**Materials Design Analysis Reporting (MDAR)**
**Checklist for Authors**

The MDAR framework establishes a minimum set of requirements in transparent reporting mainly applicable to studies in the life sciences.

*eLife* asks authors to **provide detailed information within their article** to facilitate the interpretation and replication of their work. Authors can also upload supporting materials to comply with relevant reporting guidelines for health-related research (see EQUATOR Network), life science research (see the BioSharing Information Resource), or animal research (see the ARRIVE Guidelines and the STRANGE Framework; for details, see *eLife’s Journal Policies*). Where applicable, authors should refer to any relevant reporting standards materials in this form.

For all that apply, please note **where in the article** the information is provided. Please note that we also collect information about data availability and ethics in the submission form.

### Materials:

| Material Type                  | Indicate where provided: section/figure legend | N/A |
|-------------------------------|-----------------------------------------------|-----|
| Newly created materials       | The manuscript includes a dedicated "materials availability statement" providing transparent disclosure about availability of newly created materials including details on how materials can be accessed and describing any restrictions on access. | A “materials availability statement” is included at the end of the manuscript, before figure legends. |
| Antibodies                    | For commercial reagents, provide supplier name, catalogue number and RRID, if available. | N/A |
| DNA and RNA sequences          | Short novel DNA or RNA including primers, probes: Sequences should be included or deposited in a public repository. | The oligos and crRNA are listed in the methods section or additional tables. The sequences of plasmids cloned will be uploaded in the public repository. |
| Cell materials                | Cell lines: Provide species information, strain. Provide accession number in repository OR supplier name, catalog number, clone number, OR RRID. | N/A |
| Primary cultures: Provide species, strain, sex of origin, genetic modification status. | N/A |
|---|---|
| **Experimental animals** | **Indicate where provided: section/figure legend** | N/A |
| Laboratory animals or Model organisms: Provide species, strain, sex, age, genetic modification status. Provide accession number in repository OR supplier name, catalog number, clone number, OR RRID. | Model organism (C. elegans) strains are listed in the method section with proper citations. | N/A |
| Animal observed in or captured from the field: Provide species, sex, and age where possible. | N/A |
| **Plants and microbes** | **Indicate where provided: section/figure legend** | N/A |
| Plants: provide species and strain, ecotype and cultivar where relevant, unique accession number if available, and source (including location for collected wild specimens). | N/A |
| Microbes: provide species and strain, unique accession number if available, and source. | N/A |
| **Human research participants** | **Indicate where provided: section/figure legend) or state if these demographics were not collected** | N/A |
| If collected and within the bounds of privacy constraints report on age, sex, gender and ethnicity for all study participants. | N/A |
**Design:**

| Study protocol                                                                 | Indicate where provided: section/figure legend | N/A |
|--------------------------------------------------------------------------------|-----------------------------------------------|-----|
| If the study protocol has been pre-registered, provide DOI. For clinical trials, provide the trial registration number OR cite DOI. |                                               | N/A |

| Laboratory protocol                                                             | Indicate where provided: section/figure legend | N/A |
|--------------------------------------------------------------------------------|-----------------------------------------------|-----|
| Provide DOI OR other citation details if detailed step-by-step protocols are available. | General methods are described in materials and methods. | N/A |

| Experimental study design (statistics details) *                                  | Indicate where provided: section/figure legend | N/A |
|--------------------------------------------------------------------------------|-----------------------------------------------|-----|
| For in vivo studies: State whether and how the following have been done          | Indicate where provided: section/figure legend. If it could have been done, but was not, write “not done” | N/A |
| Sample size determination                                                        | The sample size goal in each experiment was ten embryos per treatment; sample sizes under ten were the result of sample exclusion. |     |
| Randomisation                                                                    | During imaging, embryos with various treatments were alternated. |     |
| Blinding                                                                         |                                               | N/A |
| Inclusion/exclusion criteria                                                      | Embryos were included if RNAi depletion was penetrant as detailed in the methods and if time 0 was appropriately imaged. Embryos also excluded if debris interfered with segmentation automation. |     |

| Sample definition and in-laboratory replication                                 | Indicate where provided: section/figure legend | N/A |
|--------------------------------------------------------------------------------|-----------------------------------------------|-----|
| State number of times the experiment was replicated in the laboratory.          | Each embryo in the sample size is a replicate. |     |
| Define whether data describe technical or biological replicates.                | Biological replicates                          |     |

