The $L_p$-$L_q$ decay estimate for the multidimensional compressible flow with free surface in the exterior domain

Yoshihiro Shibata ∗and Xin Zhang †

January 26, 2021

Abstract

The aim of this paper is to develop the general $L_p$ theory for the barotropic compressible Navier-Stokes equations with the free boundary condition in the exterior domain in $\mathbb{R}^N$ ($N \geq 3$). By the spectral analysis, we obtain the classical $L_p$-$L_q$ decay estimate for the linearized model problem (with variable coefficients) in view of the partial Lagrangian transformation.

1 Introduction

1.1 Model

The motion of viscous gases in some moving exterior domain $\Omega_t \subset \mathbb{R}^N$ ($N \geq 3$) is described by the following barotropic compressible Navier-Stokes equations with the free boundary condition:
\[
\begin{aligned}
\partial_t \rho + \text{div} \left((\rho_e + \rho)\mathbf{v}\right) &= 0 \quad \text{in} \quad \bigcup_{0<t<T} \Omega_t \times \{t\} , \\
(\rho_e + \rho)(\partial_t \mathbf{v} + \mathbf{v} \cdot \nabla \mathbf{v}) - \text{Div} (\mathbf{S} - P(\rho_e + \rho) \mathbf{I}) &= 0 \quad \text{in} \quad \bigcup_{0<t<T} \Omega_t \times \{t\} , \\
(\mathbf{S} - P(\rho_e + \rho) \mathbf{I}) \mathbf{n}_t &= P(\rho_e) \mathbf{n}_t , \quad \mathbf{V}_t = \mathbf{v} \cdot \mathbf{n}_t \\
& \text{on} \quad \bigcup_{0<t<T} \Gamma_t \times \{t\} .
\end{aligned}
\]

(1.1)

Given the reference mass density $\rho_e > 0$ and the initial condition
\[
(\rho, \mathbf{v}, \Omega_t)|_{t=0} = (\rho_0, \mathbf{v}_0, \Omega) , \quad (1.2)
\]

we need to determine the unknown mass density $\rho + \rho_e$, velocity field $\mathbf{v} = (v_1, \ldots, v_N)^T$, and the moving exterior domain $\Omega_t$. In (1.1), the Cauchy stress tensor
\[
\mathbf{S}(\mathbf{v}) = \mu \mathbf{D}(\mathbf{v}) + (\nu - \mu) \text{div} \mathbf{v} \mathbf{I}
\]

for constants $\mu, \nu > 0$,

and the doubled deformation tensor $\mathbf{D}(\mathbf{v}) = \nabla \mathbf{v} + (\nabla \mathbf{v})^T$. Here, the $(i, j)$th entry of the matrix $\nabla \mathbf{v}$ is $\partial_i v_j$, $\mathbf{I}$ is the $N \times N$ identity matrix, and $\mathbf{M}^\top$ is the transposed the matrix $\mathbf{M} = [M_{ij}]$. In addition, $\text{Div} \mathbf{M}$ denotes an $N$-vector of functions whose $i$-th component is $\sum_{j=1}^N \partial_j M_{ij}$, $\text{div} \mathbf{v} = \sum_{j=1}^N \partial_j v_j$, and $\mathbf{v} \cdot \nabla = \sum_{j=1}^N v_j \partial_j$ with $\partial_j = \partial / \partial x_j$.

For the last equation in (1.1), $\mathbf{n}_t$ is the outer unit normal vector to the boundary $\Gamma_t$ of $\Omega_t$, and $\mathbf{V}_t$ stands for the normal velocity of the moving surface $\Gamma_t$. Moreover, the pressure law $P(\cdot)$ is a smooth function defined on $\mathbb{R}_+$. In fact, $P(\rho_e)$ coincides with the pressure of the atmosphere.

The long time issue for the compressible Navier-Stokes equations in $\mathbb{R}^3$ is first studied by Matsumura and Nishida in [21] provided the initial data with the $H^3(\mathbb{R}^3)$ regularity. Moreover, the authors in [20] obtained the decay properties of the solutions. For instance, they proved the following $L_2$-$L_4$ type estimates for the perturbation $(\rho, \mathbf{v})$ near the equilibrium $(\rho_e, 0)$,
\[
\| (\rho, \mathbf{v}) \|_{L_2(\mathbb{R}^3)} \leq C_0 (1 + t)^{-3/4} , \quad (1.3)
\]
for some constant $C_0$ depending on the small quantity $\| (\rho_0, u_0) \|_{L^1(\mathbb{R}^3) \cap L^2(\mathbb{R}^3)}$. The decay rate in (1.3) was recently improved in [17] by assuming negative Besov regularity for the initial data. Beyond the classical works [20, 21], Danchin [4] constructed the global solution with the byrd Besov regularity in the $L_2$ framework. Furthermore, the extension to the general $L_p$ framework was done in the works [1, 2, 8]. Very recently, the decay property of the solution of the compressible Navier-Stokes equations in the Besov norms was investigated by [5, 22].

A natural question to (1.3) is whether the general $L_p-L_q$ type estimates hold, especially for the boundary value problem in the exterior domain. Namely, the $L_p$ norm of the solution decays provided the initial states in some $L_q$ space. For example, recalling the Cauchy problem of the heat flow in $\mathbb{R}^N$ ($N \geq 2$), we have

$$\| \partial_t^\alpha e^{tA} u_0 \|_{L^p(\mathbb{R}^N)} \leq Ct^{-N(1/q-1/p)/2-\left| \alpha \right|/2} \| u_0 \|_{L^q(\mathbb{R}^N)}$$

(1.4)

for any $1 \leq q \leq p \leq \infty$, $\alpha \in \mathbb{N}_0^N$ and $t > 0$. Here $\mathbb{N}_0$ denotes the set of all nonnegative integers. The extension of (1.4) for the incompressible flow in the exterior domain was first done by Iwashita [12]. In [12], as well as the later contribution [19] by Maremonti and Solonnikov within the framework of the potential theory, the $L_p-L_q$ decay property of the Stokes operator $A_s$ associated to the Dirichlet boundary condition in the smooth exterior domain $\Omega \subset \mathbb{R}^N$ ($N \geq 3$) is established:

$$\| e^{tA_s} u_0 \|_{L^p(\Omega)} \leq C t^{-N(1/q-1/p)/2} \| u_0 \|_{L^q(\Omega)},$$

$$\| \nabla e^{tA_s} u_0 \|_{L^p(\Omega)} \leq C t^{-\sigma_1(p,q,N)} \| u_0 \|_{L^q(\Omega)},$$

(1.5)

for $t > 1$, $1 < q \leq p < \infty$ and

$$\sigma_1(p,q,N) = \begin{cases} (N/q - N/p)/2 + 1/2 & \text{for } 1 < p \leq N, \\ N/(2q) & \text{for } N < p < \infty. \end{cases}$$

Moreover, [19] proves that the gradient estimate of $e^{tA_s}$ in (1.5) is also sharp for $p > N$. If one considers the Stokes operator $A_s$ in the 2-D exterior domain, the theory in [3, 19] implies that the $L_p-L_q$ decay rate becomes worse in the plane than the higher dimensional case. For other discussion on the decay property of the semigroup generated by the Stokes operator, we refer to [9, 16, 24, 27] and the references therein.

However, concerning the compressible system, one can not expect such $L_p-L_q$ estimates for all indices $(p,q)$ as in (1.4) or (1.5) even for the Cauchy problem in view of the results [10, 11, 23, 15]. Roughly speaking, the linearized equations of (1.1) are no longer purely parabolic (see (1.12) for instance). For the compressible system with the Dirichlet boundary condition, the $L_p-L_q$ type estimate was studied in [12] in the exterior domain, and the optimal decay rate like (1.3) in the half space $\mathbb{R}^N_+$ was verified in [13]. The aim of this paper is to prove the $L_p-L_q$ type estimate for the linearized model of (1.1) with the free boundary condition whenever $\Omega$ is a smooth exterior domain in $\mathbb{R}^N$ ($N \geq 3$).

1.2 Main result

To analyze (1.1), it is necessary to transfer (1.1) to the model in some fixed reference domain. For the local well-posedness issue of (1.1), it is sufficient to use the (full) Lagrangian transformation by choosing the initial domain $\Omega$ as the reference domain (see [6] for more details). However, to construct the long time solution of (1.1), the so-called partial Lagrangian coordinates are more helpful due to the hyperbolicity of the mass equation and the free boundary condition (1.1)3. For the seek of the generality of our mathematical theory, we will treat some system (i.e. (1.3) below) with the slightly variable coefficients, while our main result also applies for the system with constant coefficients (see the comment after Theorem 1.1).
To define the partial Lagrangian coordinates, we assume that \( \Omega \subset \mathbb{R}^N \) with the boundary \( \Gamma \) is an exterior domain such that \( \mathcal{O} = \mathbb{R}^N \setminus \Omega \) is a subset of the ball \( B_R \), centred at origin with radius \( R > 1 \). Let \( \kappa \) be a \( C^\infty \) functions which equals to one for \( x \in B_R \) and vanishes outside of \( B_{2R} \). For such \( \kappa \) and some fixed \( T > 0 \), we define the partial Lagrangian mapping

\[
x = X_w(y, T) = y + \int_0^T \kappa(y)w(y, s) \, ds \quad (\forall y \in \Omega),
\]

with \( w = w(\cdot, s) \) defined in \( \Omega \). Moreover, we may take \( w \) in some maximal regularity class \( w \in H_p^1(0, T; L_q(\Omega)^N) \cap L_p(0, T; H_q^2(\Omega)^N) \) for \( 1 < p < \infty \) and \( N < q < \infty \). To guarantee the invertibility of \( X_w \), we assume that

\[
\int_0^T \|\kappa(\cdot)w(\cdot, s)\|_{H_\infty^1(\Omega)} \, ds \leq \delta < 1
\]

for some small constant \( \delta \). By \((1.6), (1.7)) \) can be reduced to the following linearized model problem with ignoring all nonlinear terms

\[
\begin{aligned}
\partial_t \rho &+ \gamma_1 \text{div} \nu = 0 & \text{in } \Omega \times \mathbb{R}_+, \\
\gamma_1 \partial_t \nu - \text{Div} \left( \mathbf{S}(\nu) - \gamma_2 \rho \mathbf{I} \right) & = 0 & \text{in } \Omega \times \mathbb{R}_+, \\
(\mathbf{S}(\nu) - \gamma_2 \rho \mathbf{I}) \mathbf{m}_\Gamma & = 0 & \text{in } \Gamma \times \mathbb{R}_+, \\
(\rho, \nu) \big|_{t=0} = (\rho_0, \nu_0) & & \text{in } \Omega,
\end{aligned}
\]

where we have set that

\[
\gamma_1 = \rho_c, \quad \gamma_2 = P'(\rho_c), \quad \mathbf{I} + \mathbf{V} = (\nabla_y X_w)^{-1}(\cdot, T), \quad J = (\det(\mathbf{I} + \mathbf{V}))^{-1},
\]

\[
\text{div} \nu = (\mathbf{I} + \mathbf{V}) : \nabla_y \nu = J^{-1} \text{div}_y(J(\mathbf{I} + \mathbf{V})^\top \nu),
\]

\[
\text{Div} \, \mathbf{M} = J^{-1} \text{Div}_y(JM(\mathbf{I} + \mathbf{V})) = \text{Div}_y \mathbf{M} + (\nu \nabla_y \nu)^\top(\mathbf{I} + \mathbf{V})^\top,
\]

\[
\mathbf{S}(\nu) = \mu \mathbf{D}(\nu) + (\nu - \mu)(\text{div} \nu) \mathbf{I}, \quad \mathbf{m}_\Gamma = (\mathbf{I} + \mathbf{V}) \mathbf{n}_\Gamma.
\]

Above, for any matrices \( \mathbf{A} = [A_{jk}] \) and \( \mathbf{B} = [B_{jk}] \), \( \mathbf{A} : \mathbf{B} \) denotes the trace of the product \( \mathbf{AB} \), that is,

\[
\mathbf{A} : \mathbf{B} = \sum_{j,k=1}^N A_{jk} B_{jk},
\]

and \( (\mathbf{B} \nabla_y | \mathbf{A}) \) stands for an \( N \)-vector with the \( i \)-th component \( \sum_{j,k} B_{jk} \partial_k A_{ij} \). In particular, it is easy to see that

\[
\text{Div} \left( f \mathbf{I} \right) = \nabla_y f + (\mathbf{V} \nabla_y | f \mathbf{I}) = (\mathbf{I} + \mathbf{V}) \nabla_y f,
\]

for any smooth function \( f \). For simplicity, we denote \( \nabla = (\mathbf{I} + \mathbf{V}) \nabla_y \) in what follows. Hereafter, we assume that

\[
\|(J^{1/2} \mathbf{I}, \nu)\|_{L_\infty(\Omega)} + \|\nabla_y(J^{1/2} \mathbf{I}, \nu)\|_{L_r(\Omega)} \leq \sigma(< 1)
\]

with some small constant \( \sigma = \sigma(\delta) \) and \( 1 < r < \infty \). By the assumption \( (1.10), (1.8) \) can be regarded as the perturbation of the standard Lamé operator, which is the motivation of our main result.

\*The details of the linearization of \((1.4)\) will be present in Appendix \( \text{A} \). Although the convection term \( \mathbf{V} \cdot \nabla \rho \) in the mass conservation law cannot be simply regarded as a perturbation term for the global well-posedness issue of \((1.1)\), it is fundamental to derive the decay properties of \((1.3)\).
Following [6], it is not hard to see that there exists a $C_0$-semigroup $\{T(t)\}_{t \geq 0}$ generated by the operator

$$A_\Omega(\rho, \mathbf{v}) = \left( \gamma_1 \text{div} \mathbf{v}, -\gamma_1^{-1} \text{Div} (\mathbf{S}(\mathbf{v}) - \gamma_2 \rho \mathbf{I}) \right)$$

in the space $H^1_p(\Omega) = H^1_p(\Omega) \times L_p(\Omega)^N$ for $1 < p < \infty$ (see Theorem 5.3 in section 5). Sometimes, we also denote the solution of (1.8) by $(\rho(t), \mathbf{v}(t))$ and $\mathbf{v} = \mathcal{P}_c T(t)(\rho_0, \mathbf{v}_0)$. Now our main result for the $L_p-L_q$ decay estimate of $\{T(t)\}_{t \geq 0}$ reads as follows.

**Theorem 1.1.** ($L_p-L_q$ decay estimate) Let $\Omega$ be a $C^3$ exterior domain in $\mathbb{R}^N$ with $N \geq 3$, and let (1.10) be satisfied for some $N < r < \infty$. Assume that $(\rho_0, \mathbf{v}_0) \in L_q(\Omega)^1+ N \cap H^1_{\rho,0}(\Omega)$ with $H^1_{\rho,0}(\Omega) = H^1_p(\Omega) \times L_p(\Omega)^N$ for $1 \leq q \leq 2 \leq p \leq r < \infty$, and $\{T(t)\}_{t \geq 0}$ is the semigroup associated to (1.8) in $H^1_{\rho,0}(\Omega)$. For convenience, we set

$$\|\rho_0(\mathbf{v}_0)\|_{p,q} = \|(\rho_0, \mathbf{v}_0)\|_{L_q(\Omega)} + \|(\rho_0, \mathbf{v}_0)\|_{H^1_{\rho,0}(\Omega)}.$$

Then for $t \geq 1$, there exists a positive constant $C$ such that

$$\|T(t)(\rho_0, \mathbf{v}_0)\|_{L_p(\Omega)} \leq Ct^{-\frac{(N/q - N/p)}{2}},$$
$$\|\nabla T(t)(\rho_0, \mathbf{v}_0)\|_{L_p(\Omega)} \leq Ct^{-\sigma_1(p,q,N)},$$
$$\|\nabla^2 \mathcal{P}_c T(t)(\rho_0, \mathbf{v}_0)\|_{L_p(\Omega)} \leq Ct^{-\sigma_2(p,q,N)},$$

where the indices $\sigma_1(p,q,N)$ and $\sigma_2(p,q,N)$ are given by

$$\sigma_1(p,q,N) = \begin{cases} (N/q - N/p)/2 + 1/2 & \text{for } 2 \leq p \leq N, \\ N/(2q) & \text{for } N < p < \infty, \end{cases}$$
$$\sigma_2(p,q,N) = \begin{cases} 3/(2q) & \text{for } N = 3, \\ (N/q - N/p)/2 + 1 & \text{for } N \geq 4 \text{ and } 2 \leq p \leq N/2, \\ N/(2q) & \text{for } N \geq 4 \text{ and } N/2 < p < \infty. \end{cases}$$

**Remark.** Let us give some comments on Theorem 1.1 above.

1. (1.8) is a system with variable coefficients only near the boundary $\Gamma$. Notice that

$$\mathbf{V} = 0, \quad J = 1, \quad \text{div} \mathbf{v} = \text{div} \mathbf{v}, \quad \mathbf{D}(\mathbf{v}) = \mathbf{D}(\mathbf{v}), \quad \mathbf{S}(\mathbf{v}) = \mathbf{S}(\mathbf{v})$$

outside of the ball $B_{2R}$ by the choice of $\kappa$ in (1.6).

2. Taking $\mathbf{V} = 0$ and $J = 1$ in Theorem 1.1, we have in particular the same decay properties for the system with constant coefficients,

$$\begin{cases} \partial_t \rho + \gamma_1 \text{div} \mathbf{v} = 0 & \text{in } \Omega \times \mathbb{R}_+, \\ \gamma_1 \partial_t \mathbf{v} - \text{Div} (\mathbf{S}(\mathbf{v}) - \gamma_2 \rho \mathbf{I}) = 0 & \text{in } \Omega \times \mathbb{R}_+, \\ (\mathbf{S}(\mathbf{v}) - \gamma_2 \rho \mathbf{I})_{\Gamma} = 0 & \text{on } \Gamma \times \mathbb{R}_+, \\ (\rho, \mathbf{v})|_{t=0} = (\rho_0, \mathbf{v}_0) & \text{in } \Omega. \end{cases}$$

Of course, the assumption (1.10) is not necessary for (1.12) any longer.

3. For simplicity, we will not seek for the optimal assumption on the regularity of $\Omega$. The assumption of $\Omega$ in $C^3$ class is for the technical reason, as the property of the Bogovskii operator will be used in the later proof.
To establish the $L_p$-$L_q$ estimates in Theorem 1.2, we use the so-called local energy approach. More precisely, we shall establish the following theorem.

**Theorem 1.2. (local energy estimate)** Let $\Omega$ be a $C^3$ exterior domain in $\mathbb{R}^N$ for $N \geq 3$, $N < r < \infty$, $1 < p \leq r$, and $L > 2R$. Denote that

\[
\Omega_L = \Omega \cap B_L, \quad H^{1,2}_p(\Omega_L) = H^1_p(\Omega_L) \times H^2_p(\Omega_L)^N, \\
X_{p,L}(\Omega) = \{(d, f) \in H^{1,0}_p(\Omega) : \text{supp } d, \text{supp } f \subset \overline{\Omega_L}\}.
\]

Then for any $(\rho_0, v_0) \in X_{p,L}(\Omega)$ and $k \in \mathbb{N}_0 = \mathbb{N} \cup \{0\}$, there exists a positive constant $C_{p,k,L}$ such that

\[
\|\partial^k_t T(t)(\rho_0, v_0)\|_{H^{1,2}_p(\Omega_L)} \leq C_{p,k,L} t^{-N/2-k} \|(\rho_0, v_0)\|_{H^{1,0}_p(\Omega)}, \quad \forall \ t \geq 1.
\]

To prove Theorem 1.2 we consider the resolvent problem of (1.8):

\[
\begin{cases}
\lambda \eta + \gamma_1 \text{div} u = d & \text{in } \Omega, \\
\gamma_1 \lambda u - \text{div} (\mathbf{S}(u) - \gamma_2 \eta \mathbf{I}) = f & \text{in } \Omega, \\
(\mathbf{S}(u) - \gamma_2 \eta \mathbf{I}) \mathbf{n} = 0 & \text{on } \Gamma.
\end{cases}
\] (1.13)

In fact, it is easy to study (1.13) whenever $\lambda$ is sufficient large (see Theorem 5.1). The case $\lambda$ is uniformly bounded from above is more involved, which is the core concern of this paper. Especially, one difficulty appears when we handle (1.13) for $\lambda = 0$. Namely, there always exists non-trivial stationary solution for the stationary Lamé system (see [18, chapter 6] for more details). Here, one can first consider the following simplified model problem in the whole space $\mathbb{R}^3$:

\[- \Delta u - \nabla \text{div} u + \nabla \eta = f.\] (1.14)

Obviously, $(u, \eta) = (0, F)$ always solves (1.14) as long as $f = \nabla F$ for some $F \in C_0^\infty(\mathbb{R}^3)$, which is quite annoying for our study of (1.13) with $\lambda = 0$. To handle such trouble, we introduce some weighted inner product structure for the rigid motion space (see subsection 5.2) to eliminate the homogeneity effect from the stationary Lamé system.

This paper is folded as follows. In sections 2 and 3, we will discuss the case where $\lambda$ in (1.13) is closed to zero. Afterwards, via the sections 4 and 5, we study (1.13) when $\lambda$ is uniformly bounded from below and also from above. Finally, we combine the previous results and prove Theorems 1.2 and 1.1 in the last section. In Appendix A, we give the derivation of (1.8) from (1.1).

**Notation**

For convenience, we introduce some useful notation. For any domain $G$ in $\mathbb{R}^N$, $1 \leq p \leq \infty$ and $k \in \mathbb{N}$, $L_p(G)$ ($L_{p,\text{loc}}(G)$) stands for the (local) Lebesgue space, and $H^k_p(G)$ ($H^k_{p,\text{loc}}(G)$) for the (local) Sobolev space. Moreover, we write

\[H^k_{p,\ell}(G) = H^k_p(G) \times H_\ell^p(G)^N, \quad H^k_{p,\text{loc}}(G) = H^k_{p,\text{loc}}(G) \times H_\ell^p(G)^N.\]

In addition, the Besov space $B^s_{q,p}(G)$ for $k-1 < s \leq k$ and $1 < p, q < \infty$ is defined by the real interpolation functor

\[B^s_{q,p}(G) = \left(L_q(G), H^k_q(G)\right)_{s/k, p}.\]

Sometimes, we write $W^s_q(G) = B^s_{q,p}(G)$ for simplicity.

\[\mathcal{E}\] stands for the closure of $E$ for any subset $E \subset \mathbb{R}^N$. 

6
For any Banach spaces $X, Y$, the total of the bounded linear transformations from $X$ to $Y$ is denoted by $\mathcal{L}(X; Y)$. We also write $\mathcal{L}(X)$ for short if $X = Y$. In addition, $\text{Hol}(\Lambda; X)$ denotes the set of $X$-valued analytic mappings defined on the domain $\Lambda \subset \mathbb{C}$.

To study the resolvent problem (1.13), we introduce that

$$\Sigma_\varepsilon = \{ \lambda \in \mathbb{C} \setminus \{0\} : |\arg \lambda| \leq \pi - \varepsilon \}, \quad \Sigma_{\varepsilon, b} = \{ \lambda \in \Sigma_\varepsilon : |\lambda| \geq b \},$$

$$K = \left\{ \lambda \in \mathbb{C} : (\Re \lambda + \frac{\gamma_1 \gamma_2}{\mu + \nu})^2 + \Im \lambda^2 > \left( \frac{\gamma_1 \gamma_2}{\mu + \nu} \right)^2 \right\},$$

$$V_{\varepsilon, b} = \Sigma_{\varepsilon, b} \cap K, \quad \dot{U}_b = \{ \lambda \in \mathbb{C} \setminus (-\infty, 0] : |\lambda| < b \}$$

for any $0 < \varepsilon < \pi/2$ and $b > 0$.

2 Important propositions for local energy decay

In this section, we will consider several model problems in the bounded domain $\Omega_{5R} = \Omega \cap B_{5R}$, which play a vital role in the construction of the solution of (1.13) in the next section.

2.1 The divergence equation with variable coefficients

First, we consider the modified divergence operator in (1.9), that is,

$$\overline{\text{div}} \ u = \text{div} \ u + \sum_{j,k=1}^{N} V_{jk} \frac{\partial^2 u_j}{\partial y_j \partial y_k} = f \quad \text{in } \Omega_{5R} = \Omega \cap B_{5R},$$

with $V = [V_{jk}]$ satisfying (1.10) for some $0 < \sigma < 1$ and $N < r < \infty$.

**Proposition 2.1.** Let $1 < p \leq r$. Then, there exist positive constants $\sigma_0 = \sigma_0(p, r)$ and $M = M(p, R)$ such that the equation (2.1) admits a solution $u \in H^2_p(\Omega_{5R})^N$ possessing the estimate:

$$\| u \|_{H^2_p(\Omega_{5R})} \leq M \| f \|_{H^1_p(\Omega_{5R})}$$

for any $0 < \sigma \leq \sigma_0$.

Hereafter, the following estimate in any uniform $C^1$ domain $G$ will be constantly used,

$$\| g h \|_{L_p(G)} \leq C \| g \|_{L_r(G)} \| h \|_{H^1_p(G)}$$

for any $r > N$ and $1 < p \leq r$. In fact, when $p = r > N$, we have

$$\| g h \|_{L_p(G)} \leq C \| g \|_{L_p(G)} \| h \|_{L_{\infty}(G)} \leq C \| g \|_{L_r(G)} \| h \|_{H^1_p(G)}.$$  

For $1 < p < r$, using the Hölder’s inequality for $1/r + 1/s = 1/p$ and the Sobolev embedding theorem yield that

$$\| g h \|_{L_p(G)} \leq C \| g \|_{L_r(G)} \| h \|_{L_{s}(G)} \leq C \| g \|_{L_r(G)} \| h \|_{H^1_{s}(G)}.$$  

**Proof.** To construct the solution $u$ of (2.1), we solve the following equation with Dirichlet boundary condition

$$\Delta \theta + \sum_{j,k=1}^{N} V_{jk} \frac{\partial^2 \theta}{\partial y_j \partial y_k} = f \quad \text{in } \Omega_{5R}, \quad \theta|_{\partial\Omega_{5R}} = 0,$$
where $\partial \Omega_{5R} = \Gamma \cup S_{5R}$ denotes the boundary of $\Omega_{5R}$. As $\mathbf{v}$ satisfies (1.10), the left-hand side of (2.3) can be regarded as the perturbation of the Laplace operator. Thus we use the standard Banach fixed point argument to find $\theta$.

