}(F - G), \hat{\psi})| + \lim_{x_0 \to 0} |(C_{x_0}(G), \hat{\psi})| \\
\leq C_n \lim_{x_0 \to 0} L|F - G||L_p| \|\hat{\psi}\|_{L_q} + \lim_{x_0 \to 0} |(C_{x_0}(G), \hat{\psi})|,
\]
where \( q = \frac{p}{p-1} \), \( L \) is given in Proposition 2.8, and \( C_n \) is a constant depending on \( n \).

For any \( \epsilon > 0 \), \( G \) is chosen as a smooth function with compact support such that
\[
||F - G||_{L^p} < \epsilon.
\]
Since \( C_{x_0}(G) \in H^2(\mathbb{R}^{n+1}_+) \), there follows

\[
C_{x_0}(G)(x) = \int_{\mathbb{R}^n} E(x_0 + x - y)G(y)dy
\]

\[
= \int_{\mathbb{R}^n} E\left(\frac{x_0}{2} + x - y\right)C_{x_0}(G)(y)dy
\]

\[
= \int_{\mathbb{R}^n} e^{2\pi i(x \cdot \xi)}e^{-\frac{2\pi}{\xi^2}}\mathcal{F}_{+}(\xi)(C_{x_0}(G))(\xi)\mathcal{F}_{+}(\xi)d\xi.
\]

This shows that

\[
(C_{x_0}(G))(\xi) = e^{-\frac{2\pi}{\xi^2}}\mathcal{F}_{+}(\xi)(C_{x_0}(G))(\xi).
\]

Therefore,

\[
(C_{x_0}(G)(x), \hat{\psi}(x)) = ((C_{x_0}(G))(\xi), \psi(\xi)) = (e^{-\frac{2\pi}{\xi^2}}\mathcal{F}_{+}(\xi)(C_{x_0}(G))(\xi), \psi(\xi)) = 0.
\]

Hence, through (3.8), for any \( \epsilon > 0 \), we have

\[
|\langle F, \hat{\psi} \rangle| \leq C_n L\|\hat{\psi}\|_{L^q} + 0,
\]

which shows \( \langle F, \hat{\psi} \rangle = 0 \).

Now we deal with the case \( p = 1 \). We use the following Lemma (for the complex analysis setting, see also e.g. [4]).

**Lemma 3.1** If \( F \in H^1(\mathbb{R}^{n+1}) \), then \( F_{x_0}(x) = F(x_0 + x) \in L^2(\mathbb{R}^n) \).

**Proof** Since \( F \) is left-monogenic, by the mean-value theorem, we have

\[
F(x_0 + x) = \frac{1}{V_{x_0}} \int_{B_x(\frac{x_0}{2})} F(y_0 + y)dy,
\]

where \( B_x(\frac{x_0}{2}) \) is the ball centered at \( x \) with radius \( \frac{x_0}{2} \), \( V_{x_0} \) is the volume of \( B_x(\frac{x_0}{2}) \). Then we have

\[
|F(x_0 + x)| \leq \frac{1}{V_{x_0}} \int_{B_x(\frac{x_0}{2})} |F(y_0 + y)|dy
\]

\[
\leq \frac{C}{x_0^{n+1}} \int_{\frac{x_0}{2}}^{\frac{3x_0}{2}} \int_{\mathbb{R}^n} |F(y_0 + y)|dydy_0
\]

\[
\leq \frac{C}{x_0^n} \sup_{y_0 > 0} \int_{\mathbb{R}^n} |F(y_0 + y)|dy,
\]

where \( C \) is a constant. This implies that \( F_{x_0}(x) \in L^\infty(\mathbb{R}^n) \). Then, we have

\[
\int_{\mathbb{R}^n} |F(x_0 + x)|^2dx = \int_{\mathbb{R}^n} |F(x_0 + x)||F(x_0 + x)|dx
\]

\[
\leq \sup_{x \in \mathbb{R}^n} |F(x_0 + x)| \int_{\mathbb{R}^n} |F(x_0 + x)|dx < \infty.
\]
The proof of the lemma is complete.

