Abstract

We prove existence of global solutions to singular SPDEs on $\mathbb{R}^d$ with cubic nonlinearities and additive white noise perturbation, both in the elliptic setting in dimensions $d = 4, 5$ and in the parabolic setting for $d = 2, 3$. We prove uniqueness and coming down from infinity for the parabolic equations. A motivation for considering these equations is the construction of scalar interacting Euclidean quantum field theories. The parabolic equations are related to the $\Phi^4_d$ Euclidean quantum field theory via Parisi–Wu stochastic quantization, while the elliptic equations are linked to the $\Phi^4_{d-2}$ Euclidean quantum field theory via the Parisi–Sourlas dimensional reduction mechanism.

Keywords: singular SPDEs, paracontrolled distributions, global solutions, stochastic quantization, dimensional reduction, semilinear elliptic equations.

1 Introduction

This paper is concerned with elliptic and parabolic partial differential equations related to the \( \Phi^4 \) Euclidean quantum field theory on the full space. More precisely, we consider the following semilinear elliptic partial differential equation on \( \mathbb{R}^d \) for \( d = 4, 5 \),

\[
(-\Delta + \mu) \varphi + \varphi^3 = \xi, \tag{1.1}
\]

where \( \xi \) is a space white noise on \( \mathbb{R}^d \) and \( \mu > 0 \). We also consider the Cauchy problem for the semilinear parabolic partial differential equation on \( \mathbb{R}^+ \times \mathbb{R}^d \) with \( d = 2, 3 \), given by

\[
(\partial_t - \Delta + \mu) \varphi + \varphi^3 = \xi, \tag{1.2}
\]

where \( \xi \) is a space-time white noise on \( \mathbb{R}^+ \times \mathbb{R}^d \) and \( \mu \in \mathbb{R} \).
Both equations fall in the category of the so-called singular SPDEs, a loose term which means that they are classically ill-posed due to the very irregular nature of the noise $\xi$. Indeed, solutions are expected to take values only in spaces of distributions of negative regularity and the non-linear terms appearing in the equations cannot be given a canonical meaning. Recent progresses by Hairer [Hai14] and others [GIP15, Kup16, OW16] have provided various existence theories for local solutions of the above parabolic equations in a periodic spatial domain. The key idea is to identify suitable subspaces of distributions large enough to contain the candidate solutions and structured enough to allow for the definition of the non-linear terms. These theories define solutions for the above equations once the non-linear term is renormalized, which formally can be understood as a subtraction of an (infinite) correction term:

$$ \varphi^3 \mapsto \varphi^3 - \infty \varphi. $$

More rigorously, and as we hinted above, this formal expression has to be understood in the sense that even though both terms separately are not well defined, certain combination has a well-defined meaning for a restricted class of distributions $\varphi$. The byproduct of the renormalization is that additional data (in the form of polynomials of the driving noise) have to be considered in order to identify canonically the result of the renormalization. It is not the main aim of this paper to discuss the features of the local solution theory for singular SPDEs as this has been done extensively in the references cited above.

Our aim here is to develop a simple global solution theory for equations (1.1) and (1.2). Global solutions rely on specific properties of the equations, in particular here on the right sign of the cubic non-linearity. The existence of global in time solutions of the parabolic equation (1.2) is relevant to the problem of stochastic quantization of the $\Phi^4_3$ Euclidean field theory, that is the measure $\nu$ on distributions over the $d$-dimensional periodic domain $\Lambda = \mathbb{T}^d$ formally given by the Euclidean path integral

$$ \nu(d\phi) = \exp \left[ - \frac{1}{2} \int_{\Lambda} \left( \frac{1}{2} |\nabla \phi|^2 + \mu \phi^2 + \frac{1}{4} \phi^4 \right) \right] d\phi, \quad (1.3) $$

where $\mathbb{T} = \mathbb{R}/2\pi \mathbb{Z}$. Global in space solutions, that is solutions defined over all $\mathbb{R}^d$ correspond to the infinite volume limit of such a measure. Existence and uniqueness of global space-time solutions for the parabolic model in $d = 2$ has been proved by Mourrat and Weber [MW17b]. More recently the same authors have proven existence and uniqueness of global solutions in time on $\mathbb{T}^3$ in [MW17a]. In this last paper they also prove the stronger property, namely, that the solutions come down from infinity, meaning that after a finite time the solution belongs to a compact set of the state space uniformly in the initial condition, a very strong property which is entirely due to the presence of the cubic drift. These results show that singular SPDEs can be used to implement rigorously the stochastic quantization approach first suggested by Parisi and Wu [PW81] and construct random fields sampled according to the measure (1.3). Another recent interesting approach which uses the SPDE to construct the measure $\nu$ is that of Albeverio and Kusuoka [AK17] which uses the invariance of approximations and uniform energy estimates on the SPDE to deduce tightness and existence of the limiting $\Phi^4_3$ measure (1.3).

In the present work we complete the picture by proving the global space-time existence and uniqueness for eq. (1.2) in $\mathbb{R}^3$ with an associated coming down from infinity property. This will be essentially a byproduct of the technique we develop to analyze the elliptic model (1.1) on $\mathbb{R}^d$ with $d = 4, 5$. The choice of dimensions has a two-fold origin: first it corresponds to the dimensions where the singularities of the elliptic equation match those of the parabolic one for
Second (and partially related reason) is that there exists a very interesting conjecture of dimensional reduction formulated first by Parisi and Sourlas [PS79] which links the behavior of certain SPDEs in $d$ dimensions to that of Euclidean field theories in $d-2$ dimensions. In particular, it is conjectured that the trace on a codimension 2 hyperplane of solutions to eq. (1.1) in $\mathbb{R}^d$ should have the law of the (parabolic) $\Phi^4_{d-2}$ model in $\mathbb{R}^{d-2}$, at least for $d = 3, 4, 5$. This conjecture has been partially validated by rigorous arguments of Klein et al. [KFP83, KLP84] in the context of a regularized version of the models. Our study of the singular equation is another step to the full rigorous verification of the dimensional reduction phenomenon. The existence theory of the $d = 3$ elliptic model is relatively straightforward and we will not consider it here.

Given the importance of these models in the mathematical physics literature and the open interesting conjectures they are related to, we found essential to devise streamlined arguments to treat global solutions of these equations. The main technical problem with globalization in the solution theory of singular SPDEs is given by the fact that the noise grows at infinity requiring the use of weighted spaces. This in turns requires to exploit fine properties of the equations in order to close the estimates. Witness of the important technical difficulties involved in the global analysis is the tour de force that Mourrat and Weber [MW17a] had to put in place to solve the parabolic model on $T^3$. One of the aim of the present paper is to provide also a simpler proof of their result, proof which is more in line with standard arguments of functional analysis/PDE theory. In order to do so we developed a new localization technique which allows to split distributions belonging to weighted spaces into an irregular component which behaves nicely at the spatial infinity and a smooth component which grows in space. The localization technique allows to split singular SPDEs in two equations:

- one containing the irregular terms but linear (or almost linear) and not requiring any particular care in the handling of the weighted spaces;
- the other containing all the more regular terms and all the non-linearities which can be analyzed using standard PDE arguments, in particular pointwise maximum principle and pointwise coercive estimates whose weighted version are easy to establish. This avoids the use of weighted $L^p$ spaces and related energy estimates which complicate the analysis of Mourrat and Weber [MW17a] and also of Albeverio and Kusuoka [AK17].

Other two improvements which we realize in this paper are the following:

a) we use a direct $L^2$ energy estimate to establish uniqueness for the parabolic model, simplifying the proof and taking full advantage of our $L^\infty$ a priori estimates;

b) we use a time dependent weight to prove the coming down from infinity, going around the painful induction present in Mourrat and Weber paper and following quite closely the strategy one would adopt for classical driven reaction diffusion equations.

A problem which still remains open is that of the global uniqueness in the elliptic setting. Probably uniqueness does not hold or holds only for large masses. This is suggested by the behavior of the corresponding $\Phi^4_{d-2}$ model which is expected to undergo a phase transition at small temperature, corresponding here to a small mass.

Organization of the paper. In Section 2 we introduce the basic notation and recall various preliminary results concerning weighted Besov spaces. Then we present interpolation results and
construct the above mentioned localization operators, which are essential in the main body of the paper. As the next step, we establish Schauder and coercive estimates in weighted Besov spaces in both elliptic and parabolic setting and finally we discuss the basic results of the paracontrolled calculus.

In Section 3 recall the results of probabilistic analysis connected to the construction of the stochastic objects needed in the sequel.

Sections 4, 5 are devoted to the existence for the elliptic $\Phi^4$ model in dimension 4 and 5, respectively. More precisely, in the first step, we decompose the equations into systems of two equations, one irregular but linear and the other one regular and containing the nonlinearity. The next step is the cornerstone of our analysis: we derive new a priori estimates for the unknowns of the decomposed system, which are then employed in order to establish existence of solutions. Here we first solve the equations on a large torus using a combination of a variational approach together with the Schaefer’s fixed point theorem. Then we let the size of the torus converge to infinity and use compactness.

The a priori estimates from Sections 4, 5 play the key role in the parabolic setting as well. Namely, in Sections 6, 7 we study the parabolic $\Phi^4$ model in dimension 2 and 3, respectively. We follow a similar decomposition into a system of equations (only with a slight modification in dimension 3) and derive parabolic a priori estimates in analogy to the elliptic situation. These bounds are then used in the proof of existence. However, we proceed differently than in the elliptic setting: we work directly on the full space and mollify the noise, which leads to existence of smooth approximate solutions. The uniform estimates together with a compactness argument allow us to pass to the limit.

In Section 8 we establish uniqueness of solutions in the parabolic setting. Unlike in the previous sections, it is not enough to work in the $L^\infty$-scale of weighted Besov spaces with polynomial weights. In particular, to compensate for the loss of weight in our estimates we employ exponential weights, requiring a different definition of the associated Besov spaces. This is discussed in Section 8.1. The proof of uniqueness then uses solely energy-type estimates in the $L^2$-scale of Besov spaces which takes the full advantage of the well-chosen space-time weight.

Section 9 is then concerned with the coming down from infinity property. Here we work with an additional weight in time which vanishes at zero and therefore allows to obtain bounds independent of the initial condition. Such a weight requires careful Schauder and coercive estimates that are established in Sections 9.2, 9.3. The proof of the coming down from infinity then relies on our approach to a priori estimates from Section 4, 5 together with a delicate control of the behavior at zero.

Finally, in Appendix A we collect certain auxiliary results concerning existence for elliptic and parabolic variants of our problem in the smooth setting. Appendix B is then devoted to a refined Schauder estimate needed in Section 9.

We point out that for pedagogical reasons and in order not to blur our arguments, we chose to include in Section 2 only the results needed for the existence in Sections 4, 5, 6, 7. Further generalizations are needed for uniqueness in Section 8 and for the coming down from infinity in Section 9. The corresponding preliminaries are then discussed directly in the respective sections.

2 Preliminaries

2.1 Weighted Besov spaces

As the first step, we introduce weighted Besov spaces which will be used in the sequel. Recall that the collection of admissible weight functions is the collection of all positive $C^\infty(\mathbb{R}^d)$ functions $\rho$ with the following properties:

1. For all $\gamma \in \mathbb{N}_0^d$ there is a positive constant $c_\gamma$ with
   
   $$|D^\gamma \rho(x)| \leq c_\gamma \rho(x), \quad \text{for all } x \in \mathbb{R}^d.$$

2. There are two constants $c > 0$ and $b \geq 0$ such that
   
   $$0 < \rho(x) \leq c \rho(y)(1 + |x - y|^{2b/2}), \quad \text{for all } x, y \in \mathbb{R}^d.$$

The space of Schwartz functions on $\mathbb{R}^d$ is denoted by $\mathcal{S}(\mathbb{R}^d)$ and its dual, the space of tempered distributions is $\mathcal{S}'(\mathbb{R}^d)$. The Fourier transform of $u \in \mathcal{S}'(\mathbb{R}^d)$ is given by

$$\mathcal{F}u(z) = \int_{\mathbb{R}^d} u(x)e^{-iz\cdot x} \, dx,$$

so that the inverse Fourier transform is given by $\mathcal{F}^{-1}u(x) = (2\pi)^{-d}\mathcal{F}u(-x)$. By $(\Delta_i)_{i \geq 1}$ we denote the Littlewood–Paley blocks corresponding to a dyadic partition of unity. If $\rho$ is an admissible weight and $\alpha \in \mathbb{R}$, we define the weighted Besov space $B_{\infty,\infty}^\alpha(\rho)$ as the collection of all $f \in \mathcal{S}'(\mathbb{R}^d)$ with finite norm

$$\|f\|_{\mathcal{B}_{\alpha}(\rho)} = \sup_{i \geq -1} 2^{i\alpha} \|\Delta_i f\|_{L^\infty(\rho)} = \sup_{i \geq -1} 2^{i\alpha} \|\rho \Delta_i f\|_{L^\infty}.$$

More details can be found e.g. in [Tri06]. Particularly, due to [Tri06, Theorem 6.5], it holds true that

$$\|f\|_{\mathcal{B}_{\alpha}(\rho)} \sim \|\rho f\|_{\mathcal{B}_{\alpha}} \quad \text{(2.1)}$$

in the sense of equivalence of norms, where the latter denotes the norm in the classical (un-weighted) Besov space $\mathcal{B}^\alpha = B_{\infty,\infty}^\alpha(\mathbb{R}^d)$. Moreover, it was shown in [Tri06, Theorem 6.9] that for $\alpha \in (0, M)$ with $M \in \mathbb{N}$, the weighted space $\mathcal{B}^\alpha(\rho)$ admits an equivalent norm given by

$$\|f\|_{L^\infty(\rho)} + \sup_{0 < |h| \leq 1} h^{-\alpha}\|\Delta_h^M f\|_{L^\infty(\rho)}, \quad \text{(2.2)}$$

where $\Delta_h^M$ is the $M$th-order finite difference operator defined inductively by

$$(\Delta_h^1 f)(x) = f(x + h) - f(x), \quad (\Delta_h^{\ell+1} f)(x) = \Delta_h^1(\Delta_h^\ell f)(x), \quad \ell \in \mathbb{N}.$$

Introduce a partition of unity $\sum_{m \in \mathbb{Z}^d} \Lambda_m = 1$, where $\Lambda_m(x) := \Lambda(x - m)$ for a compactly supported $C^\infty$-function $\Lambda$ on $\mathbb{R}^d$ and $m \in \mathbb{Z}^d$. Then the following localization principle for weighted Besov spaces follows from (2.1) and [Tri92, Theorem 2.4.7]: let $\alpha \in \mathbb{R}$ then

$$\|f\|_{\mathcal{B}_{\alpha}(\rho)} \sim \sup_{m \in \mathbb{Z}^d} \|\Lambda_m f\|_{\mathcal{B}_{\alpha}(\rho)} \quad \text{(2.3)}$$

holds true in the sense of equivalence of norms. For most of our purposes, the following result in the case $\alpha > 0$ will be sufficient. Let $\sum_{k \geq -1} w_k = 1$ be a smooth partition of unity in spherical dyadic slices where $w_{-1}$ is supported in a ball containing zero and each $w_k$ for $k \geq 0$ is supported on the annulus of size $2^k$. Set $w_k = \sum_{i=k}^{i=k} w_i$. 

6
Lemma 2.1 It holds true that
\[ \|f\|_{L^\infty(\rho)} \leq \sup_{k \geq -1} \|\hat{w}_k f\|_{L^\infty(\rho)}, \]
and if \( \alpha > 0 \) then also
\[ \|f\|_{\mathcal{C}^\alpha(\rho)} \leq \sup_{k \geq -1} \|\hat{w}_k f\|_{\mathcal{C}^\alpha(\rho)}. \]

Proof Due to the construction of \((\hat{w}_k)_{k \geq -1}\), for every \( x \in \mathbb{R}^d \) there exists \( k \geq -1 \) such that \( f(y) = \hat{w}_k(y) f(y) \) for all \( y \in \mathbb{R}^d \) with \(|x - y| < 1\). Consequently, the first claim follows. To show the second one, let \( M \in \mathbb{N} \) be the smallest integer such that \( \alpha < M \). Then, it can be observed that, in addition to (2.2), also
\[ \|\hat{w}_k f\|_{L^\infty(\rho)} \leq \sup_{0 < |h| < \frac{1}{M}} h^{-\alpha} \|\Delta_h^M f\|_{L^\infty(\rho)} \]
defines an equivalent norm on \( \mathcal{C}^\alpha(\rho) \). The first summand is estimated as in the previous step. For the second summand, consider \(|h| < \frac{1}{M}\). Since \((\Delta_h^M f)(x)\) depends only on values \( f(y) \) for \(|y - x| \leq M|h| < 1\), we deduce that for every \( x \in \mathbb{R}^d \) there exists \( k \in \mathbb{N}_0 \) such that \( f(y) = \hat{w}_k(y) f(y) \) whenever \(|y - x| < 1\) and consequently also \((\Delta_h^M f)(y) = (\Delta_h^M (\hat{w}_k f))(y)\). Thus
\[ \sup_{0 < |h| < \frac{1}{M}} h^{-\alpha} \|\Delta_h^M f\|_{L^\infty(\rho)} \leq \sup_{k \geq -1} \sup_{0 < |h| < \frac{1}{M}} h^{-\alpha} \|\Delta_h^M (\hat{w}_k f)\|_{L^\infty(\rho)} \]
and the second claim follows. \( \square \)

Throughout this paper \( \rho \) stands for a weight which is admissible and either constant or decreasing at infinity. It depends only on the space variable in the case of elliptic problems or on both space and time for parabolic equations. We will not repeat the word “admissible” in the sequel. Moreover, we will often work with polynomial weights of the form \( \rho(x) = \langle x \rangle^{-\nu} \) where \( \langle x \rangle = (1 + |x|^2)^{1/2} \) and \( \nu \geq 0 \). In the same spirit we will consider space-time dependent polynomial weights or \( \rho(t, x) = \langle (t, x) \rangle^{-\nu} \) for \( \nu \geq 0 \). In addition, certain non-admissible weights will be needed in Section 8 and Section 9. Namely, the proof of uniqueness in Section 8 employs a weight that vanishes exponentially at infinity and consequently the definition of the associated Besov spaces cannot be based on Schwartz functions but rather on the so-called Gevrey classes as discussed in [MW17b]. The coming down from infinity property in Section 9 then requires a weight in time that vanishes in zero and is therefore also not an admissible weight in the sense of the above definition. The necessary results for these particular weights are discussed in Section 8.1 and Sections 9.1, 9.2, 9.3.

Let \( \rho \) be a polynomial space-dependent weight. Then the following embedding holds true
\[ \mathcal{C}^\beta_1(\rho^{\gamma_1}) \subset \mathcal{C}^\beta_2(\rho^{\gamma_2}) \quad \text{provided} \quad \beta_1 \geq \beta_2, \quad \gamma_1 \leq \gamma_2, \quad \text{(2.4)} \]
and, according to [Tri06, Theorem 6.31], the embedding in (2.4) is compact provided \( \beta_1 > \beta_2 \) and \( \gamma_1 < \gamma_2 \).

For parabolic equations, we will also need weighted function spaces of space-time dependent functions/distributions. Let \( \rho \) be a polynomial space-time weight and \( \alpha \in \mathbb{R} \) and denote \( \rho_t(\cdot) = \rho(t, \cdot), t \in [0, \infty) \). Then \( \mathcal{C}^{\alpha}(\rho) \) is the space of space-time distributions \( f \) that are continuous in time with values in, say \( \mathcal{C}^\alpha(\rho_0) \), and have finite norm
\[ \|f\|_{\mathcal{C}^{\alpha}(\rho)} := \sup_{t \geq 0} \|\rho_t f\|_{\mathcal{C}^\alpha}. \]
Note that since $\rho$ is a polynomial weight, the choice of $t = 0$ above was arbitrary and one could choose any $t \in [0, \infty)$. If a mapping $f : [0, \infty) \to \mathcal{C}^\alpha(\rho_0)$ is only bounded but not continuous, we write $f \in L^\infty\mathcal{C}^\alpha(\rho)$ with the norm
\[
\|f\|_{L^\infty\mathcal{C}^\alpha(\rho)} := \text{esssup}_{t \geq 0} \|(\rho f)(t)\|_{\mathcal{C}^\alpha} < \infty.
\]
Time regularity will be measured in terms of classical Hölder norms. In particular, for $\alpha \in (0,1)$ and $\beta \in \mathbb{R}$ we denote by $C^{\alpha, \beta}(\rho)$ the space of mappings $f : [0, \infty) \to \mathcal{C}^\beta(\rho_0)$ with finite norm
\[
\|f\|_{C^{\alpha, \beta}(\rho)} := \sup_{t \geq 0} \|(\rho f)(t)\|_{\mathcal{C}^\beta} + \sup_{s, t \geq 0, s \neq t} \frac{\|(\rho f)(t) - (\rho f)(s)\|_{\mathcal{C}^\beta}}{|t - s|^{\alpha}}.
\]
Moreover, if $\rho$ is a polynomial weight, this norm is equivalent to
\[
\|f\|_{C^{\alpha, \beta}(\rho)} \sim \sup_{t \geq 0} \|(\rho f)(t)\|_{\mathcal{C}^\beta} + \sup_{s, t \geq 0, s \neq t} \frac{\rho(t)(t) - \rho(s)(s)}{|t - s|^{\alpha}}.
\]
It can be seen (cf. (2.2)) that since $\rho$ is a polynomial weight, this norm is equivalent to
\[
\|f\|_{C^{\alpha, \beta}(\rho)} \sim \sup_{t \geq 0} \|(\rho f)(t)\|_{\mathcal{C}^\beta} + \sup_{s, t \geq 0, s \neq t} \frac{\rho(t)(t) - \rho(s)(s)}{|t - s|^{\alpha}}.
\]
Similarly, we define the space $C^\alpha L^\infty(\rho)$.

In the case we consider only a finite time interval $[0, T]$, for some $T > 0$, and a time-independent weight $\rho$, we write $f \in C_T^{\alpha, \beta}(\rho)$, $f \in L^\infty_T\mathcal{C}^\alpha(\rho)$, $C_T^{\alpha, \beta}(\rho)$ and $C_T^\alpha L^\infty(\rho)$ with straightforward modifications in the corresponding norms.

### 2.2 Interpolation

We present a simple interpolation result for weighted Besov spaces.

**Lemma 2.2** Let $\kappa \in (0,1)$ and let $\rho$ be a space-time weight. We have, for any $\alpha \in [0, 2 + \kappa]$
\[
\|\psi\|_{\mathcal{C}^\alpha(\rho^{1+\kappa})} \lesssim \|\psi\|_{L^\infty(\rho)}^{1-\alpha/(2+\kappa)} \|\psi\|_{\mathcal{C}^\beta(\rho^{2+\kappa})}^{\alpha/(2+\kappa)}.
\]

**Proof** It holds
\[
\|\Delta_k \psi\|_{L^\infty(\rho^{1+\kappa})} \lesssim \|\rho^{1+\kappa} \Delta_k \psi\|_{L^\infty(\rho)} \lesssim \|\rho \Delta_k \psi\|_{L^\infty(\rho)}^{1-\alpha/(2+\kappa)} \|\rho^{3+\kappa} \Delta_k \psi\|_{L^\infty(\rho)}^{\alpha/(2+\kappa)}
\]
\[
\lesssim \|\psi\|_{L^\infty(\rho)}^{1-\alpha/(2+\kappa)} \|\Delta_k \psi\|_{L^\infty(\rho^{1+\kappa})}^{\alpha/(2+\kappa)} \lesssim 2^{-\alpha k} \|\psi\|_{L^\infty(\rho)}^{1-\alpha/(2+\kappa)} \|\psi\|_{\mathcal{C}^\beta(\rho^{2+\kappa})}^{\alpha/(2+\kappa)}
\]
which proves the claim. \qed

We will also need the following version adapted to time-dependent problems.

**Lemma 2.3** Let $\kappa \in (0,1)$ and let $\rho$ be a space-time weight. We have, for any $\alpha \in [0, 2 + \kappa]$
\[
\|\psi\|_{C_t^{\alpha, \beta}(\rho^{1+\kappa})} \lesssim \|\psi\|_{L^\infty_t L^\infty(\rho)}^{1-\alpha/(2+\kappa)} \|\psi\|_{C_t^{\beta, \alpha}(\rho^{2+\kappa})}^{\alpha/(2+\kappa)}.
\]

Moreover, if $\alpha/2 \notin \mathbb{N}_0$ then
\[
\|\psi\|_{C_t^{\alpha/2, \beta}(\rho^{1+\kappa})} \lesssim \|\psi\|_{L^\infty_t L^\infty(\rho)}^{1-\alpha/(2+\kappa)} \|\psi\|_{C_t^{\beta, \alpha/2}(\rho^{2+\kappa})}^{\alpha/(2+\kappa)}.
\]

**Proof** The first claim is a straightforward modification of Lemma 2.2. The second one can be obtained by the same approach since for $\alpha/2 \notin \mathbb{N}_0$ the Hölder space $C^{\alpha/2}$ can be identified with the Besov space $B^{\alpha/2}_{\infty, \infty}$ and functions in $C^{\alpha/2} L^\infty(\rho)$ can be naturally extended to be defined on the full space $\mathbb{R} \times \mathbb{R}^d$ while preserving the same norm. \qed
2.3 Localization operators

Here we construct localization operators $\mathcal{U}_\alpha$, $\mathcal{U}_\kappa$ which play the key role in our analysis. These localizers allow to decompose a distribution $f$ into a sum of two components: one belongs to a (weighted) Besov space of higher regularity whereas the other one is less regular. To this end, let $\sum_{k \geq 1} w_k = 1$ be a smooth dyadic partition of unity on $\mathbb{R}^d$ where $w_{-1}$ is supported in a ball containing zero and each $w_k$ for $k \geq 0$ is supported on the annulus of size $2^k$. Let $(L_k)_{k \geq -1} \subset [-1, \infty)$ be a sequence of real numbers and let $f \in \mathcal{S}'(\mathbb{R}^d)$. We define the localization operators by

$$\mathcal{U}_\alpha f = \sum_k w_k \Delta_{\alpha,k} f, \quad \mathcal{U}_\kappa f = \sum_k w_k \Delta_{\kappa,k} f,$$

where $\Delta_{\alpha,L_k} = \sum_{\alpha \in L_k} \Delta_{\alpha}$ and $\Delta_{\kappa,L_k} = \sum_{\kappa \in L_k} \Delta_{\kappa}$. We point out that in the sequel, we will use various localizing sequence $(L_k)_{k \geq 1}$, depending on the context. However, for notational simplicity, we will not denote these operators by different symbols.

**Lemma 2.4** Let $L > 0$ be given. There exists a (universal) choice of parameters $(L_k)_{k \geq -1}$ such that for all $\alpha, \delta, \kappa > 0$ and $a, b \in \mathbb{R}$ it holds true

$$\|\mathcal{U}_\alpha f\|_{\mathcal{F}^a-\delta_\rho} \lesssim 2^{-\delta L} \|f\|_{\mathcal{F}^a_\rho}, \quad \|\mathcal{U}_\kappa f\|_{\mathcal{F}^\alpha_\rho} \lesssim 2^{(\alpha + \kappa) L} \|f\|_{\mathcal{F}^\alpha_\rho},$$

where the proportional constant depends on $\alpha, \delta, \kappa, a, b$ but is independent of $f$.

**Proof** Denote $c_k = -\log_2 \|w_k\|_{L^\infty(\rho)}$. Then we have

$$\|w_k\|_{L^\infty(\rho^{a + \kappa})} \simeq \|w_k\|_{L^\infty(\rho)}^{a + \kappa} = 2^{-(a + \kappa)c_k},$$

$$\|w_k\|_{H^{a + \kappa}(\rho)} \simeq \|w_k\|_{H^\infty(\rho)}^{-\delta} = 2^{\delta c_k}.$$

According to (2.3) and since there exists $M \in \mathbb{N}$ such that for every $m \in \mathbb{Z}^d$ the support of $\Lambda_m$ intersects the support of $w_k$ only for $k \in A_{m}$, where $A_{m}$ is in a set of cardinality at most $M$, it holds

$$\|\mathcal{U}_\alpha f\|_{\mathcal{F}^a_\rho} \lesssim \sup_{m \in \mathbb{Z}^d} \|\Lambda_m \mathcal{U}_\alpha f\|_{\mathcal{F}^a_\rho} \lesssim \sup_{m \in \mathbb{Z}^d} \|\Lambda_m \sum_k w_k \Delta_{\alpha,k} f\|_{\mathcal{F}^a_\rho} \lesssim M \sup_k \|w_k \Delta_{\alpha,k} f\|_{\mathcal{F}^a_\rho} \lesssim \|w_k\|_{L^\infty(\rho)}^{a + \kappa} \|\Delta_{\alpha,k} f\|_{\mathcal{F}^a_\rho} \lesssim \sup_k 2^{\delta c_k - L_k} \|f\|_{\mathcal{F}^a_\rho} \lesssim 2^{-\delta L} \|f\|_{\mathcal{F}^a_\rho},$$

where we set $L_k = c_k + L$. On the other hand, the same argument implies

$$\|\mathcal{U}_\kappa f\|_{\mathcal{F}^\alpha_\rho} \lesssim \sup_k \|w_k \Delta_{\kappa,k} f\|_{\mathcal{F}^\alpha_\rho} \lesssim \sup_k \|w_k\|_{L^\infty(\rho^{\alpha + \kappa})} \|\Delta_{\kappa,k} f\|_{\mathcal{F}^\alpha_\rho} \lesssim \sup_k 2^{(\alpha + \kappa) L_k - \delta_\rho} \|f\|_{\mathcal{F}^\alpha_\rho} \lesssim 2^{(\alpha + \kappa) L} \|f\|_{\mathcal{F}^\alpha_\rho}. \quad \square$$

**Remark 2.5** Note that the sequence $(L_k)_{k \geq 1}$ in Lemma 2.4 does not depend on any of the parameters $a, \delta, \kappa, a, b$ nor on the function $f$. 

9
We will also need the following version adapted to time-dependent problems. Let \((v_\ell)_{\ell \geq 1}\) be a smooth dyadic partition of unity on \([0, \infty)\) such that where \(v_{-1}\) is supported in a ball containing zero and each \(v_\ell\) for \(\ell \geq 0\) is supported on the annulus of size \(2^\ell\). Let \(\bar{v}_\ell = \sum_{i:i<\ell} v_i\).

For a given sequence \((L_{k,\ell})_{k,\ell \geq 1}\) we define localization operators \(\mathcal{Y}_>, \mathcal{Y}_<\) by

\[
\mathcal{Y}_> f = \sum_{k,\ell} v_\ell w_k \Delta_{L_{k,\ell}} f, \quad \mathcal{Y}_< f = \sum_{k,\ell} v_\ell w_k \Delta_{L_{k,\ell}} f.
\]

(2.6)

**Lemma 2.6** Let \(L > 0\) be given and let \(\rho\) be a space-time weight. There exists a (universal) choice of parameters \((L_{k,\ell})_{k,\ell \geq 1}\) such that for all \(\alpha, \delta, \kappa > 0\) and \(a, b \in \mathbb{R}\) it holds true

\[
\| \mathcal{Y}_> f \|_{C^{\alpha-\delta}(\rho^{-a})} \lesssim 2^{-\delta L} \| f \|_{C^{\alpha}(\rho^{-a})}, \quad \| \mathcal{Y}_< f \|_{C^\alpha(\rho^a)} \lesssim 2^{(a+\alpha)L} \| f \|_{C^{\alpha-\delta}(\rho^{b-a-\kappa})},
\]

where the proportional constant depends on \(\alpha, \delta, \kappa, a, b\) but is independent of \(f\).