Given $\omega \in H^3_p(\Omega_{5R})$ with $\omega|_{\partial \Omega_{5R}} = 0$, we consider the following equation

$$\Delta \theta = f - \sum_{j,k=1}^N V_{jk} \frac{\partial^2 \omega}{\partial y_j \partial y_k} \quad \text{in } \Omega_{5R}, \quad \theta|_{\partial \Omega_{5R}} = 0. \quad (2.4)$$

Then it is not hard to see from (2.2) that

$$\left\|V_{jk} \frac{\partial^2 \omega}{\partial y_j \partial y_k}\right\|_{H^1_p(\Omega_{5R})} \leq C \left(\|\mathbf{v}\|_{L^\infty(\Omega_{5R})} + \|\nabla \mathbf{v}\|_{L^r(\Omega_{5R})}\right) \|\omega\|_{H^2_p(\Omega_{5R})},$$

with the constant $C$ depending solely on $p$, $r$ and $\Omega_{5R}$.

Next, in view of (1.10), there exists a solution $\theta \in H^3_p(\Omega_{5R})$ of (2.3) fulfilling

$$\|\theta\|_{H^3_p(\Omega_{5R})} \leq \frac{M}{2} \left(\|f\|_{H^1_p(\Omega_{5R})} + C\sigma \|\omega\|_{H^2_p(\Omega_{5R})}\right), \quad (2.5)$$

where $M$ is a positive constant depending on $\Omega_{5R}$ and $f$. Thus, if $\omega$ satisfies the estimate

$$\|\omega\|_{H^2_p(\Omega_{5R})} \leq M\|f\|_{H^1_p(\Omega_{5R})},$$

then (2.5) yields that

$$\|\theta\|_{H^3_p(\Omega_{5R})} \leq (M/2)\|f\|_{H^1_p(\Omega_{5R})} + (C\sigma M^2/2)\|f\|_{H^1_p(\Omega_{5R})}.$$ 

Choosing $\sigma_0 > 0$ small enough such that $C\sigma_0 \leq 1$, we have

$$\|\theta\|_{H^3_p(\Omega_{5R})} \leq M\|f\|_{H^1_p(\Omega_{5R})}.$$

For simplicity, we write the solution mapping of (2.4) by $\theta = \Phi(\omega)$ for $\omega \in H^3_p(\Omega_{5R})$ with $\omega|_{\partial \Omega_{5R}} = 0$.

To verify the contraction property of $\Phi$, we take $\theta_i = \Phi(\omega_i) \in H^3_p(\Omega_{5R})$ for $i=1,2$. Then the difference $\theta_1 - \theta_2$ satisfies the following Poisson’s equation

$$\Delta (\theta_1 - \theta_2) = - \sum_{j,k=1}^N V_{jk} \frac{\partial^2 (\omega_1 - \omega_2)}{\partial y_j \partial y_k} \quad \text{in } \Omega_{5R}, \quad (\theta_1 - \theta_2)|_{\partial \Omega_{5R}} = 0.$$

Thus, by (2.2) we have

$$\|\theta_1 - \theta_2\|_{H^2_p(\Omega_{5R})} \leq (M/2)C\sigma \|\omega_1 - \omega_2\|_{H^2_p(\Omega_{5R})} \leq (1/2)\|\omega_1 - \omega_2\|_{H^2_p(\Omega_{5R})},$$

for $C\sigma_0 \leq 1$. Therefore, the Banach’s fixed point theorem implies that there exists a unique solution $\theta \in H^3_p(\Omega_{5R})$ of (2.3) with $\|\theta\|_{H^3_p(\Omega_{5R})} \leq M\|f\|_{H^1_p(\Omega_{5R})}$.

At last, setting $\mathbf{u} = \nabla \theta$, we have the desired result. This completes the proof of Proposition 2.1. \hfill \Box

### 2.2 Modified Stokes and reduced Stokes operators

Recall the notion in (1.9) and the assumption (1.10), we first consider the resolvent problem of the modified Stokes equations as follows

$$\begin{cases}
\gamma_1 \mathbf{v} - \text{Div} (\mu \mathbf{D}(\mathbf{v}) - \gamma_2 \omega \mathbf{I}) = \mathbf{f} & \text{in } \Omega_{5R}, \\
\text{div} \mathbf{v} = 0 & \text{in } \Omega_{5R}, \\
(\mu \mathbf{D}(\mathbf{v}) - \gamma_2 \omega \mathbf{I}) \mathbf{n}_{\partial \Omega_{5R}} = 0 & \text{on } \partial \Omega_{5R},
\end{cases} \quad (2.6)$$

where $\mathbf{n}_{\partial \Omega_{5R}} = (\mathbf{I} + \mathbf{V}) \mathbf{n}_{\partial \Omega_{5R}}$ and $\mathbf{n}_{\partial \Omega_{5R}}$ denotes the unit outward normal vector to $\partial \Omega_{5R} = \Gamma \cup S_{5R}$. 

8
2.2.1 Analysis of (2.6) for $\lambda \neq 0$

We will establish the following theorem by assuming $\lambda \neq 0$ in (2.6).

**Theorem 2.2.** Assume that $\Omega$ is a $C^2$ exterior domain. Let $1 < p \leq r$, $0 < \varepsilon < \pi/2$, and $\lambda_0 > 0$. Then, there exists a $\sigma_1$ depending on $\mu$, $\varepsilon$, $\lambda_0$, $p$, $r$ and $\Omega_{5R}$ such that if $0 < \sigma \leq \sigma_1$, then for any $\lambda \in \Sigma_{\varepsilon, \lambda_0}$, $f \in L_p(\Omega_{5R})^N$, problem (2.6) admits a unique solution $(v, \omega) \in H^2_p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})$ possessing the estimate:

$$|\lambda|\|v\|_{L_p(\Omega_{5R})} + |\lambda|^{1/2}\|v\|_{H^1_p(\Omega_{5R})} + \|v\|_{H^2_p(\Omega_{5R})} + \|\omega\|_{H^1_p(\Omega_{5R})} \leq C\|f\|_{L_p(\Omega_{5R})},$$

with some constant $C$ depending on $\mu$, $\varepsilon$, $\lambda_0$, $p$, $r$ and $\Omega_{5R}$.

The proof of Theorem 2.2 is similar to Proposition 2.1. By the notion in (1.9), (2.6) is rewritten as

$$\left\{ \begin{array}{ll}
\gamma_1 \lambda v - \text{Div} (\mu D(v) - \gamma_2 \omega I) = f + F(u, \omega) & \text{in } \Omega_{5R}, \\
\text{div } v = g(v) & \text{in } \Omega_{5R}, \\
(\mu D(v) - \gamma_2 \omega I) \bar{n}_{\partial \Omega_{5R}} = H(v, \omega) & \text{on } \partial \Omega_{5R},
\end{array} \right. \quad (2.7)$$

with

$$F(v, \omega) = \text{Div} (\mu V \nabla v + \mu (V \nabla v)^\top) + (V \nabla | \mu D(v) - \gamma_2 \omega I|),$$

$$g(v) = -V : \nabla y u, \quad g(v) = -V^\top v - (J - 1)(I + V)^\top v, \quad H(v, \omega) = -\mu (V \nabla v + (V \nabla v)^\top) \bar{n}_{\partial \Omega_{5R}} - (\mu D(v) - \gamma_2 \omega I) V \bar{n}_{\partial \Omega_{5R}}.$$

Thanks to (1.10), (2.6) can be regarded as the perturbation of the following linear equations:

$$\left\{ \begin{array}{ll}
\gamma_1 \lambda v - \text{Div} (\mu D(v) - \gamma_2 \omega I) = f & \text{in } \Omega_{5R}, \\
\text{div } v = g & \text{in } \Omega_{5R}, \\
(\mu D(v) - \gamma_2 \omega I) \bar{n}_{\partial \Omega_{5R}} = h & \text{on } \partial \Omega_{5R}.
\end{array} \right. \quad (2.8)$$

For (2.8), we know the following theorem from [25] Sec. 4].

**Theorem 2.3.** Assume that $\Omega$ is a $C^2$ exterior domain. Let $1 < p < \infty$, $0 < \varepsilon < \pi/2$, and $\lambda_0 > 0$. Then, for any $\lambda \in \Sigma_{\varepsilon, \lambda_0}$, $f \in L_p(\Omega_{5R})^N$, $g \in H^1_p(\Omega_{5R})$, $h \in L_p(\Omega_{5R})^N$ and $h \in H^1_p(\Omega_{5R})^N$, problem (2.8) admits a unique solution $(v, \omega) \in H^2_p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})$ possessing the estimate:

$$|\lambda|\|v\|_{L_p(\Omega_{5R})} + |\lambda|^{1/2}\|v\|_{H^1_p(\Omega_{5R})} + \|v\|_{H^2_p(\Omega_{5R})} + \|\omega\|_{H^1_p(\Omega_{5R})} \leq C(\|f\|_{L_p(\Omega_{5R})} + |\lambda|^{1/2}\|(g, h)\|_{L_p(\Omega_{5R})} + \|g\|_{H^1_p(\Omega_{5R})} + |\lambda|\|g\|_{L_p(\Omega_{5R})}),$$

with some constant $C$ depending on $\mu$, $\varepsilon$, $\lambda_0$, $p$ and $\Omega_{5R}$.

Now, let us give the proof of Theorem 2.2 by the standard Banach fixed point theorem and Theorem 2.3.

**Proof of Theorem 2.2.** Given $(u, \theta) \in H^2_p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})$, we consider

$$\left\{ \begin{array}{ll}
\gamma_1 \lambda v - \text{Div} (\mu D(v) - \gamma_2 \omega I) = f + F(u, \theta) & \text{in } \Omega_{5R}, \\
\text{div } v = g(u) = \text{div } g(u) & \text{in } \Omega_{5R}, \\
(\mu D(v) - \gamma_2 \omega I) \bar{n}_{\partial \Omega_{5R}} = H(u, \theta) & \text{on } \partial \Omega_{5R}.
\end{array} \right. \quad (2.9)$$
By (1.10) and (2.2), it is not hard to find that
\[
\begin{align*}
\|F(u, \theta)\|_{L_p(\Omega_{5R})} &\leq C\sigma\left(\|u\|_{H^k_{p}(\Omega_{5R})} + \|\theta\|_{H^k_{p}(\Omega_{5R})}\right), \\
\|g(u)\|_{H^k_{p}(\Omega_{5R})} &\leq C\sigma\|u\|_{H^k_{p}(\Omega_{5R})}, \quad \forall \, k = 0, 1, \\
\|H(u, \theta)\|_{H^k_{p}(\Omega_{5R})} &\leq C\sigma\left(\|u\|_{H^k_{p}(\Omega_{5R})} + \|\theta\|_{H^k_{p}(\Omega_{5R})}\right), \quad \forall \, k = 0, 1,
\end{align*}
\]
(2.10)
for some constant $C > 0$. For simplicity, we set
\[
N_\lambda(u, \theta; \Omega_{5R}) = |\lambda|\|u\|_{L_p(\Omega_{5R})} + |\lambda|^{1/2}\left(\|u\|_{H^1_{p}(\Omega_{5R})} + \|\omega\|_{L_p(\Omega_{5R})}\right) + \|\theta\|_{H^1_{p}(\Omega_{5R})}.
\]
Then, for any fixed $\lambda \in \Sigma_{\varepsilon, \lambda_0}$, we infer from (2.11) that
\[
\begin{align*}
\|F(u, \theta)\|_{L_p(\Omega_{5R})} + |\lambda|^{1/2}\left(\|g(u), H(u, \theta)\|_{L_p(\Omega_{5R})} + \|g(u), H(u, \theta)\|_{H^1_{p}(\Omega_{5R})}\right) \\
+ |\lambda|\|g(u)\|_{L_p(\Omega_{5R})} &\leq C\sigma N_\lambda(u, \theta; \Omega_{5R}).
\end{align*}
\]
(2.11)
Thus, by Theorem 2.3 and (2.11), there exists a solution $(v, \omega)$ of (2.9) in $H^2_p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})$ satisfying
\[
N_\lambda(v, \omega; \Omega_{5R}) \leq (M/2)(\|f\|_{L_p(\Omega_{5R})} + C\sigma N_\lambda(u, \theta; \Omega_{5R})).
\]
(2.12)
Thus, if $N_\lambda(u, \theta; \Omega_{5R}) \leq M\|f\|_{L_p(\Omega_{5R})}$, then choosing $\sigma > 0$ so small that $C\sigma M \leq 1$ in (2.12) we have
\[
N_\lambda(v, \omega; \Omega_{5R}) \leq M\|f\|_{L_p(\Omega_{5R})}.
\]
(2.13)
Next, for $(u_i, \theta_i) \in H^2_p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})$ $(i = 1, 2)$, let $(v_i, \omega_i)$ be the solution of (2.9) with respect to $(u_i, \theta_i)$. Noting that the functionals $F$, $g$, $g$ and $H$ are linear, we have
\[
\begin{align*}
\left\{ \begin{array}{ll}
\gamma_1\lambda(v_1 - v_2) - \text{Div} (\mu D(v_1 - v_2) - \gamma_2(\omega_1 - \omega_2)I) = F(u_1 - u_2, \theta_1 - \theta_2) & \text{in } \Omega_{5R}, \\
\text{Div} (v_1 - v_2) = g(u_1 - u_2) = \text{Div} g(u_1 - u_2) & \text{in } \Omega_{5R}, \\
(\mu D(v_1 - v_2) - \gamma_2(\omega_1 - \omega_2)I)\nu_{\partial\Omega_{5R}} = H(u_1 - u_2, \theta_1 - \theta_2) & \text{on } \partial\Omega_{5R}.
\end{array} \right.
\end{align*}
\]
Applying Theorem 2.3 and using (2.10) yield that
\[
N_\lambda(v_1 - v_2, \omega_1 - \omega_2; \Omega_{5R}) \leq C(M/2)\sigma N_\lambda(u_1 - u_2, \theta_1 - \theta_2; \Omega_{5R}).
\]
(2.14)
Since the quantity $N_\lambda(v, \omega; \Omega_{5R})$ gives an equivalent norm of $H^2_p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})$ for $\lambda \neq 0$, the solution mapping of (2.9) $(u, \theta) \rightarrow (v, \eta)$ is contraction by choosing $CM\sigma \leq 1$. Thus, there exists a unique $(v, \omega) \in H^2_p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})$ satisfying equations (2.6). Moreover, by (2.12), this $(v, \omega)$ satisfies (2.8). This completes the proof of Theorem 2.2. \hfill \square

In fact, the proof of Theorem 2.2 also implies the following result.

**Corollary 2.4.** Let $h \in W^{-1/p}_p(\partial\Omega_{5R})$. Under the assumptions in Theorem 2.2, the system
\[
\begin{align*}
\left\{ \begin{array}{ll}
\gamma_1\lambda v - \text{Div} (\mu D(v) - \gamma_2\omega I) = f & \text{in } \Omega_{5R}, \\
\text{Div} v = 0 & \text{in } \Omega_{5R}, \\
(\mu D(v) - \gamma_2\omega I)\nu_{\partial\Omega_{5R}} = h & \text{on } \partial\Omega_{5R},
\end{array} \right.
\end{align*}
\]
admits a unique solution $(v, \omega) \in H^2_p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})$ possessing the estimate:
\[
|\lambda|\|v\|_{L_p(\Omega_{5R})} + |\lambda|^{1/2}\|v\|_{H^1_p(\Omega_{5R})} + |v\|_{H^2_p(\Omega_{5R})} + \|\omega\|_{H^1_p(\Omega_{5R})} \leq C\left(\|f\|_{L_p(\Omega_{5R})} + \|h\|_{W^{-1/p}_p(\partial\Omega_{5R})}\right),
\]
with some constant $C$ depending on $\mu$, $\varepsilon$, $\lambda_0$, $p$, and $\Omega_{5R}$.\]
2.2.2 Reduced Stokes problem from (2.6)

To solve (2.6) with $\lambda = 0$, we introduce some reduced Stokes problem associated to (2.6). First, we review the reduced problem for the standard Stokes system. By the transformation (1.6), we set that

$$\Omega_{R,T} = \{x = X_w(y, T) \mid y \in \Omega_5\}, \quad \Gamma_{R,T} = \{x = X_w(y, T) \mid y \in \partial \Omega_5\},$$

$$u(x) = v(X_w^{-1}(x, T)), \quad \zeta(x) = \omega(X_w^{-1}(x, T)), \quad f(x) = f(X_w^{-1}(x, T)).$$

Write $\hat{n}$ for the unit outward normal to $\Gamma_{R,T}$. Then (2.6) turns to the resolvent problem of the standard Stokes operator in $\Omega_{R,T}$:

$$\begin{cases}
\gamma_1 \lambda u - \text{Div}_x (\mu D(u) - \gamma_2 \zeta I) = \tilde{f} & \text{in } \Omega_{R,T}, \\
\text{Div}_x u = 0 & \text{in } \Omega_{R,T}, \\
(\mu D(u) - \gamma_2 \zeta I) \hat{n} = 0 & \text{on } \Gamma_{R,T}.
\end{cases}$$

(2.15)

For (2.15), we introduce the weak Dirichlet problem:

$$(\nabla_x \tilde{u}, \nabla_x \varphi)_{\Omega_{R,T}} = (\tilde{f}, \nabla_x \varphi)_{\Omega_{R,T}} \quad \text{for any } \varphi \in \tilde{H}^1_{p,0}(\Omega_{R,T}),$$

(2.16)

where $\tilde{f} \in L_p(\Omega_{R,T})^N$, $1 < p, p' = p/(p - 1) < \infty$, and

$$\tilde{H}^1_{p,0}(\Omega_{R,T}) = \{\varphi \in L_{p,\text{loc}}(\Omega_{R,T}) : \nabla \varphi \in L_p(\Omega_{R,T})^N, \ \varphi|_{\Gamma_{R,T}} = 0\}.$$

Note that in view of Poincaré’s inequality,

$$\tilde{H}^1_{p,0}(\Omega_{R,T}) = H^1_{p,0}(\Omega_{R,T}) = \{\varphi \in H^1_p(\Omega_{R,T}) : \varphi|_{\Gamma_{R,T}} = 0\}.$$

Given $u \in H^2_p(\Omega_{R,T})^N$, let $K(u) \in H^1_p(\Omega_{R,T}) + \tilde{H}^1_{p,0}(\Omega_{R,T})$ be a unique solution of the weak Dirichlet problem

$$((\nabla_x K(u), \nabla_x \varphi)_{\Omega_{R,T}} = \left(\text{Div}_x (\mu D(u)) - \nabla_x \text{Div}_x u, \nabla_x \varphi \right)_{\Omega_{R,T}} \quad \text{for any } \varphi \in \tilde{H}^1_{p,0}(\Omega_{R,T}),$$

(2.17)

subject to

$$K(u) = < \mu D(u) \hat{n}, \hat{n} > - \text{Div}_x u \quad \text{on } \Gamma_{R,T}.$$  

(2.18)

And then, the reduced Stokes equations corresponding to equations (2.15) is the following:

$$\begin{cases}
\gamma_1 \lambda u - \text{Div}_x (\mu D(u) - K(u) I) = \tilde{f} & \text{in } \Omega_{R,T}, \\
(\mu D(u) - K(u) I) \hat{n} = 0 & \text{on } \Gamma_{R,T}.
\end{cases}$$

(2.19)

For more discussion on (2.19), we refer to the lecture note [25].

It is not hard to see that the weak Dirichlet problem (2.10) is transformed to the following variational equation:

$$((\nabla u, J \nabla \varphi)_{\Omega_5} = (f, J \nabla \varphi)_{\Omega_5} \quad \text{for any } \varphi \in \tilde{H}^1_{p,0}(\Omega_5),$$

(2.20)

with $\nabla = (I + V) \nabla_y$, $J = (\text{det}(I + V))^{-1}$, and

$$\tilde{H}^1_{p,0}(\Omega_5) = \{\varphi \in L_{p,\text{loc}}(\Omega_5) : \nabla \varphi \in L_p(\Omega_5)^N, \ \varphi|_{\partial \Omega_5} = 0\}.$$

(2.20) can be solved uniquely for any $f \in L_p(\Omega_5)^N \ (1 < p \leq r < \infty)$. In fact, employing the standard Banach fixed point theorem as in the proof of Theorem 2.2, and the unique solvability of the weak Dirichlet
Then we have \( f \) by (2.6) and the solenoidality of \( v \) subject to

\[
\bar{u} = \text{unique solution}
\]

From the boundary condition in (2.6), it follows that \( \bar{u} \) satisfies (1.0). By (2.6), the reduced Stokes equations (2.19) are transformed to the following equations:

\[
\begin{align*}
\gamma_1 \lambda v - \nabla \cdot (\mu \nabla v) - \bar{K}(v) I &= f \quad \text{in } \Omega_{5R}, \\
(\mu \nabla v - \bar{K}(v) \nabla) n &= 0 \quad \text{on } \partial \Omega_{5R}.
\end{align*}
\]

Let \( J_p(\Omega_{5R}) \) be a modified solenoidal space defined by

\[
J_p(\Omega_{5R}) = \{ g \in L_p(\Omega_{5R})^N \mid (g, J\nabla \phi)_{\Omega_{5R}} = 0 \quad \text{for any } \phi \in \hat{H}_p^1(\Omega_{5R}) \}. 
\]

Assume that \((v, \omega) \in H_p^2(\Omega_{5R})^N \times H_p^1(\Omega_{5R})\) is a solution of equations (2.6) for some \( f \in J_p(\Omega_{5R}) \) by Theorem 2.2 Then \( v \) also satisfies (2.23). In fact, it suffices to verify \( \bar{K}(v) = \gamma_2 \omega \). For any \( \phi \in \hat{H}_p^1(\Omega_{5R}) \), by (2.6) and the solenoidality of \( f \), we have

\[
0 = (f, J\nabla \phi)_{\Omega_{5R}} = \gamma_1 \lambda (v, J\nabla \phi)_{\Omega_{5R}} - (\nabla \cdot (\mu \nabla v), J\nabla \phi)_{\Omega_{5R}} - (\nabla \cdot v, J\nabla \phi)_{\Omega_{5R}} + (\nabla (\gamma_2 \omega), J\nabla \phi)_{\Omega_{5R}} = \gamma_1 \lambda (v, J\nabla \phi)_{\Omega_{5R}} + (\nabla (\gamma_2 \omega - \bar{K}(v)), J\nabla \phi)_{\Omega_{5R}}.
\]

By integration by parts, \( \phi_{\partial \Omega_{5R}} = 0 \) and \( \overline{\nabla v} = 0 \), we obtain that

\[
(v, J\nabla \phi)_{\Omega_{5R}} = -(\nabla ((1 + V)^T \cdot v), \phi)_{\Omega_{5R}} = (J\overline{\nabla v}, \phi)_{\Omega_{5R}} = 0.
\]

Then we have

\[
(\nabla (\gamma_2 \omega - \bar{K}(v)), J\nabla \phi)_{\Omega_{5R}} = 0 \quad \text{for any } \phi \in \hat{H}_p^1(\Omega_{5R}).
\]

From the boundary condition in (2.6), it follows that

\[
\gamma_2 \omega = \bar{K}(v) \quad \text{on } \partial \Omega_{5R},
\]

where we have used \( \overline{\nabla v} = 0 \). Thus, the uniqueness of the weak Dirichlet problem yields that \( \gamma_2 \omega = \bar{K}(v) \), which shows that \( v \in H_p^2(\Omega_{5R})^N \) solves equations (2.23). Moreover, thanks to (2.24), \( \overline{\nabla v} = 0 \) yields that \( v \in J_p(\Omega_{5R}) \).

From these observations and Theorem 2.2, we have the following theorem.

**Theorem 2.5.** Let \( 1 < p \leq r, 0 < \varepsilon < \pi/2 \), and \( \lambda_0 > 0 \). Then, there exists a \( \sigma_1 \) depending on \( \mu, \varepsilon, \lambda_0, p, r \) and \( \Omega_{5R} \) such that if \( 0 < \sigma \leq \sigma_1 \), then for any \( \lambda \in \Sigma_{\varepsilon, \lambda_0} \), \( f \in J_p(\Omega_{5R}) \), problem (2.23) admits a unique solution \( v \in H_p^2(\Omega_{5R})^N \cap J_p(\Omega_{5R}) \) possessing the estimate:

\[
|\lambda||v||L_p(\Omega_{5R}) + |\lambda|^{1/2}||v||H_p^1(\Omega_{5R}) + ||v||H_p^2(\Omega_{5R}) \leq C||f||L_p(\Omega_{5R})
\]

with some constant \( C \) depending on \( \mu, \varepsilon, \lambda_0, p, r \) and \( \Omega_{5R} \).
2.2.3 Analysis of (2.15) for \( \lambda = 0 \)

To study (2.15) for the parameter \( \lambda = 0 \), we consider the following reduced model:

\[
\begin{cases}
- \text{Div}(\mu \mathbf{D}(\mathbf{v}) - \bar{K}(\mathbf{v}) \mathbf{I}) = f & \text{in} \ \Omega_{5R}, \\
(\mu \mathbf{D}(\mathbf{v}) - \bar{K}(\mathbf{v}) \mathbf{I}) \mathbf{n}_{\partial \Omega_{5R}} = 0 & \text{on} \ \partial \Omega_{5R}.
\end{cases}
\] (2.26)

First, we introduce the rigid motion associated to (2.15). Set

\[
\mathbf{r}_{j}(x) = \begin{cases}
\mathbf{e}_j = (0, \ldots, 1, \ldots, 0) & \text{for } j = 1, \ldots, N, \\
x_k \mathbf{e}_\ell - x_\ell \mathbf{e}_k & \text{for } j = N + 1, \ldots, M.
\end{cases}
\] (2.27)

Above, \( M \) is a constant only depending of the dimension \( N \). For any vector \( \mathbf{u} \) satisfying \( \mathbf{D}(\mathbf{u}) = 0 \), \( \mathbf{u} \) is represented by a linear combination of \( \{\mathbf{r}_{j}\}_{j=1}^{M} \), namely \( \mathbf{u} = \sum_{j=1}^{M} a_j \mathbf{r}_{j} \) with some \( a_j \in \mathbb{R} \). For convenience, we denote \( \{\mathbf{p}_{j}\}_{j=1}^{M} \) for the orthonormalization of \( \{\mathbf{r}_{j}\}_{j=1}^{M} \), that is, \( \{\mathbf{p}_{j}\}_{j=1}^{M} \) satisfies

\[
(\mathbf{p}_{j}, \mathbf{p}_{k})_{\Omega_{5R}} = \delta_{jk} \quad \text{for } j, k = 1, \ldots, M.
\] (2.28)

By the transformation (1.16), we define \( \bar{\mathbf{p}}_{j}(y) = \mathbf{p}_{j}(x) \) for \( j = 1, \ldots, M \), which, thanks to (2.28), satisfy the orthogonal conditions:

\[
(\bar{\mathbf{p}}_{j}, J \bar{\mathbf{p}}_{k})_{\Omega_{5R}} = \delta_{jk} \quad \text{for } j, k = 1, \ldots, M.
\] (2.29)

In addition, \( \mathbf{D}^r(\bar{\mathbf{p}}_{j}) = \mathbf{D}(\mathbf{p}_{j}) = 0 \) and \( \text{div} \bar{\mathbf{p}}_{j} = \text{div} \mathbf{p}_{j} = 0 \). For convenience, we introduce the spaces

\[
\mathcal{R}_d(\Omega_{5R}) = \text{Span} \{\bar{\mathbf{p}}_{1}, \ldots, \bar{\mathbf{p}}_{M}\},
\]

\[
\mathcal{R}_d(\Omega_{5R})^\perp = \{\mathbf{v} \in L_{1}(\Omega_{5R})^N \mid (\mathbf{v}, J \bar{\mathbf{p}}_{j})_{\Omega_{5R}} = 0 \text{ for } j = 1, \ldots, M\}.
\] (2.30)

Now, let \( \mathbf{v} \in H^{2}_{p}(\Omega_{5R})^N \cap J_{p}(\Omega_{5R}) \) be a solution of (2.23) for some \( \mathbf{f} \in J_{p}(\Omega_{5R}) \cap \mathcal{R}_d(\Omega_{5R})^\perp \) and \( \lambda \in \Sigma_{\varepsilon, \lambda_0} \) by Theorem 2.5. Then, \( \mathbf{v} \in \mathcal{R}_d(\Omega_{5R})^\perp \) as well. In fact,

\[
0 = (\mathbf{f}, J \bar{\mathbf{p}}_{j})_{\Omega_{5R}} = \gamma_{1}(\mathbf{v}, J \bar{\mathbf{p}}_{j})_{\Omega_{5R}} - \left( \text{Div}(\mu \mathbf{D}(\mathbf{v}) - \bar{K}(\mathbf{v}) \mathbf{I}), J \bar{\mathbf{p}}_{j} \right)_{\Omega_{5R}}
\]

\[
= \gamma_{1}(\mathbf{v}, J \bar{\mathbf{p}}_{j})_{\Omega_{5R}} - \left( (\mu \mathbf{D}(\mathbf{v}) - \bar{K}(\mathbf{v}) \mathbf{I}) \mathbf{n}_{\partial \Omega_{5R}}, J \bar{\mathbf{p}}_{j} \right)_{\partial \Omega_{5R}}
\]

\[
+ \int_{\Omega_{5R}} (\mu \mathbf{D}(\mathbf{v}) - \bar{K}(\mathbf{v}) \mathbf{I}) (\mathbf{I} + \nabla \mathbf{y}) J \mathbf{p}_{j} \ dy
\]

\[
= \gamma_{1}(\mathbf{v}, J \bar{\mathbf{p}}_{j})_{\Omega_{5R}} + \frac{\mu}{2} \int_{\Omega_{5R}} \mathbf{D}(\mathbf{v}) : \mathbf{D}(\bar{\mathbf{p}}_{j}) J \ dy - (J \bar{K}(\mathbf{v}), \text{div} \mathbf{p}_{j})_{\Omega_{5R}}
\]

\[
= \gamma_{1}(\mathbf{v}, J \bar{\mathbf{p}}_{j})_{\Omega_{5R}}.
\] (2.31)

Under these preparations, we have the following theorem.