Now we continue to prove Theorem 3.1. Let $F \in H^1(\mathbb{R}^{n+1}_+), x_0 > 0$. Then we have
\[(F, \hat{\psi}) = (F - F_{x_0}, \hat{\psi}) + (F_{x_0}, \hat{\psi}).\]
For any $\epsilon > 0$, for a suitably chosen $x_0 > 0$, we have
\[|(F - F_{x_0}, \hat{\psi})| \leq C_n \|F - F_{x_0}\|_1 \|\hat{\psi}\|_\infty \leq C_n \epsilon \|\hat{\psi}\|_\infty.\]

On the other hand, as in the proof for the case $1 < p < \infty$,
\[(F_{x_0}, \hat{\psi}) = 0.\]
Hence
\[|(F, \hat{\psi})| \leq C_n \epsilon \|\hat{\psi}\|_\infty\]
for arbitrary $\epsilon > 0$. That shows $(F, \hat{\psi}) = 0$.

For $p = \infty$, we will mainly adopt the technique used in [19]. In Lemma 3.2 we will show that for $F \in H_\infty(\mathbb{R}^{n+1}_+),$
\[F(x) = HF(x) + c,\]
where $c$ is a constant. It is easily shown that
\[(c, \hat{\psi}) = 0, \quad \psi \in \Psi^{-}(\mathbb{R}^n).\]

Hence, in the following we only need to consider
\[F(x) = \frac{1}{2}(I + H)F(x) = \frac{1}{2} \sum_T (I + H)f_T(x)e_T.\]

We first consider that $\psi \in \Psi_\text{scalar}^-(\mathbb{R}^n)$. We have $\psi(\xi) = \psi_0(\xi) + \sum_{j=1}^n \psi_j(\xi)e_j = \tilde{\psi}_0(\xi)\chi_-(\xi)$, where $\tilde{\psi}_0$ is a scalar-valued Schwartz function. In particular, we note that
\[
\hat{\psi}(x) = \int_{\mathbb{R}^n} \tilde{\psi}_0(\xi) \frac{1}{2} (1 - i \frac{\xi}{|\xi|}) e^{-2\pi i (x, \xi)} d\xi = \int_{\mathbb{R}^n} \tilde{\psi}_0(\xi) \frac{1}{2} (1 + i \frac{\xi}{|\xi|}) e^{2\pi i (x, \xi)} d\xi,
\]
which means that $\hat{\psi}(x)$ is the NTBL function of functions in $H^1(\mathbb{R}^{n+1}_+)$. In the following we first accept, and use this property to prove that $(F, \hat{\psi}) = 0$ for $\psi \in \Psi^-(\mathbb{R}^n)$. Since $\hat{\psi} \in H^1(\mathbb{R}^{n+1}_+)$ and $(I + H)f_T(x) \in BMO(\mathbb{R}^n)$, $((I + H)f_T(x), \hat{\psi})$ is well-defined. As shown in [7, page 146], we have
\[
\int_{\mathbb{R}^n} \hat{\psi}(x) R_j(f_T)(x) dx = \sum_{k=0}^n \int_{\mathbb{R}^n} \mathbf{e}_k R_j(\hat{\psi}_k)(x) f_T(x) dx = -\sum_{k=0}^n \int_{\mathbb{R}^n} \mathbf{e}_k R_j(\hat{\psi}_k)(x) f_T(x) dx = -\int_{\mathbb{R}^n} R_j(\hat{\psi}) f_T(x) dx.
\]
Hence we have
\[
\int_{\mathbb{R}^n} \hat{\psi}(\xi)(f_T(\xi)) - \sum_{j=1}^{n} R_j(f_T(\xi)e_j) d\xi = \int_{\mathbb{R}^n} (\hat{\psi}(I + \sum_{j=1}^{n} R_j e_j))(f_T(\xi)) d\xi.
\]

