Experimental procedures for the syntheses of all new compounds
General procedures.

Unless indicated, all commercially available reagents and anhydrous solvents were purchased at the highest commercial quality and were used as received without further purification. All nonaqueous reactions were carried out under an argon atmosphere using dry glassware that had been flame-dried under a stream of argon unless otherwise noted. Dry tetrahydrofuran (THF), diethyl ether (Et₂O), methylene chloride (CH₂Cl₂) and dimethylformamide (DMF) were obtained by passing commercially available predried, oxygen-free formulations through activated alumina columns. Flash column chromatography was performed on silica gel (Merck Kieselgel 60, 230–400 mesh) using hexane/EtOAc or CH₂Cl₂/MeOH mixtures of increasing polarity. The progress of all the reactions was monitored by thin-layer chromatography (TLC) using glass plates precoated with silica gel-60 F254 to a thickness of 0.5 mm (Merck). ¹³C NMR and ¹H NMR spectra were recorded on either 400 MHz/500 MHz Varian instrument or a 500 MHz JEOL instrument. Chemical shifts (δ) are quoted in parts per million (ppm) referenced to the appropriate residual solvent peak, with the abbreviations s, br s, d, t, q, and m denoting singlet, broad singlet, doublet, triplet, quartet and multiplet respectively. J = coupling constants given in hertz (Hz). High-resolution mass spectra (HRMS) were recorded on a trisector WG AutoSpecQ spectrometer. Optical rotation data were collected on a Jasco P-1010 polarimeter using HPLC grade anhydrous solvents. X-ray data were recorded on a Bruker SMART APEX 3kW Sealed Tube X-ray diffraction system.
14: To a vigorous stirred solution of 8 [1,2] (10.0 g, 52.6 mmol) in glacial AcOH (20 mL), was added at room temperature a solution of ethane-1,2-dithiol (5.45 g, 57.8 mmol) and p-TsOH (1.71 g, 15.8 mmol) in glacial AcOH (40 mL). The mixture was stirred for 2 h and was quenched by water (100 mL). The solid was separated by filtration and washed with water (50 mL), with 10% aqueous solution of NaHCO₃ solution (50 mL), and with water (50 mL), and dried under reduced pressure. The crude product was then dissolved in EtOAc, rotavaped on silica and purified by a plug of silica (hexane/EtOAc = 100:5) to afford 14 as white crystals (12 g, 86%); [α]_D^{25} −373.9 (c 0.6, CHCl₃); ^1H NMR (400 MHz, CDCl₃) δ 5.76 (s, 1H), 5.71 (m, 1H), 5.11 (m, 2H), 3.42 (m, 3H), 3.23 (m, 1H), 2.69 (m, 1H), 2.52 (m, 2H), 2.24 (m, 5H), 1.96 (m, 1H), 1.50 (m, 1H); ^13C NMR (100 MHz, CDCl₃) δ 217.4, 142.3, 132.8, 126.5, 118.8, 64.9, 51.1, 40.9, 39.9, 38.5, 37.8, 36.5, 26.6; HRMS (ESI): m/e 267.0871 [M + H⁺] calcd for C₁₄H₁₉O₂S⁺: 267.0872.