**Proof** Similarly to the proof of Lemma 2.3 we denote \(c_{k,\ell} = -\log_2 \| \bar{v}_\ell w_k \|_{C^{\alpha}(\rho)}\). Then we have

\[
\| \bar{v}_\ell w_k \|_{C^\alpha(\rho^{b-a})} \simeq \| \bar{v}_\ell w_k \|_{C^{\alpha+\kappa}(\rho)} = 2^{-(a+\kappa)c_{k,\ell}},
\]

\[
\| \bar{v}_\ell w_k \|_{C^{2+\delta}(\rho^{-a})} \simeq \| \bar{v}_\ell w_k \|_{C^\delta(\rho)} = 2^{\delta c_{k,\ell}}.
\]

In view of Lemma (2.3) and Lemma 2.1, we deduce (similarly to the proof of Lemma 2.3) that

\[
\| \mathcal{Y}_> f \|_{C^{\alpha-\delta}(\rho^{-a})} \lesssim \sup_{k,\ell} \| \bar{v}_\ell w_k \|_{C^{\alpha}(\rho^{-a})} \| f \|_{C^{\alpha-\delta}(\rho^{-a})}
\]

\[
\lesssim \sup_{k,\ell} \| \bar{v}_\ell w_k \|_{C^{2+\delta}(\rho^{-a})} \| f \|_{C^{\alpha}(\rho^{-a})}
\]

\[
\lesssim \sup_{k,\ell} 2^{\delta c_{k,\ell}} \| f \|_{C^{\alpha}(\rho^{-a})},
\]

where we set \(L_{k,\ell} = c_{k,\ell} + L\). On the other hand, it holds

\[
\| \mathcal{Y}_< f \|_{C^\alpha(\rho^a)} \lesssim \sup_{k,\ell} \| \bar{v}_\ell w_k \|_{C^{\alpha}(\rho^a)} \| f \|_{C^{\alpha}(\rho^{-a})}
\]

\[
\lesssim \sup_{k,\ell} 2^{(a+\alpha)L_{k,\ell}} \| f \|_{C^{\alpha}(\rho^{b-a-\kappa})}
\]

\[
\lesssim \sup_{k,\ell} 2^{(a+\alpha)L} \| f \|_{C^{\alpha-\delta}(\rho^{b-a-\kappa})}.
\]

\[\square\]

**2.4 Elliptic Schauder estimates**

We proceed with Schauder estimates valid for elliptic partial differential equations with cubic nonlinearities. Throughout the paper, we denote \(\mathcal{D} = -\Delta + \mu\).

**Lemma 2.7** Fix \(\kappa > 0\) and let \(\psi \in \mathcal{C}^{2+\kappa}(\rho^{3+\kappa}) \cap L^\infty(\rho)\) be a classical solution to

\[
\mathcal{D} \psi + \psi^3 = \Psi
\]

then

\[
\| \psi \|_{\mathcal{C}^{2+\kappa}(\rho^{3+\kappa})} \lesssim \| \Psi \|_{\mathcal{C}^{\kappa}(\rho^{3+\kappa})} + \| \psi \|_{L^\infty(\rho)}^{3+\kappa}.
\]

10
Proof In view of [Tri06, Theorem 6.5] it holds
\[ \|Qf\|_{C^\alpha(\rho)} \simeq \|f\|_{C^{2+\alpha}(\rho)} \]
in the sense of equivalence of norms. Hence
\[ \|\psi\|_{C^{2+\alpha}(\rho^{3+\kappa})} \lesssim \|Q\psi\|_{C^\alpha(\rho^{3+\kappa})} \lesssim \|\Psi\|_{C^\alpha(\rho^{3+\kappa})} + \|\psi^3\|_{C^\alpha(\rho^{3+\kappa})} \]
and we estimate using Lemma 2.2 and weighted Young inequality
\[
\|\psi\|_{C^{2+\alpha}(\rho^{3+\kappa})} \lesssim \|\Psi\|_{C^\alpha(\rho^{3+\kappa})} + \|\psi^3\|_{L^\infty(\rho^{3+\kappa})}. \]

Thus we finally deduce that
\[
\|\psi\|_{C^{2+\alpha}(\rho^{3+\kappa})} \lesssim \|\Psi\|_{C^\alpha(\rho^{3+\kappa})} + \|\psi^3\|_{L^\infty(\rho^{3+\kappa})}. \]

\[ \square \]

2.5 Elliptic coercive estimates

An essential result in our analysis is the following maximum principle in the weighted setting.

Lemma 2.8 Fix \( \kappa > 0 \) and let \( \psi \in C^{2+\kappa}(\rho^{3+\kappa}) \cap L^\infty(\rho) \) be a classical solution to
\[ Q\psi + \psi^3 = \Psi. \]

Then the following a priori estimate holds
\[ \|\psi\|_{L^\infty(\rho)} \lesssim \rho^{\mu} 1 + \|\Psi\|_{L^\infty(\rho^3)}^{1/3}. \]

Proof Let us first show the first claim. Let \( \rho > 0 \) be the weight from the statement of the Lemma and let \( \tilde{\psi} = \rho \psi \). Due to the assumption, \( \tilde{\psi} \) is bounded and locally belongs to \( C^{2+\kappa} \). Assume for a moment that \( \tilde{\psi} \) has a global maximum and let \( \hat{x} \) be a global maximum point of \( \tilde{\psi} \). Then at \( \hat{x} \) we have
\[
0 = \nabla \tilde{\psi} = \rho \nabla \psi + \psi \nabla \rho, \quad 0 \leq -\Delta \tilde{\psi} = -\rho \Delta \psi - (\Delta \rho) \psi - 2 \nabla \rho \nabla \psi = -\rho \Delta \psi - \left( \frac{(\Delta \rho)}{\rho} - \frac{2 |\nabla \rho|^2}{\rho^2} \right) \psi,
\]
so always at \( \hat{x} \) we also have
\[
\psi^3 + \mu \psi \leq \Psi - \left( \frac{(\Delta \rho)}{\rho} - \frac{2 |\nabla \rho|^2}{\rho^2} \right) \psi
\]
and multiplying by \( \rho^3 \) leads to
\[
(\tilde{\psi})^3 \leq \rho^3 \Psi - \rho^2 (\mu + [(\Delta \rho)/\rho - 2(\nabla \rho/\rho)^2]) \tilde{\psi}.
\]
If $\bar{\psi}(\bar{x}) \geq 0$ then $(\bar{\psi})^3 \leq \|\rho^3 \Psi\|_{L^\infty} + C_{\rho,\mu} \|\rho^2 \bar{\psi}\|_{L^\infty}$. A similar reasoning at minima gives $(\bar{\psi})^3 \leq \|\rho^3 \Psi\|_{L^\infty} + C_{\rho,\mu} \|\rho^2 \bar{\psi}\|_{L^\infty}$, hence

$$\|\bar{\psi}\|_{L^\infty(\rho)} \leq \|\Psi\|_{L^\infty(\rho^3)}^{1/3} + C_{\rho,\mu} \|\bar{\psi}\|_{L^\infty(\rho^3)}^{1/3}.$$  

Using weighted Young inequality we can absorb the second term of the r.h.s. into the l.h.s. and conclude that

$$\|\bar{\psi}\|_{L^\infty(\rho)} \lesssim_{\rho,\mu} 1 + \|\Psi\|_{L^\infty(\rho^3)}^{1/3}.$$  

Next, we consider the situation when $\psi \rho$ does not attain its global maximum. Since $\psi \rho$ is smooth and bounded on $\mathbb{R}^d$ due to the assumption, it follows that $\psi \rho^{1+\delta}$ vanishes at infinity for every $\delta \in (0,1)$. Consequently, it has a global maximum point and the previous part of the proof applies with $\rho$ replaced by $\rho^{1+\delta}$. The conclusion then follows by sending $\delta \rightarrow 0$ since the corresponding constant $c_{\rho^{1+\delta},\mu}$ is bounded uniformly in $\delta \in (0,1)$.

**2.6 Parabolic Schauder estimates**

As the next step, we derive a parabolic analog of Section 2.4. To this end, we first observe that the following Schauder estimates hold true in the weighted Besov spaces. They can be proved similarly to [GIP15, Lemma A.9], see also [MW17b, Section 3.2].

**Remark 2.9** We note that the Schauder estimates below are formulated for a positive mass $\mu > 0$. However, it can be observed that for the parabolic $\Phi^4$ model studied in Sections 6, 7, 8, 9 this does not bring any loss of generality. Indeed, we may always add a linear term with positive mass to both sides of the equation and consider the original massive term as a right hand side. This is not true for the elliptic $\Phi^4$ model where the positivity of the mass seems to be essential. For notational simplicity we therefore adopt the convention that $\mu > 0$ throughout the paper, that is, for both elliptic and parabolic equations.

Recall that we denoted $\mathcal{Q} = -\Delta + \mu$ and let $\mathcal{L} = \partial_t + \mathcal{Q}$. This notation will be used throughout the paper.

**Lemma 2.10** Let $\mu > 0$, $\alpha \in \mathbb{R}$ and let $\rho$ be a space-time weight. Let $v$ and $w$ solve, respectively,

$$\mathcal{L} v = f, \quad v(0) = 0, \quad \mathcal{L} w = 0, \quad w(0) = w_0.$$  

Then it holds uniformly over $t \geq 0$

$$\|v(t)\|_{\mathcal{B}^{2+\alpha}(\rho)} \lesssim \|f\|_{L^\infty(\mathcal{B}^{-\alpha}(\rho))}, \quad \|w(t)\|_{\mathcal{B}^{2+\alpha}(\rho_0)} \lesssim \|w_0\|_{\mathcal{B}^{2+\alpha}(\rho_0)}, \quad (2.7)$$

if $0 \leq 2 + \alpha < 2$ then

$$\|v\|_{C^{(2+\alpha)/2}L^\infty(\rho)} \lesssim \|f\|_{L^\infty(\mathcal{B}^{-\alpha}(\rho))}, \quad \|v\|_{C^1L^\infty(\rho)} \lesssim \|f\|_{C^{\alpha} \mathcal{B}^{-\alpha}(\rho)};$$

$$\|w\|_{C^{(2+\alpha)/2}L^\infty(\rho_0)} \lesssim \|w_0\|_{\mathcal{B}^{2+\alpha}(\rho_0)}.$$  

12
Proof Denote \( P_t = e^{t(\Delta - \mu)} \) be the semigroup of operators generated by \( \Delta - \mu \) and recall that \( \mu > 0 \). Consider a time independent weight \( \rho \) and observe that similarly to [GIP15, Lemma A.7, Lemma A.8] it holds true uniformly over \( t \geq 0 \)

\[
\| P_t g \|_{L^\infty(\rho)} \leq e^{-\mu t} t^{-\delta/2} \| g \|_{L^\infty(\rho)}, \quad \| P_t g \|_{L^\infty(\rho)} \lesssim e^{-\mu t} t^{-\delta/2} \| g \|_{L^\infty(\rho)}
\]

and if \( 0 \leq \alpha \leq 2 \)

\[
\| (P_t - \text{Id}) g \|_{L^\infty(\rho)} \leq |e^{-\mu t} - 1| \| e^{-\Delta t} g \|_{L^\infty(\rho)} + e^{-\mu t} \| (e^{t\Delta} - \text{Id}) g \|_{L^\infty(\rho)} \lesssim \mu^{\alpha/2} \| g \|_{L^\infty(\rho)}.
\]

For a space-time weight, we obtain by the same argument

\[
\| P_t g \|_{L^\infty(\rho)} \lesssim e^{-\mu t \delta/2} \| g \|_{L^\infty(\rho)}, \quad \| P_t g \|_{L^\infty(\rho)} \lesssim e^{-\mu t \delta/2} \| g \|_{L^\infty(\rho)},
\]

(2.8)

\[
\| (P_t - \text{Id}) g \|_{L^\infty(\rho)} \lesssim t^{\alpha/2} \| g \|_{L^\infty(\rho)}.
\]

Then, if \( 2^{-2k} > t \) it follows from the fact that the weight is nonincreasing in time that

\[
\left\| \int_0^t P_{t-s} \Delta_k f_s ds \right\|_{L^\infty(\rho)} \lesssim 2^{-k\alpha} \| f \|_{L^\infty(\rho)} \lesssim \| f \|_{L^\infty(\rho)}.
\]

If \( 2^{-2k} \leq t \) then we split the integral into two parts

\[
\left\| \int_0^t P_{t-s} \Delta_k f_s ds \right\|_{L^\infty(\rho)} \lesssim \int_0^t e^{-\mu(t-s)} ds \| f \|_{L^\infty(\rho)} \lesssim 2^{-k(2+\alpha)} \| f \|_{L^\infty(\rho)}
\]

and

\[
\left\| \int_0^{t-2^{2k}} P_{t-s} \Delta_k f_s ds \right\|_{L^\infty(\rho)} \lesssim e^{-\mu t} \int_0^{t-2^{2k}} e^{\mu s} (t-s)^{-1-\epsilon} ds \lesssim \| f \|_{L^\infty(\rho)}.
\]

Note that all the above inequalities are uniform over \( t \geq 0 \). Hence the first bound in (2.7) follows. The second one is obtained as (recall that the weight is nonincreasing in time)

\[
\| w(t) \|_{L^\infty(\rho)} \lesssim e^{-\mu t} \| w_0 \|_{L^\infty(\rho)} \lesssim \| w_0 \|_{L^\infty(\rho)}.
\]

The time regularity of \( w \) follows from

\[
\| w(t) - w(s) \|_{L^\infty(\rho)} = \| P_s (P_{t-s} - \text{Id}) w_0 \|_{L^\infty(\rho)} \lesssim |t-s|^{(2+\alpha)/2} \| w_0 \|_{L^\infty(\rho)}
\]

and due to

\[
v(t) - v(s) = (P_{t-s} - \text{Id}) v(s) + \int_s^t P_{t-r} f(r) dr, \quad s < t,
\]

we obtain

\[
\| v(t) - v(s) \|_{L^\infty(\rho)} \lesssim |t-s|^{(2+\alpha)/2} \| v(s) \|_{L^\infty(\rho)} + |t-s|^{(2+\alpha)/2} \| f \|_{L^\infty(\rho)}
\]

\[
\lesssim |t-s|^{(2+\alpha)/2} \| f \|_{L^\infty(\rho)}.
\]

The proof is complete.

Next, we derive a Schauder estimate for parabolic equations including a cubic nonlinearity.
Lemma 2.11 Let $\mu > 0$ and let $\rho$ be a space-time weight. Fix $\kappa > 0$ and let $\psi \in C^{2+\kappa} \cap C^1 L^\infty(\rho^{3+\kappa}) \cap L^\infty L^\infty(\rho)$ be a classical solution to

$$L\psi + \psi^3 = \Psi, \quad \psi(0) = \psi_0.$$ 

Then

$$\|\psi\|_{C^{2+\kappa} (\rho^{3+\kappa})} + \|\psi\|_{C^1 L^\infty(\rho^{3+\kappa})} \lesssim \|\psi_0\|_{C^{2+\kappa}(\rho_0)} + \|\Psi\|_{C^{2+\kappa}(\rho^{3+\kappa})} + \|\psi\|^{3+\kappa}_{L^\infty L^\infty(\rho)}.$$ 

Proof Due to Lemma 2.10 it holds

$$\|\psi\|_{C^{2+\kappa} (\rho^{3+\kappa})} + \|\psi\|_{C^1 L^\infty(\rho^{3+\kappa})} \lesssim \|\psi_0\|_{C^{2+\kappa}(\rho_0)} + \|\Psi\|_{C^{2+\kappa}(\rho^{3+\kappa})} + \|\psi\|^{3+\kappa}_{C^{2+\kappa}(\rho^{3+\kappa})}$$

and we estimate pointwise in time using Lemma 2.3 and the weighted Young inequality

$$\|\psi^3\|_{C^{2+\kappa}(\rho^{3+\kappa})} \lesssim \|\psi_0\|_{C^{2+\kappa}(\rho_0)} + \|\Psi\|_{C^{2+\kappa}(\rho^{3+\kappa})} + \|\psi\|^{3+\kappa}_{C^{2+\kappa}(\rho^{3+\kappa})}$$

and the claim follows.

2.7 Parabolic coercive estimates

Similarly to Section 2.5 we obtain the following maximum principle for parabolic equations.

Lemma 2.12 Let $\mu \in \mathbb{R}$ and let $\rho$ be a space-time weight. Fix $\kappa > 0$ and let $\psi \in C^{2+\kappa} \cap C^1 L^\infty(\rho^{3+\kappa}) \cap L^\infty L^\infty(\rho)$ be a classical solution to

$$L\psi + \psi^3 = \Psi, \quad \psi(0) = \psi_0.$$ 

Then the following a priori estimate holds

$$\|\psi\|_{L^\infty L^\infty(\rho)} \lesssim 1 + \|\psi_0\|_{L^\infty(\rho_0)} + \|\Psi\|^{1/3}_{L^\infty L^\infty(\rho^3)},$$

where $\rho_0 = \rho(0, \cdot)$.

Proof Let $\tilde{\psi} = \psi \rho$ and assume for the moment that $\tilde{\psi}$ attains its (global) maximum $M = \tilde{\psi}(t^*, x^*)$ at the point $(t^*, x^*)$. If $M \leq 0$, then it is necessary to investigate the minimum point (or alternatively the maximum of $-\tilde{\psi}$), which we discuss below. Let us therefore assume that $M > 0$. If $t_* = 0$ then

$$\tilde{\psi} \leq \|\psi_0\|_{L^\infty(\rho_0)}$$

Assume that $t_* > 0$. Then

$$\rho^2 \partial_t \tilde{\psi} + \rho^2 (-\Delta + \mu) \tilde{\psi} + \tilde{\psi}^3 = \rho^2 \Psi + \rho \partial_t \rho \tilde{\psi} - \rho^2 (\Delta \rho) \psi - 2 \rho^2 \nabla \rho \nabla \psi.$$
and
\[ \partial_t \tilde{\psi}(t^*, x^*) = 0, \quad \nabla \tilde{\psi}(t^*, x^*) = 0, \quad \Delta \tilde{\psi}(t^*, x^*) \leq 0 \]
hence \( \rho \nabla \psi = -\psi \nabla \rho \). Consequently \(-\rho^2 \Delta \tilde{\psi}(t^*, x^*) \geq 0\) and also \( \rho \partial_t \rho \tilde{\psi}(t^*, x^*) \leq 0 \) since \( \partial_t \rho \leq 0 \). Hence
\[ M^3 \leq \left[ \rho^3 \Psi - \mu \rho^2 \tilde{\psi} - \rho^2 (\Delta \rho) \psi - 2 \rho^2 \nabla \rho \nabla \psi \right]_{(t^*, x^*)} \]
\[ \leq \| \Psi \|_{L^\infty L^\infty(\rho^3)} + \rho^2(t^*, x^*) \left[ |\mu| + \| \nabla \rho \|_{L^\infty}^2 + \| \Delta \rho \|_{L^\infty} \right] \| \tilde{\psi} \|_{L^\infty L^\infty} \]
\[ \leq \| \Psi \|_{L^\infty L^\infty(\rho^3)} + c_{\rho, \mu} \| \tilde{\psi} \|_{L^\infty L^\infty}. \]
Therefore we deduce that
\[ \tilde{\psi} \lesssim \| \psi_0 \|_{L^\infty(\rho_0)} + \| \Psi \|_{L^\infty L^\infty(\rho^3)}^{1/3} + c_{\rho, \mu} \| \tilde{\psi} \|_{L^\infty L^\infty}^{1/3}. \]
The same argument applied to \(-\tilde{\psi}\) yields
\[ -\tilde{\psi} \lesssim \| \psi_0 \|_{L^\infty(\rho_0)} + \| \Psi \|_{L^\infty L^\infty(\rho^3)}^{1/3} + c_{\rho, \mu} \| \tilde{\psi} \|_{L^\infty L^\infty}^{1/3} \]
hence, taking supremum over \((t, x) \in [0, \infty) \times \mathbb{R}^d\) and applying the weighted Young inequality yields the claim.

Next, we consider the situation when \(\psi \rho\) does not attain its global maximum. Since \(\psi \rho\) is smooth and bounded on \([0, \infty) \times \mathbb{R}^d\) due to the assumption, it follows that \(\psi \rho^{1+\delta}\) vanishes at infinity for every \(\delta \in (0, 1)\). Consequently, it has a global maximum point and the previous part of the proof applies with \(\rho\) replaced by \(\rho^\delta\). The conclusion then follows by sending \(\delta \to 0\) since the corresponding constant \(c_{\rho^{1+\delta}, \mu}\) is bounded uniformly in \(\delta \in (0, 1)\).

\[ \Box \]

### 2.8 Paracontrolled calculus

The foundations of paracontrolled calculus were laid down in the seminal work [GIP15] of Gubinelli, Imkeller and Perkowski, to which we refer the reader for a number of facts used here. We refer to the book [BCD11] of Bahouri, Chemin and Danchin for a gentle introduction to the use of paradifferential calculus in the study of nonlinear PDEs. We shall then freely use the decomposition for the paraproduct of \(f\) by \(g\) and the corresponding resonant term, defined in terms of Littlewood–Paley decomposition.

The following basic results are obtained similarly to the unweighted setting.

**Lemma 2.13** Let \(\rho\) be a weight.

1. Let \(A\) be an annulus, let \(\alpha \in \mathbb{R}\) and let \((u_j)_{j \geq -1}\) be a sequence of smooth functions such that \(F u_j\) is supported in \(2^j A\) and \(\| u_j \|_{L^\infty(\rho)} \lesssim 2^{-j\alpha}\) for all \(j \geq -1\). Then
\[ u = \sum_{j \geq -1} u_j \in C^\alpha(\rho) \quad \text{and} \quad \| u \|_{C^\alpha(\rho)} \lesssim \sup_{j \geq -1} \{2^{j\alpha} \| u_j \|_{L^\infty(\rho)}\}. \]
2. Let $\mathcal{B}$ be a ball, let $\alpha > 0$ and let $(u_j)_{j \geq -1}$ be a sequence of smooth functions such that $\mathcal{F} u_j$ is supported in $2^j \mathcal{B}$ and $\|u_j\|_{L^\infty(\rho)} \lesssim 2^{-j\alpha}$ for all $j \geq -1$. Then

$$u = \sum_{j \geq -1} u_j \in \mathcal{G}^\alpha(\rho) \quad \text{and} \quad \|u\|_{\mathcal{G}^\alpha(\rho)} \lesssim \sup_{j \geq -1} \{2^{j\alpha}\|u_j\|_{L^\infty(\rho)}\}.$$

**Proof** The proof follows the lines of [GIP15, Lemma A.3]. \qed

**Lemma 2.14 (Paraproduct estimates)** Let $\rho_1, \rho_2$ be weights and $\beta \in \mathbb{R}$. Then it holds

$$\|f < g\|_{\mathcal{G}^{\alpha}(\rho_1, \rho_2)} \lesssim \beta \|f\|_{L^\infty(\rho_1)} \|g\|_{\mathcal{G}^\beta(\rho_2)},$$

and if $\alpha < 0$ then

$$\|f < g\|_{\mathcal{G}^{\alpha}(\rho_1, \rho_2)} \lesssim_{\alpha, \beta} \|f\|_{\mathcal{G}^{\alpha}(\rho_1)} \|g\|_{\mathcal{G}^\beta(\rho_2)}.$$  

If $\alpha + \beta > 0$ then it holds

$$\|f \circ g\|_{\mathcal{G}^{\alpha}(\rho_1, \rho_2)} \lesssim_{\alpha, \beta} \|f\|_{\mathcal{G}^{\alpha}(\rho_2)} \|g\|_{\mathcal{G}^\beta(\rho_2)}.$$  

**Proof** The proof follows the lines of [GIP15, Lemma 2.1] and uses Lemma 2.13 instead of [GIP15, Lemma A.3]. \qed

We also obtain the following weighted analog of [GIP15, Lemma 2.2, Lemma 2.3], which is proved analogously.

**Lemma 2.15** Let $\rho_1, \rho_2$ be weights and $\alpha \in (0, 1)$ and $\beta \in \mathbb{R}$. For all $j \geq -1$ it holds

$$\|\Delta_j(fg) - f \Delta_j g\|_{L^\infty(\rho_1, \rho_2)} \lesssim 2^{-j\alpha} \|f\|_{\mathcal{G}^\alpha(\rho_1)} \|g\|_{L^\infty(\rho_2)},$$

$$\|\Delta_j(f < g) - f \Delta_j g\|_{L^\infty(\rho_1, \rho_2)} \lesssim 2^{-j(\alpha + \beta)} \|f\|_{\mathcal{G}^{\alpha}(\rho_1)} \|g\|_{\mathcal{G}^\beta(\rho_2)}.$$  

With this in hand, we derive a weighted commutator estimate.

**Lemma 2.16 (Commutator lemma)** Let $\rho_1, \rho_2, \rho_3$ be weights and let $\alpha \in (0, 1)$ and $\beta, \gamma \in \mathbb{R}$ such that $\alpha + \beta + \gamma > 0$ and $\beta + \gamma < 0$. Then there exist a trilinear bounded operator $\text{com}(\cdot, \cdot, \cdot)$ satisfying

$$\|\text{com}(f, g, h)\|_{\mathcal{G}^{\alpha + \beta + \gamma}(\rho_1, \rho_2, \rho_3)} \lesssim \|f\|_{\mathcal{G}^{\alpha}(\rho_1)} \|g\|_{\mathcal{G}^\beta(\rho_2)} \|h\|_{\mathcal{G}^\gamma(\rho_3)}$$

and for smooth functions $f, g, h$

$$\text{com}(f, g, h) = (f < g) \circ h - f (g \circ h).$$  

**Proof** In view of Lemma 2.13, Lemma 2.14, Lemma 2.15, the proof is the same as the proof of [GIP15, Lemma 2.4]. \qed

We will also need the following paralinearization lemma for the square.

**Lemma 2.17 (Paralinearization)** Let $\rho$ be weights and $\alpha \in (0, 1)$. Then

$$\|f^2 - 2f \times f\|_{\mathcal{G}^{2\alpha}(\rho)} \lesssim \|f^2\|_{\mathcal{G}^{\alpha}(\rho^\frac{1}{2})}.$$  

16
Proof The proof is similar to [GIP15, Lemma 2.6].

Moreover, we will make use of the time-mollified paraproducts as introduced in [GIP15, Section 5]. Let \( Q : \mathbb{R} \to \mathbb{R}_+ \) be a smooth function, supported in \([-1, 1]\) and \( \int_{\mathbb{R}} Q(s) \, ds = 1 \), and for \( i \geq -1 \) define the operator \( Q_i : C^\infty(\rho) \to C^\infty(\rho) \) by

\[
Q_i(f)(t) = \int_{\mathbb{R}} 2^{2i} Q(2^{2i}(t-s)) f(s \vee 0) \, ds.
\]

Finally, we define the modified paraproduct of \( f, g \in C^\infty(\rho) \) by

\[
f \prec g := \sum_{i \geq -1} (S_{i-1} Q_i f) \Delta_i g.
\]

Setting \( \mathcal{L} = \partial_t + (-\Delta + \mu) \), the following useful properties of this paraproduct in weighted Besov spaces can be shown similarly to [GIP15, Lemma 5.1].

Lemma 2.18 Let \( \rho_1, \rho_2 \) be space-time weights. Let \( \alpha \in (0, 1) \), \( \beta \in \mathbb{R} \), and let \( f \in C^\infty(\rho_1) \cap C^{\alpha/2}L^\infty(\rho_1) \) and \( g \in C^\infty(\beta)(\rho_2) \). Then

\[
\| [\mathcal{L}, f \prec g] \|_{C^{\alpha+\beta-2(\rho_1, \rho_2)}} \lesssim (\| f \|_{C^{\alpha/2}L^\infty(\rho_1)}) \| g \|_{C^\beta(\rho_2)},
\]

and

\[
\| f \prec g - f \prec g \|_{C^{\alpha+\beta}(\rho_1, \rho_2)} \lesssim \| f \|_{C^{\alpha/2}L^\infty(\rho_1)} \| g \|_{C^\beta(\rho_2)}.
\]

3 Probabilistic analysis

3.1 Space white noise

Let \( \xi \) be a space white noise on \( \mathbb{R}^d \), that is, a family of centered Gaussian random variables \( \{\xi(h); h \in L^2(\mathbb{R}^d)\} \) such that

\[
\mathbb{E}[\xi(h)^2] = \|h\|_{L^2}^2.
\]

Let \( \xi_M \) denote its periodization on \( T^d_M = (MT)^d = [-\frac{M}{2}, \frac{M}{2}]^d \) given by

\[
\xi_M(h) := \xi(h_M), \quad \hbox{where} \ h_M(x) = 1_{[-\frac{M}{2}, \frac{M}{2}]^d}(x) \sum_{y \in M \mathbb{Z}^d} h(x+y).
\]

Let

\[
\mathcal{D} X = \xi, \quad \mathcal{D} X_M = \xi_M,
\]

and denote by \([X^2], [X^3]\) and \([X^2_M], [X^3_M]\) the corresponding Wick powers. They can be constructed by using a suitable mollification \( \xi_\varepsilon = \xi * \eta_\varepsilon \) and \( \xi_{M, \varepsilon} = \xi_M * \eta_\varepsilon \) (where \( \eta_\varepsilon \) stands for a smoothing kernel) and setting

\[
\mathcal{D} X_\varepsilon = \xi_\varepsilon, \quad \mathcal{D} X_{M, \varepsilon} = \xi_{M, \varepsilon},
\]

\[
[X^2] := \lim_{\varepsilon \to 0} [X^2_\varepsilon] := \lim_{\varepsilon \to 0} X^2_\varepsilon - a_\varepsilon, \quad [X^3] := \lim_{\varepsilon \to 0} [X^3_\varepsilon] := \lim_{\varepsilon \to 0} X^3_\varepsilon - 3a_\varepsilon X_\varepsilon,
\]

\[
[X^2_M] := \lim_{\varepsilon \to 0} [X^2_{M, \varepsilon}] := \lim_{\varepsilon \to 0} X^2_{M, \varepsilon} - a_{M, \varepsilon}, \quad [X^3_M] := \lim_{\varepsilon \to 0} [X^3_{M, \varepsilon}] := \lim_{\varepsilon \to 0} X^3_{M, \varepsilon} - 3a_{M, \varepsilon} X_{M, \varepsilon},
\]

where \( a_\varepsilon = \mathbb{E}[X^2(0)] \) and \( a_{M, \varepsilon} = \mathbb{E}[X^2_M(0)] \) are logarithmically diverging constants (as \( \varepsilon \to 0 \)) and the limits are understood in a suitable Besov space a.s. More precisely, the following result holds.
Theorem 3.1 Let $d = 4$. Let $\rho(x) = \langle x \rangle^{-\nu}$ for some $\nu > 0$. Then there exist random distributions $X$, $[X^2]$, $[X^3]$ and $X_M$, $[X_M^2]$, $[X_M^3]$ given by the formulas above, such that for every $\kappa, \sigma > 0$ it holds

\[
\|X\|_{\mathcal{E}^{-\kappa}(\rho^\sigma)}, \|X^2\|_{\mathcal{E}^{-\kappa}(\rho^\sigma)}, \|X^3\|_{\mathcal{E}^{-\kappa}(\rho^\sigma)} \lesssim 1,
\]
\[
\|X_M\|_{\mathcal{E}^{-\kappa}(\mathbb{T}_M)}, \|X_M^2\|_{\mathcal{E}^{-\kappa}(\mathbb{T}_M)}, \|X_M^3\|_{\mathcal{E}^{-\kappa}(\mathbb{T}_M)} \lesssim 1,
\]
and in addition $X_M \to X$, $[X_M^2] \to [X^2]$, $[X_M^3] \to [X^3]$ in $\mathcal{E}^{-\kappa}(\rho^\sigma)$ a.s. as $M \to \infty$.