**Theorem 2.6.** Let \( 1 < p \leq r \). Then, for any \( \mathbf{f} \in J_{p}(\Omega_{5R}) \cap \mathcal{R}_d(\Omega_{5R})^\perp \), problem (2.26) admits a unique solution \( \mathbf{v} \in H^{2}_{p}(\Omega_{5R})^N \cap J_{p}(\Omega_{5R}) \cap \mathcal{R}_d(\Omega_{5R})^\perp \) possessing the estimate:

\[
\|\mathbf{v}\|_{H^{2}_{p}(\Omega_{5R})} \leq C \|\mathbf{f}\|_{L_{p}(\Omega_{5R})}.
\]

**Proof.** In view of Theorem 2.5 and the Fredholm alternative principle, to prove Theorem 2.6 it is enough to verify the uniqueness in the \( L_{2}((\Omega_{5R})^N \) framework. Namely, if \( \mathbf{v} \in H^{2}_{2}(\Omega_{5R})^N \cap J_{2}(\Omega_{5R}) \cap \mathcal{R}_d(\Omega_{5R})^\perp \) satisfies the homogeneous equations:

\[
\begin{cases}
- \text{Div}(\mu \mathbf{D}(\mathbf{v}) - \bar{K}(\mathbf{v}) \mathbf{I}) = 0 & \text{in} \ \Omega_{5R}, \\
(\mu \mathbf{D}(\mathbf{v}) - \bar{K}(\mathbf{v}) \mathbf{I}) \mathbf{n}_{\partial \Omega_{5R}} = 0 & \text{on} \ \partial \Omega_{5R}.
\end{cases}
\]
then we shall show that $v = 0$. By the similar argument to (2.31), we have

$$0 = \left(- \nabla \cdot (\mu \nabla \cdot v) - K(v) 1, Jv \right)_{\Omega_5} = \frac{\mu}{2} \int_{\Omega_5} D(v) \cdot D(v) J dy.$$ 

Therefore, $D(v) = 0$ in $\Omega_5$, and then $v$ is a linear combination of $\{p_j\}_{j=1}^M$. Since $v \in \mathcal{R}_d(\Omega_5)^\perp$, we have $v = 0$. This completes the proof of Theorem 2.6.

We now consider the Stokes equation:

$$\begin{cases}
- \nabla \cdot (\mu \nabla \cdot v) - \gamma_2 \omega 1 = f & \text{in } \Omega_5, \\
\nabla \cdot v = 0 & \text{in } \Omega_5, \\
(\mu \nabla \cdot v - \gamma_2 \omega 1) \pi_{\alpha_5R} = 0 & \text{on } \partial \Omega_5.R.
\end{cases} \tag{2.32}$$

From Theorem 2.6 we have the following corollary.

**Corollary 2.7.** Let $1 < p \leq r$. Then, for any $f \in \mathcal{J}_p(\Omega_5) \cap \mathcal{R}_d(\Omega_5)^\perp$, problem (2.32) admits a unique solution $v \in H^2_p(\Omega_5)^N \cap \mathcal{J}_p(\Omega_5) \cap \mathcal{R}_d(\Omega_5)^\perp$ and $\omega \in H^1_p(\Omega_5)$ possessing the estimate:

$$\|v\|_{H^2_p(\Omega_5)} + \|\omega\|_{H^1_p(\Omega_5)} \leq C\|f\|_{L^p(\Omega_5)}.$$ 

**Proof.** Let $v \in H^2_p(\Omega_5)^N \cap \mathcal{J}_p(\Omega_5) \cap \mathcal{R}_d(\Omega_5)^\perp$ be a solution of equations (2.26), whose existence is guaranteed by Theorem 2.6. For any $\varphi \in \mathcal{H}_p(\Omega_5)$,

$$0 = (f, J \nabla \varphi)_{\Omega_5} = - \left(\nabla \cdot (\mu \nabla \cdot v), J \nabla \varphi \right)_{\Omega_5} + (\nabla K(v), J \nabla \varphi)_{\Omega_5} = - (\nabla \cdot \nabla v, J \nabla \varphi)_{\Omega_5}.$$ 

Moreover, by the boundary condition in (2.26), we have

$$\overline{\nabla} v = \delta^{-1} < \mu \nabla \cdot v > \pi_{\alpha_5R} \pi_{\alpha_5R} > - K(v) = \delta^{-1} < (\mu \nabla \cdot v - K(v)) \pi_{\alpha_5R} \pi_{\alpha_5R} > 0 \text{ on } \partial \Omega_5.$$ 

Then, the uniqueness of the weak Dirichlet problem yields that $\overline{\nabla} v = 0$ in $\Omega_5$. Thus, $v$ automatically satisfies equations (2.32) with imposing $\omega = \gamma_2^{-1} \overline{K}(v)$, which completes the proof of Corollary 2.7. 

2.3 Modified compressible model problem

In this subsection, we consider the following problem:

$$\begin{cases}
\gamma_1 \overline{\nabla} v = d & \text{in } \Omega_5, \\
- \nabla \cdot (S(v) - \gamma_2 \omega 1) = f & \text{in } \Omega_5, \\
(S(v) - \gamma_2 \omega 1) \pi_{\alpha_5R} = h & \text{on } \partial \Omega_5, \tag{2.33}
\end{cases}$$

with $S(v) = \mu \nabla (v) + (\nu - \mu)(\overline{\nabla} v)$. Concerning (2.33), we have the following theorem.

**Theorem 2.8.** Let $1 < p \leq r$. Then, for any $d \in H^1_p(\Omega_5)$, $f \in L^p(\Omega_5)^N$ and $h \in H^1_p(\Omega_5)^N$ satisfying the orthogonal condition:

$$(f, J \overline{p}_j)_{\Omega_5} + (h, J \overline{p}_j)_{\alpha_5R} = 0 \quad (j = 1, \ldots, M), \tag{2.34}$$

problem (2.33) admits a unique solution $v \in H^2_p(\Omega_5)^N \cap \mathcal{R}_d(\Omega_5)^\perp$ and $\omega \in H^1_p(\Omega_5)$ possessing the estimate:

$$\|v\|_{H^2_p(\Omega_5)} + \|\omega\|_{H^1_p(\Omega_5)} \leq C\left(\|f\|_{L^p(\Omega_5)} + \|(d, h)\|_{H^1_p(\Omega_5)}\right).$$
Proof. Let \( v_1 \in H^2_p(\Omega_{5R})^N \) be a solution of the divergence equation: \( \gamma_1 \nabla \cdot v_1 = d \) in \( \Omega_{5R} \) possessing the estimate:

\[
\|v_1\|_{H^2_p(\Omega_{5R})} \leq C\|d\|_{H^p_\gamma(\Omega_{5R})}.
\]

The existence of such \( v_1 \) is guaranteed by Proposition 2.4. Therefore, to construct the solution of \( (2.33) \), it suffices to solve the following system:

\[
\begin{aligned}
\text{div} u &= 0 & \text{in } & \Omega_{5R}, \\
(\mu \nabla (u) - \gamma_2 \omega I) &= f + F_1 & \text{in } & \Omega_{5R}, \\
(u)_{\partial \Omega_{5R}} &= h + H_1 & \text{on } & \partial \Omega_{5R},
\end{aligned}
\]

(2.35)

with \( F_1 = \nabla (S(v_1)) \), and \( H_1 = -S(v_1)_{\partial \Omega_{5R}} \). Then \( v = v_1 + u \) and \( \omega \) satisfy the equations \( (2.33) \). Moreover, the divergence theorem of Gauss yields that

\[
(F_1, Jp_j)_{\Omega_{5R}} + (H_1, Jp_j)_{\partial \Omega_{5R}} = \frac{1}{2} \int_{\Omega_{5R}} S(v_1) : D(p_j) J\,dy = 0.
\]

(2.36)

To obtain the solution of \( (2.35) \), we consider the following two linear systems:

\[
\begin{aligned}
\nabla \cdot v_2 &= 0 & \text{in } & \Omega_{5R}, \\
(\gamma_1 \lambda_0 v_2 - \nabla (\mu \nabla (v_2)) - \gamma_2 \omega_2 I) &= f + F_1 & \text{in } & \Omega_{5R}, \\
(\mu \nabla (v_2))_{\partial \Omega_{5R}} &= h + H_1 & \text{on } & \partial \Omega_{5R},
\end{aligned}
\]

(2.37)

\[
\begin{aligned}
\nabla \cdot v_3 &= 0 & \text{in } & \Omega_{5R}, \\
(\mu \nabla (v_3) - \gamma_2 \omega_3 I) &= \gamma_1 \lambda_0 v_2 & \text{in } & \Omega_{5R}, \\
(\mu \nabla (v_3))_{\partial \Omega_{5R}} &= 0 & \text{on } & \partial \Omega_{5R},
\end{aligned}
\]

(2.38)

where \( \lambda_0 > 0 \) is a fixed large number. At least formally, \((u, \omega) = (v_2, \omega_2) + (v_3, \omega_3)\) gives a solution of \( (2.33) \). Thanks to Corollary 2.4, there exists a solution of \( (2.33) \) such that

\[
\begin{aligned}
\|v_2\|_{H^2_p(\Omega_{5R})} + \|\omega_2\|_{H^1_p(\Omega_{5R})} &\leq C(\|f + F_1\|_{P_p(\Omega_{5R})} + \|h + H_1\|_{H^1_p(\Omega_{5R})}) \\
&\leq C(\|f\|_{P_p(\Omega_{5R})} + \|(d, h)\|_{H^1_p(\Omega_{5R})}).
\end{aligned}
\]

Additionally, \( v_2 \in \bar{R}_d(\Omega_{5R}) \). In fact, \( (2.34) \) and \( (2.36) \) yield that

\[
\gamma_1 \lambda_0 (v_2, Jp_j)_{\Omega_{5R}} = \left(\frac{\nabla (\mu \nabla (v_2)) - \gamma_2 \omega_2 I}{\nabla (\mu \nabla (v_2)) - \gamma_2 \omega_2 I}, Jp_j \right)_{\Omega_{5R}} + (f + F_1, Jp_j)_{\Omega_{5R}} = (h + H_1, Jp_j)_{\partial \Omega_{5R}} + (f + F_1, Jp_j)_{\partial \Omega_{5R}} = 0.
\]

On the other hand, to solve \( (2.33) \), we notice that \( \gamma_1 \lambda_0 v_2 \in \bar{J}_p(\Omega_{5R}) \) from the divergence equation, as

\[
(v_2, J\nabla \varphi)_{\Omega_{5R}} = (J\nabla \varphi)_{\Omega_{5R}} = (J\nabla \varphi v_2, \bar{\nabla}_{\partial \Omega_{5R}})_{\partial \Omega_{5R}} - (\nabla \cdot v_2, J\nabla \varphi)_{\Omega_{5R}} = 0.
\]

Then, by Corollary 2.7, there exists a solution \( v_3 \in H^2_p(\Omega_{5R})^N \cap \bar{R}_d(\Omega_{5R}) \) and \( \omega_3 \in H^1_p(\Omega_{5R}) \) of the system \( (2.38) \) satisfying

\[
\|v_3\|_{H^2_p(\Omega_{5R})} + \|\omega_3\|_{H^1_p(\Omega_{5R})} \leq C\|\gamma_1 \lambda_0 v_2\|_{L_p(\Omega_{5R})} \leq C(\|f\|_{L_p(\Omega_{5R})} + \|(d, h)\|_{H^1_p(\Omega_{5R})}).
\]

Combing the discussion above, we find one solution \((v, \omega) \) of \( (2.33) \) by defining \( (v, \omega) = (v_1 + v_2 + v_3, \omega_2 + \omega_3) \in H^2_p(\Omega_{5R})^N \times H^1_p(\Omega_{5R}) \).

15
Moreover, we have
\[ \|v\|_{H^2_p(\Omega_{5R})} + \|\omega\|_{H^1_p(\Omega_{5R})} \leq C(\|(f, h)\|_{H^1_p(\Omega_{5R})} + \|g\|_{L^p(\Omega_{5R})}). \]

To meet the orthogonal condition, i.e. \( v \in \mathcal{R}_d(\Omega_{5R})^\perp \), we refine the definition of the velocity field by
\[
\tilde{v} = v - \sum_{j=1}^{M} (v, J\tilde{p}_j)\Omega_{5R} \tilde{p}_j \in \mathcal{R}_d(\Omega_{5R})^\perp.
\]

Since \( \overline{D}(\tilde{p}_j) = 0 \) and \( \text{div} \tilde{p}_j = 0 \), we see that \( \tilde{v} \) and \( \omega \) satisfy equations \((2.33)\) with the desired estimate.

We now prove the uniqueness. Let \( v \in H^2_p(\Omega_{5R})^N \cap \mathcal{R}_d(\Omega_{5R})^\perp \) and \( \omega \in H^1_p(\Omega_{5R}) \) for \( 2 \leq p \leq r \) satisfy the homogeneous equations:
\[
\begin{cases}
\text{div} v = 0 & \text{in } \Omega_{5R}, \\
- \text{div} (\mu \overline{D}(v) - \gamma_2 \omega I) = 0 & \text{in } \Omega_{5R}, \\
(\mu \overline{D}(v) - \gamma_2 \omega I) \pi_{\Omega_{5R}} = 0 & \text{on } \partial\Omega_{5R},
\end{cases}
\tag{2.39}
\]

By the previous discussion on the existence issue of \((2.33)\), given any \( g \in L^2(\Omega_{5R})^N \cap \mathcal{R}_d(\Omega_{5R})^\perp \), there exists \( (u, \theta) \in (H^2_p(\Omega_{5R})^N \cap \mathcal{R}_d(\Omega_{5R})^\perp) \times H^1_p(\Omega_{5R}) \) fulfilling the equations:
\[
\begin{cases}
\text{div} u = 0 & \text{in } \Omega_{5R}, \\
- \text{div} (\mu \overline{D}(u) - \gamma_2 \theta I) = g & \text{in } \Omega_{5R}, \\
(\mu \overline{D}(u) - \gamma_2 \theta I) \pi_{\Omega_{5R}} = 0 & \text{on } \partial\Omega_{5R}.
\end{cases}
\]

By the divergence theorem of Gauß, we have
\[
0 = \left( \text{div} (\mu \overline{D}(v) - \gamma_2 \omega I), J u \right)_{\Omega_{5R}} = \\
= \left( (\mu \overline{D}(v) - \gamma_2 \omega I) \pi_{\Omega_{5R}}, J u \right)_{\partial\Omega_{5R}} + \frac{\mu}{2} \int_{\Omega_{5R}} \overline{D}(v) : \overline{D}(u) J dy + (J \gamma_2 \omega, \text{div} u)_{\Omega_{5R}}
\]
\[
= \frac{\mu}{2} \int_{\Omega_{5R}} \overline{D}(v) : \overline{D}(u) J dy
= \left( J v, \text{div} (\mu \overline{D}(u) - \gamma_2 \theta I) \right)_{\Omega_{5R}} = (J v, g)_{\Omega_{5R}}.
\]

For any \( f \in L^2(\Omega_{5R})^N \), we set
\[
f_\perp = f - \sum_{j=1}^{M} (f, J\tilde{p}_j)\Omega_{5R} \tilde{p}_j \in L^2(\Omega_{5R})^N \cap \mathcal{R}_d(\Omega_{5R})^\perp.
\]

Then we infer from \( v \in \mathcal{R}_d(\Omega_{5R})^\perp \) that
\[
(J v, f)_{\Omega_{5R}} = (J v, f_\perp)_{\Omega_{5R}} + \sum_{j=1}^{M} (f, J\tilde{p}_j)\Omega_{5R} (J v, \tilde{p}_j)_{\Omega_{5R}} = (J v, f_\perp)_{\Omega_{5R}} = 0.
\]

The arbitrary choice of \( f \) yields that \( J v = 0 \), and thus \( v = 0 \).
Now, the equations (2.39) are reduced to the form:

\[
\begin{align*}
\nabla \omega &= (I + V) \nabla y \omega = 0 & \text{in } \Omega_{S_R}, \\
\omega \pi_{\partial \Omega_{S_R}} &= \omega (I + V)n_{\partial \Omega_{S_R}} = 0 & \text{on } \partial \Omega_{S_R}.
\end{align*}
\]

Therefore, \( \nabla y \omega = 0 \) in \( \Omega_{S_R} \), and then \( \omega = 0 \) by the boundary condition.

Next, we assume that \( (v, \omega) \in (H_{S_R}^2(\Omega_{S_R})^N \cap \mathcal{R}_d(\Omega_{S_R})) \times H_{S_R}^1(\Omega_{S_R}) \) for some \( 1 < p < 2 \) satisfies the equations (2.39). Notice that the embedding \( H_{S_R}^1(\Omega_{S_R}) \to L_q(\Omega_{S_R}) \) with \( 0 < N(1/p - 1/q) < 1 \). Then, by Theorem 2.2, there exists \( (u, \theta) \in H_{S_R}^2(\Omega_{S_R})^N \times H_{S_R}^1(\Omega_{S_R}) \) satisfying

\[
\begin{align*}
\gamma_1\lambda u - \text{Div} (\mu \mathcal{D}(u) - \gamma_2 \theta I) &= \gamma_1\lambda v & \text{in } \Omega_{S_R}, \\
\text{Div} u &= 0 & \text{in } \Omega_{S_R}, \\
(\mu \mathcal{D}(u) - \gamma_2 \theta I) \pi_{\partial \Omega_{S_R}} &= 0 & \text{on } \partial \Omega_{S_R},
\end{align*}
\]

for some \( \lambda > 0 \). In fact, we have \( (u, \theta) = (v, \omega) \in H_{S_R}^2(\Omega_{S_R})^N \times H_{S_R}^1(\Omega_{S_R}) \) by the uniqueness in Theorem 2.2. If \( q \geq 2 \), we have \( (v, \omega) \in H_{S_R}^2(\Omega_{S_R})^N \times H_{S_R}^1(\Omega_{S_R}) \) and the uniqueness of (2.39) from the previous discussion on the case \( p \geq 2 \). Otherwise, we repeat such argument in finite times. This completes the proof of Theorem 2.8.

\[ \square \]

3 Resolvent problem for \( \lambda \) near zero

In this section, we will study the behaviour of the solution of the system (1.13) whenever \( \lambda \) lies near the origin. The main result reads as follows.

**Theorem 3.1.** Let \( (d, f) \in X_{p,L}(\Omega) \) for \( 1 < p \leq r \) and \( L > 2R > 0 \). Then there exist a constant \( \lambda_1 > 0 \) and two families of the operators \((M_\lambda, V_\lambda)\) for any \( \lambda \in \hat{U}_{\lambda_1} = \{ \lambda \in \mathbb{C}\backslash(-\infty, 0) : |\lambda| < \lambda_1 \} \) with

\[ M_\lambda \in \text{Hol} \left( \hat{U}_{\lambda_1}; \mathcal{L}(X_{p,L}(\Omega); H_{p,\text{loc}}^1(\Omega)) \right), \quad V_\lambda \in \text{Hol} \left( \hat{U}_{\lambda_1}; \mathcal{L}(X_{p,L}(\Omega); H_{p,\text{loc}}^1(\Omega)^N) \right), \]

so that \( (\eta, u) = (M_\lambda, V_\lambda)(d, f) \) solves (1.13). Moreover, there exist families of the operators

\[ M_i^\lambda \in \text{Hol} \left( \hat{U}_{\lambda_1}; \mathcal{L}(X_{p,L}(\Omega); H_{p,\text{loc}}^1(\Omega)) \right) \quad (i = 1, 2), \]

\[ V^j_\lambda \in \text{Hol} \left( \hat{U}_{\lambda_1}; \mathcal{L}(X_{p,L}(\Omega); H_{p,\text{loc}}^1(\Omega)^N) \right) \quad (j = 0, 1, 2), \]

such that

\[ M_\lambda = (\lambda^{N-2} \log \lambda)^{M_\lambda^1 + M_\lambda^2}, \]

\[ V_\lambda = (\lambda^{N/2-1} \log \lambda)^{V_\lambda^0} + (\lambda^{N-2} \log \lambda)^{V_\lambda^1 + V_\lambda^2}, \]

for any \( \lambda \in \hat{U}_{\lambda_1} \) and \( \sigma(N) = ((-1)^N + 1)/2 \).

3.1 Resolvent problem in \( \mathbb{R}^N \)

In this subsection, we review the result of some model problem in \( \mathbb{R}^N \):

\[
\begin{align*}
\lambda \eta + \gamma_1 \text{div} u &= d & \text{in } \mathbb{R}^N, \\
\gamma_1 \lambda u - \text{Div} (S(u) - \gamma_2 \eta I) &= f & \text{in } \mathbb{R}^N.
\end{align*}
\]

with the parameters in (3.1) satisfy \( \mu, \nu, \gamma_1, \gamma_2 > 0 \). Now, we recall the notion in (1.15) and the results in [20] Subsec. 3.1].
Theorem 3.2. Let $1 < p < \infty$, $0 < \varepsilon < \pi/2$, and $\lambda_0 > 0$. Then there exist two families of operators

$$(P(\lambda), V(\lambda)) \in \text{Hol} \left( \Sigma_{\varepsilon} \cap K; \mathcal{L}(H^{1,0}_p(\mathbb{R}^N); H^{1,2}_p(\mathbb{R}^N)) \right),$$

such that $(\eta, u) = (P(\lambda), V(\lambda))(d, f)$ is a solution of (3.1). Moreover, there exists a constant $C_{\varepsilon, \lambda_0}$ so that

$$|\lambda||\eta||_{H^{1,0}_p(\mathbb{R}^N)} + \sum_{j=0}^{2} |\lambda|^{j/2}||\dot{u}||_{H^{2-j}_p(\mathbb{R}^N)} \leq C_{\varepsilon, \lambda_0} ||(d, f)||_{H^{1,0}_p(\mathbb{R}^N)}$$

for any $\lambda \in V_{\varepsilon, \lambda_0}$.

Theorem 3.3. Let $1 < p < \infty$, $0 < \varepsilon < \pi/2$, $L \geq R > 0$, and $N \geq 3$. Set that

$$X_{p,L}(\mathbb{R}^N) = \{(d, f) \in H^{1,0}_p(\mathbb{R}^N) : \text{supp}\, d, \text{supp}\, f \subset B_L \}.$$ Then the following assertions hold:

1. There exist a constant $\lambda_0 > 0$ and two families of operators

$$M_{\lambda} \in \text{Hol} \left( \hat{U}_{\lambda_0}; \mathcal{L}(X_{p,L}(\mathbb{R}^N); H^{1}_{p,\text{loc}}(\mathbb{R}^N)) \right),$$

such that for any $(d, f) \in X_{p,L}(\mathbb{R}^N)$ and $\lambda \in K \cap \hat{U}_{\lambda_0}$

$$(M_{\lambda}, V_{\lambda})(d, f) = (P(\lambda), V(\lambda))(d, f).$$

Moreover, there exist families of operators

$$M^1_{\lambda} \in \text{Hol} \left( \hat{U}_{\lambda_0}; \mathcal{L}(X_{p,L}(\mathbb{R}^N); H^{1}_{p}(B_L)) \right) \quad (i = 1, 2),$$

such that

$$M_{\lambda} = (\lambda^{N-2} \log \lambda)M^1_{\lambda} + M^2_{\lambda},$$

for any $\lambda \in \hat{U}_{\lambda_0}$ and $\sigma(N) = ((-1)^N + 1)/2$.