One can easily show that \( \hat{\psi}(I + \sum_{j=1}^{n} R_j e_j) = 0 \). In fact, since the Fourier multiplier of \( R_j \) is \(-i\xi\), we have
\[
\left( \hat{\psi}(I + \sum_{j=1}^{n} R_j e_j) \right)^\vee(\xi) = \psi(\xi)(1 + i \sum_{j=1}^{n} \frac{\xi_j e_j}{|\xi|}) = \hat{\psi}_0(\xi) \frac{1}{2}(1 - i \frac{\xi}{|\xi|})(1 + i \frac{\xi}{|\xi|}) = 0.
\]
Thus \( \hat{\psi}(I + \sum_{j=1}^{n} R_j e_j) = 0 \), and hence \( ((H + I) f_T(\xi), \hat{\psi}) = 0 \) for \( \psi \in \Psi_{\text{scalar}}(\mathbb{R}^n) \). Consequently, \( (F, \hat{\psi}) = 0 \) for \( \psi \in \Psi_{\text{scalar}}(\mathbb{R}^n) \). For \( \psi \in \Psi^-(\mathbb{R}^n) \), we have
\[
(F, \hat{\psi}) = \sum_S e_S(F, (\psi_S \chi^-)^\wedge).
\]
Then, for each \( S \), we have
\[
(F, (\psi_S \chi^-)^\wedge) = 0
\]
by applying the above argument. We have \( (F, \hat{\psi}) = 0 \) for \( \psi \in \Psi^-(\mathbb{R}^n) \).

\[
\Box
\]

**Proof of Theorem 3.2.** We first consider the case \( p = 1 \). Define
\[
\Phi_{x_0}(\xi) = \Phi(x_0 + \xi) = \int_{\mathbb{R}^n} e^+(x, \xi) \hat{F}(\xi) d\xi
\]
and
\[
G_{x_0}(\xi) = G(x_0 + \xi) = \int_{\mathbb{R}^n} P_{x_0}(\xi - \xi) F(\xi) d\xi.
\]
Since \( F \in L^1(\mathbb{R}^n) \), we have
\[
e^{-2\pi x_0|\xi|} \chi_+(\xi) \hat{F}(\xi) \in L^2(\mathbb{R}^n).
\]
Consequently, combining with \( \hat{F}(\xi) = \chi_+(\xi) \hat{F}(\xi) \), we have
\[
\hat{\Phi}_{x_0}(\xi) = e^{-2\pi x_0|\xi|} \chi_+(\xi) \hat{F}(\xi) = \hat{G}_{x_0}(\xi) \in L^2(\mathbb{R}^n), \quad (3.9)
\]
and then, \( \Phi_{x_0}(\xi) = G_{x_0}(\xi) \) by the uniqueness of the Fourier transformation. We also note that \( G_{x_0} \in L^1(\mathbb{R}^n) \) since
\[
\|G_{x_0}\|_{L^1} \leq C_n \|F\|_{L^1}\|P_{x_0}\|_{L^1} < \infty.
\]
By interchanging the derivatives with the integral, we can show that $\Phi$ is left-monogenic since $e^+(x,\xi)$ is monogenic. Thus $\Phi(x) \in H^1(\mathbb{R}^{n+1}_+)$.

Next we consider the case for $L^p(\mathbb{R}^n), 1 < p \leq \infty$. By the assumption, we have

$$0 = (\hat{F}, \psi) = (\hat{F}^+ + \hat{F}^-, \psi) = (\hat{F}^-, \psi), \quad \text{for all } \psi \in \Psi^-(\mathbb{R}^n),$$

where $F^+ = \frac{1}{2}(I + H)F$ and $F^- = \frac{1}{2}(I - H)F$, and $(\hat{F}^+, \psi) = 0$ follows from the proof of Theorem 3.1 (Note that this argument only works for $1 < p \leq \infty$, not including $p = 1$). Consequently, we can have, for $\varphi$ being a scalar-valued Schwartz function taking zero in some neighborhood of the origin,

$$(\hat{F}^-, \varphi) = (\hat{F}^-, \varphi\chi_+) + (\hat{F}^-, \varphi\chi_-) = 0,$$

where $(\hat{F}^-, \varphi\chi_+) = 0$ follows from the proof of Theorem 3.1 and $(\hat{F}^-, \varphi\chi_-) = 0$ is given by (3.10). This implies that $\hat{F}^-$ is either zero or a distribution with support at the origin.