Proof We give a sketch of the proof since similar arguments are already present in the literature on parabolic $\Phi^4_3$ models, and in particular in the work of Mourrat and Weber [MW17b]. Following the approach of Gubinelli and Perkowski [GP17] we represent the random fields $X$ and $X_M$ as Wiener integrals over a white noise $W$ on $\mathbb{R}^4$. As a consequence we can write

\[
X(x) = \int_{\mathbb{R}^4} e^{2\pi i x \cdot \theta} \frac{W(d\theta)}{\mu + |\theta|^2}, \quad X_M(x) = \int_{\mathbb{R}^4} e^{2\pi i x \cdot \theta} \frac{W(d\theta)}{\mu + |\theta_M|^2},
\]

where $(|\theta_M|^i)^i = M^{-1} |\theta^i| - 1/2$, $i = 1, \ldots, d$ is the discretization of $\theta \in \mathbb{R}^4$ on a grid of size $M^{-1}$. The reader can check that this gives a periodic random field with the correct covariance. Wick powers of $X$ (or $X_M$) can then be expressed as multiple Wiener integrals over $W$. We present the details for $[X^3]$:

\[
[X^3](x) = \int_{(\mathbb{R}^4)^3} e^{2\pi i (\theta_1 + \theta_2 + \theta_3) \cdot x} \frac{W(d\theta_1 d\theta_2 d\theta_3)}{\prod_{i=1}^3 (\mu + |\theta_i|^2)},
\]
\[
[X_M^3](x) = \int_{(\mathbb{R}^4)^3} e^{2\pi i (|\theta_1|_M + |\theta_2|_M + |\theta_3|_M) \cdot x} \frac{W(d\theta_1 d\theta_2 d\theta_3)}{\prod_{i=1}^3 (\mu + |\theta_i|_M|^2)}.\]

And $L^2$ bound on the Littlewood–Paley block of these quantities reads, for $k \geq -1$,

\[
\mathbb{E}[\Delta_k [X_M^3](x)]^2 = \int_{(\mathbb{R}^4)^3} K_k(|\theta_1|_M + |\theta_2|_M + |\theta_3|_M)^2 \frac{d\theta_1 d\theta_2 d\theta_3}{\prod_{i=1}^3 (\mu + |\theta_i|_M|^2)} \lesssim 1,
\]

where $K_k$ is the Fourier multiplier associated with $\Delta_k$. From this we deduce by hypercontractivity that $\mathbb{E}[\|\Delta_k [X_M^3](x)\|_p^2] \lesssim 1$ and therefore that

\[
\mathbb{E}[\|\Delta_k [X_M^3]\|_{L^p(\rho^\sigma)}^p] \lesssim \int_{\mathbb{R}^4} \mathbb{E}[\|\Delta_k [X_M^3](x)\|_p^p] \rho(x)^{\sigma p} dx \lesssim \int_{\mathbb{R}^4} \rho(x)^{\sigma p} dx \lesssim 1,
\]

for $p$ sufficiently large so that the space integral is finite. As a consequence of Bernstein inequality it follows that

\[
\sum_k \mathbb{E}[\|\Delta_k [X_M^3]\|_{L^p(\rho^\sigma)}^p] \lesssim 2^{4k/p} \sum_k \mathbb{E}[\|\Delta_k [X_M^3]\|_{L^p(\rho^\sigma)}^p] \lesssim 1,
\]

and therefore

\[
\mathbb{E}[\|X_M^3\|_{C^{-\kappa}(\rho^\sigma)}^p] < \infty,
\]

for $p$ large enough and $\kappa > 0$ small. Convergence of $[X_M^3]$ to $[X^3]$ can be handled by coupling, observing that estimation of $[X_M^3] - [X^3]$ involves computations similar to the above. Indeed, it holds

\[
\mathbb{E}[\|\Delta_k (X_M^3 - X^3)(x)\|^2] = \int_{(\mathbb{R}^4)^3} \left( \frac{K_k(|\theta_1|_M + |\theta_2|_M + |\theta_3|_M)}{\prod_{i=1}^3 (\mu + |\theta_i|_M|^2)} - \frac{K_k(\theta_1 + \theta_2 + \theta_3)}{\prod_{i=1}^3 (\mu + |\theta_i|^2)} \right)^2 d\theta_1 d\theta_2 d\theta_3
\]

18
which by dominated convergence tends to zero as $M \to \infty$. Therefore we can estimate

$$\mathbb{E}[\|\Delta_k([X^3_M] - [X^3_0])_L^p(\rho)] \lesssim \int \mathbb{E}[\|\Delta_k([X^3_M] - [X^3_0])(x)]_L^p(x)^\sigma dx \lesssim o_M(1).$$

This result will be used for the study of elliptic $\Phi^4$ model in dimension 4, see Section 4. When $d = 5$ then the space white noise becomes more irregular and our analysis requires additional probabilistic objects. More precisely, we let

$$Q_X = \llbracket X^3 \rrbracket, \quad Q_Y = \llbracket X^2 \rrbracket,$$

$$Q_X^\epsilon = \llbracket X^3_\epsilon \rrbracket, \quad Q_Y^\epsilon = \llbracket X^2_\epsilon \rrbracket,$$

$$X^\epsilon = \lim_{\epsilon \to 0} X^\epsilon \circ X_\epsilon, \quad X^\epsilon_Y = \lim_{\epsilon \to 0} X^\epsilon_Y \circ [X_\epsilon^2] - \frac{b_\epsilon}{3}, \quad X^\epsilon_Y = \lim_{\epsilon \to 0} X^\epsilon_Y \circ [X_\epsilon^2] - b_\epsilon X_\epsilon,$$

where

$$b_\epsilon := 3\mathbb{E}[(X^\epsilon_Y \circ [X^2_\epsilon])(0)].$$

Similarly, we define the periodic analogs.

**Theorem 3.2** Let $d = 5$. Let $\rho(x) = \langle x \rangle^{-\nu}$ for some $\nu > 0$. Then there exist random distributions

$$X, [X^2], [X^3], X^Y, X^Y_Y, X^Y_Y, X^Y_Y$$

and their periodic versions

$$X_M, [X^2_M], [X^3_M], X^Y_M, X^Y_Y, X^Y_Y, X^Y_Y_M$$

given by the formulas above, such that if $\tau$ denotes one of the distributions in (3.1) and $\tau_M$ is the associated periodic version from (3.2), then $\tau \in C^{\alpha_\tau}(\rho^\sigma)$ and $\tau_M \in C^{\alpha_\tau}(\mathbb{T}^d_M)$ for $\alpha_\tau$ given by Table 1 and every $\kappa, \sigma > 0$. Moreover, $\tau_M \to \tau$ in $C^{\alpha_\tau}(\rho^\sigma)$ a.s. as $M \to \infty$.

**Proof** Apart form the higher complexity of the terms involved in the $d = 5$ case, the analysis proceeds like in Theorem 3.1. The various stochastic objects can be written as multiple iterated Wiener integrals and renormalizations accounts for cancellations of certain terms in the associated kernels. In the periodic and parabolic setting this analysis has already been performed several times with small variations, for example in [CC18], [MWX16] and more recently in [FG17] and in [GP17] for the KPZ equation. Estimation in weighted Besov spaces and convergence of the periodic to the non-periodic versions proceed like in the $\mathbb{R}^4$ case.

| $\alpha_\tau$ | $X$ | $[X^2]$ | $[X^3]$ | $X^Y$ | $X^Y_Y$ | $X^Y_Y$ | $X^Y_Y_M$ |
|---------------|-----|---------|---------|-------|---------|---------|-----------|
| $-\frac{1}{2} - \kappa$ | $-1 - \kappa$ | $-\frac{3}{2} - \kappa$ | $\frac{1}{2} - \kappa$ | $1 - \kappa$ | $-\kappa$ | $-\kappa$ | $-\frac{1}{2} - \kappa$ |

Table 1: Regularity of stochastic objects.
3.2 Space-time white noise

If $\xi$ is a space white noise on $\mathbb{R} \times \mathbb{R}^d$, i.e. a family of centered Gaussian random variables \{\xi(h); h \in L^2(\mathbb{R} \times \mathbb{R}^d)\} such that
$$\mathbb{E}[\xi(h)^2] = \|h\|_{L^2}^2,$$
then we may define its periodization $\xi_M$ on $\mathbb{T}_M = [-\frac{M}{2}, \frac{M}{2}]^d$ by
$$\xi_M(h) := \xi(h_M), \quad \text{where } h_M(t, x) = 1_{[-\frac{M}{2}, \frac{M}{2}]}(x) \sum_{y \in MZ^d} h(t, x + y).$$

Our construction of solutions to the parabolic $\Phi^4$ model in Section 6 and Section 7 relies on a smooth and space periodic approximation $\xi_\varepsilon$ of the driving space-time white noise $\xi$, defined on the torus of size $M = \frac{1}{\varepsilon}$. To be more precise, let $\xi_\varepsilon$ be a periodic version of a space-time mollification of $\xi$ defined on $\mathbb{R} \times \mathbb{T}_{1/\varepsilon}^d$ and let $X, X_\varepsilon$ be stationary solutions to
$$\mathcal{L}X = \xi, \quad \mathcal{L}X_\varepsilon = \xi_\varepsilon,$$
and
$$\|X^2\| := \lim_{\varepsilon \to 0} X^2_\varepsilon - a_\varepsilon, \quad \|X^3\| := \lim_{\varepsilon \to 0} X^3_\varepsilon - 3a_\varepsilon X_\varepsilon,$$
where again we can take $a_\varepsilon = \mathbb{E}[X^2_\varepsilon(0, 0)]$ is a diverging constant and the limits are understood in a suitable Besov space a.s. More precisely, the following result holds.

**Theorem 3.3** Let $d = 2$. Let $\rho(t, x) = \langle (t, x) \rangle^{-\nu}$ for some $\nu > 0$. There exists a sequence of diverging constants $(a_\varepsilon)_{\varepsilon \in (0, 1)}$ and random distributions $X, \|X^2\|, \|X^3\|$ such that for all $\kappa, \sigma > 0$ it holds
$$\|X\|_{C^\kappa(\rho^\sigma)} \leq 1,$$
and
$$\|X^2\| := \lim_{\varepsilon \to 0} X^2_\varepsilon - a_\varepsilon, \quad \|X^3\| := \lim_{\varepsilon \to 0} X^3_\varepsilon - 3a_\varepsilon X_\varepsilon,$$
where the limit is understood in $C^\kappa(\rho^\sigma)$ a.s. as $\varepsilon \to \infty$.

**Proof** The proof proceeds like in Theorem 3.1 in the proof of which we also made reference to the relevant literature. We would just like to comment on how to obtain existence for all times within the claimed weighted space. Let $Y$ be one of the random fields considered in the theorem and $Y_\varepsilon$ the corresponding approximation. By standard estimates one obtains bounds of the form
$$\mathbb{E}[\|\rho^\sigma(t, \cdot)Y(t, \cdot) - \rho^\sigma(s, \cdot)Y(s, \cdot)\|_{C^\nu(\rho^\sigma)^{-\kappa}}^p] \lesssim |t - s|^{\beta p} (s)^{-\beta p},$$
for some small $\delta, \beta > 0$ and large $p$, uniformly for $0 \leq s \leq t \leq s + 1$. Standard Kolomogorov criterion can be applied to obtain that
$$\mathbb{E}[\|\rho^\sigma Y\|_{C^\nu([L, L+1]; \rho^\sigma)^{-\kappa}}^p] \lesssim L^{-\beta p},$$
for all $L \geq 1$ and some $\delta' > 0$. Finally if $p$ is large enough this shows that the random variable $\sum_{L=0}^{\infty} \|\rho^\sigma Y\|_{C^\nu([L, L+1]; \rho^\sigma)^{-\kappa}}^p$ has finite expectation. Finally a simple gluing argument
implies that the random variable $\|\rho^\sigma Y\|_{C^d(R^d)}$ has also finite $L^p$ moments. Weighted space convergence of the approximation $Y_\varepsilon$ to $Y$ can be handled similarly since we can establish that

$$
\sup_{L} L^{\beta_\varepsilon} E[\|\rho^\sigma Y_\varepsilon - \rho^\sigma Y\|_{C^d((L+1);C^d)}^p] \lesssim o_\varepsilon(1),
$$

from which we obtain easily the convergence in the weighted norm $C^d C^d(\rho^\sigma)$ as $\varepsilon \to 0$. □

Similarly to the elliptic 5 dimensional case, we define

$$
\mathcal{L}^\tau X^\varepsilon = [X^3], \quad X^\varepsilon(0) = 0, \quad \mathcal{L}^\tau X^\varepsilon = [X^2], \quad X^\varepsilon(0) = 0,
$$

$$
\mathcal{L}^\tau X_\varepsilon = [X^3], \quad X_\varepsilon(0) = 0, \quad \mathcal{L}^\tau X_\varepsilon = [X^2], \quad X_\varepsilon(0) = 0,
$$

$$
X^\varepsilon = \lim_{\varepsilon \to 0} X^\varepsilon \circ X_\varepsilon, \quad X^\varepsilon = \lim_{\varepsilon \to 0} X_\varepsilon \circ [X^2] - \frac{b_\varepsilon}{3}, \quad X^\varepsilon = \lim_{\varepsilon \to 0} X^\varepsilon \circ [X^2] - b_\varepsilon X_\varepsilon,
$$

where $b_\varepsilon(t) = 3E[(X^2_\varepsilon \circ [X^2_\varepsilon])(t,0)]$ stands for a suitable renormalization constant which is $t$ dependent and such that $\sup_{t \geq 0} |b_\varepsilon(t)| \lesssim |\log \varepsilon|$. Moreover, it can be seen that, for each fixed $\varepsilon$, $b_\varepsilon$ is smooth and has bounded first derivative.

**Theorem 3.4** Let $d = 3$. Let $\rho(t, x) = \langle(t, x)\rangle^{-\nu}$ for some $\nu > 0$. Then there exist random distributions

$$
X, [X^2], [X^3], X^\varepsilon, X^\varepsilon, X^\varepsilon, X^\varepsilon
$$

such that if $\tau$ denotes one of the distributions in (3.3) then

$$
\tau \in C^\delta C^\delta - \gamma(\rho^\sigma) \cap C^\delta C^\delta - \gamma(\rho^\sigma)
$$

for $\alpha_\tau$ given by Table 1, every $\kappa, \sigma > 0$ and some $\delta, \gamma > 0$. Moreover, if $\tau_\varepsilon$ is the smooth version of $\tau$ then $\tau_\varepsilon \to \tau$ in $C^\delta C^\delta - \gamma(\rho^\sigma) \cap C^\delta C^\delta - \gamma(\rho^\sigma)$ a.s. as $\varepsilon \to 0$.

**Proof** The convergence and renormalization of the stochastic terms has been performed several times in the literature, see the proof of Theorem 3.2 for precise references. As for the convergence in the space-time weighted Besov–Hölder spaces arguments similar to those described in Theorem 3.3 can be applied to establish the claim. □

### 4 Elliptic $\Phi^4_4$ model

The goal of this section is threefold. First, we derive a suitable decomposition of the elliptic $\Phi^4_4$ model (1.1) in dimension 4. Second, we establish a priori estimates for the involved quantities. This will also serve as a basis for the investigation of the parabolic $\Phi^4_4$ model in dimension 2, see Section 6. Finally, we employ Schaefer’s fixed point theorem together with compactness arguments in order to construct solutions to the decomposed elliptic system.
4.1 Decomposition into simpler equations

We study the elliptic equation

\[-\Delta + \mu \phi + \phi^3 - 3a\phi - \xi = 0\]

in \(\mathbb{R}^4\) where \(\xi\) is a space white noise and \(a\) stands for a renormalization constant needed to define the stochastic objects below. We let \((-\Delta + \mu) = \mathcal{D}\) and introduce the ansatz

\[\phi = X + \phi + \psi,\]

with

\[\mathcal{D}X = \xi, \quad [X^3] := X^3 - 3aX, \quad [X^2] := X^2 - a.\]

Consequently,

\[0 = \mathcal{D} \phi + \phi^3 - 3a\phi - \xi = \mathcal{D} \phi + \mathcal{D} \psi + [X^3] + 3(\phi + \psi)[X^2] + 3(\phi + \psi)^2X + (\phi + \psi)^3.\]

This equation will be decomposed into a system of equations, namely,

\[\mathcal{D} \phi + \Phi = 0, \quad \mathcal{D} \psi + \psi^3 + \Psi = 0, \quad (4.1)\]

where in \(\Phi\) we collect all the contributions of negative regularity and in \(\Psi\) all the others (belonging locally to \(L^\infty\)). In addition, with the help of the operators \(\mathcal{U}_{\leq}, \mathcal{U}_{>}\) defined in Section 2.3, we localize all the irregular contributions. Namely, each irregular term depending on \(\phi + \psi\) will be decomposed into two parts: one even more irregular but controlled by the \(L^\infty\)-norm of \(\phi + \psi\); and its regular counterpart, which will be included into \(\Psi\). This step will be beneficial for the a priori estimates in Section 4.2 as it allows to estimate \(\phi\) easily and therefore eliminate various norms of \(\phi\) from the estimates of \(\psi\). In other words, thanks to the localizers \(\mathcal{U}_{\leq}, \mathcal{U}_{>}\) we are able to decouple (4.1) and develop an efficient approach towards a priori estimates.

Therefore, including the localizers, we define

\[\Phi := [X^3] + 3(\phi + \psi) \prec \mathcal{U}_{>} [X^2] + 3(\phi + \psi)^2 \prec \mathcal{U}_{>} X,\]

\[\Psi := \Psi_1 + \Psi_2,\]

\[\Psi_1 := \phi^3 + 3\psi\phi^2 + 3\psi^2\phi,\]

\[\Psi_2 := 3(\phi + \psi) \prec \mathcal{U}_{\leq} [X^2] + 3(\phi + \psi)^2 \prec \mathcal{U}_{\leq} X + 3(\phi + \psi) \succ [X^2] + 3(\phi + \psi)^2 \succ X.\]

4.2 A priori estimates

Recall that the stochastic objects can be constructed so that

\[
\|X\|_{\mathcal{E}^{-(\rho^*)}}, \|X^2\|_{\mathcal{E}^{-(\rho^*)}}, \|X^3\|_{\mathcal{E}^{-(\rho^*)}} \lesssim 1
\]

provided \(\rho\) is a polynomial weight of the form \(\rho(x) = \langle x \rangle^{-\nu}\) for some \(\nu > 0\) and \(\kappa, \sigma > 0\). Hence in view of Lemma 2.4 we can choose small parameters \(\alpha > \kappa > 0\) and \(\delta = 2 - \kappa - \alpha > 0, \beta = \alpha - \kappa > 0\) to set up the localization operators so that (in the sequel, the parameter \(\sigma\) is always positive but may change from bound to bound)

\[
\|\mathcal{U}_{>} X\|_{\mathcal{E}^{\alpha-2(\rho^{-1})}} \lesssim 2^{-\delta L} \|X\|_{\mathcal{E}^{-(\rho^*)}}, \quad \|\mathcal{U}_{\leq} X\|_{\mathcal{E}^{-(\rho^*)}} \lesssim 2^{(\alpha+\kappa)L} \|X\|_{\mathcal{E}^{-(\rho^*)}},
\]

22
and
\[ \| \mathcal{H}_x [X^2] \|_{L^2} \lesssim 2^{-3L/2} \| [X^2] \|_{L^2 \cap (0, \rho)}, \quad \| \mathcal{H}_x [X^2] \|_{L^2 (0, \rho^2)} \lesssim 2^{(\alpha + \epsilon)L/2} \| [X^2] \|_{L^2 \cap (0, \rho^2)}. \]

From this we have
\[ \| \Phi \|_{L^2 \cap (0, \rho^2)} \lesssim \| [X^2] \|_{L^2 \cap (0, \rho^2)} + \| \phi \|_{L^2 \cap (0, \rho^2)} \| \mathcal{H}_x [X^2] \|_{L^2 \cap (0, \rho^2)} + \| \phi \|_{L^2 \cap (0, \rho^2)}^2 \| \mathcal{H}_x \|_{L^2 \cap (0, \rho^2)} \lesssim 1 + \| \phi \|_{L^2 \cap (0, \rho^2)} \| \mathcal{H}_x [X^2] \|_{L^2 \cap (0, \rho^2)} \lesssim 2^{(2 - \kappa - \alpha)N/2} + \| \phi \|_{L^2 \cap (0, \rho^2)}^2 \| \mathcal{H}_x [X^2] \|_{L^2 \cap (0, \rho^2)}. \]

Hence it follows from the Schauder estimates that
\[ \| \phi \|_{L^2 \cap (0, \rho^2)} \lesssim \| \phi \|_{L^2 \cap (0, \rho^2)} \lesssim 2^{(2 - \kappa - \alpha)N/2} + \| \phi \|_{L^2 \cap (0, \rho^2)}^2 \| \mathcal{H}_x [X^2] \|_{L^2 \cap (0, \rho^2)}. \quad \text{(4.3)} \]

Consequently, whenever \( L > 0 \) is such that \( \| \phi \|_{L^2 \cap (0, \rho^2)} \lesssim 2^{(2 - \kappa - \alpha)N/2} \) and consequently \( 2^{(\alpha + \epsilon)L} \approx 1 \) for some \( \epsilon \in (0, 1) \). Furthermore, it holds true that
\[ \| \Psi_1 \|_{L^2 \cap (0, \rho^2)} \lesssim (1 + \| \psi \|_{L^2 \cap (0, \rho^2)})(1 + \| \psi \|_{L^2 \cap (0, \rho^2)}) \quad \text{(4.4)} \]

and
\[ \| \Psi_1 \|_{L^2 \cap (0, \rho^2)} \lesssim (1 + \| \psi \|_{L^2 \cap (0, \rho^2)})(1 + \| \psi \|_{L^2 \cap (0, \rho^2)}) + (1 + \| \psi \|_{L^2 \cap (0, \rho^2)})(1 + \| \psi \|_{L^2 \cap (0, \rho^2)})(1 + \| \psi \|_{L^2 \cap (0, \rho^2)})(1 + \| \psi \|_{L^2 \cap (0, \rho^2)}). \quad \text{(4.5)} \]

which implies also
\[ \| \Psi_1 \|_{L^2 \cap (0, \rho^2)} \lesssim (1 + \| \psi \|_{L^2 \cap (0, \rho^2)})(1 + \| \psi \|_{L^2 \cap (0, \rho^2)}). \quad \text{(4.6)} \]

Thus, according to Lemma 2.7
\[ \| \psi \|_{L^2 \cap (0, \rho^2)} \lesssim (1 + \| \psi \|_{L^2 \cap (0, \rho^2)})(1 + \| \psi \|_{L^2 \cap (0, \rho^2)}). \]

Since we have due to Lemma 2.2
\[ \| \psi \|_{L^2 \cap (0, \rho^2)} \lesssim \| \psi \|_{L^2 \cap (0, \rho^2)} \lesssim \| \psi \|_{L^2 \cap (0, \rho^2)} \lesssim 2^{(\alpha / (2 + \beta)} \| \psi \|_{L^2 \cap (0, \rho^2)} \]

the weighted Young inequality yields
\[ \| \psi \|_{L^2 \cap (0, \rho^2)} \lesssim 2^{(\alpha / (2 + \beta)} \| \psi \|_{L^2 \cap (0, \rho^2)} \]

Now, it holds
\[ \| \Psi \|_{L^2 \cap (0, \rho^2)} \lesssim (1 + \| \psi \|_{L^2 \cap (0, \rho^2)})(1 + \| \psi \|_{L^2 \cap (0, \rho^2)}) \]

for some \( \epsilon \in (0, 1) \). Consequently, Lemma 2.8 implies
\[ \| \psi \|_{L^2 \cap (0, \rho^2)} \lesssim 1 + \| \psi \|_{L^2 \cap (0, \rho^2)} \]

for some \( \epsilon \in (0, 1) \). Therefore we deduce
\[ \| \psi \|_{L^2 \cap (0, \rho^2)} \lesssim 1. \]
4.3 Existence

As the first step towards the existence of solutions to the elliptic \( \Phi^4 \) model (1.1) in dimension 4, we consider the problem on a large torus \( T_M^4 \) of a fixed size \( M \in \mathbb{N} \). As observed in Section 4.1, it reduces to solving the system (4.1), (4.2) with the space white noise \( \xi \) as well as the probabilistic objects \( X, [X^2], [X^3] \) replaced by their periodic approximations \( \xi_M, X_M, [X_M^2], [X_M^3] \). We refer to Section 3.1 for details of the probabilistic construction.

The proof of existence will be divided into two steps. First, we construct a suitable fixed point map

\[
\mathcal{K} : \mathcal{C}^\beta(T_M^4) \times \mathcal{C}^\beta(T_M^4) \to \mathcal{C}^\beta(T_M^4) \times \mathcal{C}^\beta(T_M^4).
\]

Second, we apply Schaefer’s fixed point theorem [Eva10, Section 9.2.2, Theorem 4] to show that \( \mathcal{K} \) has a fixed point. More precisely, we define the mapping \( \mathcal{K} \) as follows: given

\[
(\tilde{\phi}, \tilde{\psi}) \in \mathcal{C}^\beta(T_M^4) \times \mathcal{C}^\beta(T_M^4),
\]

let \( \mathcal{K}(\tilde{\phi}, \tilde{\psi}) = (\phi, \psi) \) be a solution to

\[
\mathcal{L} \phi + \Phi(\tilde{\phi}, \tilde{\psi}) = 0, \quad \mathcal{L} \psi + \psi^3 + \Psi(\tilde{\phi}, \tilde{\psi}) = 0, \quad (4.8)
\]

where

\[
\begin{align*}
\Phi(\tilde{\phi}, \tilde{\psi}) &= [X^3] + 3(\tilde{\phi} + \tilde{\psi}) < \mathbb{W}_x [X^2] + 3(\tilde{\phi} + \tilde{\psi})^2 < \mathbb{W}_x X, \\
\Psi(\tilde{\phi}, \tilde{\psi}) &= \Psi_1(\tilde{\phi}, \tilde{\psi}) + \Psi_2(\tilde{\phi}, \tilde{\psi}), \\
\Psi_1(\tilde{\phi}, \tilde{\psi}) &= \tilde{\phi}^3 + 3\tilde{\psi}\tilde{\phi}^2 + 3\tilde{\psi}^2\tilde{\phi}, \\
\Psi_2(\tilde{\phi}, \tilde{\psi}) &= 3(\tilde{\phi} + \tilde{\psi}) < \mathbb{W}_x [X^2] + 3(\tilde{\phi} + \tilde{\psi})^2 < \mathbb{W}_x X + 3(\tilde{\phi} + \tilde{\psi}) ≲ [X^2] + 3(\tilde{\phi} + \tilde{\psi})^2 \gtrsim X.
\end{align*}
\]

Note that the first equation in (4.8) always has a (unique) solution \( \phi \) which belongs to \( \mathcal{C}^{\alpha}(T_M^4) \) due to (4.3). Indeed, in view of the given regularity of \( (\tilde{\phi}, \tilde{\psi}) \) and the estimates from Section 4.2 imply (recall that \( \alpha = \beta + \kappa \))

\[
||\Phi(\tilde{\phi}, \tilde{\psi})||_{\mathcal{C}^{\alpha-2}(T_M^4)} \lesssim 1.
\]

Next, we observe that due to (4.4), (4.5) (performed on \( T_M^4 \)) the term \( \Psi(\tilde{\phi}, \tilde{\psi}) \) belongs to \( \mathcal{C}^{\gamma}(T_M^4) \) provided \( (\tilde{\phi}, \tilde{\psi}) \in \mathcal{C}^{\beta}(T_M^4) \times \mathcal{C}^{\beta}(T_M^4) \) and \( \gamma = \beta - \kappa \). Hence according to Proposition A.1 there exists \( \psi \) which is a unique classical solution of the second equation in (4.8) and belongs to \( \mathcal{C}^{2+\gamma}(T_M^4) \). This shows that the map \( \mathcal{K} \) is well-defined. As the next step, we will show that the map \( \mathcal{K} \) has a fixed point.

**Proposition 4.1** There exists \( (\phi, \psi) \in \mathcal{C}^{\beta}(T_M^4) \times \mathcal{C}^{\beta}(T_M^4) \) such that \( (\phi, \psi) = \mathcal{K}(\phi, \psi) \). Moreover, \( (\phi, \psi) \) belongs to \( \mathcal{C}^{\alpha}(T_M^4) \times \mathcal{C}^{2+\beta}(T_M^4) \) for \( \alpha = \beta + \kappa \).

**Proof** We intend to apply the Schaefer’s fixed point theorem which can be found in [Eva10, Section 9.2.2, Theorem 4]. To this end, it is necessary to verify that the map \( \mathcal{K} \) is continuous and compact and the set

\[
\{(\phi, \psi) \in \mathcal{C}^{\beta}(T_M^4) \times \mathcal{C}^{\beta}(T_M^4); (\phi, \psi) = \lambda \mathcal{K}(\phi, \psi) \text{ for some } 0 \leq \lambda \leq 1\}
\]

is bounded.
Continuity and compactness: Assume that \((\tilde{\phi}_n, \tilde{\psi}_n) \to (\tilde{\phi}, \tilde{\psi})\) in \(C^\beta(\mathbb{T}_M^4) \times C^\beta(\mathbb{T}_M^4)\) and denote \((\phi_n, \psi_n) = \mathcal{K}(\tilde{\phi}_n, \tilde{\psi}_n)\). First, we observe that a slight modification of (4.4), (4.5) and (4.6) shows that

\[
\|\Psi(\tilde{\phi}_n, \tilde{\psi}_n)\|_{C^\gamma(\mathbb{T}_M^4)} \leq c(\|\tilde{\phi}_n + \tilde{\psi}_n\|_{C^\beta(\mathbb{T}_M^4)}) \lesssim 1
\]

(4.10)

uniformly in \(n\). Hence due to the Schauder estimates and Lemma 2.7, it follows

\[
\|\phi_n\|_{C^\alpha(\mathbb{T}_M^4)} + \|\psi_n\|_{C^{2+\gamma}(\mathbb{T}_M^4)} \lesssim 1
\]

(4.11)

uniformly in \(n\). According to the compact embedding (2.4) we deduce that there exists a subsequence still denoted by \((\phi_n, \psi_n)\) which converges to certain \((\phi, \psi)\) in \(C^\beta(\mathbb{T}_M^4) \times C^\beta(\mathbb{T}_M^4)\). Moreover, due to the uniform bound (4.11), it holds

\[
\|\phi\|_{C^\alpha(\mathbb{T}_M^4)} + \|\psi\|_{C^{2+\gamma}(\mathbb{T}_M^4)} \lesssim 1.
\]

Since \(\Phi\) as well as \(\Psi\) in (4.8) depends continuously on \((\tilde{\phi}_n, \tilde{\psi}_n)\), which can be seen by similar estimates as in Section 4.2, we may pass to the limit and conclude that \((\phi, \psi) = \mathcal{K}(\tilde{\phi}, \tilde{\psi})\). In view of uniqueness, we deduce that every subsequence converges to the same limit which implies that the whole sequence converges and the desired continuity of \(\mathcal{K}\) follows. Furthermore, compactness of \(\mathcal{K}\) is also a direct consequence of the bound (4.11).