2. There exist operators

$$M_0 \in \mathcal{L}(X_{p,L}(\mathbb{R}^N); H^{1}_{p,\text{loc}}(\mathbb{R}^N)), \quad V_0 \in \mathcal{L}(X_{p,L}(\mathbb{R}^N); H^{2}_{p,\text{loc}}(\mathbb{R}^N))^N$$

such that for any $(d, f) \in X_{p,L}(\mathbb{R}^N)$, $(\eta_0, u_0) = (M_0, V_0)(d, f)$ is a solution of

$$\begin{cases} \gamma_1 \text{div}\, u = d & \text{in } \mathbb{R}^N, \\ -\text{Div}\, (S(u) - \gamma_2 \eta I) = f & \text{in } \mathbb{R}^N, \end{cases}$$

18
In fact, here and in the following, given function $a$ for $x$ of the rigid motion in (2.27). We introduce a family of vectors $\psi$ such that

\[
\begin{aligned}
\gamma_1 \text{div} u &= d & \text{in } & \Omega_{5R}, \\
-D\text{div}(S(u) - \gamma_2 \eta I) &= f & \text{in } & \Omega_{5R}, \\
(S(u) - \gamma_2 \eta I) \mathbf{n} &= 0 & \text{on } & \Gamma, \\
(S(u) - \gamma_2 \eta I) n_{5R} &= 0 & \text{on } & S_{5R},
\end{aligned}
\] (3.2)

Here, $n_{5R}$ denotes the unit outer normal to $S_{5R} = \{x \in \mathbb{R}^N \mid |x| = 5R\}$. Let $3R < b_0 < b_1 < b_2 < b_3 < 4R$ and set

\[
D_{b_1,b_2} = \{x \in \mathbb{R}^N \mid b_1 < |x| < b_2\}, \quad D_{b_1,b_2}^+ = \{x \in D_{b_1,b_2} \mid x_j > 0 \ (j = 1, \ldots, N)\}.
\]

Let $\psi \in C_0^\infty(\mathbb{R}^N)$ such that supp $\psi \subset D_{b_1,b_2}$, and $\tilde{\psi} = 1$ on some ball $B \subset D_{b_1,b_2}^+$. Recall the basis $\{r_j\}_{j=1}^M$ of the rigid motion in (2.27). We introduce a family of vectors $\Omega_\psi = \{q_j\}_{j=1}^M$, another normalization of $\{r_j\}_{j=1}^M$ in such a way that

\[
(q_j, q_k)_\psi = \left(\psi q_j, q_k\right)_{\mathbb{R}^N} = \int_{\mathbb{R}^N} \psi(x) q_j(x) \cdot q_k(x) \, dx = \delta_{j,k}.
\] (3.3)

Here and in the following, given function $a(x)$, $\tilde{a}(y)$ is defined by $a(x) = \tilde{a}(y)$ in view of (3.6). Since $x = X_w(y,T) = y$ for $y \not\in B_{2R}$, we infer from (3.3) that

\[
\delta_{j,k} = (\psi q_j, q_k)_{\mathbb{R}^N} = (\tilde{\psi} q_j, q_k)_{\Omega_{5R}} = (\tilde{\psi} q_j, J q_k)_{\Omega_{5R}} = (\psi q_j, J q_k)_{\Omega_{5R}},
\] (3.4)

for $\tilde{q}_j \in \{q_j, \tilde{q}_j\}$ with $j, k = 1, \ldots, M$. Moreover, for simplicity we write

- $f \perp \Omega_\psi$ if $(f, J q_j)_{\Omega_{5R}} = 0$ for any $q_j \in \Omega_\psi$;
- $f \perp \Omega_\psi$ if $(f, \tilde{q}_j)_{\psi} = 0$ for any $q_j \in \Omega_\psi$.

In fact, $f \perp \Omega_\psi$ is equivalent to $f \in \mathcal{R}_d(\Omega_{5R})^\perp$ by (3.30) in the previous section. Thus Theorem 2.8 yields the following result for (3.2).
Theorem 3.4. Let $1 < p \leq r$. Let $(d, f) \in H^{1,0}_p(\Omega_{5R})$ with $f \perp \Omega_R$. Then there exist operators

$$(\mathcal{J}, \mathcal{W}) \in \mathcal{L}(H^{1,0}_p(\Omega_{5R}), H^{1,2}_p(\Omega_{5R}))$$

such that $(\eta, u) = (\mathcal{J}, \mathcal{W})(d, f)$ is a unique solution of (3.2) with $u \perp \Omega_R$. Moreover, the following estimate holds,

$$\|\eta\|_{H^2_p(\Omega_{5R})} + \|u\|_{H^2_p(\Omega_{5R})} \leq C(\|d\|_{H^1_p(\Omega_{5R})} + \|f\|_{L_p(\Omega_{5R})}),$$

for some constant $C > 0$.

To prove Theorem 3.4, we introduce cut-off functions $\varphi$, $\psi_0$, and $\psi_\infty$ such that $0 \leq \varphi, \psi_0, \psi_\infty \leq 1$, $\varphi, \psi_0, \psi_\infty \in C^\infty(\mathbb{R}^N)$, and

$$\varphi(x) = \begin{cases} 1 & \text{for } |x| \leq b_1, \\ 0 & \text{for } |x| \geq b_2, \end{cases} \quad \psi_0(x) = \begin{cases} 1 & \text{for } |x| \leq b_2, \\ 0 & \text{for } |x| \geq b_3, \end{cases} \quad \psi_\infty(x) = \begin{cases} 1 & \text{for } |x| \geq b_1, \\ 0 & \text{for } |x| \leq b_0. \end{cases} \quad (3.5)$$

For any $(d, f) \in H^{1,0}_p(\Omega_{5R})$, we have

$$\|\psi_\infty d\|_{H^1_p(\mathbb{R}^N)} + \|\psi_\infty f\|_{L_p(\mathbb{R}^N)} \leq C(\|d\|_{H^1_p(\Omega)} + \|f\|_{L_p(\Omega)}). \quad (3.6)$$

Then, by Theorem 3.3 and (3.6), there exists a $\lambda_0 > 0$ such that $(\eta_\lambda, u_\lambda) = (\mathcal{M}_\lambda, \mathcal{V}_\lambda)(\psi_\infty d, \psi_\infty f)$ solves the following equations:

$$\begin{cases} \lambda_\lambda + \gamma_1 \text{div } u_\lambda = \psi_\infty d & \text{in } \mathbb{R}^N, \\ \gamma_1 \lambda u_\lambda - \text{Div } (S(u_\lambda) - \gamma_2 \eta_\lambda I) = \psi_\infty f & \text{in } \mathbb{R}^N, \end{cases} \quad (3.7)$$

and satisfies the estimate:

$$\|\eta_\lambda\|_{H^1_p(B_{6R})} + \|u_\lambda\|_{H^2_p(B_{6R})} \leq C(\|d\|_{H^1_p(\Omega)} + \|f\|_{L_p(\Omega)}). \quad (3.8)$$

Moreover, we set $(\eta_0, u_0) = (\mathcal{M}_0, \mathcal{V}_0)(\psi_\infty d, \psi_\infty f) \in H^{1,2}_{p, \text{loc}}(\mathbb{R}^N)$ fulfilling that

$$\begin{cases} \gamma_1 \text{div } u_0 = \psi_\infty d & \text{in } \mathbb{R}^N, \\ - \text{Div } (S(u_0) - \gamma_2 \eta_0 I) = \psi_\infty f & \text{in } \mathbb{R}^N, \end{cases} \quad (3.9)$$

and

$$\lim_{\lambda \in U_{\lambda_0}} \left( \|\eta_\lambda - \eta_0\|_{H^1_p(B_{6R})} + \|u_\lambda - u_0\|_{H^2_p(B_{6R})} \right) = 0. \quad (3.10)$$

On the other hand, let us set

$$f_{R_d} = \sum_{j=1}^{M} (\psi_0 f, J\bar{q}_j)_{\Omega_{5R}} \psi q_j, \quad f_\perp = \psi_0 f - f_{R_d} \in L_p(\Omega_{5R})^N.$$

Obviously, $f_\perp \perp \Omega_R$. In fact, (3.4) implies that

$$(f_\perp, J\bar{q}_\ell)_{\Omega_{5R}} = (\psi_0 f, J\bar{q}_\ell)_{\Omega_{5R}} - \sum_{j=1}^{M} (\psi_0 f, J\bar{q}_j)_{\Omega_{5R}} (\psi q_j, J\bar{q}_\ell)_{\Omega_{5R}} = 0,$$

20
for any \( \ell = 1, \ldots, M \). Then, Theorem 3.4 yields that there exists a (unique) solution \((\eta_\ell, u_\ell) \in H^{1,2}_p(\Omega_R)\) with \(u_\ell \perp \Omega_R\) of the following equations:

\[
\begin{cases}
\gamma_1 \text{div} u_\ell = \psi_0 d & \text{in } \Omega_R, \\
- \text{div}(S(u_\ell) - \gamma_2 \eta_\ell I) = f_\perp & \text{in } \Omega_R, \\
(S(u_\ell) - \gamma_2 \eta_\ell I) \nabla = 0 & \text{on } \Gamma, \\
(S(u_\ell) - \gamma_2 \eta_\ell I) n_{S_\ell R} = 0 & \text{on } S_\ell R,
\end{cases}
\]

(3.11)

possessing the estimate

\[
\|\eta_\ell\|_{H^2_p(\Omega_R)} + \|u_\ell\|_{H^2_p(\Omega_R)} \leq C(\|d\|_{H^1_p(\Omega)} + \|f\|_{L^p(\Omega)}).
\]

(3.12)

We now introduce parametrices:

\[
\tilde{\eta}_\lambda = \Phi_\lambda(d, f) = (1 - \varphi)\eta_\lambda + \varphi\eta_\ell, \quad \tilde{u}_\lambda = \Psi_\lambda(d, f) = (1 - \varphi)u_\lambda + \varphi u_\ell
\]

for \( \lambda \in \tilde{U}_\lambda \cup \{0\} \). Notice that

\[
S(\tilde{u}_\lambda) - \gamma_2 \tilde{\eta}_\lambda I = (1 - \varphi)(S(u_\lambda) - \gamma_2 \eta_\lambda I) + \varphi(S(u_\ell) - \gamma_2 \eta_\ell I) + V_\lambda(d, f),
\]

with

\[
V_\lambda(d, f) = \mu((u_\ell - u_\lambda) \otimes \nabla \varphi + \nabla \varphi \otimes (u_\ell - u_\lambda)) + (\nu - \mu)((u_\ell - u_\lambda) \cdot \nabla \varphi) I,
\]

(3.13)

and supp \( V_\lambda(d, f) \subset D_{b_1,b_2} \). Then it holds that

\[
\begin{cases}
\lambda \tilde{\eta}_\lambda + \gamma_1 \text{div} \tilde{u}_\lambda = d + D_\lambda(d, f) & \text{in } \Omega, \\
\gamma_1 \tilde{u}_\lambda - \text{div}(S(\tilde{u}_\lambda) - \gamma_2 \tilde{\eta}_\lambda I) = f + F_\lambda(d, f) & \text{in } \Omega, \\
(S(\tilde{u}_\lambda) - \gamma_2 \tilde{\eta}_\lambda I) \nabla = 0 & \text{on } \Gamma,
\end{cases}
\]

(3.14)

where \( D_\lambda(d, f) \) and \( F_\lambda(d, f) \) with \( \lambda \in \tilde{U}_\lambda \cup \{0\} \) are defined as

\[
D_\lambda(d, f) = \lambda \varphi \eta_\ell + \gamma_1 \nabla \varphi \cdot (u_\ell - u_\lambda), \\
F_\lambda(d, f) = -\varphi f_\perp d + \gamma_1 \lambda \varphi \varphi u_\ell + ((S(u_\lambda) - \gamma_2 \eta_\lambda I) - (S(u_\ell) - \gamma_2 \eta_\ell I)) \nabla \varphi - \text{div} V_\lambda(d, f).
\]

Moreover, by (3.8), (3.10), and (3.12), we have

\[
Q_\lambda(d, f) = (D_\lambda, F_\lambda)(d, f) \in X_{p, 5R}(\Omega) \quad \text{for any } \lambda \in \tilde{U}_\lambda \cup \{0\},
\]

\[
\lim_{\lambda \in \tilde{U}_\lambda \atop |\lambda| \to 0} \|Q_\lambda - Q_0\|_{L(X_{p, 5R}(\Omega))} = 0.
\]

(3.15)

In particular, by Rellich's compactness theorem, \( Q_0 \) is a compact operator on \( X_{p, 5R}(\Omega) \). Moreover, \( I + Q_0 \) is invertible due to the following lemma.

**Lemma 3.5.** Given \( Q_0 = (F_0, G_0) \) as above, \( I + Q_0 \) has a bounded inverse in \( L(X_{p, 5R}(\Omega)) \), which is denoted by \((I + Q_0)^{-1}\).

The proof of Lemma 3.5 is postponed to the next subsection, and we continue the proof of Theorem 3.1. Notice that

\[
I + Q_\lambda = (I + Q_0)(I + (I + Q_0)^{-1}(Q_\lambda - Q_0)).
\]
Then by (3.15) and Lemma [3.5] we can choose \( \lambda_1 \leq \lambda_0 \) such that

\[
\|(I + Q_0)^{-1}(Q_0 - Q_0)\|_{L^2(X_p,SR(\Omega))} \leq 1/2,
\]

for any \( \lambda \in \hat{U}_{\lambda_1} \). Moreover, the inverse of \( I + Q_\lambda \) exists for any \( \lambda \in \hat{U}_{\lambda_1} \) formulated by

\[
(I + Q_\lambda)^{-1} = \sum_{j=0}^{\infty} \left( -(I + Q_0)^{-1}(Q_\lambda - Q_0)\right)^j (I + Q_0)^{-1}.
\]

Thus we can define the operators \((M_\lambda, V_\lambda)\) as

\[
(\eta, \mathbf{u}) = (M_\lambda, V_\lambda)(d, f) = (\Phi_\lambda, \Psi_\lambda) \circ (I + Q_\lambda)^{-1}(d, f),
\]

for any \((d, f) \in X_p,SR(\Omega)\) and \( \lambda \in \hat{U}_{\lambda_1} \). In fact, \((\eta, \mathbf{u})\) clearly satisfies (1.13) by (3.14). Furthermore, the existence of operators \(M_\lambda^i\) \((i = 1, 2)\) and \(V_\lambda^j\) \((j = 0, 1, 2)\) is immediate from Theorems 3.3 and 3.4. So the details are omitted here.

### 3.3 Proof of Lemma 3.5

Before proving Lemma [3.5] we start with the following lemma, which plays an essential role in the later proof.

**Lemma 3.6.** Let \( 1 < p \leq r \) and \( N \geq 3 \). Assume that \( \Omega \) is a \( C^3 \) exterior domain in \( \mathbb{R}^N \). Let \((\mathbf{u}, \eta) \in H^{1,2}_{p,lo}(\Omega)\) satisfy the homogeneous equations:

\[
\begin{cases}
\text{div } \mathbf{u} = 0 & \text{in } \Omega, \\
-\text{Div}(\mu \overline{\mathbf{D}}(\mathbf{u}) - \gamma_2 \eta \mathbf{I}) = 0 & \text{in } \Omega, \\
(\mu \overline{\mathbf{D}}(\mathbf{u}) - \gamma_2 \eta \mathbf{I}) \mathbf{n}_\Gamma = 0 & \text{on } \Gamma.
\end{cases}
\]

Assume in addition that \( \eta(y) = C_{\infty} + O(|y|^{-(N-1)}) \), \( \mathbf{u}(y) = O(|y|^{-(N-2)}) \), and \( \nabla \mathbf{u}(y) = O(|y|^{-(N-1)}) \) as \( |y| \to \infty \), where \( C_{\infty} \) is some constant. Then, \( u = 0 \) and \( \eta = 0 \) for almost all \( y \in \Omega \). In particular, \( C_{\infty} = 0 \).

**Proof.** Case \( p \geq 2 \). It suffices to consider \((\eta, \mathbf{u}) \in H^{1,2}_{2,lo}(\Omega)\) in this situation. Let \( \phi \) be a \( C^\infty(\mathbb{R}^N) \) function which equals 1 for \( y \in B_1 \) and 0 for \( y \notin B_2 \). Let \( \phi_L(y) = \phi(y/L) \) for any large \( L > 6R \). Set \( \tilde{C} = \gamma_2 C_{\infty} \) and \( \tilde{\eta} = \gamma_2 (\eta - C_{\infty}) \). Then, \((\tilde{\eta}, \mathbf{u}) \in H^{1,2}_{2,lo}(\Omega)\) solves equations:

\[
\begin{cases}
\overline{\text{div }} \mathbf{u} = 0 & \text{in } \Omega, \\
-\text{Div}(\mu \overline{\mathbf{D}}(\mathbf{u}) - \tilde{\eta} \mathbf{I}) = 0 & \text{in } \Omega, \\
(\nu \overline{\mathbf{D}}(\mathbf{u}) - \tilde{\eta} \mathbf{I}) \mathbf{n}_\Gamma = \tilde{C} \mathbf{n}_\Gamma & \text{on } \Gamma,
\end{cases}
\]

Then, by the divergence theorem of Gauß, (3.17), and (1.11), we have

\[
0 = -\left( \overline{\text{Div}}(\mu \overline{\mathbf{D}}(\mathbf{u}) - \tilde{\eta} \mathbf{I}), J \phi_L \mathbf{u} \right)_\Omega
= -\left( \tilde{C} \mathbf{n}_\Gamma, J \phi_L \mathbf{u} \right)_\Gamma + \frac{\mu}{2} \int_\Omega \overline{\mathbf{D}}(\mathbf{u}) : \overline{\mathbf{D}}(\phi_L \mathbf{u}) J dy - (\tilde{J} \tilde{\eta} \overline{\text{Div}}(\phi_L \mathbf{u}))_\Omega
= -\tilde{C} \int_\Omega \overline{\text{Div}}(\phi_L \mathbf{u}) J dy + \frac{\mu}{2} \int_\Omega \overline{\mathbf{D}}(\mathbf{u}) : \phi_L \overline{\mathbf{D}}(\mathbf{u}) J dy + I_L,
\]
with \( I_L = \frac{\mu}{2} \int_{L \leq |y| \leq 2L} \mathbf{D}(u) : (\nabla \phi_L \otimes u + u \otimes \nabla \phi_L) \, dy + \int_{L \leq |y| \leq 2L} \bar{\eta}(\nabla \phi_L \cdot u) \, dy \).

Using the radiation condition, we have
\[
|I_L| \leq CL^{-1} \int_{L \leq |y| \leq 2L} |\frac{1}{|y|^{N-1}}| \cdot |\frac{1}{|y|^{N-2}}| \, dy \leq CL^{-(N-2)} \to 0
\]
as \( L \to \infty \), because \( N \geq 3 \). Moreover, (1.11) implies that
\[
\int_{\Omega} \text{div} (\phi_L u) J \, dy = \int_{L \leq |y| \leq 2L} (\nabla \phi_L) \cdot u \, dy.
\]
Since \( \text{div} u = 0 \) for \( y \in \mathbb{R}^N \setminus B_{2R} \), by [24, Lemma 6] there exists a \( v \in H^1_3(\mathbb{R}^N)^N \) supported in \( D_{R_2,R_3} \) for some \( 2R < R_2 < L/2 < 3L < R_3 \) such that \( \text{div} v = 0 \) in \( \mathbb{R}^N \) and \( (\nabla \phi_L) \cdot u = (\nabla \phi_L) \cdot v \) in \( \mathbb{R}^N \). Hence,
\[
\int_{L \leq |y| \leq 2L} (\nabla \phi_L) \cdot u \, dy = \int_{|y| < R_3} (\nabla \phi_L) \cdot v \, dy = \int_{|y| < R_3} \text{div} (\phi_L v) \, dy = 0.
\]
Thus, letting \( L \to \infty \) yields that
\[
\int_{\Omega} \mathbf{D}(u) : D(u) \, J \, dy = 0,
\]
which implies that \( \mathbf{D}(u) = 0 \) in \( \Omega \), or equivalently, \( u \in \text{Span} \{ \bar{q}_1, \ldots, \bar{q}_M \} \) (see subsection 3.2). But, \( u(y) = O(|y|^{-(N-2)}) \to 0 \) as \( |y| \to \infty \), and so \( u = 0 \). By (3.16), \( \nabla \eta = 0 \) in \( \Omega \) and \( \eta = 0 \) on \( \Gamma \). This shows that \( \eta = 0 \). Since \( \eta - C_\infty \to 0 \) as \( |y| \to \infty \), \( C_\infty = 0 \).

Case 1 \( p < 2 \). For \( (\eta, u) \in H^{1,2}_{p,\text{loc}}(\Omega) \) with \( 1 < p < 2 \), we use the hypoellipticity of the Stokes operator. Let \( \omega \) be a \( C^\infty(\mathbb{R}^N) \) function which equals 1 for \( x \in \mathbb{R}^N \setminus B_{4R} \) and 0 for \( x \in B_{2R} \). Let \( \mathbf{B} \) be the Bogovskii operator, and set
\[
(\upsilon, \zeta) = (\omega u - \mathbf{B}[(\nabla \omega) \cdot u], \gamma_2 \omega(\eta - C_\infty)).
\]
We see that \( (\zeta, \upsilon) \in H^{1,2}_{p,\text{loc}}(\mathbb{R}^N) \) satisfies the Stokes equations:
\[
\upsilon - \mu \Delta \upsilon + \nabla \zeta = f, \quad \text{div} \upsilon = 0 \quad \text{in} \ \mathbb{R}^N
\]
with
\[
f = -2\mu((\nabla \omega) \cdot \nabla) u - \mu(\Delta \omega) u + \mu \mathbf{B}[(\nabla \omega) \cdot u] + \gamma_2 (\eta - C_\infty) \nabla \omega + \omega u - \mathbf{B}[(\nabla \omega) \cdot u] \in H^1_{p}(\mathbb{R}^N)^N.
\]
Notice that \( \text{supp} f \subset B_{4R} \). By the Sobolev imbedding theorem, \( \upsilon \in L_q(\mathbb{R}^N)^N \), where \( q \) is an exponent such that \( 0 < N(1/p - 1/q) < 1 \). By the standard result for the Stokes equations, we have \( (\zeta, \upsilon) \in H^{1,2}_{q,\text{loc}}(\mathbb{R}^N) \), which yields that \( (\eta, u) \in H^{1,2}_{1,2}(\mathbb{R}^N \setminus B_{4R}) \).

We next consider the interior problem:
\[
\begin{align*}
\left\{ 
\begin{array}{ll}
\text{div} \upsilon &= 0 & \text{in} \ \Omega_{5R}, \\
\gamma_1 \lambda \upsilon - \text{Div}[(\mu \mathbf{D}(u) - \gamma_2 \eta \mathbf{I})] &= \gamma_1 \lambda u & \text{in} \ \Omega_{5R}, \\
(\mu \mathbf{D}(u) - \gamma_2 \eta \mathbf{I}) \mathbf{n} &= 0 & \text{on} \ \Gamma, \\
(\mu \mathbf{D}(u) - \gamma_2 \eta \mathbf{I}) \mathbf{n} &= \mathbf{h} & \text{on} \ S_{5R},
\end{array}
\right.
\end{align*}
\]
\( (3.18) \)
with \( h = (\mu D(u) - \gamma_2 \eta I) n_{S_{\frac{3}{4}R}} \in W_{q}^{1, -1/q}(S_{\frac{3}{4}R}) \) by the discussion above. Since \( u \in H_{q}^{2}(\Omega_{5R}) \subset L_{q}(\Omega_{5R}) \), choosing \( \lambda > 0 \) so large if necessary, by Corollary 2.4 \((\eta, u) \in H_{q}^{1,2}(\Omega_{5R})\), and so we have \((\eta, u) \in H_{q, loc}^{1,2}(\Omega)\). If \( p < q < 2 \), then repeated use of this argument finally implies that \((\eta, u) \in H_{2, loc}^{1,2}(\Omega)\). This completes the proof of Lemma 3.6. \( \square \)

**Proof of Lemma 3.6.** According to the compactness of \( Q_{0} \) and the Fredholm alternative theorem, it is sufficient to verify the injectivity of \( \mathcal{I} + Q_{0} \). Let \((d, f) \in \text{Ker}(\mathcal{I} + Q_{0})\), that is, \((d, f) + Q_{0}(d, f) = (0, 0)\). Since \( \text{supp} Q_{0}(d, f) \subset D_{b_{1}, b_{2}}, \text{supp} (d, f) \subset D_{b_{1}, b_{2}} \). As \( \psi_{0} = \psi_{\infty} = 1 \) in \( D_{b_{1}, b_{2}} \), we have

\[
(d, f) = (\psi_{\infty}d, \psi_{\infty}f) = (\psi_{0}d, \psi_{0}f).
\]

In particular, \( f_{\perp} = \psi_{0}f - f_{R_{d}} = f - f_{R_{d}} \) with

\[
f_{R_{d}} = \sum_{j=1}^{M} (f, q_{j})_{\Omega_{5R}} q_{j}.
\]

Then, in view of (3.14), \((\tilde{\eta}_{0}, \tilde{u}_{0}) = (1 - \varphi)(\eta_{0}, u_{0}) + \varphi(\eta_{t}, u_{t}) \) satisfies the homogeneous equations:

\[
\begin{align*}
\gamma_{1} \text{div} \tilde{u}_{0} &= 0 \quad \text{in} \quad \Omega, \\
- \text{Div} (\mu D(\tilde{u}_{0}) - \gamma_{2} \tilde{\eta}_{0} I) &= 0 \quad \text{in} \quad \Omega, \\
(\mu D(\tilde{u}_{0}) - \gamma_{2} \tilde{\eta}_{0} I) n_{\Gamma} &= 0 \quad \text{on} \quad \Gamma,
\end{align*}
\]

and the radiation condition:

\[
\tilde{\eta}_{0}(x) = O(|x|^{-(N-1)}), \quad \tilde{u}_{0}(x) = O(|x|^{-(N-2)}), \quad \nabla \tilde{u}_{0}(x) = O(|x|^{-(N-1)})
\]

as \(|x| \to \infty\) by Theorem 3.3. Thus, by Lemma 3.6

\[
\tilde{\eta}_{0} = 0, \quad \tilde{u}_{0} = 0.
\]

Then the choice of \( \varphi \) yields that

\[
\eta_{t}(x) = 0, \quad u_{t}(x) = 0 \quad \text{for} \quad |x| \leq b_{1}, \quad \eta_{0}(x) = 0, \quad u_{0}(x) = 0 \quad \text{for} \quad |x| \geq b_{2}.
\]

We now introduce the extensions

\[
(\tilde{\eta}_{t}, \tilde{u}_{t})(x) = \begin{cases} 
(\eta_{t}, u_{t})(x) & \text{for} \ x \in \Omega_{5R} \setminus B_{2R}, \\
0 & \text{for} \ x \in B_{2R}.
\end{cases}
\]