For the latter case, $\hat{F}^-$ has to be a finite linear combination of the partial derivatives of the Dirac delta function (see e.g. [12, 17]), which contradicts to $F \in L^p(\mathbb{R}^n), 1 < p < \infty$. Thus, for $1 < p < \infty$, $\hat{F}^- = 0$, and then $F^- = 0$. For $p = \infty$, $F^-$ is a constant $c$. Then, for $1 < p < \infty$, we have $F = F^+$, and for $p = \infty$, $F = F^+ + c$ being the NTBL function of some functions in $H^p(\mathbb{R}^{n+1}_+)$. \hfill \Box

**Lemma 3.2** For $F \in H^\infty(\mathbb{R}^{n+1}_+)$, we have

$$F(x) = HF(x) + c,$$

where $c$ is a constant.

**Proof:** Denote by $S_0(\mathbb{R}^n)$, where $\phi \in S_0(\mathbb{R}^n)$ is a scalar-valued Schwartz function such that $\hat{\phi}$ takes the zero value in some neighborhood of the origin. To show (3.11), it suffices to show that

$$((I - H)F(x), \phi(x)) = 0$$

holds for all $\phi \in S_0(\mathbb{R}^n)$. In fact, we have

$$((I - H)F(x), \phi(x)) = (((I - H)F)^\vee(\xi), \hat{\phi}(\xi)),$$

which means that $((I - H)F)^\vee$ is either zero or a distribution with support at the origin. Thus $(I - H)F(x) = c$, and hence $F(x) = HF(x) + c$, where $c$ is a constant.

Let $F = \sum T f_T e_T$, and $\psi(x) = \langle \frac{\phi(\xi)}{2\pi |\xi|} \rangle^\vee(x)$. Moreover, we have

$$-2\pi |\xi| e^{-2\pi x_0|\xi|} \hat{\psi}(\xi) = -e^{-2\pi x_0|\xi|} \hat{\phi}(\xi),$$

and hence,

$$(\partial_{x_0} P_{x_0} \ast \psi)(x) = -P_{x_0} \ast \phi(x).$$
Note that for $\phi \in S_0(\mathbb{R}^n)$, $\psi$ is still a Schwartz function. For each $T$, we have

$$(I + \sum_{j=1}^{n} e_j R_j)f_T(x_0 + \mathbf{x}), -\phi(\mathbf{x})$$

$$= ((I + \sum_{j=1}^{n} e_j R_j)f_T(x_0 + \mathbf{x}), (-2\pi|\xi|\hat{\psi}(\xi))'(\mathbf{x}))$$

$$= (f_T(x_0 + \mathbf{x}), (-2\pi|\xi|\hat{\psi}(\xi))'(\mathbf{x})(I - \sum_{j=1}^{n} R_j e_j))$$

$$= (f_T(x_0 + \mathbf{x}), (-2\pi|\xi|\hat{\psi}(\xi))[1 + \sum_{j=1}^{n} (\xi_j e_j)]'(\mathbf{x}))$$

$$= (f_T(x_0 + \mathbf{x}), (\phi(\mathbf{x}))(1 + \sum_{j=1}^{n} (\xi_j e_j)))[(\mathbf{x})]$$

$$= (f_T(x_0 + \mathbf{x}), (\phi(\mathbf{x}))(1 + \sum_{j=1}^{n} (\xi_j e_j)))[(\mathbf{x})].$$

(3.13)