Boundedness of (4.9): If \((\phi, \psi) = \lambda \mathcal{K}(\phi, \psi)\) for some \(0 < \lambda \leq 1\), then \((\lambda^{-1} \phi, \lambda^{-1} \psi) = \mathcal{K}(\phi, \psi)\) hence

\[
\mathcal{L} \phi + \lambda \Phi(\phi, \psi) = 0, \quad \mathcal{L} \psi + \frac{1}{\lambda^2} \psi^\beta + \lambda \Phi(\phi, \psi) = 0. \tag{4.12}
\]

We shall modify the a priori estimates from Section 4.2 in order to account for the parameter \(\lambda\) and obtain bounds uniform in \(\lambda\). First, we observe that the first equation in (4.12) does not cause any difficulties as \(\|\lambda \Phi(\phi, \psi)\|_{C^{\alpha-2}(\mathbb{T}_M^4)} \leq \|\Phi(\phi, \psi)\|_{C^{\alpha-2}(\mathbb{T}_M^4)}\). Consequently, as in (4.3) we deduce that

\[
\|\phi\|_{C^\alpha(\mathbb{T}_M^4)} \lesssim 1
\]

uniformly in \(\lambda\). The same approach can be applied to the bounds (4.4), (4.5) and (4.6) which remain unchanged and independent of \(\lambda\). Revisiting the proof of Lemma 2.7 we obtain

\[
\|\psi\|_{C^{2+\beta}(\mathbb{T}_M^4)} \lesssim \|\Psi\|_{C^\beta(\mathbb{T}_M^4)} + \frac{1}{\lambda^{2+\beta}} \|\psi\|_{L^\infty(\mathbb{T}_M^4)}^{3+\beta}. \tag{4.13}
\]

In order to control the right hand side uniformly in \(\lambda\) we revisit the proof of Lemma 2.8 and observe that it simplifies since the weight is not needed on the torus. Then we apply (4.7) and we obtain

\[
\|\psi\|_{L^\infty(\mathbb{T}_M^4)} \leq \lambda \|\Psi\|_{L^\infty(\mathbb{T}_M^4)}^{1/3} \lesssim \lambda (1 + \|\psi\|_{L^\infty(\mathbb{T}_M^4)}^{1-\varepsilon})
\]

for some \(\varepsilon \in (0, 1)\). Hence, by the weighted Young inequality, we deduce

\[
\|\psi\|_{L^\infty(\mathbb{T}_M^4)} \lesssim \lambda.
\]

Plugging this into (4.13) and using the bound for \(\Psi\) in (4.4), (4.5) leads to

\[
\|\psi\|_{C^{2+\beta}(\mathbb{T}_M^4)} \lesssim 1,
\]

uniformly in \(\lambda\) and the boundedness of (4.9) follows.
Finally, Schaefer’s fixed point theorem [Eva10, Section 9.2.2, Theorem 4] gives the existence of a fixed point of $K$. Moreover, the a priori estimates from Section 4.2 show that $\psi \in C^{2+\beta}(\mathbb{T}_M^4)$.

Therefore, we have proved the following result.

**Theorem 4.2** Let $M \in \mathbb{N}$. Let $\kappa, \alpha \in (0, 1)$ be chosen sufficiently small and let $\beta = \alpha - \kappa > 0$. There exists $(\phi, \psi) \in C^\alpha(T_M^4) \times C^{2+\beta}(T_M^4)$ which is a solution to (4.1), (4.2) on $\mathbb{T}_M^4$.

With this in hand, we are able to conclude the proof of existence on $\mathbb{R}^4$.

**Theorem 4.3** Let $\kappa, \alpha \in (0, 1)$ be chosen sufficiently small and let $\beta = \alpha - \kappa > 0$. There exists $(\phi, \psi) \in C^\alpha(\rho) \times [C^{2+\beta}(\rho^{3+\beta}) \cap L^\infty(\rho)]$ which is a solution to (4.1), (4.2) on $\mathbb{R}^4$.

**Proof** Let $(\phi_M, \psi_M) \in C^\alpha(T_M^4) \times C^{2+\beta}(T_M^4)$ denote the solution to (4.1), (4.2) constructed in Theorem 4.2. Since functions on $T_M^4$ can be regarded as periodic functions defined on the full space $\mathbb{R}^4$, we may apply the a priori estimates from Section 4.2. More precisely, in view of Theorem 3.1, we conclude that the approximate solutions $(\phi_M, \psi_M)$ are bounded uniformly in $M$ in $C^\alpha(\rho) \times [C^{2+\beta}(\rho^{3+\beta}) \cap L^\infty(\rho)]$ whenever $\rho$ is a polynomial bound. Due to (2.4), this space is compactly embedded into $C^{\alpha'}(\rho^{1+\alpha'}) \times C^{2+\beta'}(\rho^{3+\beta'})$ provided $\alpha' < \alpha$ and $\beta' < \beta < \beta'$. Therefore, there exists a subsequence, still denoted $(\phi_M, \psi_M)$ which converges in $C^{\alpha'}(\rho^{1+\alpha'}) \times C^{2+\beta'}(\rho^{3+\beta'})$ to certain $(\phi, \psi) \in C^\alpha(\rho) \times [C^{2+\beta}(\rho^{3+\beta}) \cap L^\infty(\rho)]$. Passing to the limit in (4.1), (4.2) concludes the proof of existence on the full space.

## 5 Elliptic $\Phi^4_5$ model

In this section we focus on the elliptic $\Phi^4$ model (1.1) in dimension 5. First we decompose the equation into a system of equations and establish a priori estimates for the involved quantities. Due to the lower regularity of the driving noise, the analysis is more involved than in Section 6. In particular, it is necessary to include additional paracontrolled ansatz, which allows to cancel certain irregular term. Consequently, the a priori estimates become rather delicate and are presented in Sections 5.3, 5.4, 5.5, 5.6, 5.7 below. This will also serve as a basis for the investigation of the parabolic $\Phi^4$ model in dimension 3 in Sections 7, 8, 9.

### 5.1 Decomposition into simpler equations

We study the elliptic equation

$$(-\Delta + \mu)\phi + \phi^3 + (-3a + 3b)\phi - \xi = 0$$  \hspace{1cm} (5.1)

in $\mathbb{R}^5$ where $\xi$ is a space white noise and $a, b$ stand for renormalization constants. We let $(-\Delta + \mu) = \mathcal{D}$ and introduce the ansatz

$$\phi = X - X^\mathcal{D} + \phi + \psi$$

with

$$\mathcal{D} X = \xi, \quad [X^3] := X^3 - 3aX, \quad [X^2] := X^2 - a,$$

$$\mathcal{D} X^\mathcal{D} = [X^3], \quad \mathcal{D} X^\mathcal{Y} = [X^2].$$
\[ X^\psi = X^Y \circ X, \quad X^\omega = X^Y \circ [X^2] - \frac{b}{3}, \quad X^\sigma = X^Y \circ [X^2] - bX. \]

Recall that if \( \varrho \) is a polynomial weight of the form \( \varrho(x) = \langle x \rangle^{-\nu} \) for some \( \nu > 0 \) and \( \sigma > 0 \) then these objects can be constructed in spaces \( \mathcal{C}^\alpha(\varrho^\sigma) \) where the respective values of \( \alpha \) are given in Table 1. The parameter \( \kappa > 0 \) can be chosen arbitrarily small.

As a consequence, the left hand side of (5.1) rewrites as

\[
\mathcal{D} \varphi + \varphi^3 + (-3a + 3b)\varphi - \xi = \mathcal{D} \phi + \mathcal{D} \psi + 3[X^2](-X^Y + \phi + \psi) + 3X(-X^Y + \phi + \psi)^2 + (-X^Y + \phi + \psi)^3 + 3b\varphi. \tag{5.2}
\]

Our goal is to construct \( \psi \) with regularity \( 2 + \alpha \) whereas \( \phi \) will be of regularity \( \frac{1}{2} + \alpha \) for some \( \alpha > 0 \) small. Consequently, the third term on the right hand side of (5.2) is not expected to be well-defined and difficulties also arise in the fourth term. In order to cancel the most irregular part of the third term, we assume further that \( \phi \) is paracontrolled by \( X^Y \), namely, it holds

\[ \phi = \vartheta - 3(-X^Y + \phi + \psi) \prec X^Y \tag{5.3} \]

for some \( \vartheta \) which is more regular (we will see below that \( \vartheta \) has the regularity \( 1 + \alpha \)). Hence, (5.1) rewrites as

\[
0 = \mathcal{D} \vartheta + \mathcal{D} \psi + 3[X^2] \prec (-X^Y + \phi + \psi) - 3[\mathcal{D} , (-X^Y + \phi + \psi) \prec X^Y \\
+ 3X(-X^Y + \phi + \psi)^2 + (-X^Y + \phi + \psi)^3 + 3b\varphi. \tag{5.4}
\]

### 5.2 Including the localizers

As the first step, we decompose the right hand side of (5.2) into four parts: in magenta we collect all the contributions of negative regularity containing only various versions of \( X \) (belonging at least to \( \mathcal{C}^{-1-\kappa} \)), in orange we collect all the terms of negative regularity depending on \( \phi + \psi \) (belonging also to \( \mathcal{C}^{-1-\kappa} \)), the blue color denotes all the terms belonging locally to \( L^\infty \) and we keep the term \( \psi^3 \) separate. In particular, we write

\[
3[X^2] \succ (-X^Y + \phi + \psi) = -3[X^2] \succ X^Y + 3[X^2] \succ (\phi + \psi), \tag{5.5}
\]

\[
3[X^2] \prec (-X^Y + \phi + \psi) = -3[X^2] \prec X^Y + 3[X^2] \prec (\phi + \psi) + 3[X^2] \circ (-X^Y + \phi) + 3[X^2] \circ \psi.
\]

Now we add the last term from the right hand side of (5.4) to obtain

\[
3[X^2] \circ (-X^Y + \phi) + 3b\varphi = -3X^\psi + 3[X^2] \circ \vartheta - 9[X^2] \circ ((-X^Y + \phi + \psi) \prec X^Y) \\
+ 3b(-X^Y + \phi + \psi) \\
= -3X^\psi + 3[X^2] \circ \vartheta - 9(-X^Y + \phi + \psi)(X^Y \circ [X^2]) - 9\text{com}(-X^Y + \phi + \psi, X^Y, [X^2]) + 3b(-X^Y + \phi + \psi) \\
= -3X^\psi + 3[X^2] \circ \vartheta - 3(-X^Y + \phi + \psi)X^\psi \\
- 9\text{com}(-X^Y + \phi + \psi, X^Y, [X^2]).
\]

27
Next, we have
\[
3X(-X^Y + \phi + \psi)^2 = 3X(X^Y)^2 - 6XX^Y(\phi + \psi) + 3X(\phi + \psi)^2
\]
\[
= 3X (X^Y)^2 + 3X (Y^X)^2 + 3X \circ (X^Y)^2
\]
\[
- 6X \triangleright (X^Y(\phi + \psi)) - 6X \prec (X^Y(\phi + \psi)) - 6X \circ (X^Y(\phi + \psi))
\]
\[
+ 3X(\phi + \psi)^2,
\]
where
\[
3X \circ (X^Y)^2 = 6X \circ (X^Y \prec X^Y) + 3X \circ R_1(X^Y) = 6X^Y X^Y + 6\text{com}(X^Y, X^Y, X) + 3X \circ R_1(X^Y).
\]

Here, in view of Lemma 2.17,
\[
\|R_1(X^Y)\|_{\varphi^1 - 2\kappa(\mu^2)} = \|(X^Y)^2 - 2X^Y \prec X^Y\|_{\varphi^1 - 2\kappa(\mu^2)} \lesssim \|X^Y\|^2_{\varphi^1 - 2\kappa(\mu^2)}.
\]

Similarly we decompose
\[
6X \circ (X^Y \triangleright (\phi + \psi)) = 6(\phi + \psi)X^Y + 6\text{com}(\phi + \psi, X^Y, X),
\]
and observe that all the other terms are well-defined. Thus we obtain
\[
3X(-X^Y + \phi + \psi)^2 = 3X (X^Y)^2 + 3X \prec (X^Y)^2 + 6X^Y X^Y
\]
\[
+ 6\text{com}(X^Y, X^Y, X) + 3X \circ R_1(X^Y)
\]
\[
- 6X \triangleright (X^Y(\phi + \psi)) - 6X \prec (X^Y(\phi + \psi)) - 6X \circ (X^Y \triangleright (\phi + \psi))
\]
\[
- 6(\phi + \psi)X^Y - 6\text{com}(\phi + \psi, X^Y, X) + 3X(\phi + \psi)^2.
\]

For the remaining term in (5.4) we write
\[
(-X^Y + \phi + \psi)^3 = (-X^Y + \phi)^3 + 3(-X^Y + \phi)^2\psi + 3(-X^Y + \phi)\psi^2 + \psi^3.
\]

As the next step, we refine the above decomposition even further. To be more precise, we employ the localization operators \(\mathcal{U}_{\succ}\) and \(\mathcal{U}_{\prec}\) such that \(\mathcal{U}_{\succ} + \mathcal{U}_{\prec} = 1\) (see Section 2.3 for their construction) and carefully separate certain contributions of the orange terms above. While following the same regularity rules as above, all these terms will be written as a sum of magenta and blue terms, which will lead to our final decomposition. Namely,
\[
3\|X^2\| \triangleright (\phi + \psi) = 3\mathcal{U}_{\succ}[X^2] \triangleright (\phi + \psi) + 3\mathcal{U}_{\prec}[X^2] \triangleright (\phi + \psi)
\]
\[
3\|X^2\| \prec (\phi + \psi) = 3\mathcal{U}_{\succ}[X^2] \prec (\phi + \psi) + 3\mathcal{U}_{\prec}[X^2] \prec (\phi + \psi),
\]
\[
-3(-X^Y + \phi + \psi)X^Y = 3X^Y X^Y - 3(\phi + \psi) \prec \mathcal{U}_{\prec} X^Y
\]
\[
- 3(\phi + \psi) \prec \mathcal{U}_{\prec} X^Y - 3(\phi + \psi) \succ X^Y,
\]
\[
6X \triangleright (X^Y(\phi + \psi)) = 6\mathcal{U}_{\succ} X \triangleright (X^Y(\phi + \psi)) + 6\mathcal{U}_{\prec} X \triangleright (X^Y(\phi + \psi)),
\]
\[
(5.6)
\]
\[ 6X \prec (X^Y (\phi + \psi)) = 6\mathcal{W}_\rho X \prec (X^Y (\phi + \psi)) + 6\mathcal{W}_\xi X \prec (X^Y (\phi + \psi)), \]  
(5.7)

\[ 6(\phi + \psi)X^Y = 6(\phi + \psi) \prec \mathcal{W}_\rho X^Y + 6(\phi + \psi) \prec \mathcal{W}_\xi X^Y + 6(\phi + \psi) \triangleright X^Y, \]

\[ 3X(\phi + \psi)^2 = 3\mathcal{W}_\rho X \succ (\phi + \psi)^2 + 3\mathcal{W}_\xi X \succ (\phi + \psi)^2 + 3X \ll (\phi + \psi)^2. \]  
(5.8)

We point out that the concrete choice of the localizers \( \mathcal{W}_\rho, \mathcal{W}_\xi \) in the above changes from line to line. In particular, it will be seen below that the localization of \( X \) in (5.6), (5.7) is different from (5.8).

Now, let \( \Phi \) be the sum of all the magenta terms above and \( \Psi \) the sum of all the blue terms. We require that, separately,

\[ \mathcal{Q} \phi + \Phi = 0, \quad \mathcal{Q} \psi + \psi^3 + \Psi = 0. \]  
(5.9)

Note that in order to have the term \([X^2] \circ \vartheta \) well-defined, it is necessary that \( \vartheta \) is at least of regularity \( 1 + \alpha \) for some \( \alpha > 0 \). This will be shown below.

### 5.3 Bound for \( \phi \) in \( \mathcal{C}^\alpha(\rho) \)

At this point we only consider the equation for \( \phi \) and intend to show that it belongs to \( \mathcal{C}^\alpha(\rho) \) for some \( \alpha > 0 \). Therefore, we aim to estimate \( \Phi \) in \( \mathcal{C}^{-2+\alpha}(\rho) \). Recall that before we included the localization operators \( \mathcal{W}_\rho, \mathcal{W}_\xi \) above, all the magenta and all the orange terms were actually better, namely, of regularity at least \( -1 - \kappa \). Thanks to the operator \( \mathcal{W}_\rho \), we are able to profit from this difference of actual and wanted regularity. More precisely, we gain a small factor in all the terms in \( \Phi \) containing \( \phi + \psi \). As a consequence, a suitable choice of the sequences \((L_k)_{k \in \mathbb{N}_0}\) in the construction of \( \mathcal{W}_\rho, \mathcal{W}_\xi \), yields a bound for \( \Phi \) that only depends on the data of the problem but not on the solution.

Let \( L > 0 \) to be chosen below. First of all, we observe that all the magenta terms that do not contain \( \phi + \psi \) can be bounded in \( \mathcal{C}^{-1-\kappa}(\rho^\alpha) \). For the remaining terms, it holds

\[ \|3\mathcal{W}_\rho [X^2] \succ (\phi + \psi)\|_{\psi^{-2+\alpha}(\rho)} + \|3\mathcal{W}_\xi [X^2] \prec (\phi + \psi)\|_{\psi^{-2+\alpha}(\rho)} \]
\[ \lesssim \|\phi + \psi\|_{L^\infty(\rho)} \|\mathcal{W}_\rho [X^2]\|_{\psi^{-2+\alpha}} \lesssim 2^{-(1-\alpha-\kappa)L} \|\phi + \psi\|_{L^\infty(\rho)}, \]

hence the localizing operators are determined by

\[ \|\mathcal{W}_\rho [X^2]\|_{\psi^{-2+\alpha}} \lesssim 2^{-(1-\alpha-\kappa)L} \|[X^2]\|_{\psi^{-1-\alpha}(\rho^\alpha)}. \]  
(5.10)

Similarly,

\[ \|3(\phi + \psi) \prec \mathcal{W}_\rho X^Y\|_{\psi^{-2+\alpha}(\rho)} \lesssim \|\phi + \psi\|_{L^\infty(\rho)} \|\mathcal{W}_\rho X^Y\|_{\psi^{-2+\alpha}} \lesssim 2^{-(2-\alpha-\kappa)L/2} \|\phi + \psi\|_{L^\infty(\rho)}, \]

provided

\[ \|\mathcal{W}_\rho X^Y\|_{\psi^{-2+\alpha}} \lesssim 2^{-(2-\alpha-\kappa)L/2} \|X^Y\|_{\psi^{-\kappa}(\rho^\alpha)}, \]  
(5.11)

\[ \|6\mathcal{W}_\rho X \succ (X^Y (\phi + \psi))\|_{\psi^{-2+\alpha}(\rho)} + \|6\mathcal{W}_\xi X \prec (X^Y (\phi + \psi))\|_{\psi^{-2+\alpha}(\rho)} \]
\[ \lesssim \|\phi + \psi\|_{L^\infty(\rho)} \|\mathcal{W}_\rho X\|_{\psi^{-2+\alpha}(\rho^\alpha)} \]
\[ \lesssim 2^{- \frac{(1-\alpha-\kappa)\lambda}{2}} \|\phi + \psi\|_{L^\infty(\rho)}. \]
So we can choose \( \varepsilon \) as well as the corresponding localizers provided according to Table 2

| Object | \([X^2]\) | \(X\bar{\psi}\) | \(X\) | \(X\bar{\psi}\) | \(X\) |
|--------|-------|-------|-----|-------|-----|
| \(L\)  | \(L\)  | \(\frac{L}{2}\) | \(\frac{2L}{3}\) | \(\frac{L}{2}\) | \(\frac{4L}{3}\) |

Table 2: The value of parameter \( L \) used to construct \( \mathcal{U}_{\varepsilon}, \mathcal{W}_{\varepsilon} \).

provided

\[
\| \mathcal{W}_\varepsilon X \|_{\mathcal{C}^{-2+\alpha}(\rho^{-\alpha})} \lesssim 2^{-\left(\frac{1}{3} - \alpha - \kappa\right)\frac{3}{4}L} \| X \|_{\mathcal{C}^{-\frac{1}{3} - \alpha}(\rho^{\alpha})},
\]

(5.12)

\[
\| 6(\phi + \psi) \|_{\mathcal{C}^{-2+\alpha}(\rho)} \lesssim 6 \| \phi + \psi \|_{L^\infty(\rho)} \| \mathcal{W}_\varepsilon X \bar{\psi} \|_{\mathcal{C}^{-2+\alpha}}
\lesssim 2^{-\left(2 - \alpha - \kappa\right)L/2} \| \phi + \psi \|_{L^\infty(\rho)},
\]

provided

\[
\| \mathcal{W}_\varepsilon X \bar{\psi} \|_{\mathcal{C}^{-2+\alpha}} \lesssim 2^{-\left(2 - \alpha - \kappa\right)L/2} \| X \bar{\psi} \|_{\mathcal{C}^{-\frac{1}{3} - \alpha}(\rho^{\alpha})},
\]

(5.13)

and finally

\[
\| 3 \mathcal{W}_\varepsilon X > (\phi + \psi)^2 \|_{\mathcal{C}^{-2+\alpha}(\rho)} \lesssim \| \phi + \psi \|_{L^\infty(\rho)}^2 \| \mathcal{W}_\varepsilon X \|_{\mathcal{C}^{-2+\alpha}(\rho^{-1})}
\lesssim 2^{-\left(\frac{2}{3} - \alpha - \kappa\right)\frac{3}{4}L} \| \phi + \psi \|_{L^\infty(\rho)}^2,
\]

provided

\[
\| \mathcal{W}_\varepsilon X \|_{\mathcal{C}^{-2+\alpha}(\rho^{-1})} \lesssim 2^{-\left(\frac{2}{3} - \alpha - \kappa\right)\frac{3}{4}L} \| X \|_{\mathcal{C}^{-\frac{1}{3} - \alpha}(\rho^{\alpha})};
\]

(5.14)

In view of Lemma 2.4, once the weight \( \rho \) is fixed, the value of \( L \) completely determines how the associated localizers \( \mathcal{W}_\varepsilon \) and \( \mathcal{W}_{\varepsilon} \) are defined. The above considerations and in particular (5.10), (5.11), (5.12), (5.13), (5.14) lead us the values of \( L \) for various objects in our expansion summarized (in chronological order) in Table 2.

Collecting all the above estimates and using the Schauder estimates we deduce that

\[
\| \phi \|_{L^\infty(\rho)} \lesssim \| \phi \|_{\mathcal{C}^{-\alpha}(\rho)}
\lesssim \| \Phi \|_{\mathcal{C}^{-2+\alpha}(\rho)} \lesssim 1 + 2^{-\left(1 - \alpha - \kappa\right)L} \| \phi + \psi \|_{L^\infty(\rho)} + 2^{-\left(\frac{2}{3} - \alpha - \kappa\right)\frac{3}{4}L} \| \phi + \psi \|_{L^\infty(\rho)}^2.
\]

Consequently, in view of the embedding (2.4), whenever \( L > 0 \) is such that \( \| \phi + \psi \|_{L^\infty(\rho)} \lesssim 2^{(1 - \alpha - \kappa)L} \) it follows

\[
\| \phi \|_{L^\infty(\rho)} + \| \phi \|_{\mathcal{C}^{-\alpha}(\rho)} \lesssim 1.
\]

(5.15)

So we can choose \( L > 0 \) such that \( \| \phi + \psi \|_{L^\infty(\rho)} \lesssim 1 + \| \psi \|_{L^\infty(\rho)} \lesssim 2^{(1 - \alpha - \kappa)L} \). This value of \( L \) as well as the corresponding localizers given according to Table 2 are fixed for the rest of the proof.

5.4 Bound for \( \phi \) in \( \mathcal{C}^{-\frac{1}{3} + \alpha}(\rho^{\frac{3}{2} + \alpha}) \)

As the next step, we estimate \( \Phi \) in \( \mathcal{C}^{-\frac{1}{3} + \alpha}(\rho^{\frac{3}{2} + \alpha}) \). It will be seen below that all the terms except for the one which is quadratic in \( \phi + \psi \) can be even estimated in \( \mathcal{C}^{-\frac{2}{3} + \alpha}(\rho) \). Let \( \varepsilon \in (0, 1) \) be a generic constant whose value changes from line to line. Recall that the parameter \( L > 0 \) was
fixed in the previous section. In view of Lemma 2.4, the sequence \((L_k)_{k \in \mathbb{N}_0}\) is therefore also fixed (and possibly different for each application of the localizing operators, cf. Table 2). Accordingly, Lemma 2.4 yields

\[
\begin{align*}
\|T_{\gamma} X^2\|_{\mathcal{E}^{-1/2 + \alpha}} & \lesssim 2^{-\left(\frac{1}{2} - \alpha - \kappa\right)L} \|X^2\|_{\mathcal{E}^{-1/2 + \alpha}}, \\
\|T_{\gamma} X^\gamma\|_{\mathcal{E}^{-1/2 + \alpha}} & \lesssim 2^{-\left(\frac{1}{2} - \alpha - \kappa\right)L/2} \|X^\gamma\|_{\mathcal{E}^{-1/2 + \alpha}}, \\
\|T_{\gamma} X\|_{\mathcal{E}^{-3/2 + \alpha}} & \lesssim 2^{-\left(1 - \alpha - \kappa\right)L} \|X\|_{\mathcal{E}^{-3/2 + \alpha}}, \\
\|T_{\gamma} X^\gamma\|_{\mathcal{E}^{-3/2 + \alpha}} & \lesssim 2^{-\left(1 - \alpha - \kappa\right)L/2} \|X^\gamma\|_{\mathcal{E}^{-3/2 + \alpha}}, \\
\|T_{\gamma} X\|_{\mathcal{E}^{-5/2 + \alpha}} & \lesssim 2^{-\left(1 - \alpha - \kappa\right)L} \|X\|_{\mathcal{E}^{-5/2 + \alpha}}.
\end{align*}
\]

which implies

\[
\begin{align*}
\|\mathcal{N}(\gamma) X^2\|_{\mathcal{E}^{-1/2 + \alpha}} & \lesssim \|\mathcal{N}(\gamma) X^2\|_{\mathcal{E}^{-1/2 + \alpha}} + \|\mathcal{N}(\gamma) X^\gamma\|_{\mathcal{E}^{-1/2 + \alpha}} \\
& \lesssim \|\mathcal{N}(\gamma) X\|_{\mathcal{E}^{-3/2 + \alpha}} + \|\mathcal{N}(\gamma) X^\gamma\|_{\mathcal{E}^{-3/2 + \alpha}} \\
& \lesssim 2^{-\left(1 - \alpha - \kappa\right)L} \|X\|_{\mathcal{E}^{-3/2 + \alpha}} + \|\mathcal{N}(\gamma) X^\gamma\|_{\mathcal{E}^{-3/2 + \alpha}} \\
& \lesssim 2^{-\left(1 - \alpha - \kappa\right)L} \|\mathcal{N}(\gamma) X\|_{\mathcal{E}^{-3/2 + \alpha}} + \|\mathcal{N}(\gamma) X^\gamma\|_{\mathcal{E}^{-3/2 + \alpha}}.
\end{align*}
\]

For the last term, we note that a higher power of \(\rho\) is necessary and estimate

\[
\begin{align*}
\|\mathcal{N}(\gamma) X\|_{\mathcal{E}^{-1/2 + \alpha}} & \lesssim \|\mathcal{N}(\gamma) X\|_{\mathcal{E}^{-1/2 + \alpha}} + \|\mathcal{N}(\gamma) X^\gamma\|_{\mathcal{E}^{-1/2 + \alpha}} \\
& \lesssim 2^{-\left(1 - \alpha - \kappa\right)L} \|\mathcal{N}(\gamma) X\|_{\mathcal{E}^{-1/2 + \alpha}} + \|\mathcal{N}(\gamma) X^\gamma\|_{\mathcal{E}^{-1/2 + \alpha}}.
\end{align*}
\]

To summarize, collecting all the above estimates and using the Schauder estimates we deduce that

\[
\|\mathcal{N}(\gamma) X\|_{\mathcal{E}^{-1/2 + \alpha}} \lesssim 1 + \|\psi\|_{L^\infty(\rho)}. \tag{5.16}
\]
5.5 Bound for $\vartheta$ in $\mathscr{C}^{1+\alpha}(\rho^{2+\alpha})$

As the next step, we derive a bound for $\vartheta$ in $\mathscr{C}^{1+\alpha}(\rho^{2+\alpha})$ which will be needed in the sequel in order to control $\psi$. In view of the paracontrolled ansatz (5.3), equation (5.4) as well as the decomposition (5.9), we observe that the most irregular part of $\Phi$, namely the two magenta terms coming from (5.5), cancel out, and additionally the blue term coming from (5.5) and a commutator appear. More precisely, $\vartheta$ solves

$$\mathcal{L} \vartheta + \Theta = 0,$$

with

$$\Theta = \Phi + 3[X^2] > X^Y - 3\mathscr{W}_> [X^2] > (\phi + \psi) + 3\mathscr{W}_< [X^2] > (\phi + \psi) - 3[\mathcal{L}, (-X^Y + \phi + \psi) \prec]X^Y.$$