By (3.22), (3.11), (3.19), and (1.11), \((\tilde{\eta}_{t}, \tilde{u}_{t}) \in H_{p}^{1,2}(B_{5R})\) satisfy equations:

\[
\begin{align*}
\gamma_{1} \text{div} \tilde{u}_{t} &= d \quad \text{in} \quad B_{5R}, \\
- \text{Div} (S(\tilde{u}_{t}) - \gamma_{2} \tilde{\eta}_{t} I) &= f - f_{R_{d}} \quad \text{in} \quad B_{5R}, \\
S(\tilde{u}_{t}) - \gamma_{2} \tilde{\eta}_{t} I n_{S_{5R}} &= 0 \quad \text{on} \quad S_{5R}.
\end{align*}
\]

On the other hand, by (3.22), and (3.19),

\[
\begin{align*}
\gamma_{1} \text{div} u_{0} &= d \quad \text{in} \quad B_{5R}, \\
- \text{Div} (S(u_{0}) - \gamma_{2} \eta_{0} I) &= f \quad \text{in} \quad B_{5R}, \\
S(u_{0}) - \gamma_{2} \eta_{0} I n_{S_{5R}} &= 0 \quad \text{on} \quad S_{5R}.
\end{align*}
\]
Setting \((\theta, \mathbf{v}) = (\tilde{\eta}_\epsilon^\ast - \eta_\epsilon, \tilde{u}_\epsilon^\ast - \mathbf{u}_0)\), we have

\[
\begin{aligned}
\text{div} \mathbf{v} &= 0 \quad \text{in } B_{5R}, \\
- \text{Div} (\mu \mathbf{D}(\mathbf{v}) - \gamma_2 \theta \mathbf{I}) &= -f_{\mathcal{R}_d} \quad \text{in } B_{5R}, \\
(\mu \mathbf{D}(\mathbf{v}) - \gamma_2 \theta \mathbf{I}) \mathbf{n}_{S_{5R}} &= 0 \quad \text{on } S_{5R}.
\end{aligned}
\]

(3.24)

We now take the inner product \((\dot{\cdot}, \mathbf{q}_j)_{B_{5R}}\) on the both side of (3.24) and use the divergence theorem of Gauß,

\[-(f_{\mathcal{R}_d}, \mathbf{q}_j)_{B_{5R}} = \left( - \text{Div} (\mu \mathbf{D}(\mathbf{v}) - \gamma_2 \theta \mathbf{I}), \mathbf{q}_j \right)_{B_{5R}} = \frac{\mu}{2} \int_{B_{5R}} \mathbf{D}(\mathbf{v}) : \mathbf{D}(\mathbf{q}_j) d\mathbf{y} - (\gamma_2 \theta, \text{div} \mathbf{q}_j)_{B_{5R}} = 0,
\]

which yields that \((f, \mathbf{q}_j)_{\Omega_{5R}} = (f_{\mathcal{R}_d}, \mathbf{q}_j)_{B_{5R}} = 0\). Thus, \(f_{\mathcal{R}_d} = 0\) due to (3.20). Furthermore, \((\mathbf{v}, \theta)\) solves the homogeneous equations:

\[
\begin{aligned}
\text{div} \mathbf{v} &= 0 \quad \text{in } B_{5R}, \\
- \text{Div} (\mu \mathbf{D}(\mathbf{v}) - \gamma_2 \theta \mathbf{I}) &= 0 \quad \text{in } B_{5R}, \\
(\mu \mathbf{D}(\mathbf{v}) - \gamma_2 \theta \mathbf{I}) \mathbf{n}_{S_{5R}} &= 0 \quad \text{on } S_{5R}.
\end{aligned}
\]

Therefore, \(\theta = 0\) and \(\mathbf{D}(\mathbf{v}) = 0\) in \(B_{5R}\). In particular, \(\eta_\epsilon = \eta_\epsilon^\ast\) and \(\mathbf{D}(\mathbf{u}_0 - \mathbf{u}_\epsilon) = 0\) in \(\Omega_{5R}\). According to (3.21) and (3.22), we have

\[0 = \eta_\epsilon + \varphi(\eta_\epsilon^\ast - \eta_\epsilon) = \eta_\epsilon^\ast \quad \text{in } \Omega_{5R}.
\]

On the other hand, by \(\mathbf{D}(\mathbf{u}_0 - \mathbf{u}_\epsilon) = 0\) on \(\Omega_{5R}\), we assume that \(\mathbf{u}_0 = \mathbf{u}_\epsilon + \mathbf{q}_\ast\) for some \(\mathbf{q}_\ast \in \text{Span} \{\Omega_{5R}\}\). Since \(\mathbf{u}_\epsilon \perp \Omega_{5R}\) in \(\Omega_{5R}\) and (3.22), we have \((\mathbf{u}_\epsilon, \mathbf{q}_j)_{\Omega_{5R}} = 0\) for all \(j = 1, \ldots, M\), which yields that \((\mathbf{u}_\epsilon, \mathbf{q}_\ast)_{\Omega_{5R}} = 0\). Thus, by (3.21), we see that

\[0 = (\tilde{\eta}_0, \mathbf{q}_\ast)_{\Omega_{5R}} = (\tilde{\mathbf{u}}_\epsilon + (1 - \varphi)(\mathbf{u}_0 - \mathbf{u}_\epsilon), \mathbf{q}_\ast)_{\Omega_{5R}} = ((1 - \varphi)\mathbf{q}_\ast, \mathbf{q}_\ast)_{\Omega_{5R}} = 0,
\]

which implies that \((1 - \varphi)\mathbf{q}_\ast \cdot \mathbf{q}_\ast = 0\) in \(\Omega_{5R}\). Then \(\mathbf{q}_\ast = 0\) by the choice of \(\varphi\). Again using (3.21), we have

\[0 = \mathbf{u}_0 + \varphi(\mathbf{u}_\epsilon - \mathbf{u}_0) = \mathbf{u}_0 - \varphi\mathbf{q}_\ast = \mathbf{u}_0 \quad \text{in } \Omega_{5R}.
\]

Therefore, \((\eta_0, \mathbf{u}_0) = (0, 0)\) in \(\Omega_{5R}\), which, combined with equations (3.23), yields that \((d, f) = (0, 0)\). This completes the proof of Lemma 3.5.

\[\square\]

4 Some auxiliary problem

In thin section, we introduce some model problem which will be useful for our later study on the resolvent estimates of the Lamé operators. For any fixed \(\lambda \in \Sigma_\varepsilon\) and \(0 < \varepsilon < \pi/2\), we consider the following system in the uniform \(C^2\) domain \(G\) :

\[
\begin{aligned}
\zeta \mathbf{u} - \text{Div} (\alpha \mathbf{D}(\mathbf{u}) + (\beta - \alpha + \gamma \lambda^{-1}) \text{div} \mathbf{u} \mathbf{I}) &= \mathbf{f} \quad \text{in } G, \\
(\alpha \mathbf{D}(\mathbf{u}) + (\beta - \alpha + \gamma \lambda^{-1}) \text{div} \mathbf{u} \mathbf{I}) \mathbf{n}_{\partial G} &= \mathbf{g} \quad \text{on } \partial G,
\end{aligned}
\]

(4.1)
with the constants $\alpha, \beta, \gamma > 0$ and the parameter $\zeta \in \mathbb{C}$. For $\lambda \in \Sigma_{\varepsilon}$ and $\zeta_0 > 0$, we introduce that
\[
\Xi_{\varepsilon, \lambda}^1 = \{ z \in \Sigma_{\varepsilon} : |\arg z - \arg(\alpha + \beta + \gamma \lambda^{-1})| \leq \pi - \varepsilon \}, \\
\Xi_{\varepsilon, \lambda}^2 = \{ z \in \Xi_{\varepsilon, \lambda}^1 : |\arg z - \arg(2\alpha + \beta + \gamma \lambda^{-1})| \leq \pi - \varepsilon \}, \\
\Xi_{\varepsilon, \lambda} = \begin{cases} 
\Xi_{\varepsilon, \lambda}^2 & \text{for } \Im \lambda = 0, \\
\{ z \in \Xi_{\varepsilon, \lambda}^2 : \Im((\beta + \gamma \lambda^{-1})^{-1} z) \Im \lambda > 0 \} & \text{for } \Im \lambda \neq 0,
\end{cases}
\Xi_{\varepsilon, \lambda, \zeta_0} = \{ z \in \Xi_{\varepsilon, \lambda} : |z| \geq \zeta_0 \}.
\]

Then the result on (4.1) reads as follows:

**Theorem 4.1.** Let $0 < \varepsilon < \pi/2$, $\alpha, \beta, \gamma, b > 0$, $1 < p < \infty$, and $\lambda \in \Sigma_{\varepsilon, b}$. Assume that $G$ is a uniform $C^2$ domain in $\mathbb{R}^N$. Then for any $(f, g) \in L_p(G)^N \times H^1_p(G)^N$, there exists $\zeta_0 > 0$ such that (4.1) admits a unique solution $u \in H^2_p(G)^N$ for any $\zeta \in \Xi_{\varepsilon, \lambda, \zeta_0}$. Moreover, we have
\[
2 \sum_{j=0}^{2} |\zeta|^{(2-j)/2}||\nabla^j u||_{L_p(G)} \leq C \left( ||f||_{L_p(G)} + \sum_{j=0}^{1} |\zeta|^{(1-j)/2}||\nabla^j g||_{L_p(G)} \right)
\]
for some constant $C$ depending solely on $\varepsilon, \alpha, \beta, \gamma, b, p, N$.

**Remark 4.2.** Let us give some comments before the proof of Theorem 4.1.

1. It is not hard to see that $\Xi_{\varepsilon, \lambda, \zeta_0} \neq \emptyset$ for any $0 < \varepsilon < \pi/2$, $\lambda \in \Sigma_{\varepsilon}$, and $\zeta_0 > 0$. In fact, as $\gamma \lambda^{-1}$ still lies in $\Sigma_{\varepsilon}$ with $\gamma > 0$, we see that
\[
|\arg(s\alpha + \beta + \gamma \lambda^{-1})| \leq \pi - \varepsilon
\]
for any $s, \alpha, \beta > 0$. In particular, $\mathbb{R}_+ \subset \Xi_{\varepsilon, \lambda}^2 \subset \Xi_{\varepsilon, \lambda}^1$. On the other hand, for any $\omega > 0$, we have
\[
\Im((\beta + \gamma \lambda^{-1})^{-1} z) \Im \lambda = \gamma(\beta \lambda + \gamma^{-1} \Im \lambda)^2 > 0 \quad (\Im \lambda \neq 0),
\]
which implies $\mathbb{R}_+ \subset \Xi_{\varepsilon, \lambda}$ as well. Thus $\{ \omega \in \mathbb{R}_+ : \omega \geq \zeta_0 \} \subset \Xi_{\varepsilon, \lambda, \zeta_0}$.

2. In Theorem 4.1, $G$ can be bounded or unbounded. Moreover, Theorem 4.1 can be extended to the uniform domain $G$ of the class $W^{2-1/p}_r$ with $r > N$ and $r \geq \max\{p, p/(p-1)\}$ in the framework of the $\mathcal{R}$-boundedness theory. We refer to [4] for more details.

As (4.1) is an elliptic system, we study only the model problems in $\mathbb{R}^N$ and $\mathbb{R}^N_+$ (i.e. (4.2) and (4.4) below) with respect to (1.1) here, which essentially give us the interior and boundary estimates of (4.1).

### 4.1 The auxiliary problem in $\mathbb{R}^N$

To prove Theorem (4.1) we first consider the model problem in $\mathbb{R}^N$ ($N \geq 2$),
\[
\zeta u - \alpha \Delta u - (\beta + \gamma \lambda^{-1}) \nabla \text{div } u = f \quad \text{in } \mathbb{R}^N.
\]

By the discussion in [28, Sec. 2], the solution of (4.2) can be formulated by
\[
u(x) = A(\zeta, \mathbb{R}^N) f = \frac{1}{\alpha} \mathcal{F}^{-1}_{\xi} \left[ \frac{2\xi}{\alpha \Im(\xi) + |\xi|^2} \right](x) \\
- \frac{\beta + \gamma \lambda^{-1}}{\alpha(\alpha + \beta + \gamma \lambda^{-1})} \mathcal{F}^{-1}_{\xi} \left[ \frac{\xi(\xi \cdot \mathcal{F} g(\xi))}{(\alpha \Im(\xi) + |\xi|^2)((\alpha + \beta + \gamma \lambda^{-1})^{-1} \Im(\xi) + |\xi|^2)} \right](x),
\]
for (4.3)
with the Fourier transformation and its inverse in $\mathbb{R}^N$ defined by
\[
\mathcal{F}_x[f](\xi) = \int_{\mathbb{R}^N} e^{-ix\cdot\xi} f(x) \, dx, \quad \mathcal{F}_x^{-1}[f](x) = (2\pi)^{-N} \int_{\mathbb{R}^N} e^{ix\cdot\xi} f(\xi) \, d\xi.
\]
Then by applying the classical Fourier multiplier theory and [28, Lemma 2.1], it is not hard to find that

**Theorem 4.3.** Let $0 < \varepsilon < \pi/2$, $0 < \alpha, \beta, \gamma, b > 0$, $1 < p < \infty$ and $\lambda \in \Sigma_{\varepsilon, b}$. For any $f \in L_p(\mathbb{R}^N)^N$ and $\zeta \in \Xi^1_{\varepsilon, \lambda}$, (4.2) admits a solution $u = A(\zeta, \mathbb{R}^N) f \in H^p_0(\mathbb{R}^N)^N$ satisfying
\[
\sum_{j=0}^2 |\zeta|^{(2-j)/2} \|\nabla^j u\|_{L_p(\mathbb{R}^N)} \leq C \|f\|_{L_p(\mathbb{R}^N)}
\]
for some constant $C$ depending solely on $\varepsilon, \alpha, \beta, \gamma, b, p, N$.

### 4.2 The auxiliary problem in $\mathbb{R}^N_+$

In this subsection, we consider (4.1) whenever $G$ is the half-space $\mathbb{R}^N_+$, namely,
\[
\mathbb{R}^N_+ = \{ x = (x', x_N) \in \mathbb{R}^N : x' = (x_1, \ldots, x_{N-1}) \in \mathbb{R}^{N-1}, \ x_N > 0 \},
\]
and $\partial G = \mathbb{R}^N_0 = \{ x = (x', 0) \in \mathbb{R}^N \}$. Now, (4.1) in $\mathbb{R}^N$ is rewritten by
\[
\begin{cases}
\begin{align*}
\zeta u - \alpha \Delta u - (\beta + \gamma \lambda^{-1}) \nabla u &= f \quad \text{in} \quad \mathbb{R}^N_+, \\
\alpha (\partial_N u_N + \partial_x u_N) &= -g_j \quad (j = 1, \ldots, N-1) \quad \text{on} \quad \mathbb{R}^N_0, \\
2\alpha \partial_N u_N + (\beta - \alpha + \gamma \lambda^{-1}) \nabla u &= -g_N \quad \text{on} \quad \mathbb{R}^N_0.
\end{align*}
\end{cases}
\]

For (4.4), we can establish the following result.

**Theorem 4.4.** Let $0 < \varepsilon < \pi/2$, $0 < \alpha, \beta, \gamma, b > 0$, $1 < p < \infty$ and $\lambda \in \Sigma_{\varepsilon, b}$. For any $f \in L_p(\mathbb{R}^N)^N$, $g \in H^1_p(\mathbb{R}^N)^N$ and $\zeta \in \Xi^1_{\varepsilon, \lambda}$, (4.3) admits a solution $u = A(\zeta, \mathbb{R}^N_+) f \in H^p_0(\mathbb{R}^N_+)^N$ satisfying
\[
\sum_{j=0}^2 |\zeta|^{(2-j)/2} \|\nabla^j u\|_{L_p(\mathbb{R}^N_+)} \leq C \left( \|f\|_{L_p(\mathbb{R}^N_+)} + \sum_{j=0}^1 |\zeta|^{(1-j)/2} \|\nabla^j g\|_{L_p(\mathbb{R}^N_+)} \right)
\]
for some constant $C$ depending solely on $\varepsilon, \alpha, \beta, \gamma, b, p, N$.

To prove Theorem 4.4, we make some reduction. As in [7, Sec. 4], the odd and even extensions for the function $f$ in $\mathbb{R}^N_+$ are denoted by
\[
f^o(x) = \begin{cases}
f(x) & \text{for } x_N > 0, \\
f(x', -x_N) & \text{for } x_N < 0,
\end{cases}
\quad f^e(x) = \begin{cases}
f(x) & \text{for } x_N > 0, \\
f(x', -x_N) & \text{for } x_N < 0.
\end{cases}
\]
Set that $F = (f_1^o, \ldots, f_{N-1}^o, f_N^e)$, and $U = A(\zeta, \mathbb{R}^N) F$. Then $U$ satisfies
\[
\begin{cases}
\zeta U - \alpha \Delta U - (\beta + \gamma \lambda^{-1}) \nabla U &= f \quad \text{in} \quad \mathbb{R}^N_+, \\
\partial_N U_N &= 0 \quad \text{on} \quad \mathbb{R}^N_0.
\end{cases}
\]
Let $v = u - U|_{\mathbb{R}^N_+}$. Then (4.4) and (4.5) yield that
\[
\begin{cases}
\zeta v - \alpha \Delta v - (\beta + \gamma \lambda^{-1}) \nabla v &= 0 \quad \text{in} \quad \mathbb{R}^N_+, \\
\alpha (\partial_N v_j + \partial_j u_N) &= -h_j \quad (j = 1, \ldots, N-1) \quad \text{on} \quad \mathbb{R}^N_0, \\
2\alpha \partial_N u_N + (\beta - \alpha + \gamma \lambda^{-1}) \nabla v &= -h_N \quad \text{on} \quad \mathbb{R}^N_0.
\end{cases}
\]

27
where the vector $h = (h_1, \ldots, h_{N-1}, h_N)$ is given by

$$h_j = g_j + \alpha(\partial_U j + \partial j_U), \quad h_N = g_N + (\beta - \alpha + \gamma \lambda^{-1}) \text{div} \, U.$$  

Thanks to Theorem 4.3, it is not hard to see that Theorem 4.4 holds true so long as we can verify the following result.

**Theorem 4.5.** Let $0 < \varepsilon < \pi/2$, $\alpha, \beta, \gamma, b > 0$, $1 < p < \infty$ and $\lambda \in \Sigma_{\varepsilon, b}$. For any $h \in H^1_p(\mathbb{R}^N_+)$ and $\zeta \in \Xi_{\varepsilon, \lambda}$, (4.6) admits a solution $v = B(\zeta, \mathbb{R}^N_+) h \in H^1_p(\mathbb{R}^N_+)$ satisfying

$$\sum_{j=0}^2 |\zeta^{(2-j)/2} \|\nabla^j v\|_{L^p(\mathbb{R}^N)} \leq C \sum_{j=0}^1 |\zeta^{(1-j)/2} \|\nabla^j h\|_{L^p(\mathbb{R}^N)}$$

for some constant $C$ depending solely on $\varepsilon, \alpha, \beta, \gamma, b, p, N$.

The proof of Theorem 4.5 is standard. As the first stage, we derive the solution formula of (4.6). By applying the partial Fourier transform to (4.6), we have

$$\begin{cases}
(\zeta + \alpha |\xi'|^2) \hat{v}_j - \alpha \hat{v}^\xi_j = (\beta + \gamma \lambda^{-1}) (i \xi_j \cdot \hat{v}' + \partial_N \hat{v}_N) = 0, & \text{for } x_N > 0, \\
(\zeta + \alpha |\xi'|^2) \hat{v}_N - \alpha \hat{v}^\xi_N = (\beta + \gamma \lambda^{-1}) (i \xi_j \cdot \hat{v}' + \partial_N \hat{v}_N) = 0, & \text{for } x_N > 0, \\
\alpha \partial_N \hat{v}_j + i \xi_j \hat{v}_N = -\hat{h}_j & (j = 1, \ldots, N) \quad \text{for } x_N = 0, \\
2 \alpha \partial_N \hat{v}_N + (\beta - \alpha + \gamma \lambda^{-1}) (i \xi_j \cdot \hat{v}' + \partial_N \hat{v}_N) = -\hat{h}_N & \text{for } x_N = 0,
\end{cases} \quad (4.7)$$

where $\hat{f}(\xi', x_N) = \int_{\mathbb{R}^{N-1}} e^{-ix' \cdot \xi'} f(x', x_N) \, dx'$, and $\xi' = (\xi_1, \ldots, \xi_{N-1})$.

Next, we introduce

$$A = \sqrt{(\alpha + \beta + \gamma \lambda^{-1})^{-1} \zeta + |\xi'|^2}, \quad B = \sqrt{\alpha^{-1} \zeta + |\xi'|^2}; \quad (4.8)$$

and suppose that

$$\hat{v}_\ell = P_\ell (e^{-Bx_N} - e^{-Ax_N}) + Q_\ell e^{-Bx_N}, \quad \forall \, \ell = 1, \ldots, N.$$  

Then by inserting the formulas above into (4.7) and equating the coefficients of $e^{-Ax_N}$ and $e^{-Bx_N}$, we see that

$$\begin{cases}
\alpha (B^2 - A^2) P_j - (\beta + \gamma \lambda^{-1}) i \xi_j (i \xi' \cdot P' - AP_N) = 0, \\
\alpha (B^2 - A^2) P_N + (\beta + \gamma \lambda^{-1}) A (i \xi' \cdot P' - AP_N) = 0, \\
i \xi' \cdot (P' + Q') - B (P_N + Q_N) = 0, \\
\alpha ((B - A) P_j + BQ_j - i \xi_j Q_N) = \hat{h}_j (\xi', 0) & (j = 1, \ldots, N), \\
(\beta + \alpha + \gamma \lambda^{-1}) ((B - A) P_N + BQ_N) - (\beta - \alpha + \gamma \lambda^{-1}) i \xi' \cdot Q' = \hat{h}_N (\xi', 0).
\end{cases} \quad (4.9)$$

From (4.9)_2 and (4.9)_3, we infer that

$$i \xi' \cdot P' = \frac{|\xi'|^2}{AB - |\xi'|^2} (i \xi' \cdot Q' - BQ_N), \quad P_N = \frac{A}{AB - |\xi'|^2} (i \xi' \cdot Q' - BQ_N). \quad (4.10)$$

Thus it suffices to solve the following linear system:

$$L \begin{bmatrix} i \xi' \cdot Q' \\ Q_N \end{bmatrix} = \begin{bmatrix} L_{11} & L_{12} \\ L_{21} & L_{22} \end{bmatrix} \begin{bmatrix} i \xi' \cdot Q' \\ Q_N \end{bmatrix} = \begin{bmatrix} i \xi' \cdot \hat{h}(\xi', 0) \\ \hat{h}_N (\xi', 0) \end{bmatrix},$$

28
where the entries of the Lopatinski matrix $L = [L_{ij}]_{2 \times 2}$ are given by

$$
L_{11} = \frac{\alpha A(B^2 - |\xi'|^2)}{AB - |\xi'|^2}, \quad L_{12} = \frac{\alpha|\xi'|^2(2AB - B^2 - |\xi'|^2)}{AB - |\xi'|^2},
$$

$$
L_{21} = \frac{(2AB - A^2 - |\xi'|^2)}{AB - |\xi'|^2} - \frac{(\beta + \gamma\lambda^{-1})(A^2 - |\xi'|^2)}{AB - |\xi'|^2},
$$

$$
L_{22} = (\alpha + \beta + \gamma\lambda^{-1})\frac{B(A^2 - |\xi'|^2)}{AB - |\xi'|^2}.
$$

Assuming that $\det L \neq 0$, we obtain

$$
i\xi' \cdot Q' = (\det L)^{-1}(L_{22} i\xi' \cdot \hat{h} - L_{12}\hat{h}_N)(\xi', 0),
$$

$$
Q_N = (\det L)^{-1}(-L_{21}i\xi' \cdot \hat{h} + L_{11}\hat{h}_N)(\xi', 0),
$$

Then (4.10), (4.9), and (4.9) imply that

$$
P_j = \frac{(\beta + \gamma\lambda^{-1})i\xi_j(|\xi'|^2 - A^2)}{\alpha(B^2 - A^2)\det L(AB - |\xi'|^2)}H,
$$

$$
P_N = -\frac{(\beta + \gamma\lambda^{-1})A(|\xi'|^2 - A^2)}{\alpha(B^2 - A^2)\det L(AB - |\xi'|^2)}H,
$$

$$
Q_j = \frac{1}{\alpha B} \hat{h}_j(\xi', 0) + \frac{i\xi_j}{B\det L}(-L_{21}i\xi' \cdot \hat{h} + L_{11}\hat{h}_N)(\xi', 0)
$$

$$
- \frac{(\beta + \gamma\lambda^{-1})i\xi_j(|\xi'|^2 - A^2)}{\alpha B(B + A)\det L(AB - |\xi'|^2)}H,
$$

with

$$
H = \det L(i\xi' \cdot Q' - BQ_N) = ((L_{22} + BL_{21})i\xi' \cdot \hat{h} - (L_{12} + BL_{11})\hat{h}_N)(\xi', 0).
$$

For simplicity, we denote

$$
N(\zeta, \zeta'; \lambda) = \frac{(\beta + \gamma\lambda^{-1})(|\xi'|^2 - A^2)}{\alpha(AB - |\xi'|^2)}.
$$

Then we have for $j = 1, \ldots, N - 1$,

$$
\hat{v}_j(\zeta', x_N) = \frac{1}{\alpha B} e^{-Bx_N} \hat{h}_j(\zeta', 0)
$$

$$
- \frac{i\xi_j}{B\det L} e^{-Bx_N} - \frac{N(\zeta, \zeta'; \lambda)}{B(B + A)\det L}(L_{22} + BL_{21})(BM(x_N) - e^{-Bx_N})(i\xi' \cdot \hat{h})(\zeta', 0),
$$

$$
+ \frac{i\xi_j}{B\det L} e^{-Bx_N} - \frac{N(\zeta, \zeta'; \lambda)}{B(B + A)\det L}(L_{12} + BL_{11})(BM(x_N) - e^{-Bx_N})\hat{h}_N(\zeta', 0),
$$

$$
\hat{v}_N(\zeta', x_N) = -\frac{L_{21}}{\det L} e^{-Bx_N} + \frac{N(\zeta, \zeta'; \lambda)}{B + A} \frac{A}{\det L}(L_{22} + BL_{21})M(x_N)(i\xi' \cdot \hat{h})(\zeta', 0)
$$

$$
+ \frac{L_{11}}{\det L} e^{-Bx_N} + \frac{N(\zeta, \zeta'; \lambda)}{B + A} \frac{A}{\det L}(L_{12} + BL_{11})M(x_N)\hat{h}_N(\zeta', 0).
$$

Thus, we define $B(\zeta, \mathbb{R}^N_+; h) = F^{-1}_{\zeta'}(\hat{v}_1, \ldots, \hat{v}_{N-1}, \hat{v}_N)$. Based on the formula of $B(\zeta, \mathbb{R}^N_+)$ and the Fourier analysis (as in [7, Sec. 4]), Theorem 4.5 can be proved with the following two lemmas.