In the second equality we have used the result proved in [1, page 146], while the other equalities follow from the properties of the Fourier transform and the Fourier multiplier of the Riesz transformations. Since $\psi$ is a Schwartz function, for any $\epsilon > 0$, we can find $\tilde{\psi}$, a $C^\infty$-function with compact support, such that $||\psi - \tilde{\psi}||_{L^1} < \epsilon$ and $||\partial_j \psi - \partial_j \tilde{\psi}||_{L^1} < \epsilon, 1 \leq j \leq n$. We also note that

$$\partial_0 P_{x_0}(\mathbf{x}) = \frac{1}{\sigma_n} \frac{\partial}{\partial x_0} x_0 = \frac{1}{\sigma_n} \frac{-nx_0^2 + |\mathbf{x}|^2}{x_0^2 + |\mathbf{x}|^2}.$$ 

Thus,

$$|f_T(\mathbf{x}), (\partial_0 P_{x_0} * (\psi - \tilde{\psi}))(\mathbf{x})|$$

$$\leq \frac{C'}{\sigma_n} \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{x_0^2}{x_0^2 + |\mathbf{x} - \mathbf{y}|^2} \frac{y_0^2}{y_0^2 + |\mathbf{x} - \mathbf{y}|^2} ||\psi(y) - \tilde{\psi}(y)||_{L^1} dy dx$$

$$+ \frac{C''}{\sigma_n} \int_{\mathbb{R}^n} \int_{\mathbb{R}^n} \frac{|\mathbf{x} - \mathbf{y}|^2}{x_0^2 + |\mathbf{x} - \mathbf{y}|^2} ||\psi(y) - \tilde{\psi}(y)||_{L^1} dy dx$$

$$\leq C' ||P_{x_0} * (|\psi - \tilde{\psi}|)||_{L^1} + \frac{C''}{x_0} ||P_{x_0} * (|\psi - \tilde{\psi}|)||_{L^1}$$

$$\leq (C' + \frac{C''}{x_0}) ||\psi - \tilde{\psi}||_{L^1},$$

$\leq C\epsilon.$
where $C', C''$ and $C$ are constants. Hence,

$$
(3.13) = ((\partial_0 P_{x_0} \ast f_T)(x), \tilde{\psi}(x)) + \sum_{j=1}^{n} \partial_j f_T(x_0 + x)e_j + \tilde{\psi}(x))
$$

$$
+ (f_T(x), \partial_0 P_{x_0} \ast (\psi - \tilde{\psi})(x)) + (f_T(x_0 + x), \sum_{j=1}^{n} - (\partial_j \psi(x) - \partial_j \tilde{\psi}(x))e_j)
$$

$$
= ((\partial_0 + \sum_{j=1}^{n} \partial_j e_j) f_T(x_0 + x), \tilde{\psi}(x))
$$

$$
+ (f_T(x), \partial_0 P_{x_0} \ast (\psi - \tilde{\psi})(x)) + (f_T(x_0 + x), \sum_{j=1}^{n} - (\partial_j \psi(x) - \partial_j \tilde{\psi}(x))e_j)
$$

$$
= (D f_T(x_0 + x), \tilde{\psi}(x))
$$

$$
+ (f_T(x), \partial_0 P_{x_0} \ast (\psi - \tilde{\psi})(x)) + (f_T(x_0 + x), \sum_{j=1}^{n} - (\partial_j \psi(x) - \partial_j \tilde{\psi}(x))e_j).
$$

Then, we have

$$
((I + \sum_{j=1}^{n} e_j R_j)F(x_0 + x), -\phi(x))
$$

$$
= (DF(x_0 + x), \tilde{\psi}(x))
$$

$$
+ (F(x), \partial_0 P_{x_0} \ast (\psi - \tilde{\psi})(x)) + (F(x_0 + x), \sum_{j=1}^{n} - (\partial_j \psi(x) - \partial_j \tilde{\psi}(x))e_j).
$$

Since $F$ is left-monogenic, we have

$$
((I + \sum_{j=1}^{n} e_j R_j)F(x_0 + x), -\phi(x))
$$

$$
= (F(x), \partial_0 P_{x_0} \ast (\psi - \tilde{\psi})(x)) + (F(x_0 + x), \sum_{j=1}^{n} - (\partial_j \psi(x) - \partial_j \tilde{\psi}(x))e_j).
$$