Next, we observe that all the remaining terms from $\Phi$ can be estimated in $\mathscr{C}^{-1+\alpha}(\rho^{2+\alpha})$. Indeed, all the terms that do not contain $\phi + \psi$ are bounded in this space and for the terms containing $\phi + \psi$, we observe that

$$\|\mathscr{W}_> [X^2]\|_{\mathscr{C}^{-1+\alpha}(\rho^{2+\alpha})} \lesssim \|\phi + \psi\|_{\mathscr{C}^{1+\alpha}(\rho^{2+\alpha})} \|\mathscr{W}_> [X^2]\|_{\mathscr{C}^{-\frac{2}{3}}(\rho^{\frac{1}{2}})},$$

and consequently

$$\|3\mathscr{W}_> [X^2] \prec (\phi + \psi)\|_{\mathscr{C}^{-1+\alpha}(\rho^{2+\alpha})} \lesssim \|\phi + \psi\|_{\mathscr{C}^{1+\alpha}(\rho^{2+\alpha})} \|\mathscr{W}_> [X^2]\|_{\mathscr{C}^{-\frac{2}{3}}(\rho^{\frac{1}{2}})} \lesssim \frac{2^{-\frac{1}{3}} L \|\phi + \psi\|_{\mathscr{C}^{1+\alpha}(\rho^{2+\alpha})}}{\|\phi + \psi\|_{\mathscr{C}^{1+\alpha}(\rho^{2+\alpha})}} \lesssim 1 + \|\phi + \psi\|_{\mathcal{L}^\infty(\rho)} + \|\phi + \psi\|_{\mathscr{C}^{1+\alpha}(\rho^{2+\alpha})}.$$
and finally
\[ \| 3 \mathcal{Z} \circ X \|_{\mathcal{E}^{-1+\alpha}(\rho^{2+\alpha})} \lesssim \| \phi + \psi \|_{L^\infty(\rho)}^2 \| \mathcal{Z} \circ X \|_{\mathcal{E}^{-1+\alpha}(\rho^{2+\alpha})} \lesssim 2^{-\left(1-\alpha-\kappa\right)\frac{1}{2}} \| \phi + \psi \|_{L^\infty(\rho)}^2 \lesssim 1 + \| \psi \|_{L^\infty(\rho)}^{1+\varepsilon}. \]

Hence, we have shown that
\[ \| \Phi + 3 \| \mathcal{X}^2 \| > \mathcal{X}^\gamma - 3 \| \mathcal{X}^2 \| > (\phi + \psi) \|_{\mathcal{E}^{-1+\alpha}(\rho^{2+\alpha})} \lesssim 1 + \| \psi \|_{L^\infty(\rho)}^{1+\varepsilon} + \| \psi \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})}. \]

Similarly,
\[ \| 3 \mathcal{Z} \circ [X^2] \|_{\mathcal{E}^{-1+\alpha}(\rho^{2+\alpha})} \lesssim \| \phi + \psi \|_{L^\infty(\rho)} \| \mathcal{Z} \circ [X^2] \|_{\mathcal{E}^{-1+\alpha}(\rho^{2+\alpha})} \lesssim 2^{(\alpha+\kappa)L}(1 + \| \psi \|_{L^\infty(\rho)}) \lesssim 1 + \| \psi \|_{L^\infty(\rho)}^{1+\varepsilon}, \]

and for the commutator, we obtain
\[ \| 3 \mathcal{Z} \circ (-X^Y + \phi + \psi) \circ [X^Y] \|_{\mathcal{E}^{-1+\alpha}(\rho^{2+\alpha})} \lesssim \| -X^Y + \phi + \psi \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})} \| X^Y \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})} \lesssim 1 + \| \phi + \psi \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})} \]
\[ \lesssim 1 + \| \psi \|_{L^\infty(\rho)} + \| \psi \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})}. \]

To summarize, we have proved that
\[ \| \phi \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})} \lesssim 1 + \| \psi \|_{L^\infty(\rho)} + \| \psi \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})}. \]

5.6 Bound for \( \psi \) in \( \mathcal{E}^{2+\gamma}(\rho^{3+\gamma}) \)

In this section we make use of the estimates (5.15), (5.16), (5.17) in order to estimate \( \psi \) in \( \mathcal{E}^{2+\gamma}(\rho^{3+\gamma}) \) for \( \gamma = \alpha - \kappa > 0 \) such that \( \gamma \leq \frac{1}{2} - 3\kappa \) (which can be achieved by a suitable choice of \( \alpha, \kappa > 0 \)). In view of (5.9) and Lemma 2.7, it is therefore necessary to estimate \( \Psi \) in \( \mathcal{E}^{\gamma}(\rho^{3+\gamma}) \). We estimate as follows
\[ \| 3[X^2] \circ \psi \|_{\mathcal{E}^{\gamma}(\rho^{3+\gamma})} \lesssim \| \psi \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})} + \| \psi \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})} \lesssim 1 + \| \psi \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})}^{1+\varepsilon} + \| \psi \|_{L^\infty(\rho)} + \| \psi \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})}, \]

and according to Lemma 2.16
\[ \| 9 \text{com}(\phi + \psi, X^Y, X^2) \|_{\mathcal{E}^{\gamma}(\rho^{3+\gamma})} \lesssim 1 + \| \phi + \psi \|_{\mathcal{E}^{1/2}(\rho^{2+\alpha})} \lesssim 1 + \| \psi \|_{L^\infty(\rho)} + \| \psi \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})}, \]
\[ \| 6 \text{com}(X^Y, X^Y, X) \|_{\mathcal{E}^{\gamma}(\rho^{3+\gamma})} \lesssim 1, \]
\[ \| 6 X \circ (\phi + \psi) \|_{\mathcal{E}^{\gamma}(\rho^{3+\gamma})} \lesssim \| \phi + \psi \|_{\mathcal{E}^{1/2}(\rho^{2+\alpha})} \lesssim \| \psi \|_{L^\infty(\rho)} + \| \psi \|_{\mathcal{E}^{1+\alpha}(\rho^{2+\alpha})}, \]
\[ \|6\text{com}(\phi + \psi, X^Y, X)\|_{\gamma(\rho^2+\gamma)} \lesssim \|\phi + \psi\|_{\epsilon \frac{1}{2} (\rho^2 + \alpha)} \lesssim \|\psi\|_{L^\infty(\rho)} + \|\psi\|_{\epsilon^1 + \alpha(\rho^2 + \alpha)}, \]

\[ \|(-X^Y + \phi)^3 + 3(-X^Y + \phi)^2 \psi + 3(-X^Y + \phi)\psi^2\|_{\gamma(\rho^2+\gamma)} \lesssim (1 + \|\psi\|_{L^\infty(\rho)})(1 + \|\psi\|_{\gamma(\rho^2+\gamma)}). \]

Next, we observe that due to our choice of \( L \) at the end of Section 5.2, it holds that

\[ 2^{(1+\gamma+\kappa)L} \simeq 1 + \|\psi\|_{\epsilon^1 + \alpha(\rho^2)}, \quad 2^{(\gamma+\kappa)L/2} \simeq 1 + \|\psi\|_{L^\infty(\rho)}, \]

\[ 2^{(\frac{1}{2} + \gamma+\kappa)^{\frac{3}{2}}L} \simeq 1 + \|\psi\|_{L^\infty(\rho)}, \quad 2^{(\frac{1}{4} + \gamma+\kappa)^{\frac{3}{4}}L} \simeq 1 + \|\psi\|_{L^\infty(\rho)} \]

for some \( \epsilon \in (0, 1) \) (whose value possibly changes from bound to bound); and in view of Table 2 we have

\[ \|\mathcal{W}_\epsilon[X^2]\|_{\gamma(\rho^2)} \lesssim 2^{(1+\gamma+\kappa)L}\|X^2\|_{\epsilon^{-1}(\rho^2)}, \]

\[ \|\mathcal{W}_\epsilon[X^Y]\|_{\gamma(\rho^2+\gamma)} \lesssim 2^{(\gamma+\kappa)L/2}\|X^Y\|_{\epsilon^{-\kappa}(\rho^2)}, \]

\[ \|\mathcal{W}_\epsilon[X]\|_{\gamma(\rho^2)} \lesssim 2^{(\frac{1}{2} + \gamma+\kappa)^{\frac{3}{2}}L}\|X\|_{\epsilon^{-\kappa}(\rho^2)}, \]

\[ \|\mathcal{W}_\epsilon[X]\|_{\gamma(\rho^2+\gamma)} \lesssim 2^{(\gamma+\kappa)L/2}\|X^Y\|_{\epsilon^{-\kappa}(\rho^2)}, \]

\[ \|3\mathcal{W}_\epsilon[X]\|_{\gamma(\rho^2+\gamma)} \lesssim 2^{(\frac{1}{4} + \gamma+\kappa)^{\frac{3}{4}}L}\|X\|_{\epsilon^{-\kappa}(\rho^2)} \]

This leads to

\[ \|3\mathcal{W}_\epsilon[X^2]\|_{\gamma(\rho^2+\gamma)} \lesssim (\phi + \psi)\|_{\gamma(\rho^2+\gamma)} \lesssim \|\phi + \psi\|_{L^\infty(\rho)}\|\mathcal{W}_\epsilon[X^2]\|_{\gamma(\rho^2+\gamma)} \lesssim 2^{(1+\gamma+\kappa)L}\|\phi + \psi\|_{L^\infty(\rho)} \lesssim 1 + \|\psi\|_{L^\infty(\rho)}^{\frac{1+\epsilon}{\gamma+\kappa}}(1 + \|\psi\|_{\gamma(\rho^2+\gamma)}), \]

\[ \|3\mathcal{W}_\epsilon[X^2]\|_{\gamma(\rho^2+\gamma)} \lesssim (\phi + \psi)\|_{\gamma(\rho^2+\gamma)} \lesssim \|\phi + \psi\|_{L^\infty(\rho)}\|\mathcal{W}_\epsilon[X^Y]\|_{\gamma(\rho^2+\gamma)} \lesssim 2^{(\gamma+\kappa)L/2}\|\phi + \psi\|_{L^\infty(\rho)} \lesssim 1 + \|\psi\|_{L^\infty(\rho)}^{\frac{1+\epsilon}{\gamma+\kappa}}\|\psi\|_{\gamma(\rho^2+\gamma)}, \]

\[ \|3(\phi + \psi)\|_{\gamma(\rho^2+\gamma)} \lesssim \|\phi + \psi\|_{L^\infty(\rho)}\|\mathcal{W}_\epsilon[X^Y]\|_{\gamma(\rho^2+\gamma)} \lesssim 2^{(\gamma+\kappa)L/2}\|\phi + \psi\|_{L^\infty(\rho)} \lesssim 1 + \|\psi\|_{L^\infty(\rho)}^{\frac{1+\epsilon}{\gamma+\kappa}}. \]

\[ \|3(\phi + \psi)\|_{\gamma(\rho^2+\gamma)} \lesssim \|\phi + \psi\|_{\epsilon^1(\rho^2+\gamma)} \lesssim 1 + \|\psi\|_{\epsilon^1 + \alpha(\rho^2 + \alpha)}, \]

34
\[ \|6 \mathcal{U}_\varepsilon X \succ (X^\varepsilon (\phi + \psi))\|_{\varepsilon, (\rho^2 + \gamma)} \lesssim \|\phi + \psi\|_{L^\infty (\rho)} \|\mathcal{U}_\varepsilon X\|_{\varepsilon, \gamma (\rho^2)} \lesssim 2^{(\frac{1}{2} + \gamma + \kappa)} \|\phi + \psi\|_{L^\infty (\rho)} \lesssim 1 + \|\psi\|^1_{L^\infty (\rho)} , \]

\[ \|6 \mathcal{U}_\varepsilon X \prec (X^\varepsilon (\phi + \psi))\|_{\varepsilon, (\rho^2 + \gamma)} \lesssim \|\mathcal{U}_\varepsilon X\|_{\varepsilon, \gamma (\rho^2 + \gamma + \kappa)} \|\phi + \psi\|_{L^\infty (\rho)} \lesssim (\gamma + \kappa) \|\phi + \psi\|_{L^\infty (\rho)} \lesssim 1 + \|\psi\|^1_{L^\infty (\rho)} , \]

\[ \|6 (\phi + \psi) \prec X^\varepsilon \|_{\varepsilon, (\rho^2 + \gamma)} \lesssim \|\phi + \psi\|_{L^\infty (\rho)} \|X^\varepsilon\|_{\varepsilon, \gamma (\rho^2 + \gamma)} \lesssim (\gamma + \kappa) \|\phi + \psi\|_{L^\infty (\rho)} \lesssim 1 + \|\psi\|^1_{L^\infty (\rho)} , \]

and finally

\[ \|3 (\phi + \psi)^2 \|_{\varepsilon, (\rho^2 + \gamma)} \lesssim \|\phi + \psi\|^2_{L^\infty (\rho)} \|X^\varepsilon\|_{\varepsilon, \gamma (\rho^2 + \gamma)} \lesssim (\gamma + \kappa) \|\phi + \psi\|_{L^\infty (\rho)} \|\phi + \psi\|^2_{L^\infty (\rho)} \lesssim 1 + \|\psi\|^2_{L^\infty (\rho)} \]

To summarize, we have shown that

\[ \|\Psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} \lesssim 1 + \|\psi\|_{L^\infty (\rho)} + \|\psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} + \|\psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} + \|\psi\|_{L^\infty (\rho)} + \|\psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} + \|\psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} \]

Due to interpolation from Lemma 2.2 we estimate

\[ \|\psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} \lesssim \|\psi\|_{L^\infty (\rho)} + \|\psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} \]

\[ \|\psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} \lesssim \|\psi\|_{L^\infty (\rho)} + \|\psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} \]

\[ \|\psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} \lesssim \|\psi\|_{L^\infty (\rho)} + \|\psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} \]

therefore, Lemma 2.7 together with the weighted Young inequality implies

\[ \|\psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} \lesssim \|\Psi\|_{\varepsilon, \gamma (\rho^2 + \gamma)} + \|\psi\|_{L^\infty (\rho)} \lesssim 1 + \|\psi\|_{L^\infty (\rho)} \]

(5.18)
5.7 Bound for $\psi$ in $L^\infty(\rho)$

As the next step, towards the application of Lemma 2.8, it is necessary to estimate $\Psi$ in $L^\infty(\rho^3)$. We observe that for most of the terms we may use the estimates above, only the cubic term is estimated as follows

$$\|(-X^\phi + \phi)^3 + 3(-X^\phi + \phi)^2\psi + 3(-X^\phi + \phi)\psi^2\|_{L^\infty(\rho^3)} \lesssim 1 + \|\psi\|^2_{L^\infty(\rho)},$$

and we may also improve the bound

$$\|3\mathcal{H}_L[X^2] \lesssim (\phi + \psi)\|_{L^\infty(\rho^3)} \lesssim \|\phi + \psi\|_{L^\infty(\rho)}\|\mathcal{H}_L[X^2]\|_{L^\infty(\rho^3)} \lesssim 2^{(1+\gamma+\kappa)\rho} \|\phi + \psi\|_{L^\infty(\rho)} \lesssim 1 + \|\psi\|^{2+\varepsilon}_{L^\infty(\rho)}.$$ 

Therefore, we deduce

$$\|\Psi\|_{L^\infty(\rho^3)} \lesssim 1 + \|\psi\|^{1+\alpha(\rho^2+\alpha)}_{L^\infty(\rho)} + \|\psi\|^{\frac{\gamma}{2}+(\rho^2+\alpha)}_{L^\infty(\rho)}$$

and applying again the interpolation from Lemma 2.2 together with (5.18) leads to

$$\|\Psi\|_{L^\infty(\rho^3)} \lesssim 1 + \|\psi\|^{2+\varepsilon}_{L^\infty(\rho)}.$$ 

Finally, according to Lemma 2.8 and weighted Young inequality we conclude

$$\|\psi\|_{L^\infty(\rho)} \lesssim 1 + \|\Psi\|^{1/3}_{L^\infty(\rho)} \lesssim 1 + \|\psi\|^{1+\kappa}_{L^\infty(\rho)} \lesssim 1,$$

and the proof is complete.

5.8 Existence

The construction of a solution proceeds similarly to Section 4.3. More precisely, we first consider the problem on a large torus of size $M$ and establish existence based on Schaefer’s fixed point theorem [Eva10, Section 9.2.2, Theorem 4]. Then we make use of the a priori estimates from Sections 5.3, 5.4, 5.5, 5.7, 5.7 together with Theorem 3.2 and a compactness argument to pass to the limit as $M \to \infty$.

Recall that in view of the computations in Sections 5.1, 5.2, system (1.1) in dimension 5 reduces to equations (5.9), (5.3).

**Theorem 5.1** Let $\kappa, \alpha \in (0, 1)$ be chosen sufficiently small and let $\gamma = \alpha - \kappa > 0$. There exists

$$(\phi, \psi) \in \mathcal{C}^{\frac{1}{2}+\alpha}(\rho^{3+\alpha}) \cap \mathcal{C}^\alpha(\rho) \times \mathcal{C}^{2+\gamma}(\rho^{3+\gamma}) \cap L^\infty(\rho)$$

which is a solution to (5.9), (5.3) on $\mathbb{R}^5$.

**Proof** Step 1 – existence on a large torus: Similarly to the proof of Theorem 4.2, we define a fixed point map

$$\mathcal{K} : \mathcal{C}^{\frac{1}{2}+\beta}(T^5_M) \times \mathcal{C}^{1+\beta}(T^5_M) \to \mathcal{C}^{\frac{1}{2}+\beta}(T^5_M) \times \mathcal{C}^{1+\beta}(T^5_M)$$
for a small parameter $\beta \in (0,1)$ as follows: given

$$(\tilde{\varphi}, \tilde{\psi}) \in \mathcal{C}^{\frac{1}{2}+\beta}(\mathbb{T}_N^5) \times \mathcal{C}^{1+\beta}(\mathbb{T}_N^5),$$

let $K(\tilde{\varphi}, \tilde{\psi}) = (\varphi, \psi)$ be a solution to

$$\mathcal{D} \varphi + \Phi(\tilde{\varphi}, \tilde{\psi}) = 0, \quad \mathcal{D} \psi + \psi^3 + \Psi(\tilde{\varphi}, \tilde{\psi}) = 0, \quad (5.19)$$

where $\Phi(\tilde{\varphi}, \tilde{\psi})$ and $\Psi(\tilde{\varphi}, \tilde{\psi})$ contain all the magenta and blue terms from Section 5.2, respectively, with $\phi, \psi$ replaced by $\tilde{\phi}, \tilde{\psi}$.

The first equation in (5.19) always has a (unique) solution $\phi$ which belongs to $\mathcal{C}^\alpha(\mathbb{T}_N^5)$ due to the bounds in Section 5.3. Moreover, Section 5.4 shows that $\phi \in \mathcal{C}^{\frac{1}{2}+\alpha}(\mathbb{T}_N^5)$ and we may choose $\alpha > \beta$. Furthermore, similarly to (5.3) we denote

$$\vartheta := \phi + 3(-\frac{X^Y}{M^2} + \tilde{\phi} + \tilde{\psi}) < X^Y$$

and observe that due to Section 5.5 and Section 5.6 (performed on $\mathbb{T}_N^5$) the right hand side $\Psi(\tilde{\varphi}, \tilde{\psi})$ belongs to $\mathcal{C}^\gamma(\mathbb{T}_N^5)$ provided $(\tilde{\varphi}, \tilde{\psi}) \in \mathcal{C}^{\frac{1}{2}+\beta}(\mathbb{T}_N^5) \times \mathcal{C}^{1+\beta}(\mathbb{T}_N^5)$ and $\gamma = \beta - \kappa$, $\gamma \leq \frac{1}{2} - 3\kappa$. Hence Proposition A.1 implies existence of a unique classical solution to the second equation in (5.19). Hence the map $K$ is well-defined.

Next, we deduce that the map $K$ has a fixed point $(\phi, \psi) \in \mathcal{C}^{\frac{1}{2}+\alpha}(\mathbb{T}_N^5) \times \mathcal{C}^{2+\gamma}(\mathbb{T}_N^5)$ for $\alpha = \beta + \kappa$ and $\gamma = \beta - \kappa$. More precisely, the proof follows the lines of Proposition 4.1 and employs the estimates from Section 5.4, Section 5.5 and Section 5.6. The proof of existence on $\mathbb{T}_N^5$ is therefore complete.

**Step 2 – existence on the full space:** For $M \in \mathbb{N}$ let $(\phi_M, \psi_M)$ denote the solution to (5.9), (5.3) on $\mathbb{T}_N^5$ constructed above. Then the a priori estimates from Section 4.2 apply and, in view of Theorem 3.1, we conclude that the approximate solutions $(\phi_M, \psi_M)$ are bounded uniformly in $M$ in

$$[\mathcal{C}^{\frac{1}{2}+\alpha}(\rho^{2+\alpha}) \cap \mathcal{C}^\alpha(\rho)] \times [\mathcal{C}^{2+\gamma}(\rho^{3+\gamma}) \cap L^\infty(\rho)]$$

whenever $\rho$ is a polynomial bound. Due to (2.4), this space is compactly embedded into $\mathcal{C}^{\frac{1}{2}+\alpha'}(\rho^{2+\alpha''}) \times \mathcal{C}^{2+\gamma'}(\rho^{3+\gamma''})$ provided $\alpha' < \alpha < \alpha''$ and $\gamma' < \gamma < \gamma''$. Therefore, there exists a subsequence, still denoted $(\phi_M, \psi_M)$ which converges in $\mathcal{C}^{\frac{1}{2}+\alpha'}(\rho^{2+\alpha''}) \times \mathcal{C}^{2+\gamma'}(\rho^{3+\gamma''})$ to certain

$$(\phi, \psi) \in [\mathcal{C}^{\frac{1}{2}+\alpha}(\rho^{2+\alpha}) \cap \mathcal{C}^\alpha(\rho)] \times [\mathcal{C}^{2+\gamma}(\rho^{3+\gamma}) \cap L^\infty(\rho)].$$

Passing to the limit in (5.9), (5.3) concludes the proof of existence on the full space.

### 6 Parabolic $\Phi^4$ model

The analysis of the parabolic $\Phi^4$ model on $\mathbb{R}^2$, that is,

$$\partial_t \varphi + (-\Delta + \mu)\varphi + \varphi^3 - 3\alpha \varphi - \xi = 0, \quad \varphi(0) = \varphi_0, \quad (6.1)$$

where $\xi$ is a space-time white noise, is very similar to the elliptic $\Phi^4$ model on $\mathbb{R}^4$. Indeed, the regularity of the space white noise in dimension 4 is the same as the regularity of the space-time white noise in dimension 2. Without loss of generality we assume that the mass $\mu$ is strictly positive (otherwise we add a linear term with positive mass to both sides of (6.1) and consider
the original massive term as a right hand side, see Remark 2.9). Then we proceed as in Section 4, let \((-\Delta + \mu) = \mathcal{D}\) and \(\mathcal{L} = \partial_t + \mathcal{D}\) and introduce the ansatz

\[ \varphi = X + \phi + \psi, \]

with \(\mathcal{L}X = \xi, \quad [X^3] := X^3 - 3aX, \quad [X^2] := X^2 - a.\)

Recall that \(X\) is chosen stationary. This leads us to the system of equations

\[ \mathcal{L}\phi + \Phi = 0, \quad \phi(0) = \phi_0, \quad \mathcal{L}\psi + \psi^3 + \Psi = 0, \quad \psi(0) = 0, \quad (6.2) \]

where \(\varphi_0 \in \mathcal{C}^\alpha(\rho_0)\); and \(\Phi\) and \(\Psi\) are given as in (4.2) but employing the parabolic localizers \(\mathcal{V}_\theta, \mathcal{V}_\xi\) instead of \(\mathcal{W}_\theta, \mathcal{W}_\xi\).

The existence of a solution can now be proved by choosing a smooth and space periodic approximation \(\xi_\varepsilon\) of the driving space-time white noise \(\xi\), defined on the torus of size \(\frac{1}{\varepsilon}\) and solving (6.1) on the approximate level with the associated renormalization constant \(a_\varepsilon\). Subsequently, we may pass to the limit using the above uniform estimates together with compactness. To be more precise, let \(\xi_\varepsilon\) be a periodic version of a space-time mollification of \(\xi\) defined on \([0, \infty) \times \mathbb{T}^d_{1/\varepsilon}\) and define \(X_\varepsilon\) as the stationary solution to

\[ \mathcal{L}X_\varepsilon = \xi_\varepsilon. \]

The other stochastic objects were defined in Theorem 3.3. Throughout this section, \(\rho\) denotes a polynomial space-time weight.

Let \(\varphi_{\varepsilon,0}\) be a mollification of the initial condition \(\varphi_0\). Then according to Proposition A.2, for every \(\varepsilon \in (0, 1)\) there exists \(\varphi_{\varepsilon} \in \mathcal{C}^\infty([0, \infty) \times \mathbb{T}^d_{1/\varepsilon})\) which is the unique classical solution to

\[ \mathcal{L}\varphi_\varepsilon + \varphi_\varepsilon^3 - 3a_\varepsilon \varphi_\varepsilon - \xi_\varepsilon = 0, \quad \varphi(0) = \varphi_{\varepsilon,0}. \]

As the next step, we proceed with the same decomposition \(\varphi_\varepsilon = X_\varepsilon + \phi_\varepsilon + \psi_\varepsilon\) as above, only starting from the mollified version \(\xi_\varepsilon\) instead of from \(\xi\). According to Corollary A.3 it holds for every \(\varepsilon \in (0, 1)\) that \(\varphi_\varepsilon \in \mathcal{C}\mathcal{C}^{\varepsilon,2+\kappa}((\rho^{3+\kappa}) \cap \mathcal{C}^1 L^\infty(\rho^{3+\kappa}) \cap \mathcal{L}^\infty L^\infty(\rho))\) and the same regularity holds for \(\phi_\varepsilon, \psi_\varepsilon\). Hence we follow the lines of Section 4.2 and employ Lemmas 2.3, 2.6, 2.10, 2.11, 2.12, in order to deduce that the following bound holds true uniformly in \(\varepsilon \in (0, 1)\)

\[ \|\phi_\varepsilon\|_{\mathcal{C}\mathcal{C}^{\varepsilon,\alpha}(\rho)} + \|\phi_\varepsilon\|_{\mathcal{C}\mathcal{C}^{\varepsilon,2} L^\infty(\rho)} + \|\psi_\varepsilon\|_{\mathcal{C}\mathcal{C}^{\varepsilon,2+\beta}(\rho^{3+\beta})} + \|\psi_\varepsilon\|_{\mathcal{C}^{1} L^\infty(\rho^{3+\beta})} + \|\psi_\varepsilon\|_{L^\infty L^\infty(\rho)} \lesssim 1. \quad (6.3) \]

Based on this uniform bound we are able to pass to the limit.

**Theorem 6.1** Let \(\kappa, \alpha \in (0, 1)\) be chosen sufficiently small and let \(\beta = \alpha - \kappa > 0\). If \(\varphi_0 \in \mathcal{C}\mathcal{C}^{\alpha}(\rho_0)\) then there exists

\[ (\phi, \psi) \in [\mathcal{C}\mathcal{C}^{\alpha}(\rho) \cap \mathcal{C}^{\alpha/2} L^\infty(\rho)] \times [\mathcal{C}\mathcal{C}^{2+\beta}(\rho^{3+\beta}) \cap \mathcal{C}^{1} L^\infty(\rho^{3+\beta}) \cap \mathcal{L}^\infty L^\infty(\rho)] \]

which is a solution to (6.2).

**Proof** Due to (6.3), the approximate solutions \((\phi_\varepsilon, \psi_\varepsilon)\) are bounded uniformly in \(\varepsilon \in (0, 1)\) in

\[ [\mathcal{C}\mathcal{C}^{\alpha}(\rho) \cap \mathcal{C}^{\alpha/2} L^\infty(\rho)] \times [\mathcal{C}\mathcal{C}^{2+\beta}(\rho^{3+\beta}) \cap \mathcal{C}^{1} L^\infty(\rho^{3+\beta}) \cap \mathcal{L}^\infty L^\infty(\rho)] \]

38
whenever \( \rho \) is a polynomial bound. Due to (2.4), Arzelà-Ascoli and Aubin-Lions-type argument (see [Sim87, Lemma 1, Theorem 5]) this space is compactly embedded into

\[
[C_{loc} C^\alpha C^{(\alpha-1)/2} C^{-\gamma}] \times [C_{loc} C^{2+\beta-\varepsilon} C^{-\gamma}] 
\]

provided \( \varepsilon \in (0, \alpha \wedge \beta \wedge 1) \) and \( \gamma, \delta \in (0, 1) \) are chosen small. Therefore, there exists a subsequence, still denoted \( (\phi, \psi) \) which converges in this space to certain \( (\bar{\phi}, \bar{\psi}) \) and we intend to pass to the limit in (6.2).

To this end, we fix \( T > 0 \). Note that due to Theorem 3.3, the linearity of the localizers \( \varphi \geq 0 \) and Lemma 2.6 it follows that

\[
\begin{align*}
\varphi_\varepsilon X_\varepsilon &\to \varphi_\varepsilon X \quad \text{in} \quad C_T C^\alpha C^{(\alpha-1)/2} C^{-\gamma}, \\
\varphi_\varepsilon [X_\varepsilon^2] &\to \varphi_\varepsilon [X_\varepsilon^2] \quad \text{in} \quad C_T C^{2+\beta-\varepsilon} C^{-\gamma}.
\end{align*}
\]

Note that we employed the same spaces as for the a priori estimates in Section 4.2. As a consequence and in view of the estimates from Section 4.2, we observe that there exists \( K \) such that

\[
\Phi_\varepsilon \to \Phi \quad \text{in} \quad C_T C^{\alpha-2-\varepsilon} C^{(\alpha-1)/2} C^{-\gamma} K, \\
\Psi_\varepsilon \to \Psi \quad \text{in} \quad C_T C^{\beta-\varepsilon} C^{(\alpha-1)/2} C^{-\gamma} K,
\]

where \( \Phi, \Psi \) are defined as in (4.2). The constant \( K > 0 \) needs to be chosen sufficiently large in order to compensate for the lack of convergence of \( \phi_\varepsilon \) and \( \psi_\varepsilon \) in \( C_T L^\infty (\rho) \), which has to be replaced by \( C_T L^\infty (\rho^{1+\varepsilon}) \) and \( C_T L^\infty (\rho^{3+\beta+\varepsilon}) \), respectively. Passing to the limit in the remaining terms in (6.2) is straightforward, and therefore, the couple \( (\phi, \psi) \) solves (6.2), which is understood in distributional sense.