**Lemma 4.6.** Let $0 < \varepsilon < \pi/2$ and $\xi' \in \mathbb{R}^{N-1}$. Then for any $a > 0$ and $\lambda \in \Sigma$, we have

$$
|a\lambda + |\xi'|^2| \geq \sin(\varepsilon/2)(a|\lambda| + |\xi'|^2).
$$
Lemma 4.7. There exists some constant \( c \) depending solely on \( \varepsilon, b, \alpha, \beta, \gamma \) such that

\[
|\det \mathbf{L}| \geq c(|\zeta| + |\xi'|^2)
\]  

(4.11)

for all \( \zeta \in \Xi_{\varepsilon, \lambda} \).

Lemma 4.6 is standard, while Lemma 4.7 is the key point in our results. The study of \( \det L \) is the main task of the next subsection.

4.3 Proof of Lemma 4.7

For \( A \) and \( B \) defined in (4.8), we introduce

\[
P = P(\zeta, \xi'; \lambda) = \frac{\zeta}{AB - |\xi'|^2} = \frac{\alpha(\alpha + \beta + \gamma \lambda^{-1})(AB + |\xi'|^2)}{\zeta + (2\alpha + \beta + \gamma \lambda^{-1})|\xi'|^2}.
\]

Then the entries of \( \mathbf{L} \) can be rewritten as follows

\[
L_{11} = AP, \quad L_{12} = |\xi'|^2(2\alpha - P), \quad L_{21} = 2\alpha - P, \quad L_{22} = BP.
\]

Moreover, \( \det \mathbf{L} = (\zeta + 4\alpha|\xi'|^2)P - 4\alpha^2|\xi'|^2 \). Based on such observation, we can prove Lemma 4.7 in following steps.

**Step 1.** Firstly, we consider the case where \( |\zeta||\xi'|^{-2} = O(r_1) \ll 1 \). Then it is not hard to see that

\[
A, B = |\xi'|(1 + O(r_1)), \quad P = \frac{2\alpha(\alpha + \beta + \gamma \lambda^{-1})}{2\alpha + \beta + \gamma \lambda^{-1}} + O(r_1).
\]

Thus we have

\[
\det \mathbf{L} = \frac{4\alpha^2(\beta + \gamma \lambda^{-1})}{2\alpha + \beta + \gamma \lambda^{-1}}|\xi'|^2(1 + O(r_1)).
\]

Now we choose \( |r_1| \) small enough such that

\[
|\det \mathbf{L}| \geq \frac{2\alpha^2|\beta + \gamma \lambda^{-1}|}{2\alpha + \beta + \gamma \lambda^{-1}}|\xi'|^2 \geq \frac{\sin(\varepsilon/2)\alpha^2\beta}{(2\alpha + \beta + \gamma \lambda^{-1})/2}(1 + |\xi'|^2).
\]

**Step 2.** Secondly, we consider the case where \( |\xi'|^2|\zeta|^{-1} = O(r_2) \ll 1 \). It is not hard to see that

\[
A = (\alpha + \beta + \gamma \lambda^{-1})^{-1/2}\zeta^{1/2}(1 + O(r_2)), \quad B = \alpha^{-1/2}\zeta^{1/2}(1 + O(r_2)),
\]

\[
P = \alpha^{1/2}(\alpha + \beta + \gamma \lambda^{-1})^{1/2}(1 + O(r_2)).
\]

Thus, we have

\[
\det \mathbf{L} = \alpha^{1/2}(\alpha + \beta + \gamma \lambda^{-1})^{1/2}\zeta(1 + O(r_2)).
\]

Now, we can choose \( |r_2| \) small enough such that

\[
|\det \mathbf{L}| \geq 2^{-1}\alpha^{1/2}|\alpha + \beta + \gamma \lambda^{-1}|^{-1/2}|\zeta| \geq 4^{-1}\left(\frac{\sin(\varepsilon/2)\alpha(\alpha + \beta)}{2(2\alpha + \beta + \gamma \lambda^{-1})}\right)^{1/2}(|\zeta| + |\xi'|^2).
\]

**Step 3.** By previous two steps, we consider \( R_2^{-1}|\xi'|^{1/2} \leq |\xi'| \leq R_1|\xi'|^{1/2} \) for some fixed \( R_1, R_2 > 0 \). Set that

\[
\tilde{\zeta} = \zeta(|\zeta|^{1/2} + |\xi'|)^{-2}, \quad \tilde{\xi'} = \xi'(|\zeta|^{1/2} + |\xi'|)^{-1}
\]

\[
\tilde{A} = \sqrt{(\alpha + \beta + \gamma \lambda^{-1})^{-1}\tilde{\zeta} + |\tilde{\xi}'|^2}, \quad \tilde{B} = \sqrt{\alpha^{-1}\tilde{\xi} + |\tilde{\xi}'|^2}.
\]
For $R_2^{-1} |\zeta'|^{1/2} \leq |\zeta'| \leq R_1 |\zeta'|^{1/2}$, $(\tilde{\zeta}, \tilde{\xi}) \in D(R_1, R_2)$ with

$$D(R_1, R_2) = \{ (z, \eta') \in \Sigma_e \times \mathbb{R}^{N-1} : (1 + R_1)^{-2} \leq |z| \leq R_2^2 (1 + R_2)^{-2},
(1 + R_2)^{-1} \leq |\eta'| \leq R_1 (1 + R_1)^{-1} \}.$$  

Note that

$$P = \frac{\zeta}{AB - |\xi'|^2} = \frac{\tilde{\zeta}}{AB - |\xi'|^2},$$

then we have

$$\det L = (|\lambda|^{1/2} + |\xi'|)^2 \det \tilde{L} \quad \text{with} \quad \det \tilde{L} = (\tilde{\zeta} + 4\alpha |\tilde{\xi}|^2) P - 4\alpha^2 |\tilde{\xi}|^2.$$

To see (4.11), we shall show that

$$\begin{aligned}
1 &= 0 \quad \text{for some } (\zeta, \xi'),
\end{aligned}$$

Denote the inner product $(f, g) = \int_0^\infty f(x)g(x) \, dx$, and $\|f\| = (f, f)^{1/2}$. By taking the inner products between (4.12), (4.12) and $w$, we have

$$0 = \zeta \|w\|^2 + \alpha \sum_{j,k=1}^{N-1} \|i\xi_k w_j\|^2 + \alpha \sum_{j=1}^{N-1} \|i\xi_j w_N\|^2 - \alpha \sum_{j=1}^{N-1} (\partial_N^2 w_j, w_j) - \alpha (\partial_N^2 w_N, w_N)$$

$$+ \alpha \|i\xi' \cdot w'\|^2 + \alpha (\partial_N w_N, i\xi' \cdot w' - (\beta + \gamma \lambda^{-1})(\partial_N (i\xi' \cdot w' + \partial_N w_N), w_N)$$

$$+ (\beta - \alpha + \gamma \lambda^{-1})(i\xi' \cdot w' + \partial_N w_N, i\xi' \cdot w')$$

$$= \zeta \|w\|^2 + \alpha \sum_{j,k=1}^{N-1} \|i\xi_k w_j\|^2 + 2\alpha \|\partial_N w_N\|^2 + \alpha \|i\xi' \cdot w'\|^2 + \alpha \sum_{j=1}^{N-1} \|\partial_N w_j + i\xi_j w_N\|^2$$

$$+ (\beta - \alpha + \gamma \lambda^{-1})(i\xi' \cdot w' + \partial_N w_N)^2,$$

where we have used the integration by parts and the boundary conditions in (4.12) for the last equality. Then taking the imaginary part and real part respectively, we have

$$0 = \Re \zeta \|w\|^2 + \gamma \Re (\lambda^{-1}) \|i\xi' \cdot w' + \partial_N w_N\|^2,$$

(4.13)

$$0 = \Re \zeta \|w\|^2 + \alpha \sum_{j,k=1}^{N-1} \|i\xi_k w_j\|^2 + 2\alpha \|\partial_N w_N\|^2 + \alpha \|i\xi' \cdot w'\|^2 + \alpha \sum_{j=1}^{N-1} \|\partial_N w_j + i\xi_j w_N\|^2$$

$$+ (\beta - \alpha + \gamma \Re (\lambda^{-1}))(i\xi' \cdot w' + \partial_N w_N)^2,$$

(4.14)

From (4.14), we obtain that

$$0 \geq \Re \zeta \|w\|^2 + \alpha \sum_{j=1}^{N-1} \|\partial_N w_j + i\xi_j w_N\|^2 + (\beta + \gamma \Re (\lambda^{-1}))(i\xi' \cdot w' + \partial_N w_N)^2$$

$$\geq \Re \zeta \|w\|^2 + (\beta + \gamma \Re (\lambda^{-1}))(i\xi' \cdot w' + \partial_N w_N)^2.$$
In what follows, we shall prove that \( \|w\|^2 = 0 \), which is a contradiction with our choice of \( w \). In other words, \( \det \mathbf{L} \neq 0 \) for any \((\tilde{\zeta}, \tilde{\xi}) \in D(R_1, R_2)\). By the continuity of \( \det \mathbf{L} \), we have \( \det \mathbf{L} \geq c \) for some constant \( c > 0 \).

If \( \Im(\lambda^{-1}) = 0 \), or equivalently \( \Im \lambda = 0 \), then \( \Re(\lambda^{-1}) = |\lambda|^{-2}\Re \lambda > 0 \) as \( \lambda^{-1} \in \Sigma_\varepsilon \). Thus (4.13) and (4.15) imply that
\[
\Im \zeta \|w\|^2 = 0, \quad \Re \zeta \|w\|^2 \leq 0.
\]
Thus \( \|w\| = 0 \) for \( \zeta \in \Sigma_\varepsilon \).

If \( \Im(\lambda^{-1}) \neq 0 \), then \( \|i\xi \cdot w' + \partial_N w_N\|^2 = -\Im \zeta \|w\|^2/\Im(\lambda^{-1}) \) from (4.13). Inserting it into (4.15), we have
\[
\left( \Re \zeta - \frac{\Im \zeta \left( \beta + \gamma \Re (\lambda^{-1}) \right)}{\gamma \Im (\lambda^{-1})} \right) \|w\|^2 \leq 0. \tag{4.16}
\]
As \( \Im((\beta + \gamma \lambda^{-1})^{-1}) \Im \lambda > 0 \) for \( \zeta \in \Xi_{\varepsilon, \lambda} \), the coefficient in (4.16) satisfies
\[
\Re \zeta - \frac{\Im \zeta \left( \beta + \gamma \Re (\lambda^{-1}) \right)}{\gamma \Im (\lambda^{-1})} = \frac{\beta \lambda + \gamma^2 \Im((\beta + \gamma \lambda^{-1})^{-1})}{\gamma} > 0.
\]
Hence \( \|w\| = 0 \).

5 Resolvent problem for \( \lambda \) away from zero

According to Theorem 5.1, we shall study the (1.13) whenever \( \lambda \) is uniformly bounded from below in this section. In next subsection, we first consider the case where \( \lambda \) is far away from the origin. Then we study (1.13) whenever \( \lambda \) lies in some ring-shaped region.

5.1 Resolvent problem for large \( \lambda \)

Recall the notion in (1.15). The main result of this subsection reads:

**Theorem 5.1.** Let \( 1 < p \leq r < \infty \), and \( 0 < \varepsilon < \pi/2 \). Assume that \( \Omega \) is a \( C^2 \) exterior domain in \( \mathbb{R}^N \) for \( N \geq 3 \). Then there exist \( \lambda_2 > 0 \) and two families of operators
\[
(\mathcal{P}_\infty(\lambda), \mathcal{V}_\infty(\lambda)) \in \text{Hol}\left( V_{\varepsilon, \lambda_2} ; \mathcal{L}(H^1_p(\Omega); H^{1,2}_p(\Omega)) \right),
\]
such that \( (\eta, u) = (\mathcal{P}_\infty(\lambda), \mathcal{V}_\infty(\lambda))(d, f) \in H^{1,2}_p(\Omega) \) is a unique solution of (1.13) for any \( \lambda \in V_{\varepsilon, \lambda_2} \) and any \( (d, f) \in H^{1,0}_p(\Omega) \). Moreover, we have
\[
\|\eta\|_{H^1_p(\Omega)} + \|u\|_{H^2_p(\Omega)} \leq C(\|d\|_{H^1_p(\Omega)} + \|f\|_{L_p(\Omega)}) \tag{5.1}
\]
for some constant \( C \) depending solely on \( \lambda_2, \varepsilon, p, \mu, \nu, \gamma_1, \gamma_2, N \).

The proof of Theorem 5.1 is similar to Theorem 2.2. In fact, we can rewrite (1.13) by
\[
\begin{cases}
\lambda \eta + \gamma_1 \text{div} u = d + \rho(u) & \text{in } \Omega, \\
\gamma_1 u - \text{Div} (S(u) - \gamma_2 \eta I) = f + F(\eta, u) & \text{in } \Omega, \\
(S(u) - \gamma_2 \eta I) n_{\Gamma} = H(\eta, u) & \text{on } \Gamma,
\end{cases}
\]

with
\[ \rho(u) = -\gamma_1 V : \nabla u, \]
\[ V_1(u) = \mu(V \nabla u + (V \nabla u)^\top) + (\nu - \mu)(V : \nabla u), \]
\[ F(\eta, u) = (V \nabla | S(u) - \gamma_2 \eta l) + \text{Div} V_1(u), \]
\[ H(\eta, u) = -(S(u) - \gamma_2 \eta l) V n_r - V_1(u) n_r. \]

Moreover, Eq. (1.10) and (2.2) yield that
\[ \| (\rho(u), H(\eta, u)) \|_{H^2_p(\Omega)} + \| F(\eta, u) \|_{L_p(\Omega)} \leq C \sigma(\eta, \nabla u) \| H^2_p(\Omega) \] for any \( 1 < p \leq r < \infty \). Then Theorem 5.1 can be proved by taking advantage of (5.2), the fixed point theorem, and the following result in [6]. So the details of the proof are left to the reader.

**Theorem 5.2.** [6 Theorem 2.4] Assume that \( \Omega \) is a \( C^2 \) exterior domain in \( \mathbb{R}^N \) for \( N \geq 3 \). Let \( 0 < \varepsilon < \pi/2 \), and \( 1 < p < \infty \). Set
\[ Y_p(\Omega) = H^1_p(\Omega) \times L_p(\Omega)^N \times H^1_p(\Omega)^N. \]

Then there exist \( \lambda_2 > 0 \) and two families of operators
\[ (\tilde{P}_\infty(\lambda), \tilde{V}_\infty(\lambda)) \in \text{Hol} \left( V_{\varepsilon, \lambda_2}; L(Y_p(\Omega); H^1_p(\Omega)) \right), \]

such that the following system:
\[ \begin{cases} 
\lambda \eta + \gamma_1 \text{div} u = d & \text{in } \Omega, \\
\gamma_1 A u - \text{Div} (S(u) - \gamma_2 \eta l) = f & \text{in } \Omega, \\
(S(u) - \gamma_2 \eta l) n_r = h & \text{on } \Gamma,
\end{cases} \]

admits a unique solution \( (\eta, u) = (\tilde{P}_\infty(\lambda), \tilde{V}_\infty(\lambda))(d, f, h) \in H^1_p(\Omega) \) for \( \lambda \in V_{\varepsilon, \lambda_2} \) and for \( (d, f, h) \in Y_p(\Omega) \). Moreover, we have
\[ \| \eta \|_{H^2_p(\Omega)} + \| u \|_{H^2_p(\Omega)} \leq C(\| (d, h) \|_{H^1_p(\Omega)} + \| f \|_{L_p(\Omega)}) \]
for some constant \( C \) depending solely on \( \lambda_2, \varepsilon, p, \nu, \gamma_1, \gamma_2, N \).

The existence of the semigroup \( \{ T(t) \}_{t \geq 0} \) associated to (1.8) is immediate from Theorem 5.1. For \( 1 < p, q < \infty \), we define
\[ D_p(A_\Omega) = \{ (\eta, u) \in H^{1,0}_p(\Omega) | u \in H^2_p(\Omega)^N, (S(u) - \gamma_2 \eta l) n_r = 0 \}, \]
\[ D_{p,q}(\Omega) = (H^{1,0}_p(\Omega), D_p(A_\Omega))_{1-1/q, 0} \subset H^1_p(\Omega) \times B^{2(1-1/q)}(\Omega)^N. \]

**Theorem 5.3.** The operator \( A_\Omega \) generates a \( C_0 \)-semigroup \( \{ T(t) \}_{t \geq 0} \) in \( H^{1,0}_p(\Omega) \) for any \( 1 < p \leq r < \infty \), which is analytic as well. Denote by \( (\rho, v)(t) = T(t)(\rho_0, v_0) \). Then there exists positive constants \( \gamma_0 \) and \( C \) such that the following assertions hold.

1. For \( (\rho_0, v_0) \in H^{1,0}_p(\Omega) \), we have
\[ \| (\rho, v)(t) \|_{H^{1,0}_p(\Omega)} + t \| \partial_t (\rho, v)(t) \|_{H^{1,0}_p(\Omega)} + \| (\rho, v)(t) \|_{D_p(A_\Omega)} \leq C e^{\gamma_0 t} \| (\rho_0, v_0) \|_{H^{1,0}_p(\Omega)}. \]

2. For \( (\rho_0, v_0) \in D_p(A_\Omega) \), we have
\[ \| \partial_t (\rho, v)(t) \|_{H^{1,0}_p(\Omega)} + \| (\rho, v)(t) \|_{D_p(A_\Omega)} \leq C e^{\gamma_0 t} \| (\rho_0, v_0) \|_{D_p(A_\Omega)}. \]

3. For \( (\rho_0, v_0) \in D_{p,q}(\Omega) \), we have
\[ \| e^{-\gamma_0 t} (\partial_t \rho_0 \rho) \|_{L_q(\mathbb{R}_+; H^1_p(\Omega))} + \| e^{-\gamma_0 t} \partial_t v \|_{L_q(\mathbb{R}_+; L_p(\Omega))} + \| e^{-\gamma_0 t} v \|_{L_q(\mathbb{R}_+; H^2_p(\Omega))} \leq C \| (\rho_0 \|_{H^1_p(\Omega)} + \| v_0 \|_{B^{2(1-1/q)}(\Omega)}. \]

33
5.2 Resolvent problem for $\lambda$ in some compact subset

Thanks to Theorem 5.1 and Theorem 3.1 it remains to study (1.13) whenever $\lambda$ is uniformly bounded from above and also from below. To this end, let us take some suitable positive constants $\lambda'_1$ and $\lambda'_2$ such that

$$0 < \lambda'_1 - 1, \quad 0 < \lambda'_2 - 1,$$

with $\lambda_1$ and $\lambda_2$ given by Theorem 3.1 and Theorem 5.1 respectively. For fixed constants $\mu, \nu, \gamma_1, \gamma_2 > 0$, we set

$$K_\varepsilon = \{ \lambda \in \mathbb{C} \setminus \{ 0 \} : (\Re \lambda + \frac{\gamma_1 \gamma_2}{\mu + \nu} + \varepsilon)^2 + \Im \lambda^2 \geq (\frac{\gamma_1 \gamma_2}{\mu + \nu} + \varepsilon)^2 \},$$

$$D'_\varepsilon = \{ \lambda \in \Sigma_\varepsilon \cap K_\varepsilon : \lambda'_1 \leq |\lambda| \leq \lambda'_2 \}.\tag{5.4}$$

In this section, we address the resolvent problem (1.13) whenever $\lambda$ lies in $D'_\varepsilon$ above. The main theorem of this section reads as follows:

**Theorem 5.4.** Suppose that $\Omega$ is a $C^2$ exterior domain in $\mathbb{R}^N$ for $N \geq 3$. Let $0 < \varepsilon < \pi/2$, $N < r < \infty$, $1 < p \leq r$, and $\lambda \in D'_\varepsilon$. Then there exist two families of operators

$$(P_{mid}(\lambda), V_{mid}(\lambda)) \in \text{Hol} \left( D'_\varepsilon; \mathcal{L}(H^1_p(\Omega); H^{1,2}_p(\Omega)) \right),$$

such that $(\eta, u) = (P_{mid}(\lambda), V_{mid}(\lambda))(d, f) \in H^1_p(\Omega)$ is a unique solution of (1.13) for any $\lambda \in D'_\varepsilon$ and for any $(d, f) \in H^1_p(\Omega)$. Moreover, we have

$$\|\eta\|_{H^1_p(\Omega)} + \|u\|_{H^2_p(\Omega)} \leq C \left( \|d\|_{H^1_p(\Omega)} + \|f\|_{L_p(\Omega)} \right)$$

for some constant $C$ depending solely on $\lambda'_1, \lambda'_2, \varepsilon, p, r, \mu, \nu, \gamma_1, \gamma_2, N$.

To check the solvability of (1.13) for $\lambda$ in $D'_\varepsilon$, we will study some model problem in the bounded domain $\Omega_{5R}$ in Subsection 5.2.1. Afterwards, we construct the solution operators by fixing $\lambda$, and then extend the result to the whole region $D'_\varepsilon$ by the compactness of $D'_\varepsilon$.

### 5.2.1 Some model problem in $\Omega_{5R}$

Recall the notion in (1.15): We consider the following system in $\Omega_{5R}$ for any fixed $\lambda \in \Sigma_\varepsilon \cap K$:

$$\begin{aligned}
\lambda \eta + \gamma_1 \text{div} u &= d &\quad &\text{in} \; \Omega_{5R}, \\
\gamma_1 \lambda u - \text{div} (S(u) - \gamma_2 \eta I) &= f &\quad &\text{in} \; \Omega_{5R}, \\
(S(u) - \gamma_2 \eta I) n_{5R} &= 0 &\quad &\text{on} \; \Gamma, \\
(S(u) - \gamma_2 \eta I) n_{s_{5R}} &= 0 &\quad &\text{on} \; S_{5R}. 
\end{aligned}\tag{5.5}$$

The result for (5.5) can be established as follows.

**Theorem 5.5.** Let $\Omega, \varepsilon, p, r$ be given as in Theorem 5.4. Then there exist continuous linear operators

$$(P_0(\lambda), V_0(\lambda)) \in \mathcal{L}(H^1_p(\Omega_{5R}); H^{1,2}_p(\Omega_{5R}))$$

for any fixed $\lambda \in \Sigma_\varepsilon \cap K$ such that $(\eta, u) = (P_0(\lambda), V_0(\lambda))(d, f) \in H^{1,2}_p(\Omega_{5R})$ is a unique solution of (5.5) for any $(d, f) \in H^1_p(\Omega_{5R})$. Moreover, we have

$$\|\eta\|_{H^1_p(\Omega_{5R})} + \|u\|_{H^2_p(\Omega_{5R})} \leq C_\lambda \left( \|d\|_{H^1_p(\Omega_{5R})} + \|f\|_{L_p(\Omega_{5R})} \right)$$

for some constant $C_\lambda$ depending solely on $\lambda, \varepsilon, p, r, \mu, \nu, \gamma_1, \gamma_2, N$. 

34
To solve (5.6), we consider
\[
\begin{aligned}
&\left\{ \begin{aligned}
&\lambda \eta + \gamma_1 \text{div} \ u = d \\
&\gamma_1 \lambda \mathbf{u} - \text{Div} (\mathbf{S}(\mathbf{u}) - \gamma_2 \eta \mathbf{I}) = \mathbf{f}
\end{aligned} \right. & \text{in } \Omega_{5R}, \\
&\left(\mathbf{S}(\mathbf{u}) - \gamma_2 \eta \mathbf{I}\right) \mathbf{n}_{\partial \Omega_{5R}} = \mathbf{g} & \text{on } \partial \Omega_{5R}.
\end{aligned}
\]  

(5.6)

Applying Theorem 4.1, we have the following theorem for (5.6).

**Theorem 5.6.** Let \( \Omega, \varepsilon \) be given as in Theorem 5.4 and \( 1 < p < \infty \). Set that
\[
Y_p(\Omega_{5R}) = H^1_p(\Omega_{5R}) \times L^p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})^N.
\]

Then there exist continuous linear operators
\[
\left(\mathcal{P}_0(\lambda), \mathcal{V}_0(\lambda)\right) \in \mathcal{L}(Y_p(\Omega_{5R}); H^1_p(\Omega_{5R}))
\]
for any fixed \( \lambda \in \Sigma_{\varepsilon} \cap K \) such that \( (\eta, \mathbf{u}) = \left(\mathcal{P}_0(\lambda), \mathcal{V}_0(\lambda)\right)(d, \mathbf{f}, \mathbf{g}) \in H^1_p(\Omega_{5R}) \) is a (unique) solution of (5.6) for any \( (d, \mathbf{f}, \mathbf{g}) \in Y_p(\Omega_{5R}) \). Moreover, we have
\[
\|\eta\|_{H^1_p(\Omega_{5R})} + \|\mathbf{u}\|_{H^1_p(\Omega_{5R})} \leq C_{\lambda}(\|\mathcal{P}_0(\lambda)\|_{Y_p(\Omega_{5R}) \rightarrow H^1_p(\Omega_{5R})} + \|\mathcal{V}_0(\lambda)\|_{Y_p(\Omega_{5R}) \rightarrow H^1_p(\Omega_{5R})})
\]
for some constant \( C_{\lambda} \) depending solely on \( \lambda, \varepsilon, p, \mu, \nu, \gamma_1, \gamma_2, N \).

**Proof.** Now, let us construct \( \mathcal{P}_0(\lambda) \) and \( \mathcal{V}_0(\lambda) \). We reduce (5.6) by inserting \( \eta = \lambda^{-1}(d - \gamma_1 \text{div} \ u) \) into (5.6) to get
\[
\left\{ \begin{aligned}
&\lambda \mathbf{u} = \text{Div} (\alpha \mathbf{D}(\mathbf{u}) + (\beta - \alpha + \gamma_2 \lambda^{-1}) \text{div} \ mathbf{u}) = \mathbf{F} & \text{in } \Omega_{5R}, \\
&(\alpha \mathbf{D}(\mathbf{u}) + (\beta - \alpha + \gamma_2 \lambda^{-1}) \text{div} \ mathbf{u}) \mathbf{n}_{\partial \Omega_{5R}} = \mathbf{G} & \text{on } \partial \Omega_{5R},
\end{aligned} \right.
\]
with
\[
(\alpha, \beta) = \gamma_1^{-1}(\mu, \nu), \quad \mathbf{F} = \mathbf{f}, \quad \lambda \mathbf{v} - \lambda^{-1} \gamma_2 \nabla d, \quad \text{and } \mathbf{G} = \gamma_1^{-1} \mathbf{g} + \lambda^{-1} \gamma_2 \mathbf{d} \mathbf{n}_{\partial \Omega_{5R}}.
\]

(5.8)

So we shall study the solvability of (5.7) in what follows.