Thus, for any $\epsilon > 0$, we have

$$
|(I + \sum_{j=1}^{n} e_j R_j)F(x_0 + x), -\phi(x)|
$$

$$
\leq |(F(x), \partial_0 P_{x_0} \ast (\psi - \tilde{\psi})(x))| + |(F(x_0 + x), \sum_{j=1}^{n} - (\partial_j \psi(x) - \partial_j \tilde{\psi}(x))e_j)|
$$

$$
\leq C''(|\psi - \tilde{\psi}|_{L^1} + \sum_{j=1}^{n} ||\partial_j \psi - \partial_j \tilde{\psi}||_{L^1})
$$

$$
\leq (n + 1)C'' \epsilon,
$$
where $C'''$ is a constant. Hence,

$$((I + \sum_{j=1}^{n} e_j R_j)F(x_0 + \underline{x}), -\phi(\underline{x})) = 0.$$ 

Finally, we have

$$((I + \sum_{j=1}^{n} e_j R_j)F(\underline{x}), \phi(\underline{x})) = \lim_{x_0 \to 0} ((I + \sum_{j=1}^{n} e_j R_j)F(x_0 + \underline{x}), \phi(\underline{x})) = 0$$

for all $\phi \in S_0(\mathbb{R}^n)$. The proof is completed. \hfill \qed

**Remark 3.5** If $F \in H^\infty(\mathbb{R}^{n+1}_+)$ is vector-valued, the above result becomes

$$F(\underline{x}) = f_0(\underline{x}) - \sum_{j=1}^{n} R_j(f_0)(\underline{x})e_j + c.$$ 

We note that the proof of the above lemma holds for $H^p(\mathbb{R}^{n+1}_+), 1 \leq p \leq \infty$. This means that we have given an alternative proof of the Cauchy integral formula for $H^p(\mathbb{R}^{n+1}_+), 1 \leq p < \infty$, i.e.,

$$F(x_0 + \underline{x}) = \int_{\mathbb{R}^n} E(\underline{x} - \underline{y})F(\underline{y})d\underline{y},$$

and for $H^{\infty}(\mathbb{R}^{n+1}_+)$,

$$F(x_0 + \underline{x}) = \int_{\mathbb{R}^n} E(\underline{x} - \underline{y})F(\underline{y})d\underline{y} + c,$$

where $E(\underline{x} - \underline{y})$ is revised corresponding to the revision of $R_j, 1 \leq j \leq n$.

When $p = 2$, we can prove $F(\underline{x}) = HF(\underline{x})$ in the normal sense. The proof of the above lemma is motivated by the case $p = 2$. In fact, a direct computation of $DF = 0$ yields

$$(\partial_0 f_T(x_0 + \underline{x}) + \sum_{j=1}^{n} (-1)^j \partial_j f_{T_j}(x_0 + \underline{x}))e_T = 0, \quad \text{for all } T,$$

where $T_j$ satisfies $(-1)^j e_j e_{T_j} = e_T$. We note that

$$l_j = N(j \cap T_j) + P(j, T_j),$$

where $N(A) = \#A$ denotes the number of elements in some set $A$, and

$$P(j, T_j) = \#\{k; j > k, k \in T_j\}.$$ 

Taking the Fourier transform on $\underline{x}$, we have

$$(\partial_0 \hat{f}_T(x_0 + \xi) + \sum_{j=1}^{n} (-1)^j (2\pi i \xi_j) \hat{f}_{T_j}(x_0 + \xi))e_T = 0.$$ 

16
Using the fact that
\[
\lim_{x_0 \to 0} \partial_0 \hat{f}_T(x_0 + \xi) = \lim_{x_0 \to 0} \partial_0 (P_{x_0} \ast f_T)(\xi) = \partial_0 (e^{-2\pi x_0 |\xi|} \hat{f}_T(\xi)) = -2\pi |\xi| \hat{f}_T(\xi),
\]
we have
\[
(\hat{f}_T(\xi) + \sum_{j=1}^{n} (-1)^j (-i \frac{\xi_j}{|\xi|}) \hat{f}_j(\xi)) e_T = 0,
\]
and consequently,
\[
(f_T(x) + \sum_{j=1}^{n} (-1)^j R_j(f_T)(x)) e_T = 0.
\]
This means that \( F(x) = H F(x) \).