It remains to show that

\[
(\phi, \psi) \in [C_C^\alpha (\rho) \cap C^{\alpha/2} L^\infty (\rho)] \times [C_C^{2+\beta} (\rho^{3+\beta}) \cap C^1 L^\infty (\rho^{3+\beta}) \cap L^\infty L^\infty (\rho)].
\]

To this end, we observe that according to the above convergence \( (\phi_\varepsilon, \psi_\varepsilon) \to (\phi, \psi) \) it follows that \( \Delta_i \phi_\varepsilon (t, x) \to \Delta_i \phi (t, x) \) and \( \Delta_i \psi_\varepsilon (t, x) \to \Delta_i \psi (t, x) \) for every \( i \geq -1 \) and almost every \( (t, x) \in [0, \infty) \times \mathbb{R}^2 \). In addition, the Littlewood–Paley blocks \( \Delta_i \phi_\varepsilon, \Delta_i \psi_\varepsilon \) satisfy the uniform bounds (even uniform in \( \varepsilon, i \) and \( t \))

\[
\| p_i \Delta_i \phi_\varepsilon (t) \|_{L^\infty} \lesssim 1, \quad \| p_i \Delta_i \psi_\varepsilon (t) \|_{L^\infty} \lesssim 1.
\]

Consequently, \( p_i \Delta_i \phi_\varepsilon (t) \to p_i \Delta_i \phi (t) \) and \( p_i \Delta_i \psi_\varepsilon (t) \to p_i \Delta_i \psi (t) \) weak-star in \( L^\infty (\mathbb{R}^2) \) for every \( i \geq -1 \) and almost every \( t \in [0, \infty) \). Since the \( L^\infty \)-norm is weak-star lower semicontinuous, we obtain

\[
\| p_i \Delta_i \phi (t) \|_{L^\infty} \leq \liminf_{\varepsilon \to 0} \| p_i \Delta_i \phi_\varepsilon (t) \|_{L^\infty} \leq \liminf_{\varepsilon \to 0} \| p_i \phi \|_{C_T C^{\alpha} (\rho)} 2^{-i\alpha} \lesssim 2^{-i\alpha},
\]

\[
\| p_i \Delta_i \psi (t) \|_{L^\infty} \leq \liminf_{\varepsilon \to 0} \| p_i \Delta_i \psi_\varepsilon (t) \|_{L^\infty} \leq \liminf_{\varepsilon \to 0} \| \psi \|_{C_T L^\infty (\rho)} \lesssim 1,
\]

and by the same argument

\[
\| p_i^{3+\beta} \Delta_i \psi (t) \|_{L^\infty} \leq \liminf_{\varepsilon \to 0} \| p_i^{3+\beta} \Delta_i \psi_\varepsilon (t) \|_{L^\infty} \leq \liminf_{\varepsilon \to 0} \| \psi (t) \|_{C_T C^{2+\beta} (\rho^{3+\beta})} \lesssim 2^{-i(2+\beta)}.
\]

This implies that

\[
(\phi, \psi) \in L^\infty C^{\alpha} (\rho) \times [L^\infty C^{2+\beta} (\rho^{3+\beta}) \cap L^\infty L^\infty (\rho)].
\]

39
Now, using the convergence \((\phi_\varepsilon, \psi_\varepsilon) \to (\phi, \psi)\) in \(C^{\alpha/2}_{\text{loc}} L^\infty(\rho) \times C^1_{\text{loc}} L^\infty(\rho)\) we obtain
\[
\|\phi(t) - \phi(s)\|_{L^\infty(\rho)} = \lim_{\varepsilon \to 0} \|\phi_\varepsilon(t) - \phi_\varepsilon(s)\|_{L^\infty(\rho)} \leq \lim_{\varepsilon \to 0} \|\phi_\varepsilon\|_{C^{\alpha/2}_{\text{loc}} L^\infty(\rho)}|t - s|^{\alpha/2} \lesssim |t - s|^{\alpha/2}
\]
and similarly for the norm of \(\psi\) in \(C^{\alpha/2}_{\text{loc}} L^\infty(\rho^{3+\beta})\). Hence
\[
(\phi, \psi) \in C^{\alpha/2}_{T} L^\infty(\rho^{3+\beta}) \times C^1_{T} L^\infty(\rho^{3+\beta}).
\]
Now, we apply the Schauder estimates for both \(\phi\) and \(\psi\) (i.e. Lemma 2.10 and Lemma 2.11) to obtain continuity in time, namely,
\[
(\phi, \psi) \in C_T G^\alpha(\rho) \times C_T G^{2+\beta}(\rho^{3+\beta}).
\]
The proof is complete. \(\square\)

7 Parabolic \(\Phi^4_3\) model

We proceed by similar arguments as in the elliptic \(\Phi^4_5\) model discussed in Section 5. More precisely, we intend to study the parabolic equation
\[
\partial_t \varphi + (-\Delta + \mu) \varphi + \varphi^3 + (-3a + 3b) \varphi - \xi = 0, \quad \varphi(0) = \varphi_0, \quad (7.1)
\]
in \(\mathbb{R}^3\) where \(\xi\) is a space-time white noise, \(a, b\) stand for renormalization constants. We recall that according to Theorem 3.4 the renormalization constant \(b\) depends on time and is bounded. Without loss of generality we assume \(\mu > 0\) (see Remark 2.9).

While the existence of solutions to the parabolic \(\Phi^4\) model in dimension 2 was a more or less straightforward consequence of the elliptic a priori estimates for the \(\Phi^4_5\) model from Section 4.2, the situation is more involved in dimension 3, which will be seen in the sequel. To be more precise, we let \((-\Delta + \mu) = \mathcal{L}\) and \(\mathcal{L} = \partial_t + \mathcal{L}\) and we introduce the ansatz
\[
\varphi = X - X^Y + \phi + \psi
\]
with \(X\) being stationary and
\[
\mathcal{L} X = \xi, \quad [X^2] := X^2 - a, \quad [X^3] := X^3 - 3aX,
\]
\[
\mathcal{L} X^Y = [X^3], \quad X^Y(0) = 0, \quad \mathcal{L} X^Y = [X^2], \quad X^Y(0) = 0,
\]
\[
X^Y = X^Y \circ X, \quad X^Y = X^Y \circ [X^2] - \frac{b}{3}, \quad X^Y = X^Y \circ [X^2] - bX.
\]
Thus, the left hand side of (7.1) rewrites as
\[
\mathcal{L} \varphi + \varphi^3 + (-3a + 3b) \varphi - \xi = \mathcal{L} \phi + \mathcal{L} \psi + 3[X^2](X^Y + \phi + \psi) + 3X(X^Y + \phi + \psi)^2 + (-X^Y + \phi + \psi)^3 + 3b \varphi.
\]

In Section 6 we were able to apply the elliptic a priori estimates pointwise in time. In view of the decomposition of the elliptic \(\Phi^4_5\) model, this is no longer possible here. The difficulty arises in the paracontrolled ansatz similar to (5.3) and the associated commutator as in (5.4). Indeed,
since the differential operator in (7.1) includes also time derivative, we require sufficient time regularity in order to control the commutator. To this end, we make use of the time-mollified paraproduct, introduced in Section 2.8, and apply Lemma 2.18. More precisely, we assume that ϕ is paraccontrolled by $X^Y$, namely, it holds

$$\phi = \vartheta - 3(-X^Y + \phi + \psi) \prec X^Y$$

(7.2)

for some $\vartheta$ which is more regular (we will see below that $\vartheta$ has the regularity $1 + \alpha$).

Furthermore, it can be seen in Lemma 2.11 that the expected time regularity for $\psi$ is not optimal. Indeed, we cannot go beyond $C^1$ with respect to time, which would be natural for taking the full advantage of the interpolation (in time) from Lemma 2.3 and mimicking the strategy of Section 5. Therefore, the terms requiring time regularity of $\phi + \psi$ has to be treated differently. To this end, it is necessary to consider a higher power of the weight $C$ in the bounds for $\vartheta$, which will help us compensate for sub-optimal time interpolation. Therefore, we aim at estimating $\vartheta$ in $C^\epsilon^{1+\alpha}(\rho^{3+\gamma})$ where $0 < \gamma' < \gamma$. This issue will become even more challenging in the coming down from infinity in Section 9, where no time interpolation is available.

With (7.2) at hand, (7.1) rewrites as

$$0 = \mathcal{L}\vartheta + \mathcal{L}\psi - 3\left(\left(-X^Y + \phi + \psi\right) \prec \left[X^2\right] - (-X^Y + \phi + \psi) \prec \left[X^2\right]\right)$$

$$+ 3\left[X^2\right] \prec \left(-X^Y + \phi + \psi\right) - 3\left[\mathcal{L}, (-X^Y + \phi + \psi) \prec X^Y\right]$$

$$+ 3X(-X^Y + \phi + \psi)^2 + (-X^Y + \phi + \psi)^3 + 3b\varphi.$$  

(7.3)

Next, we proceed with the same decomposition into regular (blue) and irregular (magenta) part as in Section 5.2. It leads to

$$\mathcal{L}\phi + \Phi = 0, \quad \phi(0) = \phi_0 = \varphi_0,$$

$$\mathcal{L}\psi + \psi^3 + \tilde{\Psi} = 0, \quad \psi(0) = 0,$$  

(7.4)

where

$$\tilde{\Psi} := \Psi - 9\left[X^2\right] \circ \left(-X^Y + \phi + \psi\right) \prec X^Y - (-X^Y + \phi + \psi) \prec X^Y,$$  

(7.5)

and $\Phi, \Psi$ are given exactly as in Section 5 with the same bounds applied pointwise in time, and $\varphi_0 \in C^{1+\alpha}(\rho^{3+\gamma})$ for some $\gamma' \in (0, \gamma)$ to be chosen below (the role of the parameter $\gamma$ is the same as in Section 5, in particular, $\gamma = \alpha - \kappa$). The additional commutator in (7.5) is bounded as

$$\|9\left[X^2\right] \circ \left(-X^Y + \phi + \psi\right) \prec X^Y - (-X^Y + \phi + \psi) \prec X^Y\|_{C^{\epsilon_{\gamma}(\rho^{3+\gamma})}}$$

$$\lesssim \|\left[X^2\right]\|_{C^{\epsilon(\rho^{3+\gamma})}} \|X^Y + \phi + \psi\|_{C^{\alpha\kappa/2L^{\infty}(\rho^{3+\gamma})}} \|X^Y\|_{C^{\epsilon_{\gamma}(\rho^{3+\gamma})}}$$

$$\lesssim 1 + \|\phi + \psi\|_{C^{\alpha\kappa/2L^{\infty}(\rho^{3+\gamma})}}.$$  

The equation for $\vartheta$ now reads as

$$\mathcal{L}\vartheta + \Theta = 0, \quad \vartheta(0) = \varphi_0,$$

with

$$\Theta = \Phi + 3\left[X^2\right] \succ X^Y - 3\gamma'\left[X^2\right] \succ (\phi + \psi) + 3\gamma'\left[X^2\right] \succ (\phi + \psi)$$

$$- 3\left((-X^Y + \phi + \psi) \prec \left[X^2\right] - (-X^Y + \phi + \psi) \prec \left[X^2\right]\right) - 3[\mathcal{L}, (-X^Y + \phi + \psi) \prec X^Y].$$  

41
Here the two new terms are estimated using Lemma 2.18 as follows

\[ 3 \| (-X^Y +\phi + \psi) - (-X^Y +\phi + \psi) \|_{C^\alpha(-1+a)(\rho^3)} \lesssim \| -X^Y +\phi + \psi \|_{C^{(\alpha+a)/2}L^\infty(\rho^3)} \| X^2 \|_{C^\alpha(-1+a)(\rho^3)} \lesssim 1 + \| \phi + \psi \|_{C^{(\alpha+a)/2}L^\infty(\rho^3)}, \]

\[ 3 \| [\mathcal{L}, (-X^Y +\phi + \psi)] \|_{C^\alpha(-1+a)(\rho^3)} \lesssim \left( \| -X^Y +\phi + \psi \|_{C^{(\alpha+a)/2}L^\infty(\rho^3)} + \| -X^Y +\phi + \psi \|_{C^{(\alpha+a)/2}L^\infty(\rho^3)} \right) \| X^Y \|_{C^\alpha(-1+a)(\rho^3)} \lesssim 1 + \| \phi + \psi \|_{C^{(\alpha+a)/2}L^\infty(\rho^3)} + \| \phi + \psi \|_{C^{(\alpha+a)/2}L^\infty(\rho^3)} \lesssim 1 + \| \phi + \psi \|_{C^{(\alpha+a)/2}L^\infty(\rho^3)} \lesssim 1 + \| \phi + \psi \|_{C^{(\alpha+a)/2}L^\infty(\rho^3)} \]

where \( 0 < \gamma'' < \gamma' \) and we chose \( \alpha \) and \( \kappa \) sufficiently small such that \( \alpha + \kappa < \delta \) for \( \delta \) from Theorem 3.4. All the other terms in \( \Theta \) can be estimated pointwise in time by the same approach as in Section 5.5. Therefore, it only remains to bound the time regularity of \( \phi + \psi \). Choosing \( \gamma'' \) sufficiently large and using Lemma 2.3, we obtain for \( \lambda \in (0,1) \)

\[ \| \phi + \psi \|_{C^{(\alpha+a)/2}L^\infty(\rho^3)} \lesssim \| \phi + \psi \|_{L^\infty(L^\infty(\rho^3)\|C^{(\lambda+a)/2}L^\infty(\rho^3)\}) \| \phi + \psi \|_{C^{(\lambda+a)/2}L^\infty(\rho^3)} \| \lambda \|_{C^1(L^\infty(\rho^3))}. \]

Observe that the small parameter \( \lambda \) is only needed in order to absorb the \( C^1 \)-norm of \( \psi \) into the left hand side. And the same bound holds true for \( \phi + \psi \in C^{(\alpha+a)/2}L^\infty(\rho^3) \) needed to estimate the additional term in \( \Psi \). This is sufficient in order to obtain the desired uniform bounds for \( \phi, \vartheta, \psi \).

To be more precise, as in the case of the parabolic \( \Phi^3 \) model in dimension 2, we show existence via a smooth approximation and compactness. To this end, let \( \xi_\varepsilon \) be a smooth and periodic approximation of the driving space-time white noise \( \xi \), defined on the torus of size \( \frac{1}{\varepsilon} \). If \( \varphi_{\varepsilon,0} \) is a smooth approximation of the initial condition \( \varphi_0 \), then according to Proposition A.2, for every \( \varepsilon \in (0,1) \) there exists \( \varphi_{\varepsilon} \in C^\infty([0,T] \times \mathbb{T}^3_{1/\varepsilon}) \) which is the unique classical solution to

\[ \mathcal{L} \varphi_{\varepsilon} + \varphi_{\varepsilon}^3 + (-3a_{\varepsilon} + 3b_{\varepsilon}) \varphi_{\varepsilon} = \xi_{\varepsilon} = 0, \quad \varphi(0) = \varphi_{\varepsilon,0}. \]

Now, we proceed with the same decomposition \( \varphi_{\varepsilon} = X_{\varepsilon} - X^Y + \phi_{\varepsilon} + \psi_{\varepsilon} \) as above, only starting from the mollified noise \( \xi_{\varepsilon} \) instead of \( \xi \). Next, in view of the bounds from Theorem 3.4, the a priori estimates from Sections 5.3, 5.4, 5.5, 5.6, 5.7 apply mutatis mutandis (using Lemmas 2.3, 2.6, 2.10, 2.11, 2.12), with only slight modification due to the necessary time regularity needed for the additional commutators in \( \Psi \) and \( \Theta \).

To summarize, we deduce that the following bounds hold true uniformly in \( \varepsilon \in (0,1) \)

\[ \| \varphi_{\varepsilon} \|_{C^{\alpha}(\rho)} + \| \varphi_{\varepsilon} \|_{C^{(\alpha+a)/2}L^\infty(\rho^3)} + \| \varphi_{\varepsilon} \|_{C^{(\lambda+a)/2}L^\infty(\rho^3)} \lesssim 1, \]

\[ \| \varphi_{\varepsilon} \|_{C^{(1+a)/2}L^\infty(\rho^3)} + \| \varphi_{\varepsilon} \|_{C^{(1+a)/2}L^\infty(\rho^3)} \lesssim 1 \quad (7.6) \]

\[ \| \psi_{\varepsilon} \|_{C^{2+\gamma}(\rho^3)} + \| \psi_{\varepsilon} \|_{C^1L^\infty(\rho^3)} \lesssim 1. \]

Consequently, we are able to pass to the limit.
Theorem 7.1 Let $\kappa, \alpha \in (0, 1)$ be chosen sufficiently small and let $\gamma = \alpha - \kappa > 0$ and $\gamma' \in (0, \gamma)$ sufficiently large. If $\varphi_0 \in C^{1+\alpha}(\rho_0^{\frac{3}{2}+\gamma'})$ then there exist

$$\phi \in C^{\rho^{3+\gamma}} \cap C^{\rho^{3+\gamma}} \cap C^{(\frac{3}{2}+\gamma)\rho^{\frac{3}{2}+\alpha}} \cap C^{(\frac{3}{2}+\gamma)\rho^{\frac{3}{2}+\alpha}},$$

$$\psi \in C^{\rho^{3+\gamma}} \cap C^{(1+\alpha)\rho^{\frac{3}{2}+\gamma'}},$$

$$\psi \in C^{\rho^{3+\gamma}} \cap C^{(1+\alpha)\rho^{\frac{3}{2}+\gamma'}} \cap L^\infty \cap L^\infty \rho^{\frac{3}{2}+\alpha},$$

which is a solution to (7.4), (7.2).

Proof The proof follows the lines of Theorem 6.1. Based on the uniform bounds from (7.6) we obtain compactness of the sequence of approximate solutions $(\phi_\varepsilon, \theta_\varepsilon, \psi_\varepsilon)$ in a slightly worse space. In view of Theorem 3.4, this allows us to pass to the limit in the approximate version of (7.4), (7.2). Finally, we obtain that the limit solutions belong to the spaces where the uniform bounds hold.

8 Uniqueness for the parabolic models

This section is concerned with uniqueness to the parabolic $\Phi^d$ model for $d = 2, 3$.

Theorem 8.1 The parabolic $\Phi^d$ model (1.2) in dimension 2 and 3 has a unique solution: Let $(\phi, \psi), (\tilde{\phi}, \tilde{\psi})$ be two solutions in the sense of Theorem 6.1 and Theorem 7.1, respectively, starting from an initial condition $\varphi_0 + \psi_0 = \tilde{\varphi}_0 + \tilde{\psi}_0 = \varphi_0$. Then $\phi + \psi = \tilde{\phi} + \tilde{\psi}$.

In what follows we present the proof of this result in the more involved setting of $d = 3$. The two dimensional case follows the same pattern but is significantly easier and the details are left to the reader. Since the cubic term does not seem to be helpful for uniqueness, namely, when we study the equation for a difference of two solutions, it is necessary to find another mechanism which could handle the loss of weight in the terms of lower order. This issue can be easily seen on the model equation

$$\mathcal{L}v = vf, \quad v(0) = 0,$$

which is the form the equation for the difference takes. Intuitively, if $f$ can only be bounded in a weighted space and accordingly also $v$ is bounded in a weighted space, then the product $vf$ can only be bounded when multiplied by the product of the two weights. Hence the right hand side requires higher weight than the left hand side which causes difficulties in closing the estimates.

We overcome this problem by introducing an exponential weight of the form $\rho(x)\pi(t, x) := (x)^{-a}e^{-t(x)^b}$ for $a \in \mathbb{R}$ and $b \in (0, 1)$. As usual $t \in [0, \infty)$ denotes the time variable. However, this is not an admissible weight in the sense of Section 2.1 and consequently the definition of the associated weighted Besov spaces requires a different approach, either employing ultra-distributions (see [ST87]) or Gevrey classes (see [Rod93]). In Section 8.1 we recall the basic ideas based on Gevrey classes following the detailed presentation of [MW17b], where we also refer the reader for further details. Note that exponential weights have already been employed in [HL15, HL18].

With suitable weighted Besov spaces at hand, we employ the classical $L^2$-energy technique. First, and similarly to the previous sections, we decompose the equation for the difference of two solutions into its regular and irregular components. Then we test both equations by a suitable test function, which corresponds to the chain rule for certain Besov norm in the $L^2$-scale. This
way we obtain a control of the $B^\beta_{2,2}(\pi_t)$-norm of the regular component and the $B^{-\beta}_{2,2}(\pi_t)$-norm of the irregular one, for some $\beta \in (0, 1)$. The advantage of the exponential weight $\pi$ (which depends on time) originates in the form of its time derivative. More precisely, this gives a good term on the left hand side with weight of the form $\pi \rho^{-2\beta}$, that is, explosive at infinity in the space variable. This term is essential in order to control all the terms on the right hand side.

8.1 Besov spaces with exponential weights

For the proof of Theorem 8.1, we will employ weighted Besov spaces with weights of the form $\rho(x)\pi(t,x) := \langle x \rangle^{-a} e^{-t \langle x \rangle^b}$ for $a \in \mathbb{R}$ and $b \in (0, 1)$ and $t \in [0, \infty)$, which stands for the time variable. In order to compensate for the exponential growth, the definition of the corresponding Besov spaces relies on the so-called Gevrey classes rather than on Schwartz functions. Since multiplication by the polynomial weight $\langle x \rangle^{-a}$ only introduces a logarithmic correction, namely, $(x)^{-a} e^{-t(x)^b} = e^{-t(x)^b - a \log(x)}$, we may work with the same Gevrey class $G^\theta$ of index $\theta \in (1, 1/b)$ as for the case of only exponential weight $e^{-t(x)^b}$. Consequently, the results of [MW17b, Section 2] remain valid and given $T > 0$ the corresponding bounds are uniform over all $t \in [0, T]$. Next, we define the weighted Besov spaces (based on a partition of unity from $G^\theta$), as the completion of $C_c^\infty$ with respect to the norm

$$
\|f\|_{B^\beta_{p,q}(\pi, \rho)} := \left( \sum_{k \geq -1} \left( 2^{\alpha k} \|\Delta_k f\|_{L^p(\pi)} \right)^q \right)^{\frac{1}{q}},
$$

where $\pi_t(\cdot) = \pi(t, \cdot)$. Note that unlike [MW17b] we pull the weight inside the $L^p$-norm, which is consistent with our definition of weighted Besov spaces in Section 2.1. The corresponding results of [MW17b, Section 3.3] (with straightforward modifications due to the weights) remain valid. More precisely, the following paraproduct estimates will be used in the sequel.

Lemma 8.2 Let $\kappa \in [0, 1]$, $\beta \in \mathbb{R}$ and $\delta > 0$. Then it holds uniformly in $t \geq 0$

$$
\|f \prec g\|_{B^\gamma_{2,2}(\pi_t)} \lesssim \|f\|_{L^2(\pi)} \|g\|_{L^\infty(\rho)} \wedge \|f\|_{L^\infty(\rho)} \|g\|_{B^\beta_{2,2}(\pi_t)},
$$

and if $\alpha < 0$ then uniformly over $t \geq 0$

$$
\|f \prec g\|_{B^{\alpha+\beta}_{2,2}(\pi_t)} \lesssim \|f\|_{B^\alpha_{2,2}(\pi_t)} \|g\|_{L^\infty(\rho)} \wedge \|f\|_{L^\infty(\rho)} \|g\|_{B^\beta_{2,2}(\pi_t)}.
$$

If $\alpha, \beta \in \mathbb{R}$ such that $\alpha + \beta > 0$ then it holds uniformly in $t \geq 0$

$$
\|f \circ g\|_{B^{\alpha+\beta}_{2,2}(\pi_t)} \lesssim \|f\|_{L^\infty(\rho)} \|g\|_{B^\beta_{2,2}(\pi_t)}.
$$

Proof Let $0 < \gamma < \delta$. As a consequence of [MW17b, Theorem 3.17] and embeddings of Besov spaces, we have

$$
\|f \prec g\|_{B^\beta_{2,2}(\pi_t)} \lesssim \|f\|_{B^{-\gamma}_{2,\infty}(\pi_t)} \|g\|_{B^{\beta+\gamma}_{2,\infty}(\pi_t)} \lesssim \|f\|_{L^2(\pi_t)} \|g\|_{B^{\beta+\delta}_{\infty,\infty}(\rho)}.
$$

So the first bound follows and similarly we obtain the third bound. The remaining bounds follow directly from [MW17b, Theorem 3.17].

Similarly to Lemma 2.16 we obtain the following result, whose proof is a straightforward modification of [GIP15, Lemma 2.4].
Lemma 8.3 Let $\alpha \in (0,1)$ and $\beta, \gamma \in \mathbb{R}$ such that $\alpha + \beta + \gamma > 0$ and $\beta + \gamma < 0$. Then for every $\delta > 0$ it holds uniformly in $t \geq 0$

$$\| \mathrm{com}(f,g,h) \|_{B^{\alpha+\beta+\gamma}_2(\pi_1\pi_2)} \lesssim \|f\|_{B^{\alpha}_2(\pi_1)} \|g\|_{B^{\beta}(\pi_1)} \|h\|_{B^\gamma(\pi_2)}.$$ 

8.2 Proof of Theorem 8.1

Proof We prove the result for the case $d = 3$. Recall that if $\varphi$ is a solution to (1.2) in the sense of Theorem 7.1 then $\varphi = X - X^\varphi + \phi + \psi$, where $\phi$ is paracontrolled by $X^\varphi$ and equations (7.4), (7.2) are satisfied. For the purposes of the proof of uniqueness, it is not necessary to consider the modified paraproduct and therefore we may work with a similar decomposition as in the elliptic setting in Section 5. We define

$$\phi = \theta - 3(-X^\varphi + \phi + \psi) \prec X^\varphi$$

where (formally)

$$0 = \mathcal{L}\theta + \mathcal{L}\psi + 3\|X^2\| \lesssim (-X^\varphi + \phi + \psi) - 3[\mathcal{L}, (-X^\varphi + \phi + \psi) \prec]X^\varphi$$

$$+ 3X(-X^\varphi + \phi + \psi)^2 + (-X^\varphi + \phi + \psi)^3 + 3b\varphi.$$ 

For notational simplicity, we chose to write the above equation in this not rigorous form – with the infinite constant $b$ appearing – instead of introducing the full decomposition with all the trees. Indeed, we are actually interested in a difference of the corresponding equations for two solutions $\varphi$ and $\tilde{\varphi}$ starting from the same initial condition. Thus the decomposition will simplify as the terms that do not depend on the solutions cancel out.

So if we denote by $\tilde{\varphi} = X - X^\varphi + \tilde{\phi} + \tilde{\psi}$ another solution starting from the same initial condition and set $\zeta = \varphi - \tilde{\varphi}$ and $\eta = \theta - \tilde{\theta} + \psi - \tilde{\psi}$, then we have

$$\zeta = \phi + \psi - \tilde{\phi} - \tilde{\psi} = -3\zeta \prec X^\varphi + \eta.$$ 

In addition, it holds

$$0 = \mathcal{L}\zeta + 3\|X^2\| \lesssim \zeta + 3b\zeta + Y\zeta, \quad \zeta(0) = 0,$$

$$0 = \mathcal{L}\eta + 3\|X^2\| \lesssim \eta + 3b\eta - 3[\mathcal{L}, \zeta \prec]X^\varphi + Y\zeta, \quad \eta(0) = 0,$$

with

$$Y = 3X(-2X^\varphi + \phi + \psi + \tilde{\phi} + \tilde{\psi})$$

$$+ [(-X^\varphi + \phi + \psi)^2 + (-X^\varphi + \phi + \psi)(-X^\varphi + \tilde{\phi} + \tilde{\psi}) + (-X^\varphi + \tilde{\phi} + \tilde{\psi})^2].$$ 

From the estimates of the solutions from Theorem 5.1 we obtain $Y \in \mathcal{C}^{-1/2-\kappa}(\rho^\sigma)$. However, we stress that the term $3\|X^2\| \circ \zeta + 3b\zeta$ is to be understood in the following sense

$$3\|X^2\| \circ \zeta + 3b\zeta = -9\|X^2\| \circ (\zeta \prec X^\varphi) + 3b\zeta + 3\|X^2\| \circ \eta$$

$$= -9\zeta \left(\|X^2\| \circ X^\varphi - \frac{b}{3}\right) - 9\mathrm{com}(\zeta, X^\varphi, \|X^2\|) + 3\|X^2\| \circ \eta,$$

where $X^\varphi = \|X^2\| \circ X^\varphi - \frac{b}{3}$ is the renormalized resonant product in $\mathcal{C}^{-\kappa}(\rho^\sigma)$. 

45
Similarly, we may test the equation for \( \Delta \) hence \( \gamma \) since
\[
\langle \pi \Delta_k \eta, \pi \Delta_k (\mathcal{L} \eta) \rangle = -2 \langle \pi \Delta_k \eta, \frac{\nabla \pi}{\pi} \nabla \Delta \Delta_k \eta \rangle.
\]
Since \( \nabla \pi = \pi t \beta \rho^{-2b-1} \nabla \rho \) and \( |\nabla \rho/\rho^2| \lesssim 1 \), we obtain \( |\nabla \pi| \lesssim t \rho^{1-2b} \lesssim 1 \) as a consequence of \( b \in (0,1/2) \) and \( t \in [0,T] \). Hence by Young’s inequality
\[
|\langle \pi \Delta_k \eta, \nabla \pi \nabla \Delta \Delta_k \eta \rangle| \leq C_{T,\delta} \| \Delta_k \eta \|^2_{L^2(\pi\rho^a)} + \delta \| \nabla \Delta \Delta_k \eta \|^2_{L^2(\pi\rho^a)}.
\]
Now we estimate by duality, for some \( \gamma \) in \((0,1)\) and some \( 0 < a < b/2 \),
\[
|\langle \pi \Delta_k \eta, \pi \Delta_k (\mathcal{L} \eta) \rangle| \lesssim 2^{-2b} \| \Delta_k \eta \|^2_{L^2(\pi\rho^a)} + \delta 2^{-2b} \| \nabla \Delta \Delta_k \eta \|^2_{L^2(\pi\rho^a)}
\]
Moreover, by a suitable choice of \( a \in (0,b/2) \) and \( \beta, \gamma \in (0,1) \) such that \( \beta < 2\beta + \gamma < \beta + 1 \) (hence \( \beta + \gamma < 1 \), interpolation implies
\[
2^{2(2\beta+\gamma)} \| \Delta_k \eta \|^2_{L^2(\pi\rho^a)} \leq C_\delta 2^{2\beta} \| \rho^{-b/2} \Delta_k \eta \|^2_{L^2(\pi\rho^a)} + \delta 2^{2\beta} \| \nabla \Delta \Delta_k \eta \|^2_{L^2(\pi\rho^a)}
\]
Similarly, we may test the equation for \( \Delta_k \zeta \) by \( \pi^2 \Delta_k \zeta \) to obtain
\[
\frac{1}{2} \partial_t \| \Delta_k \zeta \|^2_{L^2(\pi\rho^a)} + \| \nabla \Delta_k \zeta \|^2_{L^2(\pi\rho^a)} + \mu \| \Delta_k \zeta \|^2_{L^2(\pi\rho^a)} + \| \rho^{-b} \Delta_k \zeta \|^2_{L^2(\pi\rho^a)}
\]
Next, we estimate
\[
|\langle \pi \Delta_k \zeta, \nabla \pi \nabla \Delta_k \zeta \rangle| \leq C_{T,\delta} \| \rho^{1-2b} \Delta_k \zeta \|^2_{L^2(\pi\rho^a)} + \delta \| \nabla \Delta_k \zeta \|^2_{L^2(\pi\rho^a)}
\]
and by duality
\[
|\langle \pi^2 \Delta_k \zeta, \Delta_k (\mathcal{L} \zeta) \rangle| \lesssim 2^{2\beta} \| \Delta_k \zeta \|^2_{L^2(\pi\rho^a)} + \delta 2^{2\beta} \| \nabla \Delta \Delta_k \zeta \|^2_{L^2(\pi\rho^a)}
\]
where by a suitable choice of \( c \in (0,b/2) \)
\[
2^{2(1+\kappa-2\beta)} \| \Delta_k \zeta \|^2_{L^2(\pi\rho^a)} \leq C_\delta 2^{-2\beta} \| \rho^{-b/2} \Delta_k \zeta \|^2_{L^2(\pi\rho^a)} + \delta 2^{-2\beta} \| \nabla \Delta_k \zeta \|^2_{L^2(\pi\rho^a)}
\]
46
\[ C_δ 2^{-2βk} \| Δ_k ζ \|_{L^2(π)}^2 + δ^2 2^{-2βk} \| ρ^{-β} Δ_k ζ \|_{L^2(π)}^2 + δ^2 2^{-2βk} \| \nabla Δ_k ζ \|_{L^2(π)}^2, \]

provided \(-β < 1 + κ - 2β < 1 - β\) hence \(κ < β < 1 + κ\).