According to Theorem 4.1 and Remark 4.2, there exists \( \zeta_\lambda \in \Xi_{\varepsilon, \lambda, \zeta_0} \) for some \( \zeta_0 > 0 \) such that
\[
\left\{ \begin{aligned}
&\zeta_\lambda \mathbf{u} - \text{Div} (\alpha \mathbf{D}(\mathbf{u}) + (\beta - \alpha + \gamma_2 \lambda^{-1}) \text{div} \ mathbf{u}) = \mathbf{F} \quad \text{in } \Omega_{5R}, \\
&(\alpha \mathbf{D}(\mathbf{u}) + (\beta - \alpha + \gamma_2 \lambda^{-1}) \text{div} \ mathbf{u}) \mathbf{n}_{\partial \Omega_{5R}} = \mathbf{G} \quad \text{on } \partial \Omega_{5R},
\end{aligned} \right.
\]
(5.9)

admits a solution \( \mathcal{R}_{\zeta_\lambda}(\mathbf{F}, \mathbf{G}) = \mathbf{u} \in H^2_p(\Omega_{5R})^N \) for any \( (\mathbf{F}, \mathbf{G}) \in L^p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})^N \). Moreover, we have
\[
\|\mathbf{u}\|_{H^2_p(\Omega_{5R})} \leq C_{\lambda}(\|\mathbf{F}\|_{L^p(\Omega_{5R})} + \|\mathbf{G}\|_{H^1_p(\Omega_{5R})}).
\]

(5.10)

Next, we rewrite (5.9) by
\[
\left\{ \begin{aligned}
&\lambda \mathbf{u} - \text{Div} (\alpha \mathbf{D}(\mathbf{u}) + (\beta - \alpha + \gamma_2 \lambda^{-1}) \text{div} \ mathbf{u}) = \mathbf{F} + (\lambda - \zeta_\lambda) \mathcal{R}_{\zeta_\lambda}(\mathbf{F}, \mathbf{G}) & \text{in } \Omega_{5R}, \\
&(\alpha \mathbf{D}(\mathbf{u}) + (\beta - \alpha + \gamma_2 \lambda^{-1}) \text{div} \ mathbf{u}) \mathbf{n}_{\partial \Omega_{5R}} = \mathbf{G} & \text{on } \partial \Omega_{5R},
\end{aligned} \right.
\]
and then denote
\[
\mathcal{T}_\lambda(\mathbf{F}, \mathbf{G}) = \left((\lambda - \zeta_\lambda) \mathcal{R}_{\zeta_\lambda}(\mathbf{F}, \mathbf{G}), 0\right)
\]
for any \( (\mathbf{F}, \mathbf{G}) \in L^p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})^N \). By the Rellich’s Theorem, we know that \( \mathcal{T}_\lambda \) is compact on \( L^p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})^N \). Furthermore, we claim that \( I + \mathcal{T}_\lambda \) is invertible from \( L^p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})^N \) into itself. By the existence of \( (I + \mathcal{T}_\lambda)^{-1} \), \( \mathbf{u} = \mathcal{R}_{\zeta_\lambda} \circ (I + \mathcal{T}_\lambda)^{-1}(\mathbf{F}, \mathbf{G}) \) is a solution of (5.7). According to (5.8) and (5.10), we obtain
\[
\|\mathbf{u}\|_{H^2_p(\Omega_{5R})} \leq C_{\lambda}(\|\mathbf{F}\|_{H^1_p(\Omega_{5R})} + \|\mathbf{G}\|_{L^p(\Omega_{5R})}).
\]

(5.11)

Then the bound of \( \eta \) follows from (5.6) and (5.11).
At last, we prove the claim above. In fact, the existence of \((I + T_\lambda)^{-1}\) is reduced to the injectivity of \(I + T_\lambda\) due to the Fredholm alternative theorem. So let us consider the homogeneous equation

\[
(I + T_\lambda)(F_0, G_0) = (F_0 + (\lambda - \zeta_\lambda)R_{\zeta_\lambda}(F_0, G_0), G_0) = 0
\]  

(5.12)

for some \((F_0, G_0) \in L_p(\Omega_{5R})^N \times H^1_p(\Omega_{5R})^N\). Immediately, we see from (5.12) that \(G_0 = 0\), and that

\[
F_0 + (\lambda - \zeta_\lambda)R_{\zeta_\lambda}(F_0, 0) = 0.
\]

Now, set \(u_0 = R_{\zeta_\lambda}(F_0, 0) \in H^2_p(\Omega_{5R})^N\), which satisfies

\[
\begin{aligned}
\lambda u_0 - \text{Div} \left( \alpha D(u_0) + (\beta - \alpha + \gamma_2 \lambda^{-1}) \text{div} u_0 I \right) &= 0 \quad \text{in} \quad \Omega_{5R}, \\
(\alpha D(u_0) + (\beta - \alpha + \gamma_2 \lambda^{-1}) \text{div} u_0 I) n_{\partial\Omega_{5R}} &= 0 \quad \text{on} \quad \partial\Omega_{5R}.
\end{aligned}
\]

By the discussion on (5.14) in the proof of Lemma 5.7, we can conclude that \(u_0 = F_0 = 0\). This completes our proof for the injectivity of \(I + T_\lambda\). \(\square\)

The existence in Theorem 5.5 is immediate from the fixed point argument and Theorem 5.6. To handle the uniqueness issue in Theorem 5.5, we consider some \((\eta, u) \in H^1_p(\Omega)\) satisfying the following system:

\[
\begin{aligned}
\lambda \eta + \gamma_1 \text{div} u &= 0 \quad \text{in} \quad G, \\
\lambda \gamma_1 u - \text{Div} \left( S(u) - \gamma_2 \eta I \right) &= 0 \quad \text{in} \quad G, \\
(\bar{S}(u) - \gamma_2 \eta I) \bar{n}_{\partial G} &= 0 \quad \text{on} \quad \partial G,
\end{aligned}
\]

(5.13)

where \(G \in \{\Omega_{5R}, B_{5R}, \Omega\}\), \(n_{\partial G}\) is the unit normal vector on the boundary \(\partial G\), and \(\bar{n}_{\partial G} = (I + V)n_{\partial G}\). Noting that \(\eta = -\lambda^{-1}\gamma_1 \text{div} u\), we obtain from (5.13),

\[
\begin{aligned}
\lambda u - \text{Div} \left( \alpha \bar{S}(u) + (\beta - \alpha + \lambda^{-1}\gamma_2) \text{div} u I \right) &= 0 \quad \text{in} \quad G, \\
(\alpha \bar{S}(u) + (\beta - \alpha + \lambda^{-1}\gamma_2) \text{div} u I) \bar{n}_{\partial G} &= 0 \quad \text{on} \quad \partial G,
\end{aligned}
\]

(5.14)

with \((\alpha, \beta) = \gamma_1^{-1}(\mu, \nu)\). For (5.14), we can prove the following lemma, which also yields the uniqueness of (5.13).

**Lemma 5.7.** Let \(0 < \varepsilon < \pi/2\), \(1 < p < \infty\), and \(G \in \{\Omega_{5R}, B_{5R}, \Omega\}\). Assume that \(u \in H^1_p(\Omega)\) solves (5.14) for \(\lambda \in \Sigma_{\varepsilon} \cap K\). Then \(u(y) = 0\) for any \(y \in G\).

**Proof.** Step 1. We first consider the case \(p = 2\). Taking the inner product \((\cdot, J u)/G\) for (5.14) and integration by parts yield that

\[
0 = \lambda \sqrt{J u}^2_{L^2(G)} + \frac{\alpha}{2} \int_G \bar{D}(u) : D(u) J dy + (\beta - \alpha + \gamma_2 \lambda^{-1}) ||\sqrt{J} \text{div} u||^2_{L^2(G)}
\]

(5.15)

\[
= \lambda A_0 + \alpha A_1 + (\alpha + \beta + \gamma_2 \lambda^{-1}) A_2,
\]

with

\[
A_0 = ||\sqrt{J} u||^2_{L^2(G)}, \quad A_1 = \sum_{1 \leq i < j \leq N} ||\sqrt{J} D(u)_{ij}||^2_{L^2(G)}, \quad A_2 = ||\sqrt{J} \text{div} u||^2_{L^2(G)}.
\]

Now we take the real and imaginary parts of (5.15),

\[
\Re \lambda A_0 + \alpha A_1 + (\alpha + \beta + \gamma_2 |\lambda|^{-2} \Re \lambda) A_2 = 0, \quad \Im \lambda A_0 - \gamma_2 |\lambda|^{-2} \Im \lambda A_2 = 0.
\]

(5.16)
To see $u = 0$ from (5.16), it suffices to show $A_0 = 0$. If $\exists \lambda = 0$, then $\Re \lambda > 0$ as $\lambda \in \Sigma_e$. Thus the first equality in (6.16) gives us $A_0 = 0$.

On the other hand, for $\exists \lambda \neq 0$, we insert $A_0 = \gamma_2|\lambda|^{-2}A_2$ into the first equality in (5.16),
\[
\alpha A_1 + (\alpha + \beta + 2\gamma_2|\lambda|^{-2}\Re \lambda)A_2 = 0.
\]

Observe that $A_0 = 0$ is equivalent to $A_2 = 0$ as $\lambda \neq 0$.

1. $(\exists \lambda \neq 0$ and $\Re \lambda \geq 0)$. If $\Re \lambda \geq 0$, we have $\alpha A_1 + (\alpha + \beta)A_2 \leq 0$, which yields that $A_1 = A_2 = 0$.

2. $(\exists \lambda \neq 0$ and $\Re \lambda < 0)$. By the definition of $K$, $\lambda$ fulfills that
\[
-\frac{(\alpha + \beta)|\lambda|^2}{2\gamma_2} < \Re \lambda < 0.
\]

Hence $\alpha + \beta + 2\gamma_2|\lambda|^{-2}\Re \lambda > 0$, and then $A_1 = A_2 = 0$.

This completes the proof for $p = 2$.

**Step 2.** Now we assume that $G = \Omega_{5R}$ or $B_{5R}$. By Step 1 and the boundedness of $G$, we have the uniqueness for $2 \leq p < \infty$. Suppose that $1 < p < 2$. We take advantage of the hypoellipticity of (5.14) and the embedding $H^1_p(G) \hookrightarrow L_q(G)$ for some $q$ satisfying $0 < N(1/p - 1/q) < 1$. Then we can prove that $u \in H^2_p(G)^N$ by applying this idea in finite times.

**Step 3.** At last, we study (5.14) in $\Omega$. We will see that $u \in H^2_p(\Omega)$ by the hypoellipticity of (5.14). Recall the definition of $\varphi$ in (3.5), and set $w = \varphi u$. Then we have
\[
\begin{align*}
\left\{ \begin{array}{ll}
\lambda w - \text{Div}(\alpha D(w) + (\beta - \alpha + \lambda^{-1}\gamma_2)\text{div} wI) = f_u & \text{in } \Omega_{5R}, \\
(\alpha D(w) + (\beta - \alpha + \lambda^{-1}\gamma_2)\text{div} wI)\mathbf{1}_{\partial\Omega_{5R}} = 0 & \text{on } \partial\Omega_{5R},
\end{array} \right.
\end{align*}
\]
where
\[
\begin{align*}
f_u & = -\text{Div} U - (\alpha D(u) + (\beta - \alpha + \lambda^{-1}\gamma_2)\text{div} uI) \nabla \varphi, \\
U & = \alpha(\nabla \varphi \otimes u + u \otimes \nabla \varphi) + (\beta - \alpha + \lambda^{-1}\gamma_2)(\nabla \varphi \cdot u)I.
\end{align*}
\]
Moreover, we have $f_u \in H^1_p(\Omega_{5R})^N$. Then the discussion in Step 2 implies that $w = \varphi u \in H^2_p(\Omega_{5R})^N$ for all $1 < p < \infty$. That is, $u \in H^2_p(\Omega_{5R})^N$ for $3R < b_0 < b_1 < 4R$.

Next, we consider $v = \psi_\infty u$ for $\psi_\infty$ in (3.5), which satisfies
\[
\lambda v - \text{Div}(\alpha D(v) + (\beta - \alpha + \lambda^{-1}\gamma_2)\text{div} vI) = g_u \quad \text{in } \mathbb{R}^N,
\]
where
\[
\begin{align*}
g_u & = -\text{Div} \tilde{U} - (\alpha D(u) + (\beta - \alpha + \lambda^{-1}\gamma_2)\text{div} uI) \nabla \psi_\infty, \\
\tilde{U} & = \alpha(\nabla \psi_\infty \otimes u + u \otimes \nabla \psi_\infty) + (\beta - \alpha + \lambda^{-1}\gamma_2)(\nabla \psi_\infty \cdot u)I.
\end{align*}
\]
Then we have $\text{supp } g_u \subset \Omega_{5R}$ and $\|g_u\|_{H^1_p(\Omega_{5R})}$ is finite. Thus we can use Theorem 3.2 and the argument in Step 2 to get $v = \psi_\infty u \in H^2_p(\mathbb{R}^N)^N$ for all $1 < p < \infty$. Then we have $u \in H^2_p(\Omega_{5R})^N$ by (3.5). This completes our proof. \hfill \Box

37
5.2.2 Solvability of (1.13) by fixing $\lambda$

Here we simplify the strategy in Subsection 5.2 to construct the solution operators of (1.13) for $\lambda \in D'_\varepsilon$.

**Theorem 5.8.** Let $\Omega, \varepsilon, p, r$ be given as in Theorem 5.4, and $\lambda \in D'_\varepsilon$. Then there exist continuous linear operators

$$(\mathcal{P}_{mid}(\lambda), \mathcal{V}_{mid}(\lambda)) \in \mathcal{L}(H^{1,0}_p(\Omega); H^{1,2}_p(\Omega))$$

for any fixed $\lambda \in D'_\varepsilon$ such that $(\eta, u) = (\mathcal{P}_{mid}(\lambda), \mathcal{V}_{mid}(\lambda))(d, f) \in H^{1,2}_p(\Omega)$ is a unique solution of (1.13) for any $(d, f) \in H^{1,0}_p(\Omega)$. Moreover, we have

$$\|\eta\|_{H^{1,0}_p(\Omega)} + \|u\|_{H^{1,2}_p(\Omega)} \leq C_{\lambda}(\|d\|_{H^{1,0}_p(\Omega)} + \|f\|_{L^p(\Omega)})$$

for some constant $C_{\lambda}$ depending solely on $\lambda, \varepsilon, p, r, \mu, \gamma_1, \gamma_2, N$.

Thanks to Lemma 5.9, we only focus on the constructing $\mathcal{P}_{mid}(\lambda)$ and $\mathcal{V}_{mid}(\lambda)$. By Theorem 3.2 and Theorem 5.5, we introduce that for $\lambda \in D'_\varepsilon$,

$$(\eta_\lambda, u_\lambda) = (\mathcal{P}(\lambda), \mathcal{V}(\lambda))(\psi_\infty d, \psi_\infty f), \quad (\eta_\delta, u_\delta) = (\mathcal{P}_0(\lambda)\mathcal{V}_0(\lambda))(\psi_0 d, \psi_0 f),$$

$$\tilde{\eta}_\lambda = \Phi_\lambda(d, f) = (1 - \varphi)\eta_\lambda + \varphi \eta_\delta, \quad \tilde{u}_\lambda = \Psi_\lambda(d, f) = (1 - \varphi)u_\lambda + \varphi u_\delta,$$

where $\varphi, \psi_0$ and $\psi_\infty$ are given in (3.5). Then $\tilde{\eta}_\lambda$ and $\tilde{u}_\lambda$ fulfil

$$\begin{cases}
\lambda\tilde{\eta}_\lambda + \gamma_1 \text{div} \tilde{u}_\lambda = d + D_\lambda(d, f) & \text{in } \Omega, \\
\gamma_1 \lambda \tilde{u}_\lambda - \text{Div}(S(\tilde{u}_\lambda) - \gamma_2 \tilde{\eta}_\lambda I) = f + F_\lambda(d, f) & \text{in } \Omega, \\
(S(\tilde{u}_\lambda) - \gamma_2 \tilde{\eta}_\lambda I)\tilde{n}_\Gamma = 0 & \text{on } \Gamma,
\end{cases}$$

where $V_\lambda$ is defined in (3.13), and

$$D_\lambda(d, f) = \gamma_1 \nabla \varphi \cdot (u_\varepsilon - u_\lambda),$$

$$F_\lambda(d, f) = \left((S(u_\lambda) - \gamma_2 \eta_\lambda I) - (S(u_\varepsilon) - \gamma_2 \eta_\delta I)\right)\nabla \varphi - \text{Div} V_\lambda(d, f).$$

Moreover, we have

$$Q_\lambda(d, f) = (D_\lambda, F_\lambda)(d, f) \in H^{1,0}_p(\Omega), \quad \forall \lambda \in D'_\varepsilon,$$

which is a compact operator on $H^{1,0}_p(\Omega)$ in view of the Rellich compactness theorem and

$$\text{supp } Q_\lambda(d, f) \subset \text{supp } \nabla \varphi \subset D_{b_1, b_2} = \{x \in \Omega : b_1 \leq |x| \leq b_2\}.$$

In addition, $I + Q_\lambda$ is invertible due to the following lemma.

**Lemma 5.9.** For any $\lambda \in D'_\varepsilon$, $I + Q_\lambda$ has a bounded inverse $(I + Q_\lambda)^{-1}$ in $\mathcal{L}(H^{1,0}_p(\Omega))$.

**Proof.** According to the compactness of $Q_\lambda$ and the Fredholm’s alternative theorem, it is sufficient to verify the injectivity of $I + Q_\lambda$. For any $(d, f) \in \text{Ker } (I + Q_\lambda) \subset H^{1,0}_p(\Omega)$, $\text{supp } d, \text{supp } f \subset D_{b_1, b_2}$. Thus

$$(d, f) = (\psi_\infty d, \psi_\infty f) = (\psi_0 d, \psi_0 f).$$

By Theorem 3.2 and Theorem 5.5, we denote

$$(\eta_\lambda, u_\lambda) = (\mathcal{P}(\lambda), \mathcal{V}(\lambda))(d, f), \quad (\eta_\delta, u_\delta) = (\mathcal{P}_0(\lambda), \mathcal{V}_0(\lambda))(d, f)$$
for all $\lambda \in D'_\varepsilon$. Then $(\tilde{\eta}_\lambda, \tilde{\mathbf{u}}_\lambda) = (1 - \varphi)(\eta_\lambda, \mathbf{u}_\lambda) + \varphi(\eta_b, \mathbf{u}_b)$ satisfies

$$\begin{cases}
\lambda \tilde{\eta}_\lambda + \gamma_1 \text{div} \, \tilde{\mathbf{u}}_\lambda = 0 & \text{in} \ \Omega,

\gamma_1 \lambda \tilde{\mathbf{u}}_\lambda - \text{div} \left( \mathbf{S}(\tilde{\mathbf{u}}_\lambda) - \gamma_2 \tilde{\eta}_\lambda \mathbf{I} \right) = 0 & \text{in} \ \Omega,

\left( \mathbf{S}(\tilde{\mathbf{u}}_\lambda) - \gamma_2 \tilde{\eta}_\lambda \mathbf{I} \right) \mathbf{n} = 0 & \text{on} \ \Gamma.
\end{cases}$$

Hence Lemma 5.7 yields that

$$(\tilde{\eta}_\lambda, \tilde{\mathbf{u}}_\lambda) = (1 - \varphi)(\eta_\lambda, \mathbf{u}_\lambda) + \varphi(\eta_b, \mathbf{u}_b) = (0, 0) \ \text{in} \ \Omega,$$

and that

$$\eta_b(x) = 0, \ \mathbf{u}_b = 0 \ \text{for} \ |x| \leq b_1, \ \eta_\lambda(x) = 0, \ \mathbf{u}_\lambda = 0 \ \text{for} \ |x| \geq b_2.$$ 

Next, set that

$$(\tilde{\eta}_b, \tilde{\mathbf{u}}_b)(x) = \begin{cases}
(\eta_b, \mathbf{u}_b)(x) & \text{for} \ x \in \Omega_{5R} \setminus B_{2R},

0 & \text{for} \ x \in B_{2R}.
\end{cases}$$

Then $(\rho, \mathbf{v}) = (\tilde{\eta}_b - \eta_\lambda, \tilde{\mathbf{u}}_b - \mathbf{u}_\lambda)$ satisfies

$$\begin{cases}
\lambda \rho + \gamma_1 \text{div} \mathbf{v} = 0 & \text{in} \ B_{5R},

\gamma_1 \lambda \mathbf{v} - \text{div} \left( \mathbf{S}(\mathbf{v}) - \gamma_2 \rho \mathbf{I} \right) = 0 & \text{in} \ B_{5R},

\left( \mathbf{S}(\mathbf{v}) - \gamma_2 \rho \mathbf{I} \right) \mathbf{n}_{5R} = 0 & \text{on} \ S_{5R}.
\end{cases}$$

By modifying the proof of Lemma 5.7 we obtain that $(\rho, \mathbf{v}) = (0, 0)$ in $B_{5R}$. In particular,

$$(\eta_b, \mathbf{u}_b) = (\eta_\lambda, \mathbf{u}_\lambda) \ \text{in} \ D_{b_1, b_2}.$$ 

Then (5.19) implies that $(\eta_\lambda, \mathbf{u}_\lambda) = (0, 0)$ in $D_{b_1, b_2}$, and $(d, \mathbf{f}) = (0, 0)$ for supp $d$, supp $\mathbf{f} \subset D_{b_1, b_2}$. This completes our proof.

Completing the proof of Theorem 5.4. By Theorem 5.8 we have

$$\| (P_{mid}(\lambda), V_{mid}(\lambda))(d, \mathbf{f}) \|_{H^1_p(\Omega)} \leq C \| (d, \mathbf{f}) \|_{H^1_p(\Omega)}$$

for any $\lambda \in D'_\varepsilon$. Then

$$\| (P_{mid}(\zeta), V_{mid}(\zeta))(d, \mathbf{f}) \|_{H^1_p(\Omega)} \leq C \| (d, \mathbf{f}) \|_{H^1_p(\Omega)}$$

for any $\zeta \in B_{r_\lambda}(\lambda)$ for some $r_\lambda > 0$. As $D'_\varepsilon$ is compact, we can choose finite $\lambda_1, \ldots, \lambda_{N_0} \in D'_\varepsilon$ such that $D_\varepsilon \subset \bigcup_{k=1}^{N_0} B_{r_\lambda}(\lambda_k)$. Then we have

$$\| (P_{mid}(\lambda), V_{mid}(\lambda))(d, \mathbf{f}) \|_{H^1_p(\Omega)} \leq C \| (d, \mathbf{f}) \|_{H^1_p(\Omega)}$$

for any $\lambda \in D'_\varepsilon$. 

\[ \square \]

6 \ $L_p$-$L_q$ estimates of the linearized problem

In this section, we will prove $L_p$-$L_q$ estimates of (1.8). In next subsection, we show Theorem 1.2 by using the results in sections 3 and 5. Then we review a preliminary result for some model problem in the whole space $\mathbb{R}^N$, which plays the key role in the proof of Theorem 1.1. At last, we derive the $L_p$-$L_q$ decay estimates for (1.8) in subsection 6.3.

39
6.1 Local energy estimates

This short subsection is dedicated to the proof of Theorem 1.2. Without loss of generality, we take $L = 5R$. Recall the definition $K_\varepsilon$ and $D_\varepsilon$, and choose $0 < \varepsilon < \varepsilon' < \pi/2$ such that $\lambda_1 e^{i(\pi - \varepsilon')} \in K_\varepsilon$. Then we introduce

$$\Gamma = \Gamma_{+,2} \cup \Gamma_{+,1} \cup \Gamma_{+,0} \cup D_+ \cup D_- \cup \Gamma_{-,0} \cup \Gamma_{-,1} \cup \Gamma_{-,2},$$

where $\Gamma_{\pm,k}$, $k = 0, 1, 2$, $D_\pm$ are defined by

$$\begin{align*}
\Gamma_{+,2} &= \{ \lambda = re^{i(\pi - \varepsilon')}, r : \infty \to \lambda_2' \}, \\
\Gamma_{+,1} &= \{ \lambda = re^{i(\pi - \varepsilon')}, r : \lambda_2' \to \lambda_1' \}, \\
\Gamma_{+,0} &= \{ \lambda = \lambda_1' \cos(\pi - \varepsilon') + is, s : \lambda_1' \sin(\pi - \varepsilon') \to 0 \}, \\
D_+ &= \{ \lambda = se^{i\pi}, s : 0 \to \lambda_1' \cos \varepsilon' \}, \\
\Gamma_{-,0} &= \{ \lambda = \lambda_1' \cos(-\pi + \varepsilon') + is, s : 0 \to \lambda_1' \sin(-\pi + \varepsilon') \}, \\
\Gamma_{+,1} &= \{ \lambda = re^{i(-\pi + \varepsilon')}, r : \lambda_1' \to \lambda_2' \}, \\
\Gamma_{+,2} &= \{ \lambda = re^{i(-\pi + \varepsilon')}, r : \lambda_2' \to \infty \}.
\end{align*}$$

Next, we denote that

$$T(t)(\rho_0, v_0) = \frac{1}{2\pi i} \int_{\Gamma} e^{\lambda t}(\lambda I + A_\Omega)^{-1}(\rho_0, v_0) d\lambda = \sum_{k=0}^{2} I_k(t) + J(t),$$

with

$$\begin{align*}
I_k(t) &= \frac{1}{2\pi i} \int_{\Gamma_{+,k} \cup \Gamma_{-,k}} e^{\lambda t}(\lambda I + A_\Omega)^{-1}(\rho_0, v_0) d\lambda, \\
J(t) &= \frac{1}{2\pi i} \int_{D_+ \cup D_-} e^{\lambda t}(\lambda I + A_\Omega)^{-1}(\rho_0, v_0) d\lambda.
\end{align*}$$

By Theorem 5.4 and Theorem 5.1, it is not hard to see that

$$\|I_{k'}(t)\|_{H_p^{1,2}(\Omega)} \leq C e^{t\|e^{i(\lambda_1' \cos \varepsilon')t}\|(\rho_0, v_0)\|_{H_p^{1,0}(\Omega)}}, \quad \forall \ t \geq 1, \ k' = 1, 2.$$

Thank to Theorem 3.3, $J_0$ is bounded by

$$\|J_0(t)\|_{H_p^{1,2}(\Omega; \mathbb{R}^3)} \leq C e^{-(\lambda_1' \cos \varepsilon')t}\|(\rho_0, v_0)\|_{H_p^{1,0}(\Omega)}, \quad \forall \ t \geq 1.$$

Now, let us study $J(t)$. According to Theorem 5.1, we can rewrite $J(t) = J_0(t) + J_1(t) + J_2(t)$ with

$$\begin{align*}
J_0(t) &= \frac{1}{2\pi i} \int_{D_+ \cup D_-} e^{\lambda t} \lambda^{N/2-1}(\log \lambda)^{\sigma(N)}(0, \nabla^0_\lambda)(\rho_0, v_0) d\lambda, \\
J_1(t) &= \frac{1}{2\pi i} \int_{D_+ \cup D_-} e^{\lambda t} \lambda^{N-2} \log \lambda (M^1_\lambda, \nabla^1_\lambda)(\rho_0, v_0) d\lambda, \\
J_2(t) &= \frac{1}{2\pi i} \int_{D_+ \cup D_-} e^{\lambda t} (M^2_\lambda, \nabla^2_\lambda)(\rho_0, v_0) d\lambda.
\end{align*}$$

By the analyticity of operator $(M^2_\lambda, \nabla^2_\lambda)$ near $D_+ \cup D_-$, we have $J_2(t) = 0$. Moreover, direct calculations yield

$$\begin{align*}
\|J_0(t)\|_{H_p^{1,2}(\Omega; \mathbb{R}^3)} &\leq C e^{t-N/2}\|(\rho_0, v_0)\|_{H_p^{1,0}(\Omega)}, \\
\|J_1(t)\|_{H_p^{1,2}(\Omega; \mathbb{R}^3)} &\leq C e^{t-N-1}\|(\rho_0, v_0)\|_{H_p^{1,0}(\Omega)}, \quad \forall \ t \geq 1.
\end{align*}$$
Summing up all the bounds, we obtain that
\[ ||T(t)(\rho_0, \mathbf{v}_0)||_{H^{2,1}(\mathbb{S}_R)} \leq C_\varepsilon t^{-N/2} ||(\rho_0, \mathbf{v}_0)||_{H^{1,0}(\mathbb{S})}, \quad \forall \ t \geq 1 \text{ and } N \geq 3. \]

At last, note that
\[ \partial^k_t T(t)(\rho_0, \mathbf{v}_0) = \frac{1}{2\pi i} \int_{\Gamma} e^{\lambda t} \lambda^k (\lambda I + A_\Omega)^{-1}(\rho_0, \mathbf{v}_0) d\lambda. \]

By the similar calculations, we can obtain the desired estimates for the higher derivatives in Theorem 1.2.