4 Analogue in Bergman Space

In this section we prove a representation formula for the functions in the Clifford algebra-valued Bergman space in the upper half-space as an application of our results in the previous sections. For the analogous result in the complex analysis setting, we refer to [6] and [1].

Definition 4.1 Let \( F(x) = \sum_T f_T(x)e_T \), where \( x \in \mathbb{R}_{+}^{n+1} \). If \( F \) is left-monogenic on \( \mathbb{R}_{+}^{n+1} \), and satisfies
\[
||F||^p_{A^p} = \int_{0}^{\infty} \int_{\mathbb{R}^n} |F(x_0 + \xi)|^p dx_0 dx < \infty,
\]
then we say that \( F \) belongs to the Bergman space \( A^p(\mathbb{R}_{+}^{n+1}) \).

As an application of the Fourier spectrum characterization of \( H^p(\mathbb{R}_{+}^{n+1}), 1 \leq p < \infty \), we have

Theorem 4.2 For \( F \in A^p(\mathbb{R}_{+}^{n+1}), 1 \leq p \leq 2 \), there exists a function \( G \in L^q(\mathbb{R}^n), q = \frac{n}{p-1} \), such that
\[
F(x) = \int_{\mathbb{R}^n} e^+(x, \xi) G(\xi) d\xi.
\]
Moreover, for \( 1 < p \leq 2 \),
\[
\left( \int_{\mathbb{R}^n} \frac{|\chi_+(\xi) G(\xi)|^q}{(2\pi |\xi|)^\frac{q}{p}} d\xi \right)^\frac{1}{q} \leq ||F||_{A^p} < \infty,
\]
and for \( p = 1 \),
\[
\sup_{\xi \in \mathbb{R}^n} \frac{|\chi_+(\xi) G(\xi)|}{2\pi |\xi|^\frac{1}{2}} \leq ||F||_{A^1} < \infty.
\]
Theorem 4.3 For \( F \in A^p(\mathbb{R}^{n+1}_+) \), \( 2 < p < \infty \), we have that, for \( x_0 > 0 \), there holds

\[
(F(x_0 + \cdot), \hat{\psi}) = 0
\]

for \( \psi \in \Psi^-(\mathbb{R}^n) \).

Proof of Theorem 4.2

Since \( F \) is left-monogenic, \( |F|^p \) is subharmonic for \( 1 \leq p \leq 2 \). We thus have

\[
|F(x)|^p \leq \frac{1}{V_{x_0}} \int_{B_x(\delta)} |F(y_0 + y)|^p dy,
\]

where \( B_x(\delta) \) is the ball centered at \( x \) with radius \( 0 < \delta < x_0 \), \( V_\delta \) is the volume of \( B_x(\delta) \). Then we have

\[
|F(x)|^p \leq \frac{C}{\delta^{n+1}} \int_{x_0 - \delta}^{x_0 + \delta} \int_{|x - y| < \delta} |F(y_0 + y)|^p dy dy_0
\]

and then,

\[
\int_{\mathbb{R}^n} |F(x_0 + x)|^p dx \leq \frac{C}{\delta^{n+1}} \int_{\mathbb{R}^n} \int_{0}^{\infty} \int_{|x - y| < \delta} |F(y_0 + y)|^p dy dy_0 dx
\]

\[
= \frac{C}{\delta^{n+1}} \int_{0}^{\infty} \int_{\mathbb{R}^n} \chi_{B_x(\delta)}(x) dx |F(y_0 + y)|^p dy dy_0
\]

\[
= \frac{C'\delta^n}{\delta^{n+1}} \int_{0}^{\infty} \int_{\mathbb{R}^n} |F(y_0 + y)|^p dy dy_0
\]

where the second equality used Fubini’s theorem, and \( C \) and \( C' \) are constants. The above inequality implies that \( F_{y_0}(x) = F(y_0 + x) \in H^p(\mathbb{R}^{n+1}_+) \) for \( F \in A^p(\mathbb{R}^{n+1}_+) \) and \( y_0 > 0 \). Consequently, we have

\[
F_{y_0}(x) = \int_{\mathbb{R}^n} e^+(x, \xi) \hat{F}_{y_0}(\xi) d\xi
\]

and

\[
F_{y_0}(x) = \int_{\mathbb{R}^n} P_{x_0}(x - y) F_{y_0}(y) dy.
\]