As the next step, we multiply (8.1) by \(2^{βk}\), (8.2) by \(2^{-2βk}\), integrate both inequalities over \((0, t)\) for some \(t \in (0, T)\). In addition, we choose \(δ\) sufficiently small in order to absorb some of the terms into the left hand side. Finally, we sum the two inequalities, use the fact that \(ζ(0) = 0, η(0) = 0\), and sum over \(k\) to obtain

\[ \frac{1}{2} \| η(t) \|_{B^0_{2,2}(π)}^2 + \frac{1}{2} \int_0^t \| \nabla η \|_{B^0_{2,2}(π)}^2 \, ds + \frac{1}{2} \| ζ(t) \|_{B^{-β}_{2,2}(π)}^2 + \frac{1}{2} \int_0^t \| \nabla ζ \|_{B^{-β}_{2,2}(π)}^2 \, ds \]

\[ \leq C_δ \int_0^t \| η \|_{B^0_{2,2}(π)}^2 \, ds + C_δ \int_0^t \| ζ \|_{B^{-β}_{2,2}(π)}^2 \, ds \]

\[ + δ \int_0^t \| \mathcal{L} η \|_{B^{-1-β}_{2,2}(π,ρ^α)}^2 \, ds + δ \int_0^t \| \mathcal{L} ζ \|_{B^{-1-β}_{2,2}(π,ρ^α)}^2 \, ds. \]  

(8.3)

So it remains to control \(\mathcal{L} η \|_{B^{-1-β}_{2,2}(π,ρ^α)}^2\) and \(\mathcal{L} ζ \|_{B^{-1-β}_{2,2}(π,ρ^α)}^2\). Note that both terms are multiplied by a small constant \(δ > 0\), which will be needed in order to absorb them into the left hand side.

We set \(β = 2κ, γ = \frac{1}{2} + κ\) for some \(κ > 0\) sufficiently small, which is also the parameter to be used in order to estimate the stochastic terms according to the Table 1. Then \(a = (1/2 - 3κ)b/2\) whereas \(c = κb/2\) hence \(c < a\), which will be used below in order to control the time derivative of \(ζ\).

In view of Lemma 8.2 and Lemma 8.3, we may estimate all the terms in \(\mathcal{L} η\) as follows

\[ \| 3[X^2] \prec ζ(t) \|_{B^{-1-β}_{2,2}(π,ρ^α)} \lesssim \| ζ(t) \|_{B^{1-β}_{2,2}(π)}, \]

\[ \| 9ζ \left( \| [X^2] \|_{B^{-1-β}_{2,2}(π,ρ^α)} \right) \|_{B^{1-β}_{2,2}(π)} \lesssim \| ζ(t) \|_{B^{1-β}_{2,2}(π)}, \]

\[ \| 9 \text{com}(ζ, X^Y, [X^2]) \|_{B^{-1-β}_{2,2}(π,ρ^α)} \lesssim \| ζ(t) \|_{B^{1-β}_{2,2}(π)}, \]

\[ \| 3\| [X^2] \|_{B^{-1-β}_{2,2}(π,ρ^α)} \|_{B^{1-β}_{2,2}(π)} \lesssim \| η(t) \|_{B^{1-β}_{2,2}(π)}, \]

\[ \| 3\| [X^2] \|_{B^{-1-β}_{2,2}(π,ρ^α)} \|_{B^{1-β}_{2,2}(π)} \lesssim \| η(t) \|_{B^{1-β}_{2,2}(π)}, \]

We used the fact that \(c < a\) to estimate the commutator above. Besides, note that \(\mathcal{L} ζ\) contains only one term which does not appear in \(\mathcal{L} η\) and it does not contain any term which requires time regularity. The additional term is controlled by

\[ \| 3\| [X^2] \|_{B^{-1-β}_{2,2}(π,ρ^α)} \|_{B^{1-β}_{2,2}(π)}, \]

Using the equation for \(ζ\) we get

\[ \| \partial_t ζ(t) \|_{B^{1-β}_{2,2}(π,ρ^α)} \lesssim \| (μ - Δ)ζ(t) - Λζ(t) \|_{B^{1-β}_{2,2}(π,ρ^α)} \]
Theorem 9.1: Let \( \kappa, \alpha \in (0, 1) \) be chosen sufficiently small and let \( \gamma = \alpha - \kappa > 0 \). Let \( \varphi_0 \in \mathcal{G}^{-1+\epsilon}(\rho_0^{1+\epsilon}) \) for some \( \epsilon > 0 \). Let \( L > 0 \) be such that

\[
2^L \sim \| \varphi_0 \|_{\mathcal{G}^{-1+\epsilon}(\rho_0^{1+\epsilon})}.
\]

Define

\[
\phi_0 := \mathcal{U}_{>0} \varphi_0 - X(0), \quad \psi_0 := \mathcal{U}_{<0} \varphi_0,
\]

where \( \mathcal{U}_{>0}, \mathcal{U}_{<0} \) are the localizers corresponding to \( L \). We recall that \( X \) was chosen stationary and \( X(0) \in \mathcal{G}^{-1/2-\kappa}(\rho_0^0) \) for any \( \sigma > 0 \) (see Theorem 3.4). Then it follows from Lemma 2.4 that

\[
\| \phi_0 \|_{\mathcal{G}^{-1}(\rho_0^0)} \lesssim 1
\]

uniformly over \( \varphi_0 \in \mathcal{G}^{-1+\epsilon}(\rho_0^{1+\epsilon}) \) and \( \epsilon > 0 \). Now we have all in hand to formulate the main result of this section.

**Theorem 9.1** Let \( \kappa, \alpha \in (0, 1) \) be chosen sufficiently small and let \( \gamma = \alpha - \kappa > 0 \). Let \( \varphi_0 \in \mathcal{G}^{-1+\epsilon}(\rho_0^{1+\epsilon}) \) for some \( \epsilon > 0 \). Let \( (\phi, \psi) \) be a solution to the parabolic problem (7.4), (7.2) in \( d = 3 \) with initial condition \( (\phi_0, \psi_0) \) defined above. Then, uniformly in \( \varphi_0 \),

\[
\phi \in C' \mathcal{G}^{\alpha}(\tau^{1/2}\rho) \cap C' \mathcal{G}^{1/2+\alpha}(\tau^{3/2}\rho^{3/2+\alpha}),
\]

and

\[
\psi \in C' \mathcal{G}^{2+\gamma}(\tau^{1/2}\rho^{3+\gamma}) \cap L^\infty L^\infty(\tau^{1/2}\rho).
\]

An analogous result holds true also in dimension 2. In this case, we construct the initial condition in the same way and obtain the following result.

**Theorem 9.2** Let \( \kappa, \alpha \in (0, 1) \) be chosen sufficiently small and let \( \beta = \alpha - \kappa > 0 \). Let \( (\phi, \psi) \) a solution of the parabolic problem (6.2) in \( d = 2 \) with initial condition \( (\phi_0, \psi_0) \) defined above. Then

\[
(\phi, \psi) \in C' \mathcal{G}^{\alpha}(\tau^{1/2}\rho) \times [C' \mathcal{G}^{2+\gamma}(\tau^{1/2}\rho^{3+\gamma}) \cap L^\infty L^\infty(\tau^{1/2}\rho)]
\]

uniformly in the initial condition.
In the following, we discuss the necessary preliminary results and finally prove Theorem 9.1 in Section 9.4. The proof of Theorem 9.2 will not be given since it is substantially simpler (as one does not need the paracontrolled ansatz) and follows the same pattern. As a corollary, we obtain that
\[ \|\phi(t) + \psi(t)\|_{L^\infty(\rho)} \lesssim 1 + t^{-1/2} \]
independently of the initial condition: the solution comes down from infinity in a finite time. This has been first observed by MW17a in the periodic setting.

Remark 9.3 We point out that the assumption on the regularity of initial condition in Theorems 9.1, 9.2 is very weak and the existence for such singular initial conditions is not guaranteed by the respective existence results, Theorems 7.1, 6.1. However, for instance in case of the \( \Phi^4 \) model (1.2) on \( T^3 \), if \( \varphi_0 \) belongs to the natural space \( C^{-1/2 - \kappa} \), one may use the short time existence of a unique solution from CC18 together with Theorem 9.1 to deduce global existence and the coming down from infinity property. Furthermore, revisiting the proof of our a priori estimates we see that the proportional constants depend polynomially on the noise, which implies integrability of all the moments. This way, we recover the result of MW17a.

9.1 Interpolation and localization
First, we notice that an interpolation similar to Lemma 2.3 remains valid and the proof follows the same lines.

Lemma 9.4 For \( \alpha \in [0, 2 + \kappa] \) we have
\[ \|\tau^{(1+\alpha)/2}\psi\|_{C^{\delta}(\rho^{1+\alpha})} \lesssim \|\tau^{1/2}\psi\|_{C^\infty(\rho)}^{1-\alpha/(2+\kappa)}\|\tau^{(3+\kappa)/2}\psi\|_{C^{2+\kappa}(\rho^{3+\kappa})}^{\alpha/(2+\kappa)}, \]
or more generally
\[ \|\tau^{(1+\alpha)/2}\psi\|_{C^{\delta}(\rho^{1+\alpha})} \lesssim \|\tau^{1+\delta/2}\psi\|_{C^\delta(\rho^{1+\delta})}^{1-\theta}\|\tau^{(3+\kappa)/2}\psi\|_{C^{2+\kappa}(\rho^{3+\kappa})}^\theta, \]
whenever \( \delta \in [0, \alpha] \) and \( \alpha = (1 - \theta)\delta + \theta(2 + \kappa) \) for some \( \theta \in [0, 1] \).

We stress that unlike Lemma 2.3, we do not include any interpolation in terms of time regularity into Lemma 9.4. Indeed, since the weight \( \tau \) vanishes at zero, the equivalence (2.5) is not valid anymore for the corresponding weighted Hölder spaces (in time). Therefore we proceed differently than in Section 7: below, we introduce a new modified paracontrolled ansatz which eventually leads us to the requirement \( \tau^\beta(\phi + \psi) \in C^\delta L^\infty(\rho^\sigma) \), for certain \( \beta, \delta, \sigma > 0 \). In other words, instead of time regularity of \( \phi + \psi \) in a space weighted by \( \tau^\beta \rho^\sigma \), we require time regularity of \( \tau^\beta(\phi + \psi) \) in a space weighted by an admissible space-time weight \( \rho^\sigma \), which falls in the framework of Section 2.1.

We will also need the parabolic localization (2.6) together with Lemma 2.6. However, since this is only applied to the stochastic objects that do not require any \( \tau \) weight, no \( \tau \)-adapted version of Lemma 2.6 is needed.

9.2 Weighted Schauder estimates
In this section we formulate new Schauder estimates adapted to the particular weight \( \tau \) which is not bounded away from zero. In particular, with the interpolation in hand, we may employ Lemma B.1 to deduce the following.
Lemma 9.5 Let $\alpha > -2$, $\gamma = (3 + \alpha)/2$ and $\beta_i \in [0, 2)$. Assume that $\mathcal{L} v = \sum_i V_i$. Then the following a priori estimate holds true
\[
\|v\|_{C^{\infty, \gamma}(\tau^\gamma \rho)} \lesssim \|v\|_{C^{\infty, \gamma}(\tau^{(1+\delta)/2}\rho)} + \sum_i \|\tau^{\beta_i/2} V_i\|_{C^{\infty, \gamma}(\tau^\gamma \rho)},
\]
whenever $\delta \in [0, 1 + \alpha]$ is given by $1 + \alpha = (1 - \theta)\delta + \theta(2 + \alpha)$ for some $\theta \in [0, 1]$. Consequently, it also holds
\[
\|v\|_{C^{\infty, \gamma}(\tau^\gamma \rho)} \lesssim \|v\|_{L^\infty(\tau^{1/2}\rho)} + \sum_i \|\tau^{\beta_i/2} V_i\|_{C^{\infty, \gamma}(\tau^\gamma \rho)}.
\]

Proof. First observe that
\[
(\partial_t + \mu - \Delta)(\tau^\gamma \rho v) = \tau^\gamma \rho \sum_i V_i - \left(\frac{\Delta \rho}{\rho}\right) \tau^\gamma \rho v - 2 \frac{\nabla \rho}{\rho} \nabla (\tau^\gamma \rho v) + 2 \left(\frac{\nabla \rho}{\rho}\right)^2 \tau^\gamma \rho v + \left(\frac{\partial \rho}{\rho}\right) \tau^\gamma \rho v + \gamma \tau^{-1}(1 - \tau)\tau^\gamma \rho v.
\]
By Lemma B.1 and estimating all the terms separately, we deduce
\[
\|\tau^\gamma \rho v\|_{C^{\infty, 2 + \alpha}} \lesssim \sum_i \|\tau^{\beta_i/2} V_i\|_{C^{\infty, 2 + \alpha}(\tau^\gamma \rho)} + \|\gamma^{-1}(1 - \tau)\tau^\gamma \rho v\|_{C^{\infty, 2 + \alpha}(\tau^\gamma \rho)}.
\]
where $\alpha < 2 + \alpha' < 2 + \alpha$. Now using $\tau^{(3+\alpha)/2} \leq \tau^{(2+\alpha)/2}$ for the last term on the right hand side, we obtain by interpolation from Lemma 9.4 that
\[
\|v\|_{C^{\infty, 1 + \alpha}(\tau^{(3+\alpha)/2}\rho)} + \|v\|_{C^{\infty, 2 + \alpha'}(\tau^{(3+\alpha')/2}\rho)} \leq C\|v\|_{C^{\infty, \gamma}(\tau^{(1+\delta)/2}\rho)} + \frac{1}{2}\|v\|_{C^{\infty, 2 + \alpha}(\tau^{(3+\alpha)/2}\rho)}.
\]
This allows us to absorb the residual terms in the left hand side giving the final statement. \qed

Below we need also some specific Schauder estimate for time regularity of solutions to the heat equation with a precise control of the $\tau$-weights in the source term. We derive it here.

Lemma 9.6 For any $\alpha \in (0, 2)$ and $\beta_i \in [0, 2)$ such that $\alpha + \beta_i - 2 < 0$ we have
\[
\|v\|_{C^{\infty, 2}L^\infty(\rho)} \lesssim \|v\|_{C^{\infty, \alpha}(\rho)} + \sum_i \|\tau^{\beta_i/2} V_i\|_{C^{\infty, \alpha + \beta_i - 2}(\rho)}
\]
where $\mathcal{L} v = \sum_i V_i$.

Proof. Let $f = (\partial_t + \mu - \Delta)v$ and recall that we denoted by $P_t = e^{t(\Delta - \mu)}$ the semigroup of operators generated by $\Delta - \mu$ with $\mu > 0$. Fix $t > s \geq t - 1$ and let $k \in \mathbb{N}_0$ be such that $2^{-2k} \sim |t - s|$. Then using the fact that the weight $\rho$ is nonincreasing in time we obtain
\[
\|v(t) - v(s)\|_{L^\infty(\rho)} \leq \|\Delta_{\leq k}(P_{t-s} - \text{Id})v(s)\|_{L^\infty(\rho)} + \int_s^t \|\Delta_{\leq k}P_{t-u}f(u)\|_{L^\infty(\rho)} du + \|\Delta_{> k}(v(t) - v(s))\|_{L^\infty(\rho)} =: I_1 + I_2 + I_3
\]
Now
\[
I_1 \lesssim \|\Delta_{> k}v(t)\|_{L^\infty(\rho)} + \|\Delta_{> k}v(s)\|_{L^\infty(\rho)} \lesssim 2^{-\alpha k}\|v\|_{C^{\infty, \alpha}(\rho)},
\]
and if \( t \leq 2 \) then
\[
I_2 \lesssim \sum_i 2^{(2-\alpha-\beta_i)k} \int_s^t \tau(u)^{-\beta_i/2} du \|\tau^{\beta_i/2} V_i\|_{C^{\alpha+\beta_i-2}(\rho)}
\]
\[
\lesssim \sum_i 2^{(2-\alpha-\beta_i)k} \int_s^t u^{-\beta_i/2} du \|\tau^{\beta_i/2} V_i\|_{C^{\alpha+\beta_i-2}(\rho)}
\]
\[
\lesssim |t-s|^{\alpha/2} \left[ \sum_i \frac{(t^1-\beta_i/2 - s^{1-\beta_i/2})}{|t-s|^{(1-\beta_i/2)}} \|\tau^{\beta_i/2} V_i\|_{C^{\alpha+\beta_i-2}(\rho)} \right].
\]
Since the function \( t \mapsto t^\delta \) is \( \delta \)-Hölder continuous, it holds true
\[
\frac{(t^1-\beta_i/2 - s^{1-\beta_i/2})}{|t-s|^{(1-\beta_i/2)}} \lesssim 1,
\]
hence
\[
I_2 \lesssim |t-s|^{\alpha/2} \sum_i \|\tau^{\beta_i/2} V_i\|_{C^{\alpha+\beta_i-2}(\rho)}.
\]
If \( t > 2 \) then \( s \geq 1 \) and consequently
\[
I_2 \lesssim \sum_i 2^{(2-\alpha-\beta_i)k} (t-s) \|\tau^{\beta_i/2} V_i\|_{C^{\alpha+\beta_i-2}(\rho)}
\]
\[
\lesssim |t-s|^{\alpha/2} \left[ \sum_i \frac{(t-s)}{|t-s|^{(1-\beta_i/2)}} \|\tau^{\beta_i/2} V_i\|_{C^{\alpha+\beta_i-2}(\rho)} \right] \lesssim |t-s|^{\alpha/2} \sum_i \|\tau^{\beta_i/2} V_i\|_{C^{\alpha+\beta_i-2}(\rho)}.
\]
Hence we can conclude that
\[
\sup_{\substack{s, t \in [0, \infty) \setminus \{s, t\}}} \frac{\|v(t) - v(s)\|_{L^\infty(\rho)}}{|t-s|^{\alpha/2}} \lesssim \sum_i \|\tau^{\beta_i/2} V_i\|_{C^{\alpha+\beta_i-2}(\rho)} + \|v\|_{C^{\alpha}(\rho)}
\]
and the claim follows. \( \square \)

Similarly to Lemma 2.11 we finally derive a Schauder estimate for equations including a cubic nonlinearity.

**Lemma 9.7** Fix \( \kappa > 0 \) and let \( \psi \in C^\infty C^{2+\kappa}(\rho^{3+\kappa}) \cap C^1 L^\infty(\rho^{3+\kappa}) \cap L^\infty L^\infty(\rho) \) be a classical solution to
\[
\partial_t \psi + (-\Delta + \mu) \psi + \psi^3 = \Psi, \quad \psi(0) = \psi_0.
\]
Then
\[
\|\psi\|_{C^{\alpha}(\rho^{3+\kappa})} \lesssim 1 + \|\Psi\|_{C^{\alpha}(\rho^{3+\kappa})} + \|\psi\|_{L^\infty L^\infty(\rho^{3+\kappa})}.
\]
**Proof** The proof follows from Lemma 9.4 and Lemma 9.5 using the same approach as in the proof of Lemma 2.11. \( \square \)
9.3 Weighted coercive estimate

Next, we show that also the coercive estimates remain valid for the weight \( \tau \), the proof uses the same ideas as Lemma 2.12.

Lemma 9.8 Fix \( \kappa > 0 \) and let \( \psi \in C^1 C^{2+\kappa}(\rho^{3+\kappa}) \cap C^1 L^{\infty}(\rho^{3+\kappa}) \cap L^\infty L^{\infty}(\rho) \) be a classical solution to
\[
\partial_t \psi + (\mu - \Delta) \psi + \psi^3 = \Psi, \quad \psi(0) = \psi_0.
\]
Then the following a priori estimate holds
\[
\|\psi\|_{L^\infty L^{\infty}(\tau^{1/2} \rho)} \lesssim 1 + \|\Psi\|_{L^\infty L^{\infty}(\tau^{3/2} \rho^3)}
\]
independently of the initial condition.

Proof Let \( \tilde{\psi} = \tau^{1/2} \psi \rho \) and assume for the moment that \( \tilde{\psi} \) attains its (global) maximum \( M = \tilde{\psi}(t^*, x^*) \) at the point \( (t^*, x^*) \). If \( M \leq 0 \), then it is necessary to investigate the minimum point (or alternatively the maximum of \(-\tilde{\psi} \)), which we discuss below. Let us therefore assume that \( M > 0 \). Then necessarily \( t^* > 0 \) since \( \tilde{\psi}(0) = 0 \) and
\[
\tau \rho^2 \partial_t \tilde{\psi} + \rho \tau^2 (\Delta + \mu) \tilde{\psi} + \tilde{\psi}^3 = \tau^{3/2} \rho^3 \Psi + (\tau \rho \partial_t \rho + \rho^2 \tau^{1/2} \partial_t \tau^{1/2}) \tilde{\psi} - \tau^{3/2} \rho^3 (\Delta \rho) \tilde{\psi} - 2 \tau^{3/2} \rho^3 \nabla \rho \nabla \psi.
\]
and
\[
\partial_t \tilde{\psi}(t^*, x^*) = 0, \quad \nabla \tilde{\psi}(t^*, x^*) = 0, \quad \Delta \tilde{\psi}(t^*, x^*) \leq 0
\]
hence \( \rho \nabla \psi = -\psi \nabla \rho \). Consequently \( -\rho^2 \Delta \tilde{\psi}(t^*, x^*) \geq 0 \) and also \( \rho \partial_t \rho \tilde{\psi}(t^*, x^*) \leq 0 \) since \( \partial_t \rho \leq 0 \). Hence
\[
M^3 \leq \left[ \tau^{3/2} \rho^3 \Psi \right]_{(t^*, x^*)} + \left[ -\mu \tau^2 + \rho^2 - \tau \rho \Delta \rho + 2 \tau \nabla \rho \right]_{(t^*, x^*)} M
\]
\[
\lesssim \|\Psi\|_{L^\infty L^{\infty}(\tau^{3/2} \rho^3)} + c_{\rho, \mu} \|\tilde{\psi}\|_{L^\infty L^{\infty}}.
\]
Therefore we deduce that
\[
\tilde{\psi}(t^*, x^*) = M \lesssim \|\Psi\|_{L^\infty L^{\infty}(\tau^{3/2} \rho^3)} + c_{\rho, \mu} \|\psi\|_{L^\infty L^{\infty}(\tau^{1/2} \rho)}^{1/3}.
\]
If \( M < 0 \) we can apply the same argument to \(-\tilde{\psi}\) to get
\[
-\tilde{\psi} \lesssim \|\Psi\|_{L^\infty L^{\infty}(\tau^{3/2} \rho^3)} + c_{\rho, \mu} \|\psi\|_{L^\infty L^{\infty}(\tau^{1/2} \rho)}^{1/3}.
\]

Remark 9.9 We note that the choice of \( 1/2 \) as the power of the weight \( \tau \) is dictated by the cubic nonlinearity through Lemma 9.8. More precisely, taking \( \tau^\alpha \) instead of \( \tau^{1/2} \) for some \( \alpha > 0 \) and repeating the proof of the above maximum principle, it is necessary to control \( \tau^\alpha \partial_t \tau^\alpha \) which leads to the condition \( \alpha \geq 1/2 \). Hence the choice \( \alpha = 1/2 \) gives the best result.
Section 9.4 Proof of Theorem 9.1

**Proof** Using the approach of Section 5 while choosing localization operators (2.6) according to the weighted norm \( \| \phi + \psi \|_{L^\infty L^\infty(\tau/2)^{\alpha}} \) and the constant \( L \) of various objects as in Table 2, we obtain
\[
\| \Phi \|_{C^\infty \alpha(\tau(1+\alpha)/2)^{\alpha}} \lesssim 1. \tag{9.2}
\]
The choice of the weight above is due to the following application of the weighted Schauder estimates from Lemma 9.5. Namely, Lemma 9.5 implies
\[
\| \phi \|_{C^\infty \alpha(\tau(1+\alpha)/2)^{\alpha}} \lesssim \| \phi \|_{L^\infty L^\infty(\tau/2)^{\alpha}} + \| \Phi \|_{C^\infty \alpha(\tau(1+\alpha)/2)^{\alpha}}. \tag{9.3}
\]
We note that this is not yet sufficient to bound \( \phi \) in \( L^\infty L^\infty(\tau/2)^{\alpha} \), since the power of \( \tau \) on the left hand side of (9.3) is bigger than \( 1/2 \), which matters for \( t \) small. In order to fill this gap, let \( t \in (0, 1) \) and \( k \in \mathbb{N} \) be such that \( 2^{-2k} \sim \lambda^{2/\alpha} \tau(t) \) for some small \( \lambda > 0 \) to be chosen below (the proportional constants do not depend on time). Write
\[
\| \tau(1+\alpha)/2 \phi(t) \|_{L^\infty(\rho)} \lesssim \| \tau(1+\alpha)/2 \Delta_k \phi(t) \|_{L^\infty(\rho)} + \| \tau(1+\alpha)/2 \Delta_{>k} \phi(t) \|_{L^\infty(\rho)},
\]
where \( \rho_k(\cdot) \) denotes the weight \( \rho(t, \cdot) \). For the first term on the right hand side we use the equation satisfied by \( \phi \) together with the fact that the weight \( \rho \) is nonincreasing in time. This gives
\[
\| \tau(1+\alpha)/2 \phi(t) \|_{L^\infty(\rho)} \lesssim \tau^{(1+\alpha)/2}(t) \| \Delta_k \phi(t) \|_{L^\infty(\rho)} + \| \tau^{(1+\alpha)/2} \Delta_{>k} \phi(t) \|_{L^\infty(\rho)},
\]
Recall that \( P_t = e^{t(\Delta - \mu)} \). Hence in view of (2.8), the definition of \( \tau \) and the fact that \( t \in (0, 1) \), \( \alpha - 2 < 0 \) and \( \alpha > 0 \), the above is further estimated by
\[
\lesssim \tau^{(1+\alpha)/2}(t) 2^k \| \phi(0) \|_{C^\infty \alpha-1(\rho)} + 2^{-(\alpha-2)k} \| \tau(t) \| \tau^{(1+\alpha)/2} \| \phi \|_{C^\infty \alpha-2(\rho)} + 2^{-\alpha/k} \| \tau^{(1+\alpha)/2} \phi \|_{C^\infty \alpha(\rho)}.
\]
Using the definition of \( k \) we therefore obtain
\[
\| \tau^{(1+\alpha)/2} \phi(t) \|_{L^\infty(\rho)} \lesssim \tau(t) \alpha/2 \| \phi(0) \|_{C^\infty \alpha-1(\rho)} + \tau(t) \alpha/2 \| \phi \|_{C^\infty \alpha-2(\rho)} + \lambda \| \tau^{(1+\alpha)/2} \phi \|_{C^\infty \alpha(\rho)}.
\]
Hence we may divide by \( \tau^{\alpha/2} \) to obtain
\[
\| \tau^{1/2} \phi(t) \|_{L^\infty(\rho)} \lesssim \| \phi(0) \|_{C^\infty \alpha-1(\rho)} + \| \tau^{(1+\alpha)/2} \phi \|_{C^\infty \alpha-2(\rho)} + \lambda \| \tau^{(1+\alpha)/2} \phi \|_{C^\infty \alpha(\rho)}.
\]
Taking supremum in time and applying (9.3) leads to
\[
\| \phi \|_{L^\infty L^\infty(\tau/2)^{\alpha}} \lesssim \| \phi(0) \|_{C^\infty \alpha-1(\rho)} + \lambda \| \phi \|_{L^\infty L^\infty(\tau/2)^{\alpha}} + \| \Phi \|_{C^\infty \alpha(\tau(1+\alpha)/2)^{\alpha}}.
\]
Hence we can absorb the second term on the right hand side into the left hand side by choosing \( \lambda \) sufficiently small. Therefore, according to our construction of the initial datum \( \phi(0) \), namely due to (9.1), and (9.2), (9.3) we obtain
\[
\| \phi \|_{L^\infty L^\infty(\tau/2)^{\alpha}} + \| \phi \|_{C^\infty \alpha(\tau(1+\alpha)/2)^{\alpha}} \lesssim 1
\]
uniformly in the initial condition. Next, we apply Lemma 9.5 again, use the above $L^\infty$-bound for $\phi$ together with estimates similar to Section 5.4 to obtain for some $\varepsilon \in (0, 1)$

$$\|\phi\|_{C^{\gamma}} \lesssim 1 + \|\Phi\|_{C^{\gamma-\alpha}} \lesssim 1 + \|\psi\|_{C^{\infty}(\tau^{1/2\rho})}. \quad (9.4)$$

As in Section 7, the next step is a paracontrolled ansatz for $\phi$. Here we have to be more careful due to the weight $\tau$. More precisely, we introduce a modified paracontrolled ansatz according to the formula

$$\phi = \tilde{\phi} - \tau^{-\frac{1+\alpha}{2+\alpha}} (3\tau^{\frac{1+\alpha}{2+\alpha}} (-X^Y + \phi + \psi)) \ll X^Y \quad (9.5)$$

where $\nu > 0$ will be chosen later. This leads us to

$$0 = \mathcal{L}\tilde{\phi} + \mathcal{L}\psi - \left(\tau^{-\frac{1+\alpha}{2+\alpha}} \left(3\tau^{\frac{1+\alpha}{2+\alpha}} (-X^Y + \phi + \psi)\right) \ll [X^2] \right) - 3(-X^Y + \phi + \psi) \ll [X^2]$$

$$+ 3\|X^2\| \ll (-X^Y + \phi + \psi)$$

$$- \left(\mathcal{L} \left[\tau^{-\frac{1+\alpha}{2+\alpha}} \left(3\tau^{\frac{1+\alpha}{2+\alpha}} (-X^Y + \phi + \psi)\right) \ll [X^Y]\right) \right) - \tau^{-\frac{1+\alpha}{2+\alpha}} \left(3\tau^{\frac{1+\alpha}{2+\alpha}} (-X^Y + \phi + \psi)\right) \ll [X^2]\right))$$

$$+ 3X(-X^Y + \phi + \psi)^2 + (-X^Y + \phi + \psi)^3 + 3b\varphi$$

as a replacement of (7.3). Similarly to Section 7, we obtain $\mathcal{L}\tilde{\phi} + \tilde{\Theta} = 0$ with $\tilde{\phi}(0) = \phi(0)$ and where $\tilde{\Theta}$ differs from $\Theta$ only in the two commutators above, which we denote by $\text{com}_1$, $\text{com}_2$ according to their order of appearance.

Recall that in Section 5 and Section 7, a suitable bound for $\tilde{\phi}$ was only needed in order to control the term $[X^2] \circ \tilde{\phi}$ in the equation for $\psi$. To this end, the choice of the weight $\rho^{2+\alpha}$ in Section 5.5 was rather arbitrary, which has already been observed in Section 7. Indeed, in order to control $[X^2] \circ \tilde{\phi} \in C^{\gamma}(\rho^{3+\gamma})$ (cf. Section 5.6) it is sufficient to bound $\tilde{\phi}$ in $C^{\gamma+\alpha}(\rho^{3+\gamma})$ for some $0 < \gamma' < \gamma$. Similarly to Section 7, we make use of this flexibility here: our goal is to apply Lemma 9.5 in order to estimate $\tilde{\phi}$ in $C^{\gamma+\alpha}(\rho^{3+\gamma})$. This higher weight will allow us to control the term coming from $\Psi$ in the bound for time regularity below, see (9.6).