| Ethics                                                                           | Indicate where provided: section/submission form | N/A |
|--------------------------------------------------------------------------------|-----------------------------------------------|-----|
### Analysis:

| Table Title | Indicate where provided: section/figure legend | N/A |
|-------------|-----------------------------------------------|-----|
| Attrition   |                                               |     |
| Describe whether exclusion criteria were pre-established. Report if sample or data points were omitted from analysis. If yes, report if this was due to attrition or intentional exclusion and provide justification. | Exclusion criteria are described in the methods as any embryo that does not meet phenotype penetrance. Additionally, samples were excluded if automated segmentation was unsuccessful due to debris. |     |
| Statistics  |                                               |     |
| Describe statistical tests used and justify choice of tests. | 95% confidence intervals were plotted in graphs and described in the figure legends and methods section. T tests were performed as described in the methods section. |     |
| Data availability |                                               |     |
| For newly created and reused datasets, the manuscript includes a data availability statement that provides details for access (or notes restrictions on access). | Data availability statement is included. |     |
When newly created datasets are publicly available, provide accession number in repository OR DOI and licensing details where available.  

Datasets will be provided in the public repository.

If reused data is publicly available provide accession number in repository OR DOI, OR URL, OR citation.  

N/A

| Code availability                                                                 | Indicate where provided: section/figure legend                      | N/A |
|------------------------------------------------------------------------------------|---------------------------------------------------------------------|-----|
| For any computer code/software/mathematical algorithms essential for replicating the main findings of the study, whether newly generated or re-used, the manuscript includes a data availability statement that provides details for access or notes restrictions. | The data availability statement includes details of code availability. |     |
| Where newly generated code is publicly available, provide accession number in repository, OR DOI OR URL and licensing details where available. State any restrictions on code availability or accessibility. | All new scripts are included in the public repository            |     |
| If reused code is publicly available provide accession number in repository OR DOI OR URL, OR citation. | Reused code is cited in the methods section.                     |     |

**Reporting:**
The MDAR framework recommends adoption of discipline-specific guidelines, established and endorsed through community initiatives.

| Adherence to community standards                                                                 | Indicate where provided: section/figure legend | N/A |
|-----------------------------------------------------------------------------------------------|-----------------------------------------------|-----|
| State if relevant guidelines (e.g., ICMJE, MIBBI, ARRIVE, STRANGE) have been followed, and whether a checklist (e.g., CONSORT, PRISMA, ARRIVE) is provided with the manuscript. |                                               | N/A |

* We provide the following guidance regarding transparent reporting and statistics; we also refer authors to [Ten common statistical mistakes to watch out for when writing or reviewing a manuscript](#).

**Sample-size estimation**
- You should state whether an appropriate sample size was computed when the study was being designed
- You should state the statistical method of sample size computation and any required assumptions
- If no explicit power analysis was used, you should describe how you decided what sample (replicate) size (number) to use

**Replicates**
- You should report how often each experiment was performed
● You should include a definition of biological versus technical replication
● The data obtained should be provided and sufficient information should be provided to indicate the number of independent biological and/or technical replicates
● If you encountered any outliers, you should describe how these were handled
● Criteria for exclusion/inclusion of data should be clearly stated
● High-throughput sequence data should be uploaded before submission, with a private link for reviewers provided (these are available from both GEO and ArrayExpress)

**Statistical reporting**
● Statistical analysis methods should be described and justified
● Raw data should be presented in figures whenever informative to do so (typically when N per group is less than 10)
● For each experiment, you should identify the statistical tests used, exact values of N, definitions of center, methods of multiple test correction, and dispersion and precision measures (e.g., mean, median, SD, SEM, confidence intervals; and, for the major substantive results, a measure of effect size (e.g., Pearson’s r, Cohen’s d)
● Report exact p-values wherever possible alongside the summary statistics and 95% confidence intervals. These should be reported for all key questions and not only when the p-value is less than 0.05.

**Group allocation**
● Indicate how samples were allocated into experimental groups (in the case of clinical studies, please specify allocation to treatment method); if randomization was used, please also state if restricted randomization was applied
● Indicate if masking was used during group allocation, data collection and/or data analysis