Thus

\[
\hat{F}_{y_0 + x_0}(\xi) = e^{-2\pi x_0 |\xi|} \hat{F}_{y_0}(\xi)
\]
and hence
\[ e^{2\pi(y_0+x_0)\xi} \chi_+(\xi) \hat{F}_{y_0+x_0}(\xi) = e^{2\pi y_0|\xi|} \hat{F}_{y_0}(\xi). \]

Therefore, if we let \( G(\xi) = e^{2\pi y_0|\xi|} \hat{F}_{y_0}(\xi) \), which is independent of \( y_0 \), then we have
\[
F_{y_0}(x) = \int_{\mathbb{R}^n} e^+(x, \xi) e^{-2\pi y_0|\xi|} \hat{F}_{y_0}(\xi) d\xi
= \int_{\mathbb{R}^n} e^+(y_0 + x, \xi) G(\xi) d\xi.
\]

Consequently,
\[
F(x) = \int_{\mathbb{R}^n} e^+(x, \xi) G(\xi) d\xi.
\]

Moreover, by Hausdorff-Young’s inequality, we have, for \( 1 < p \leq 2 \),
\[
\left( \int_{\mathbb{R}^n} |\chi_+(\xi) G(\xi)|^q e^{-2\pi x_0|\xi|} d\xi \right)^{\frac{1}{q}} \leq \left( \int_{\mathbb{R}^n} |F(x_0 + x)|^p dx \right)^{\frac{1}{p}},
\]
and for \( p = 1 \),
\[
\sup_{\xi \in \mathbb{R}^n} |\chi_+(\xi) G(\xi)| e^{-2\pi x_0|\xi|} \leq \int_{\mathbb{R}^n} |F(x_0 + x)| dx.
\]

For \( 1 < p \leq 2 \), by Minkowski’s inequality,
\[
\left( \int_{\mathbb{R}^n} \left( \int_0^\infty |\chi_+(\xi) G(\xi)|^p e^{-2\pi x_0|\xi|} dx_0 \right)^{\frac{q}{p}} d\xi \right)^{\frac{1}{q}} \leq \int_0^\infty \left( \int_{\mathbb{R}^n} |\chi_+(\xi) G(\xi)|^q e^{-2\pi x_0|\xi|} d\xi \right)^{\frac{p}{q}} dx_0
\leq \int_0^\infty \int_{\mathbb{R}^n} |F(x_0 + x)|^p dx dx_0,
\]
and thus
\[
\left( \int_{\mathbb{R}^n} \frac{|\chi_+(\xi) G(\xi)|^q}{(2\pi p|\xi|)^{\frac{q}{p}}} \right)^{\frac{1}{q}} \leq \left( \int_0^\infty \int_{\mathbb{R}^n} |F(x_0 + x)|^p dx dx_0 \right)^{\frac{1}{p}} < \infty.
\]

For \( p = 1 \),
\[
\sup_{\xi \in \mathbb{R}^n} \frac{|\chi_+(\xi) G(\xi)|}{2\pi |\xi|} \leq \int_0^\infty \int_{\mathbb{R}^n} |F(x_0 + x)| dx dx_0 < \infty.
\]

\textbf{Proof of Theorem 4.3}
As in the proof of Theorem 4.2, we can show that \( F_{y_0}(x) \in H^p(\mathbb{R}^{n+1}_+) \) for \( F \in A^p(\mathbb{R}^{n+1}_+), 2 < p < \infty \) and \( y_0 > 0 \). Then, by Theorem 3.1, we complete the proof. \( \square \)