Let us first estimate the new commutators appearing in $\tilde{\Theta}$. We rewrite the first commutator as

$$\text{com}_1 = \tau^{-\frac{1+\alpha}{2+\alpha}} \left(3\tau^{\frac{1+\alpha}{2+\alpha}} (-X^Y + \phi + \psi) \ll [X^2]\right) - 3\tau^{\frac{1+\alpha}{2+\alpha}} (-X^Y + \phi + \psi) \ll [X^2]\right),$$

and observe that by Lemma 2.18 it can be estimated in $C^{\gamma+\alpha}(\rho^{3+\gamma'})$, using the time regularity of $\tau^{\frac{1+\alpha}{2+\alpha}} (-X^Y + \phi + \psi)$, provided we can control the blow-up in time by a suitable power of the $\tau$ weight. Hence, in view of Lemma 9.5 (with $\beta_i = 0$), which we aim to apply in order to gain the required regularity of $\tilde{\phi}$, we estimate (provided $2 + \alpha \geq 1 + \nu$)

$$\|\text{com}_1\|_{C^{\gamma+\alpha}(\rho^{3+\gamma'})} \lesssim \|\tau^{\frac{1+\alpha}{2+\alpha}} (-X^Y + \phi + \psi) \ll [X^2] - 3\tau^{\frac{1+\alpha}{2+\alpha}} (-X^Y + \phi + \psi) \ll [X^2]\|_{C^{\gamma+\alpha}(\rho^{3+\gamma'})} \lesssim 1 + \|\tau^{\frac{1+\alpha}{2+\alpha}} (\phi + \psi)\|_{C^{\alpha+\nu}(\rho^{3+\gamma''})}$$

54
for some $0 < \gamma'' < \gamma'$. For the second commutator, it holds
\[
\text{com}_2 = -\frac{1 + \nu}{2} \tau^{-\frac{1 + \nu}{2}}(1 - \tau) \left( 3\tau^{-\frac{1 + \nu}{2}}(-X^\varphi + \phi + \psi) + \mathcal{X}^\varphi \right)
\]
\[
+ \tau^{-\frac{1 + \nu}{2}} \left[ \mathcal{L} \left( 3\tau^{-\frac{1 + \nu}{2}}(-X^\varphi + \phi + \psi) \right) - \mathcal{X}^\varphi =: \text{com}_{21} + \text{com}_{22} .
\]

The first term can be estimated in $\mathcal{C}^{1-\kappa}$ with a suitable weight. Hence Lemma 9.5 allows us to compensate for the blow up in $\tau$. More precisely, for this term we apply Lemma 9.5 with $\beta_i = 2 - \kappa - \alpha$ to obtain (provided $4 - \kappa \geq 3 + \nu$)
\[
\|\tau^{(2-\kappa-\alpha)/2} \text{com}_{21}\|_{\mathcal{C}^{1-\kappa}((\tau + 2\alpha)/2, \rho^{3+\gamma})}
\leq \|\left( \tau^{-\frac{1 + \nu}{2}}(-X^\varphi + \phi + \psi) \right) - \mathcal{X}^\varphi \|_{\mathcal{C}^{1-\kappa}(\rho^{3+\gamma'})} \leq 1 + \|\tau^{1/2}(\phi + \psi)\|_{L^\infty L^\infty(\rho)}.
\]

The second term can be estimated using Lemma 2.18 in $\mathcal{C}^{1-\alpha}((\rho^{3+\gamma'})$. So we again apply Lemma 9.5 with $\beta_i = 0$ to deduce (since $2 + \alpha \geq 1 + \nu$)
\[
\|\text{com}_{22}\|_{\mathcal{C}^{1-\alpha}(\tau^{(2+\alpha)/2}, \rho^{3+\gamma'})}
\leq 1 + \left( \tau^{-\frac{1 + \nu}{2}}(\phi + \psi) \right)_{\mathcal{C}(\alpha+\gamma)/2 L^\infty(\rho^{3+\gamma'})} + \left( \tau^{-\frac{1 + \nu}{2}}(\phi + \psi) \right)_{\mathcal{C}(\alpha+\gamma)/2 L^\infty(\rho^{3+\gamma'})}.
\]

All the other terms in $\hat{\varrho}$ can be estimated as in Section 7, or more precisely pointwise in time by the approach of in Section 5.5. To summarize, Lemma 9.5 gives
\[
\|\hat{\varrho}\|_{\mathcal{C}^{1+\alpha}(\tau^{(2+\alpha)/2}, \rho^{3+\gamma'})} \leq \|\hat{\varrho}\|_{\mathcal{C}^{1+\alpha}(\tau^{(3+4\alpha)/2}, \rho^{3+\gamma'})} + 1
\]
\[
+ \left( \tau^{-\frac{1 + \nu}{2}}(-X^\varphi + \phi + \psi) \right)_{\mathcal{X}^\varphi} \leq \left( \tau^{-\frac{1 + \nu}{2}}(-X^\varphi + \phi + \psi) \right)_{\mathcal{X}^\varphi} + \left( \tau^{-\frac{1 + \nu}{2}}(\phi + \psi) \right)_{\mathcal{X}^\varphi} + \left( \tau^{-\frac{1 + \nu}{2}}(\phi + \psi) \right)_{\mathcal{X}^\varphi}.
\]

where the only term requiring some time regularity is the second last one. This is the reason we introduced the modified $\varrho$. In order to estimate the first term on the right hand side, we use the definition of $\hat{\varrho}$ in (9.5) together with (9.4) to obtain (provided $3/2 + \alpha \geq 1 + \nu$)
\[
\|\hat{\varrho}\|_{\mathcal{C}^{1+\alpha}(\tau^{(3+4\alpha)/2}, \rho^{3+\gamma'})} \leq \|\hat{\varrho}\|_{\mathcal{C}^{1+\alpha}(\tau^{(3+4\alpha)/2}, \rho^{3+\gamma'})} + 1
\]
\[
+ \left( \tau^{-\frac{1 + \nu}{2}}(3[\tau^{-\frac{1 + \nu}{2}}(-X^\varphi + \phi + \psi)] - \mathcal{X}^\varphi) \right)_{\mathcal{X}^\varphi} \leq \left( \tau^{-\frac{1 + \nu}{2}}(3[\tau^{-\frac{1 + \nu}{2}}(-X^\varphi + \phi + \psi)] - \mathcal{X}^\varphi) \right)_{\mathcal{X}^\varphi} + \left( \tau^{-\frac{1 + \nu}{2}}(\phi + \psi) \right)_{\mathcal{X}^\varphi}.
\]

Finally, it only remains to establish the time regularity of $\tau^{(1+\nu)/2}(\phi + \psi)$. A time-interpolation as in Lemma 2.3 together with the Schauder estimates from Lemma 9.6 (choosing the right regularity for each contributions and gaining powers of $\tau$) yields for $\nu \in (0, 1)$
\[
\tau^{-\frac{1 + \nu}{2}}(\phi + \psi)_{\mathcal{X}^\varphi} \leq \tau^{-\frac{1 + \nu}{2}}(\phi + \psi)_{\mathcal{X}^\varphi} + \tau^{\frac{1 + \nu}{2}}(\phi + \psi)_{\mathcal{X}^\varphi}.
\]
\[ \left\| \phi + \psi \right\|_{L^\infty((\tau^{1/2})^\rho)} + \delta \left\| \tau^{\frac{1}{2+\alpha}} (\phi + \psi) \right\|_{C^\infty_{\gamma}(\rho^{3+\gamma})} + \delta \left\| \tau^{\frac{1}{2+\alpha}} L (\phi + \psi) \right\|_{C^\infty_{\gamma-3/2+\alpha}(\rho^{3+\gamma})} \]

\[ \leq \left\| \phi + \psi \right\|_{L^\infty((\tau^{1/2})^\rho)} + \delta \left\| \tau^{\frac{1}{2+\alpha}} (\phi + \psi) \right\|_{C^\infty_{\gamma}(\rho^{3+\gamma})} + \delta \left\| \tau^{\frac{1}{2+\alpha}} \Phi \right\|_{C^\infty_{\gamma-3/2+\alpha}(\rho^{3+\gamma})} + \delta \left\| \tau^{\frac{1}{2+\alpha}} \Phi \right\|_{C^\infty_{\gamma-3/2+\alpha}(\rho^{3+\gamma})}, \]

(9.6)

In fact, the small factor \( \delta \) will only be needed to control \( \Psi \) as it in turn also requires time regularity of \( \tau^{(1+\nu)/2} (\phi + \psi) \) which needs to be absorbed into the left hand side (cf. (7.5)). Hence taking \( \nu = 1/2 + \alpha \) we get (for a suitable choice of the parameters \( \alpha, \kappa \))

\[ \left\| \tau^{\frac{1}{2+\alpha}} (\phi + \psi) \right\|_{C^\infty_{\gamma}(\tau^{1/2})^\rho} \leq \left\| \phi + \psi \right\|_{L^\infty((\tau^{1/2})^\rho)} + \left\| \phi + \psi \right\|_{C^\infty_{\gamma-1/2+\alpha}(\tau^{3/4+\alpha/2} \rho^{3/2+\alpha})} + \delta \left\| \tau^{\frac{1}{2+\alpha}} \Phi \right\|_{C^\infty_{\gamma-3/2+\alpha}(\rho^{3+\gamma})}. \]

On the other hand, the same estimates as in Section 7 (with further details in Section 5.6) lead to

\[ \left\| \Psi \right\|_{C^\infty_{\gamma}(\tau^{3+\gamma/2})^\rho} \leq \left\| \Psi \right\|_{C^\infty_{\gamma+1/2}(\tau^{3+\gamma/2} \rho^{3+\gamma})} + \left\| \tilde{\psi} \right\|_{C^\infty_{\gamma+1/2}(\tau^{3+\gamma/2} \rho^{3+\gamma})} + \left\| \tilde{\psi} \right\|_{L^\infty((\tau^{1/2})^\rho)} + \left\| \tilde{\psi} \right\|_{L^\infty((\tau^{1/2})^\rho)} + 1 + \left\| \tau^{\frac{1}{2+\alpha}} (\phi + \psi) \right\|_{C^\infty_{\gamma}(\tau^{3+\gamma/2} \rho^{3+\gamma})}, \]

which together with the bound for \( \tilde{\psi} \), \( \phi \) above and choosing \( \delta \) sufficiently small allows to control the time regularity as follows

\[ \left\| \tau^{\frac{1}{2+\alpha}} (\phi + \psi) \right\|_{C^\infty_{\gamma}(\tau^{1/2})^\rho} \leq 1 + \left\| \tilde{\psi} \right\|_{L^\infty((\tau^{1/2})^\rho)} + \left\| \tilde{\psi} \right\|_{L^\infty((\tau^{1/2})^\rho)} + \left\| \tilde{\psi} \right\|_{C^\infty_{\gamma}(\tau^{3+\gamma/2})^\rho} + \left\| \tilde{\psi} \right\|_{C^\infty_{\gamma}(\tau^{3+\gamma/2})^\rho}. \]

This can be employed again in Lemma 9.7 to get

\[ \left\| \tilde{\psi} \right\|_{C^\infty_{\gamma}(\tau^{3+\gamma/2})^\rho} \leq 1 + \left\| \tilde{\psi} \right\|_{L^\infty((\tau^{1/2})^\rho)} + \left\| \tilde{\psi} \right\|_{C^\infty_{\gamma}(\tau^{3+\gamma/2})^\rho}. \]

As a consequence using also the weighted coercive estimate in Lemma 9.8 we can close our estimates (exactly as in Section 7) and deduce that

\[ \phi \in C^\infty(\tau^{1/2}), \quad \phi \in C^\infty(\tau^{1/2} \rho^{3+\gamma}), \quad \tilde{\psi} \in C^\infty(\tau^{2+\gamma/2}) \rho^{3+\gamma}, \quad \psi \in C^\infty(\tau^{1/2} \rho^{3+\gamma}) \cap L^\infty(\tau^{1/2} \rho). \]

Since all the weighted data is zero at time zero, the estimates we obtain are uniform in the initial conditions. □
A Auxiliary PDE results

Here we show an auxiliary existence results needed in the main body of the paper.

**Proposition A.1** Let $\Psi \in C^\gamma(T^d)$ for some $\gamma \in (0,1)$. There exists $\psi \in C^{2+\gamma}(T^d)$ which is a unique classical solution

$$\mathcal{D} \psi + \psi^3 + \Psi = 0. \quad (A.1)$$

**Proof** The energy functional associated to the second equation in (A.1) reads as

$$I(u) = \frac{1}{2} \int_{T^d} |\nabla u|^2 \, dx + \frac{\mu}{2} \int_{T^d} |u|^2 \, dx + \frac{1}{4} \int_{T^d} |u|^4 \, dx + \int_{T^d} \Psi u \, dx.$$ 

It is differentiable on $W^{1,2}(T^d) \cap L^4(T^d)$ and

$$I'(u)v = \int_{T^d} \nabla u \cdot \nabla v \, dx + \mu \int_{T^d} uv \, dx + \int_{T^d} u^3 v \, dx + \int_{T^d} \Psi v \, dx.$$ 

For $u, v \in W^{1,2}(T^d) \cap L^4(T^d)$ it holds

$$(I'(u) - I'(v))(u - v) = \int_{T^d} \nabla (u-v) \cdot \nabla (u-v) \, dx + \mu \int_{T^d} (u-v)(u-v) \, dx + \int_{T^d} (u^3-v^3)(u-v) \, dx$$

$$= \|\nabla (u-v)\|^2_{L^2(T^d)} + \mu \|u-v\|^2_{L^2(T^d)} + \int_{T^d} (u-v)^2 (u^2 + uv + v^2) \geq 0$$

since $\mu > 0$ and $u^2 + uv + v^2 \geq 0$. In addition, if $u \neq v$ the above is strictly positive and therefore $I$ is strictly convex on $W^{1,2}(T^d) \cap L^4(T^d)$ according to [BS11, Proposition 1.5.10]. Moreover, it holds

$$I(u) \geq \frac{1}{2} \|\nabla u\|^2_{L^2(T^d)} + \frac{\mu}{2} \|u\|^2_{L^2(T^d)} + \frac{1}{4} \|u\|^4_{L^4(T^d)} - \|\Psi\|_{L^2(T^d)} \|u\|_{L^2(T^d)}$$

$$\geq \frac{1}{2} \|\nabla u\|^2_{L^2(T^d)} + \frac{\mu}{2} \|u\|^2_{L^2(T^d)} + \frac{1}{4} \|u\|^4_{L^4(T^d)} - c \|u\|_{L^2(T^d)}$$

and consequently $I$ is coercive on $W^{1,2}(T^d) \cap L^4(T^d)$. Finally, if $u_n \to u$ in $W^{1,2}(T^d) \cap L^4(T^d)$ then $I(u_n) \to I(u)$ and hence $I$ is continuous on $W^{1,2}(T^d) \cap L^4(T^d)$. Therefore, it follows from [BS11, Theorem 1.5.6, Theorem 1.5.8] that $I$ has a unique minimum and as a consequence (A.1) possesses a unique weak solution in $W^{1,2}(T^d) \cap L^4(T^d)$.

Next, we show that $\|\psi\|_{L^\infty(T^d)} \leq \|\Psi\|_{L^\infty(T^d)}^{1/3}$. To this end, let $R > 0$ be such that $R^3 = \|\Psi\|_{L^\infty(T^d)}$ and test the equation by $(\psi - R)_+$ to obtain

$$- \int_{T^d} (\psi - R)_+ \Delta \psi \, dx + \mu \int_{T^d} (\psi - R)_+ \psi \, dx + \int_{T^d} (\psi - R)_+ \psi^3 \, dx = \int_{T^d} (\psi - R)_+ \Psi \, dx.$$ 

We rewrite this equation as

$$- \int_{T^d} (\psi - R)_+ \Delta \psi \, dx + \mu \int_{T^d} (\psi - R)_+ \psi \, dx + \int_{T^d} (\psi - R)_+ (\psi^3 - R^3) \, dx$$

$$= \int_{T^d} (\psi - R)_+ (\Psi - R^3) \, dx \quad (A.2)$$
and estimate all the terms. The first term on the left hand side is nonnegative due to integration by parts
\[- \int_{\mathbb{T}^d} (\psi - R) \Delta \psi \, dx = \int_{\mathbb{T}^d} |\nabla (\psi - R)|^2 \, dx \geq 0.\]

As \( \mu > 0 \), the linear term on the left hand side is nonnegative and the cubic term is also nonnegative since \( \psi \geq R \) implies \( \psi^3 \geq R^3 \). Since also \( \Psi \leq R^3 \) due to the definition of \( R \), the first term on the right hand side of (A.2) is nonpositive. Hence we deduce that
\[ \int_{\mathbb{T}^d} (\psi - R) \psi \, dx \leq 0 \]
which further implies \( \psi \leq R \). Applying the same approach to \( -\psi \) yields \( \psi \geq -R \) and the claim is proved.

Now, we include the cubic term \( \psi^3 \) into the right hand side and apply the Schauder estimates from [Tri06, (1.7)]. We obtain
\[ \|\psi\|_{W^{2,p}(\mathbb{T}^d)} \lesssim \|(-\Delta + \mu)^{\frac{3}{2}}\psi\|_{L^p(\mathbb{T}^d)} \lesssim \|\psi^3\|_{L^p(\mathbb{T}^d)} + \|\Psi\|_{L^p(\mathbb{T}^d)}, \]
which is finite for all \( p \in [1, \infty) \). It follows that also \( \psi^3 \in W^{2,p}(\mathbb{T}^d) \) and due to the embedding \( W^{2,p}(\mathbb{T}^d) = F^{2/\delta}_p(\mathbb{T}^d) \hookrightarrow B^{2-\delta}_\infty(\mathbb{T}^d) \) which holds true for all \( \delta > 0 \) by choosing \( p \in [1, \infty) \) sufficiently large (see [Tri06, (1.3), (1.299), (1.305)]), we obtain that \( \psi^3 \in \mathcal{C}^{2,\gamma}(\mathbb{T}^d) \). Thus, the Schauder estimates [Tri06, (1.6)] imply
\[ \|\psi\|_{\mathcal{C}^{2,\gamma}(\mathbb{T}^d)} \lesssim \|(-\Delta + \mu)^{\frac{3}{2}}\varphi\|_{\mathcal{C}^{2,\gamma}(\mathbb{T}^d)} \lesssim \|\psi^3\|_{\mathcal{C}^{2,\gamma}(\mathbb{T}^d)} + \|\Psi\|_{\mathcal{C}^{2,\gamma}(\mathbb{T}^d)}. \]
Therefore, \( \psi \) is a classical solution to (A.1) and belongs to \( \mathcal{C}^{2,\gamma}(\mathbb{T}^d) \). \( \square \)

**Proposition A.2** Let \( T > 0 \), \( a \in C^\infty([0,T]) \), \( \xi \in C^\infty([0,T] \times \mathbb{T}^d) \) and \( \varphi_0 \in C^\infty(\mathbb{T}^d) \). There exists \( \varphi \in C^\infty([0,T] \times \mathbb{T}^d) \) which is the unique classical solution to
\[(\partial_t - \Delta)\varphi + a\varphi + \varphi^3 - \xi = 0, \quad \varphi(0) = \varphi_0. \quad (A.3) \]

**Proof** The existence of a unique weak solution to (A.3) for initial conditions in \( L^2(\mathbb{T}^d) \) is classical and follows from monotonicity arguments applied within the Gelfand triplet
\[ [W^{1,2}(\mathbb{T}^d) \cap L^4(\mathbb{T}^d)] \hookrightarrow L^2(\mathbb{T}^d) \hookrightarrow [W^{1,2}(\mathbb{T}^d) \cap L^4(\mathbb{T}^d)]^*. \]
The resulting weak solution \( \varphi \) satisfies \( \varphi \in C_T L^2(\mathbb{T}^d) \cap L^4_T W^{1,2}(\mathbb{T}^d) \cap L^4_T L^4(\mathbb{T}^d) \).

We test (A.3) by \( \varphi^{2p-1} \) and apply the weighted Young inequality to obtain
\[
\begin{align*}
\frac{1}{2p} \int_{\mathbb{T}^d} |\varphi|^{2p} \, dx + (2p - 1) \int_{\mathbb{T}^d} |\varphi|^{2p-2} |\nabla \varphi|^2 \, dx + \int_{\mathbb{T}^d} |\varphi|^{2p+2} \, dx & \leq \int_{\mathbb{T}^d} \varphi^{2p-1} \xi \, dx + \|a\|_{L^\infty} \int_{\mathbb{T}^d} |\varphi|^{2p} \, dx \\
& \leq \kappa \int_{\mathbb{T}^d} |\varphi|^{2p+2} \, dx + c_{\kappa,p} \int_{\mathbb{T}^d} \xi^p \, dx + \|a\|_{L^\infty} \int_{\mathbb{T}^d} |\varphi|^{2p} \, dx
\end{align*}
\]

58
for every $\kappa \in (0, 1)$. Hence the Gronwall Lemma implies
\[
\frac{1}{2p} \int_{T^d} |\varphi|^{2p} \, dx + (2p - 1) \int_{T^d} |\varphi|^{2p-2} |\nabla \varphi|^2 \, dx + \int_{T^d} |\varphi|^{2p+2} \, dx \leq c_{T,p}
\]
and $\varphi \in L^\infty_T L^{2p}(T^d)$ for every $p \in \mathbb{N}$. By interpolation, we deduce that $\varphi^3 \in L^\infty_T L^p(T^d)$ for all $p \in [1, \infty)$. Hence we may include the term $\varphi^3 + a \varphi$ to the right hand side and apply a classical regularity result as for instance recalled in [DdMH15, Theorem 3.1] to deduce that there exists $\alpha \in (0, 1)$ and $p \in [1, \infty)$ such that
\[
\|\varphi\|_{C^{\alpha/2,\alpha}} \lesssim \|\varphi_0\|_{C^{\alpha/2}(T^d)} + \|a \varphi\|_{L^\infty_T L^p(T^d)} + \|\varphi^3\|_{L^p_T L^p(T^d)} + \|\xi\|_{L^\infty_T L^p(T^d)} \leq c_{\mu},
\]
where $C^{\alpha/2,\alpha} = C^{\alpha/2,\alpha}([0,T] \times T^d)$ denotes the parabolic Hölder space, that is, the Hölder space of order $\alpha$ with respect to the parabolic distance $d((t, x), (s, y)) = \max\{|t-s|^{1/2}, |x-y|\}$. It is given by the norm
\[
\|f\|_{C^{\alpha/2,\alpha}} = \sup_{(t,x)} |f(t,x)| + \sup_{(t,x) \neq (s,y)} \frac{|f(t,x) - f(s,y)|}{\max\{|t-s|^{\alpha}, |x-y|^{\beta}\}}.
\]
Thus, it follows that $\varphi^3 \in C^{\alpha/2,\alpha}$ and [DdMH15, Theorem 3.4] yields that
\[
\|\varphi\|_{C^{(\alpha+2)/2,\alpha+2}} \lesssim_{\mu} \|\varphi_0\|_{C^{\alpha/2}(T^d)} + \|a \varphi\|_{C^{\alpha/2,\alpha}} + \|\varphi^3\|_{C^{\alpha/2,\alpha}} + \|\xi\|_{C^{\alpha/2,\alpha}} \leq c_{\mu},
\]
where the parabolic Hölder space $C^{(\alpha+k)/2,\alpha+k} = C^{(\alpha+k)/2,\alpha+k}([0,T] \times T^d)$ for $\alpha \in (0, 1)$ and $k \in \mathbb{N}$ is given by the norm
\[
\|f\|_{C^{(\alpha+k)/2,\alpha+k}} = \sum_{\gamma \in \mathbb{N}_0, \sum |\gamma| \leq k} \|\partial_\gamma f\|_{C^{\alpha/2,\alpha}}.
\]
Since $\xi \in C^\infty([0,T] \times T^d)$, we may repeat the application of [DdMH15, Theorem 3.4] or also [LSU68, Chapter IV, Theorem 5.2] to finally conclude that $\varphi_\varepsilon \in C^\infty([0,T] \times T^d)$. \hfill $\square$

In the following result we regard functions on $T^d_{1/\varepsilon}$ as periodic functions defined on the full space $\mathbb{R}^d$.

**Corollary A.3** Let $\rho$ be a space-time weight and let $\xi \in C^\infty([0, \infty) \times T^d)$ be such that $\xi \in C^\infty(\rho^{3+\kappa}) \cap L^\infty L^\infty(\rho^3)$ and $a \in C^\infty([0, \infty)) \cap C_1^1((0, \infty))$. Let $\varphi \in C^\infty([0, \infty) \times T^d)$ be the corresponding unique solution to (A.3) constructed in Proposition A.2. Then $\varphi \in C^{\infty}(\rho^{3+\kappa}) \cap C^{1} L^\infty(\rho^{3+\kappa}) \cap L^\infty L^\infty(\rho)$.

**Proof** The space and time regularity follows from Lemma 2.11. The proof of the $L^\infty$-bound can be obtained by the same argument as in Lemma 2.12 applied on a finite interval $[0,T]$ and then sending $T \to \infty$, since the proportionality constant does not depend on $T$. \hfill $\square$

**B** Refined Schauder estimates

Here we establish a preliminary a priori bound which is needed in Lemma 9.5. Recall that $\tau$ is the time weight given by $\tau(t) = 1 - e^{-t}$.
Lemma B.1 For any $\alpha \in \mathbb{R}$ and $\beta \in [0, 2)$ we have
\[
\|v\|_{C^2}^{2+\alpha} \lesssim \|\tau^{\beta/2} Lv\|_{C^{\alpha+\beta}}
\]
provided $v(0) = 0$.

Proof Let $f = (\partial_t + \mu - \Delta)v$ and recall that we denoted by $P_t = e^{t(\Delta - \mu)}$ the semigroup of operators generated by $\Delta - \mu$. Since $v(0) = 0$ it holds
\[
\|\Delta_k v(t)\|_{L^\infty} \lesssim \int_0^t \|\Delta_k P_{t-s} f(s)\|_{L^\infty} ds.
\]
Fix $k \geq -1$. If $4 \geq t \geq 2^{-2k}$ we proceed to bound this quantity as follows
\[
\|\Delta_k v(t)\|_{L^\infty} \lesssim 2^{-k(2+2+2k)} \int_0^{t-2^{-2k}} (t-s)^{\beta/2-1+\epsilon} \tau(s)^{-\beta/2} \|\tau^{\beta/2} f(s)\|_{C^{\alpha+\beta}} ds
\]
\[+2^{-k(\alpha+\beta)} \int_{t-2^{2k}}^t \tau(s)^{-\beta/2} \|\tau^{\beta/2} f(s)\|_{C^{\alpha+\beta}} ds
\]
\[\lesssim 2^{-k(2+2+2k)} \int_0^{t-2^{-2k}} (t-s)^{\beta/2-1+\epsilon} \tau(s)^{-\beta/2} ds \|\tau^{\beta/2} f\|_{C^{\alpha+\beta}}
\]
\[+2^{-k(\alpha+\beta)} \int_{t-2^{2k}}^t \tau(s)^{-\beta/2} ds \|\tau^{\beta/2} f\|_{C^{\alpha+\beta}}
\]
\[\lesssim 2^{-k(2+2+2k)} \int_0^{t-2^{-2k}} (t-s)^{\beta/2-1+\epsilon} s^{-\beta/2} ds \|\tau^{\beta/2} f\|_{C^{\alpha+\beta}}
\]
\[+2^{-k(\alpha+\beta)} \int_{t-2^{2k}}^t s^{-\beta/2} ds \|\tau^{\beta/2} f\|_{C^{\alpha+\beta}}.
\]
For the first integral we obtain
\[
\int_0^{t-2^{-2k}} (t-s)^{\beta/2-1+\epsilon} s^{-\beta/2} ds
\]
\[\lesssim \int_{t/2}^{t-2^{-2k}} (t-s)^{\beta/2-1+\epsilon} s^{-\beta/2} ds + \int_0^{t/2} (t-s)^{\beta/2-1+\epsilon} s^{-\beta/2} ds
\]
\[\lesssim t^{-\beta/2} \int_{t/2}^{t-2^{-2k}} (t-s)^{\beta/2-1+\epsilon} ds + t^{-\epsilon} \int_0^{t/2} (1-s)^{\beta/2-1+\epsilon} s^{-\beta/2} ds
\]
\[\lesssim t^{-\beta/2} 2^{2k(\epsilon-\beta/2)} + 2^{2k\epsilon} \lesssim 2^{2k\epsilon},
\]
whereas for the second one
\[
\int_{t-2^{-2k}}^t s^{-\beta/2} ds \lesssim 2^{-2k(t-\beta/2)} \lesssim 2^{-2k(1-\beta/2)}.
\]
Hence, this leads to the desired bound
\[
\|\Delta_k v(t)\|_{L^\infty} \lesssim 2^{-k(2+\alpha)} \|\tau^{\beta/2} f\|_{C^{\alpha+\beta}}.
\]
If $0 < t \leq 2^{-2k}$ then
\[
\|\Delta_k v(t)\|_{L^\infty} \lesssim \int_0^t \|\Delta_k P_{t-s} f(s)\|_{L^\infty} ds \lesssim 2^{-k(\alpha + \beta)} \int_0^t \tau(s)^{-\beta/2} ds \|\tau^\beta/2 f\|_{C^{\alpha + \beta}}
\]
\[
\lesssim 2^{-k(\alpha + \beta)} t^{1-\beta/2} \|\tau^\beta/2 f\|_{C^{\alpha + \beta}} \lesssim 2^{-k(\alpha + \beta)} 2^{-2k(1-\beta/2)} \|\tau^\beta/2 f\|_{C^{\alpha + \beta}}
\]
\[
\lesssim 2^{-k(2+\alpha)} \|\tau^\beta/2 f\|_{C^{\alpha + \beta}}.
\]
Finally, for $t > 4$ we write
\[
\|\Delta_k v(t)\|_{L^\infty} \lesssim \int_0^{1/2} \|\Delta_k P_{t-s} f(s)\|_{L^\infty} ds + \int_{1/2}^t \|\Delta_k P_{t-s} f(s)\|_{L^\infty} ds = I_1 + I_2,
\]
and estimate
\[
I_1 \lesssim 2^{-k(2+\alpha)} \int_0^{1/2} (t-s)^{\beta/2-1} \tau(s)^{-\beta/2} ds \|\tau^\beta/2 f\|_{C^{\alpha + \beta}}
\]
\[
\lesssim 2^{-k(2+\alpha)} \int_0^{1/2} s^{-\beta/2} ds \|\tau^\beta/2 f\|_{C^{\alpha + \beta}} \lesssim 2^{-k(2+\alpha)} \|\tau^\beta/2 f\|_{C^{\alpha + \beta}},
\]
\[
I_2 \lesssim \int_{1/2}^t \|\tau^\beta/2 \Delta_k P_{t-s} f(s)\|_{L^\infty} ds \lesssim 2^{-k(2+\alpha)} \|\tau^\beta/2 f\|_{C^{\alpha + \beta}},
\]
where the last term was estimated as in the standard Schauder estimates. The conclusion follows.

\[\blacksquare\]