15: To a suspension of Ph₃P⁺CH₂OCH₃Cl⁻ (27.8 g, 81 mmol) in anhydrous THF (400 mL) at 0 °C, was added a solution of KHMDS (90 mL, 90 mmol, 1 M in THF). The resulting red solution was stirred at the same temperature for 30 minutes, and a solution of ketone 14 (12.0 g, 45 mmol) in THF (100 mL) was added slowly. The mixture was then warmed up to rt and left overnight. Upon completion, the reaction was quenched by saturated NH₄Cl solution (200 mL) and brine (200 mL). The residue was extracted with EtOAc (3 × 200 mL) and dried over Na₂SO₄. The solvent was removed under reduced pressure, and the crude product was purified through a plug of silica (hexane/EtOAc = 10:1 as elute) to afford the corresponding enol ether as a yellow oil. The methyl enol
ether obtained above (~13.5 g, 45 mmol) was dissolved in acetone (1.5 L). To this solution was added p-TsOH (25.6 g, 134 mmol) at 0 °C. The reaction was then warmed up to rt and stirred for 2 h. Upon completion, the reaction was quenched with saturated NaHCO₃ solution (30 mL) and the solvent was removed by rotovap (water bath temperature below 30 °C). The residue was diluted with water (400 mL) and extracted with EtOAc (3 × 200 mL). The combined organic layers were washed with brine (200 mL) and dried over Na₂SO₄. The solvent was then removed and the crude aldehyde was isolated as a 9:1 mixture of diastereomers at C1, which was used without further purification. Aldehyde obtained as described above (~12.5 g, 45 mmol) was dissolved in MeOH (300 mL) and THF (300 mL) at −78 °C, and NaBH₄ was added in small portions. The resulting suspension was stirred at the same temperature for 30 minutes before being quenched with saturated NH₄Cl solution (100 mL). The solvent was removed by rotovap (water bath temperature below 30 °C). The residue was diluted with water (300 mL) and extracted with EtOAc (3 × 200 mL). The combined organic layers were washed with brine (100 mL) and dried over Na₂SO₄. 18: To a solution of 10 (3.0 g, 15.8 mmol) in anhydrous DMF (35 mL) was added magnesium methyl carbonate (27.6 mL, 55.2 mmol, 2.0 M in DMF). This solution was degassed for 5 min under argon, then immersed in an oil bath which was preheated to 130 °C and stirred for 3 h. The reaction was cooled to 0 °C and poured in to a mixture of ice/2 N HCl (50 mL). Then this mixture was acidified to pH = 2-3 with 2 N HCl. Ether (200 mL) was added to form a two-phase clear solution. The aqueous phase was separated and re-extracted with ether (2 × 100 mL). The combined organic extracts were dried over Na₂SO₄ and concentrated under reduced pressure at 30 °C. The residue was dried on high-vacuum pump for 1 h to remove the trace of DMF to afford yellow oil. The crude product was dissolved in dry CH₂Cl₂ (35 mL), triethylloxonium tetrafluoroborate (23.6 mL, 23.6 mmol, 1 M in CH₂Cl₂) was added at 0 °C, and then DIPEA (5.5 mL, 31.5 mmol) was added dropwise. After 1 minute, TLC showed the completion of this reaction. Then this reaction was quenched with saturated NH₄Cl solution (30 mL), extracted with DCM (3 × 30 mL), washed with saturated NaHCO₃ solution and brine, dried over Na₂SO₄, and concentrated under reduced pressure. The unstable crude product 17 was used in the next step directly. To a solution of this crude ester (4.2 g, ~15.8 mmol) in dry DCM (60 mL) was added 2,6-lutidine (5.5 mL, 41.3 mmol) at 0 °C, followed by the addition of TMSOTf (5.7 mL, 13.6 mmol) dropwise. After 30 min, the reaction was diluted with hexanes (100 mL), quenched with 5% (not saturated!) This reaction was warmed up to rt and vigorous stirred for 5 h. The mixture was then diluted with water, acidified with 2 N HCl to pH = 1, and separated with EtOAc/brine (20 mL/20 mL), and the aqueous phase was extracted with EtOAc (2 x 20 mL). The organic phase was combined, dried over Na₂SO₄, and concentrate under reduced pressure to afford epoxide as a white solid. The product was used without future purification.

Epoxide obtained above (~0.7 g, 2.66 mmol) was dissolved in 1,4-dioxane (30 mL) and water (10 mL). To this solution 2,6-lutidine (0.63 mL, 5.4 mmol) and OsO₄ (0.17 mL, 4% solution in H₂O, 27 µmol) were added, and then NaIO₄ (2.3 g, 10.8 mmol) was added portionwise at 0 °C. This reaction was then warmed up to rt and stirred overnight. The reaction was diluted with water (60 mL) and extracted with CH₂Cl₂ (3 x 50 mL). The mixture was stirred for 5 min before filtration through Celite®, and the filter cake was then washed thoroughly with EtOAc (100 mL). The combined organic extracts were dried over Na₂SO₄ and concentrated under reduced pressure. The crude residue was purified by column chromatography (hexanes/CH₂Cl₂ = 1:1 to 1:3 to 100% CH₂Cl₂, then