6.2 Some result for the problem in $\mathbb{R}^N$

\[ \begin{cases} \partial_t \eta + \gamma_1 \text{div} \mathbf{u} = 0 & \text{in } \mathbb{R}^N \times \mathbb{R}_+, \\ \gamma_1 \partial_t \mathbf{u} - \text{Div} (S(\mathbf{u}) - \gamma_2 \eta I) = 0 & \text{in } \mathbb{R}^N \times \mathbb{R}_+, \\ (\eta, \mathbf{u})|_{t=0} = (\eta_0, \mathbf{u}_0) & \text{in } \mathbb{R}^N. \end{cases} \tag{6.1} \]

For (6.1), we recall the following result proved in [15], Theorems 2.3 and 2.4: There exist $\eta^0, \eta^\infty$, and $\mathbf{u}^0$ such that $(\eta, \mathbf{u}) = (\eta^0 + \eta^\infty, \mathbf{u}^0 + \mathbf{u}^\infty)$ solves (6.1), and the following assertions hold for non-negative integers $\ell, m$ and $n$.\]

1. For all $t \geq 1$, there exists a $C = C_{m,\ell,p,q} > 0$ such that
\[ \sum_{|\alpha| = \ell} ||\partial^m_x \partial^n_t \eta^0(t)||_{L_p(\mathbb{R}^N)} \leq C t^{-N(1/q - 1/p)/2 - (m+\ell)/2} ||(\eta_0, \mathbf{u}_0)||_{L_q(\mathbb{R}^N)} \]

with $1 \leq q \leq 2 \leq p \leq \infty$. Moreover,
\[ \sum_{|\alpha| = \ell} ||\partial^m_x \partial^n_t \mathbf{u}^0(t)||_{L_p(\mathbb{R}^N)} \leq C ||(\eta_0, \mathbf{u}_0)||_{L_q(\mathbb{R}^N)}, \quad \forall \ 0 < t \leq 2, \]

for $1 \leq q \leq p \leq \infty$ and $(p, q) \neq (1, 1), (\infty, \infty)$.

2. Let $(\ell)^+ = \ell$ if $\ell \geq 0$ and $(\ell)^+ = 0$ if $\ell < 0$. Let $1 < p < \infty$. Then, there exist positive constants $C$ and $c$ such that for any $t > 0$,
\[ \sum_{|\alpha| = \ell} ||\partial^m_x \partial^n_t \eta^\infty(t)||_{L_p(\mathbb{R}^N)} \leq C e^{-ct} \left( t^{n/2} ||\eta_0||_{H^{2m+\ell-n-2}_p(\mathbb{R}^N)} + ||\eta_0||_{H^\ell_p(\mathbb{R}^N)} ight) \]

\[ + t^{-n/2} ||\mathbf{u}_0||_{H^{(2m+\ell-n-1)^+}_p(\mathbb{R}^N)} + ||\mathbf{u}_0||_{H^{(\ell-1)^+}_p(\mathbb{R}^N)}, \]

\[ \sum_{|\alpha| = \ell} ||\partial^m_x \partial^n_t \mathbf{u}^\infty(t)||_{L_p(\mathbb{R}^N)} \leq C e^{-ct} \left( t^{n/2} ||\eta_0||_{H^{(2m+\ell-n-1)^+}_p(\mathbb{R}^N)} + ||\eta_0||_{H^{(\ell-1)^+}_p(\mathbb{R}^N)} ight) \]

\[ + t^{-n/2} ||\mathbf{u}_0||_{H^{(2m+\ell-n)^+}_p(\mathbb{R}^N)} + ||\mathbf{u}_0||_{H^{(\ell-2)^+}_p(\mathbb{R}^N)}. \]
6.3 Proof of Theorem 1.1

To obtain the decay estimates of \((\rho, \mathbf{v}) = T(t)(\rho_0, \mathbf{v}_0)\), we borrow the cut-off functions \(\varphi, \psi_0\) and \(\psi_\infty\) in (6.5). The proof is mainly divided into two steps, where we treat the bound of \((\rho, \mathbf{v})\) in \(\Omega_{5R}\) and \(\Omega \setminus B_{3R}\) respectively. For simplicity, we only check the \(L_p-L_q\) decay estimates for \(t \geq 3\) with the large time behaviour of the solutions involved. Afterwards, the bound for all \(t \geq 1\) can be obtained by refining the constant \(C\) in Theorem 1.1.

**Step 1.** In this part, we would like to verify the following estimate in \(\Omega_{5R}\),

\[
\|T(t)(\rho_0, \mathbf{v}_0)\|_{L^{1,2}(\Omega_{5R})} \leq Ct^{-N/(2q)}\|\rho_0, \mathbf{v}_0\|_{p,q} , \quad \forall \ t \geq 3. \tag{6.2}
\]

To prove (6.2), we introduce \((\eta, \mathbf{u})\) by solving the following system:

\[
\begin{aligned}
\partial_t \eta + \gamma_1 \text{div} \mathbf{u} &= 0 & & \text{in } \mathbb{R}^N \times \mathbb{R}^+, \\
\gamma_1 \eta \partial_t \mathbf{w} - \text{Div} (\mathbf{S}(\mathbf{w}) - \gamma_2 \eta \mathbf{I}) &= 0 & & \text{in } \mathbb{R}^N \times \mathbb{R}^+, \\
(\eta, \mathbf{u})|_{t=0} &= (\psi_\infty \rho_0, \psi_0 \mathbf{v}_0) & & \text{in } \mathbb{R}^N.
\end{aligned}
\]

In addition, Theorem 6.1 and the definition of \(\psi_\infty\) in (6.5) imply that

\[
\|(\eta, \mathbf{u})(t)\|_{L^{1,2}(\Omega_{5R})} \leq C_{p,R}(\|\eta^0, \mathbf{u}^0\|(H^{1,2}(\mathbb{R}^N)) + \|(\eta^\infty, \mathbf{u}^\infty)(t)\|_{H^{1,2}(\mathbb{R}^N)})
\leq C_{p,q,R} t^{-N/(2q)}\|\rho_0, \mathbf{v}_0\|_{p,q} , \quad \forall \ t \geq 1. \tag{6.3}
\]

Next, \((\theta, \mathbf{w}) = (\rho, \mathbf{v}) - (1 - \varphi)(\eta, \mathbf{u})\) fulfills that

\[
\begin{aligned}
\partial_t \theta + \gamma_1 \text{div} \mathbf{w} &= d_u & & \text{in } \Omega \times \mathbb{R}^+, \\
\gamma_1 \partial_t \mathbf{w} - \text{Div} (\mathbf{S}(\mathbf{w}) - \gamma_2 \theta \mathbf{I}) &= f_{\eta,u} & & \text{in } \Omega \times \mathbb{R}^+, \\
(\mathbf{S}(\mathbf{w}) - \gamma_2 \theta \mathbf{I})\mathbf{n}_\Gamma &= 0 & & \text{on } \Gamma \times \mathbb{R}^+, \\
(\theta, \mathbf{w})|_{t=0} &= (\varphi \rho_0, \varphi \mathbf{v}_0) & & \text{in } \Omega,
\end{aligned}
\]

with

\[
\begin{aligned}
d_u &= \gamma_1 \nabla \varphi \cdot \mathbf{u}, & f_{\eta,u} &= - (\mathbf{S}(\mathbf{u}) - \gamma_2 \eta \mathbf{I}) \nabla \varphi + \text{Div} \mathbf{U}, \\
\mathbf{U} &= - \mu (\mathbf{u} \otimes \nabla \varphi + \nabla \varphi \otimes \mathbf{u}) - (\nu - \mu) (\nabla \varphi \cdot \mathbf{u}) \mathbf{I},
\end{aligned}
\]

where we have used the fact that \((1 - \varphi)\mathbf{V} = 0\) from (1.11) and (6.3). Clearly, \(\text{supp}(d_u, f_{\eta,u}, \mathbf{U}) \subset D_{b_1,b_2} \subset \Omega_{5R}\).

Moreover, (6.3) yields that \((d_u, f_{\eta,u}) \in H^{1,1}_p(\Omega_{5R})\) with

\[
\|d(t, f_{\eta,u})(t)\|_{H^{1,k}_p(\Omega_{5R})} \leq C\|\eta(t)\|_{H^{1,1+k}(\Omega_{5R})} \leq C_{p,q,R} t^{-N/(2q)}\|\rho_0, \mathbf{v}_0\|_{p,q} , \quad \forall \ t \geq 1. \tag{6.5}
\]

for \(k = 0, 1\), and \(t \geq 1\).

By the definition of \((\theta, \mathbf{w})\) and (6.3), (6.2) holds true if one can show

\[
\|\theta(t)\|_{L^{1,2}(\Omega_{5R})} \leq C t^{-N/(2q)}\|\rho_0, \mathbf{v}_0\|_{p,q} , \quad \forall \ t \geq 3. \tag{6.6}
\]

To obtain (6.6), we use the Duhamel principle,

\[
\theta(t) = T(t)(\varphi \rho_0, \varphi \mathbf{v}_0) + \int_0^t T(t - s)(d_u, f_{\eta,u})(s) \, ds. \tag{6.7}
\]
As \((\varphi_0, \varphi v_0) \in X_{p,5}(\Omega)\), Theorem 6.1 yields that
\[
\|T(t)(\varphi_0, \varphi v_0)\|_{H^1_p(\Omega)} \leq Ct^{-N/2}\|\varphi_0\|_{H^1_p(\Omega)} \leq Ct^{-N/2}\|\varphi v_0\|_{H^1_p(\Omega)}
\]
for all \(t \geq 1\). To bound the second term on the right-hand side of (6.7), we write
\[
\int_0^t T(t-s)(d_u, f_{\eta,u})(s) \, ds = \left( \int_0^1 + \int_{1}^{t-2} + \int_{t-2}^t \right) T(t-s)(d_u, f_{\eta,u})(s) \, ds = I_1(t) + I_2(t) + I_3(t), \quad \forall \ t \geq 3,
\]
and then we study \(I_k(t) \) for \(k = 1, 2, 3\), respectively in what follows.

**Bound of \(I_1(t)\).** Firstly, Theorem 6.1 yields that
\[
\|\eta, u(t)\|_{H^1_p(\Omega)} \leq C(t^{-1/2}\|\psi_\infty \varphi_0, \psi_\infty v_0\|_{L_p(\Omega)} + \|\psi_\infty \varphi_0, \psi_\infty v_0\|_{L_q(\Omega)}) \leq C t^{-1/2}\|\varphi_0, v_0\|_{p,q} \text{ for } 0 < t < 1.
\]
Then, by Theorem 1.2 and (6.9), we have
\[
\|I_1(t)\|_{H^1_p(\Omega)} \leq C \int_0^1 (t-s)^{-N/2}\|d_u, f_{\eta,u}(s)\|_{H^1_p(\Omega)} \, ds \leq C \int_0^1 (t-s)^{-N/2}\|\eta, u(s)\|_{H^1_p(\Omega)} \, ds \leq C t^{-N/2}\|\varphi_0, \varphi v_0\|_{p,q} \, \forall \ t \geq 3.
\]

**Bound of \(I_2(t)\).** According to Theorem 1.2 and (6.5), we have
\[
\|I_2(t)\|_{H^1_p(\Omega)} \leq C \int_1^{t-2} (t-s)^{-N/2}s^{-N/(2q)} \, ds\|\varphi_0, v_0\|_{p,q} \text{ for } 0 < t < 1.
\]
Note that
\[
\int_1^{t-2} (t-s)^{-N/2}s^{-N/(2q)} \, ds \leq \left( \int_1^{t/3} + \int_{t/3}^{t-2} \right) (t-s)^{-N/2}s^{-N/(2q)} \, ds
\leq \int_1^{t/3} \left( (t+s)/2 \right)^{-N/2}s^{-N/(2q)} \, ds
+ \int_{t/3}^{t-2} (t-s)^{-N/2}((t+s)/4)^{-N/(2q)} \, ds = A_1(t) + A_2(t).
\]

For the bound of \(A_1(t)\), we first assume that \(N/(2q) > 1\), and obtain
\[
A_1(t) \leq C_N t^{-N/2} \int_1^{t/3} s^{-N/(2q)} \, ds \leq C q_N t^{-N/2}.
\]
Otherwise, if \(0 < N/(2q) \leq 1\) for some \(N \geq 3\), then we have
\[
A_1(t) \leq C_N \int_1^{t/3} s^{1+\sigma-N/(2q)}((t+s)^{N/2})^{-1+\sigma} \, ds \leq C_{\sigma,q} N t^{-(N/2-1-\sigma+N/(2q))},
\]
43
with $0 < \sigma < 1/2$. Thus we have

$$A_1(t) \leq C_{q,N} t^{-N/2q} \quad \text{for all } 1 \leq q \leq 2 \text{ and } N \geq 3.$$  

On the other hand,

$$A_2(t) \leq C_{q,N} t^{-N/2q} \int_{t/3}^{t-2} (t-s)^{-N/2} ds \leq C_{q,N} t^{-N/2q}.$$  

Now, combining the bounds of $A_1(t)$ and $A_2(t)$ above, we obtain

$$\int_{1}^{t-2} (t-s)^{-N/2} s^{-N/2q} ds \leq C_{q,N} t^{-N/2q},$$

which, together with (6.11), implies that

$$\|I_2(t)\|_{H^{1/2}_p(\Omega_{5R})} \leq C t^{-N/2q}\|(\rho_0, \mathbf{v}_0)\|_{p,q}, \quad \forall \ t \geq 3. \quad (6.12)$$

**Bound of $I_2(t)$**. By Theorem [5.3] we have

$$\|T(t)(d, f)\|_{H^{1/2}_p(\Omega)} \leq \begin{cases} Ct^{-1}\|(d, f)\|_{H^{1,0}_p(\Omega)}, & \forall (d, f) \in H^{1,0}_p(\Omega), \\ C\|(d, f)\|_{H^{1/2}_p(\Omega)}, & \forall (d, f) \in D_p(A_\Omega), \end{cases}$$

for $0 < t < 2$. Then by the interpolation, we see that

$$\|T(t)(d, f)\|_{H^{1/2}_p(\Omega)} \leq Ct^{-1/2}\|(d, f)\|_{H^{1,1}_p(\Omega)}. \quad (6.13)$$

Now, we infer from (6.13) and (6.5),

$$\|I_3(t)\|_{H^{1/2}_p(\Omega_{5R})} \leq C \int_{t-2}^{t} (t-s)^{-1/2}\|(d_u, f_{\eta,u})(s)\|_{H^{1,1}_p(\Omega_{5R})} \ ds$$

$$\leq C \int_{t-2}^{t} (t-s)^{-1/2} s^{-N/2q} \ ds \|\rho_0, \mathbf{v}_0\|_{p,q} \quad (6.14)$$

$$\leq C t^{-N/2q}\|(\rho_0, \mathbf{v}_0)\|_{p,q}, \quad \forall \ t \geq 3.$$  

Finally, we can conclude the claim (6.6) by summing up (6.8), (6.10), (6.12) and (6.14). This completes the proof of (6.2).

**Step 2.** Let us study the bound of $(\rho, \mathbf{v}) = T(t)(\rho_0, \mathbf{v}_0)$ near the area $\Omega \setminus B_{5R}$ by holding (6.3). Recall the definition of $\psi_\infty$ in (3.3). Then $(\tilde{\rho}, \tilde{\mathbf{v}}) = (\psi_\infty \rho, \psi_\infty \mathbf{v})$ can be regarded as a solution of

$$\begin{cases} \partial_t \tilde{\rho} + \gamma_1 \text{div} \tilde{\mathbf{v}} = \tilde{d} & \text{in } \mathbb{R}^N \times \mathbb{R}_+, \\ \gamma_1 \partial_t \tilde{\mathbf{v}} - \text{Div}(S(\tilde{\mathbf{v}}) - \gamma_2 \tilde{\rho} \mathbf{I}) = \tilde{f} & \text{in } \mathbb{R}^N \times \mathbb{R}_+, \\ (\tilde{\rho}, \tilde{\mathbf{v}})|_{t=0} = (\psi_\infty \rho_0, \psi_\infty \mathbf{v}_0) & \text{in } \mathbb{R}^N, \end{cases} \quad (6.15)$$

with

$$\tilde{d} = \gamma_1 \nabla \psi_\infty \cdot \mathbf{v}, \quad \tilde{f} = -(S(\mathbf{v}) - \gamma_2 \rho \mathbf{I}) \nabla \psi_\infty - \text{Div} \tilde{\mathbf{v}}$$

$$\tilde{\mathbf{v}} = \mu(\mathbf{v} \otimes \nabla \psi_\infty + \nabla \psi_\infty \otimes \mathbf{v}) + (\nu - \mu)(\nabla \psi_\infty \cdot \mathbf{v}) \mathbf{I}.$$

44
Moreover, we have $\text{supp}(\tilde{d}, \tilde{f}) \subset \Omega_{5R}$ and

$$
\left\| (\tilde{d}, \tilde{f})(t) \right\|_{p,q} \leq C \left\| (\rho, \mathbf{v})(t) \right\|_{H_{p}^{1}((\Omega_{5R})^{c}; H_{p}^{1}((\Omega_{5R})^{c})} \leq C_{p,q,R} \left\| (\rho, \mathbf{v})(t) \right\|_{H_{p}^{0,1}(\Omega_{5R})}
$$

for any $t > 0$ and $1 \leq q \leq 2 \leq p < \infty$. Similar to (6.13), we can conclude

$$
\left\| T(t)(\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{1,0}(\Omega)} \leq C t^{-1/2} \left\| (\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{1,0}(\Omega)} \quad (0 < t < 3)
$$

from the following inequalities in Theorem 5.3:

$$
\left\| T(t)(\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{1,0}(\Omega)} \leq C \left\| (\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{1,0}(\Omega)}, \quad \left\| T(t)(\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{2,0}(\Omega)} \leq C t^{-1} \left\| (\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{1,0}(\Omega)}.
$$

Thus (6.16) and (6.2) yield that

$$
\left\| (\tilde{d}, \tilde{f})(t) \right\|_{p,q} \leq \begin{cases} 
C t^{-1/2} \left\| (\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{1,0}(\Omega)} & \text{for } 0 < t < 2, \\
C t^{-N/(2q)} \left\| (\rho_0, \mathbf{v}_0) \right\|_{p,q} & \text{for } t \geq 2.
\end{cases}
$$

According to Theorem 3.2, we denote $\{\tilde{T}(t)\}_{t \geq 0}$ for the (analytic) semigroup associated to (6.15). Then the Duhamel principle furnishes

$$
(\tilde{\rho}, \tilde{\mathbf{v}})(t) = \tilde{T}(t)(\psi_{\infty}\rho_0, \psi_{\infty}\mathbf{v}_0) + \int_{0}^{t} \tilde{T}(t-s)(\tilde{d}, \tilde{f})(s) \, ds.
$$

Applying Theorem 6.1, we obtain for $t \geq 1$,

$$
\begin{align*}
\left\| \tilde{T}(t)(\psi_{\infty}\rho_0, \psi_{\infty}\mathbf{v}_0) \right\|_{L_{p}(\mathbb{R}^{N})} & \leq C_{p,q} t^{-(N/q-N/p)/2} \left\| (\rho_0, \mathbf{v}_0) \right\|_{p,q}, \\
\left\| \nabla \tilde{T}(t)(\psi_{\infty}\rho_0, \psi_{\infty}\mathbf{v}_0) \right\|_{L_{p}(\mathbb{R}^{N})} & \leq C_{p,q} t^{-(N/q-N/p)/2-1/2} \left\| (\rho_0, \mathbf{v}_0) \right\|_{p,q}, \\
\left\| \nabla^{2} \mathcal{P}_{c} \tilde{T}(t)(\psi_{\infty}\rho_0, \psi_{\infty}\mathbf{v}_0) \right\|_{L_{p}(\mathbb{R}^{N})} & \leq C_{p,q} t^{-(N/q-N/p)/2-1} \left\| (\rho_0, \mathbf{v}_0) \right\|_{p,q}.
\end{align*}
$$

Next, to study the second term on the right-hand side of (6.18), we write

$$
\int_{0}^{t} \tilde{T}(t-s)(\tilde{d}, \tilde{f})(s) \, ds = \left( \int_{0}^{t} + \int_{t}^{t-1} + \int_{t}^{1} \right) \tilde{T}(t-s)(\tilde{d}, \tilde{f})(s) \, ds = \tilde{I}_{1}(t) + \tilde{I}_{2}(t) + \tilde{I}_{3}(t), \quad \forall \ t \geq 3.
$$

Bound of $\tilde{I}_{1}(t)$. For $0 \leq s \leq 2$ and $t \geq 3$, we have $(t-s) \leq (t+s)/5$. Then (6.19) and (6.17) yield for $t \geq 3$,

$$
\begin{align*}
\left\| \tilde{I}_{1}(t) \right\|_{L_{p}(\mathbb{R}^{N})} & \leq C \int_{0}^{2} (t-s)^{-(N/q-N/p)/2} s^{-1/2} ds \left\| (\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{1,0}(\Omega)} \\
& \leq C t^{-(N/q-N/p)/2} \left\| (\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{1,0}(\Omega)}, \\
\left\| \nabla \tilde{I}_{1}(t) \right\|_{L_{p}(\mathbb{R}^{N})} & \leq C \int_{0}^{2} (t-s)^{-(N/q-N/p)/2-1/2} s^{-1/2} ds \left\| (\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{1,0}(\Omega)} \\
& \leq C t^{-(N/q-N/p)/2-1/2} \left\| (\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{1,0}(\Omega)}, \\
\left\| \nabla^{2} \mathcal{P}_{c} \tilde{I}_{1}(t) \right\|_{L_{p}(\mathbb{R}^{N})} & \leq C \int_{0}^{2} (t-s)^{-(N/q-N/p)/2-1} s^{-1/2} ds \left\| (\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{1,0}(\Omega)} \\
& \leq C t^{-(N/q-N/p)/2-1} \left\| (\rho_0, \mathbf{v}_0) \right\|_{H_{p}^{1,0}(\Omega)}.
\end{align*}
$$

Without loss of generality, we can divide the time interval $\mathbb{R}^{+}$ by $t = 2$, as the bound of $(\tilde{d}, \tilde{f})(t)$ for $t \in [2,3]$ is uniform up to some constant $C$.  

45
Bound of $\tilde{I}_2(t)$. As supp $(\tilde{d}, \tilde{f}) \subset \Omega_{5R}$, observe that
\[
\left\| (\tilde{d}, \tilde{f})(t) \right\|_{p,1} \leq C_{q,R} \left\| (\tilde{d}, \tilde{f})(t) \right\|_{p,q}, \quad \forall \ t > 0.
\]
Then (6.19) and (6.17) imply for $t \geq 3$,
\[
\begin{align*}
\| \tilde{I}_2(t) \|_{L_p(\mathbb{R}^N)} &\leq C \int_2^{t-1} (t-s)^{-\left(\frac{N-N/p}{2} - \frac{N}{(2q)}\right)} ds \left\| (\rho_0, \nu_0) \right\|_{p,q}, \\
\| \nabla \tilde{I}_2(t) \|_{L_p(\mathbb{R}^N)} &\leq C \int_2^{t-1} (t-s)^{-\left(\frac{N-N/p}{2} - 1/2 - \frac{N}{(2q)}\right)} ds \left\| (\rho_0, \nu_0) \right\|_{p,q}, \\
\| \nabla^2 \mathcal{P}_v \tilde{I}_2(t) \|_{L_p(\mathbb{R}^N)} &\leq C \int_2^{t-1} (t-s)^{-\left(\frac{N-N/p}{2} - 1/2 - \frac{N}{(2q)}\right)} ds \left\| (\rho_0, \nu_0) \right\|_{p,q}.
\end{align*}
\]
(6.21)

To continue the discussions, we write for $\kappa > 0$,
\[
\int_2^{t-1} (t-s)^{-\kappa} s^{-\frac{N}{(2q)}} ds = \left( \int_2^{2^{t/3}} + \int_2^{t-1} \right) (t-s)^{-\kappa} s^{-\frac{N}{(2q)}} ds \\
\leq \int_2^{2^{t/3}} (t+s/5)^{-\kappa} s^{-\frac{N}{(2q)}} ds \\
+ \int_2^{t-1} (t-s)^{-\kappa} (2(t+s)/5)^{-\frac{N}{(2q)}} ds.
\]

Then the similar argument to the bound (6.11) gives us
\[
\begin{align*}
\| \tilde{I}_2(t) \|_{L_p(\mathbb{R}^N)} &\leq Ct^{-\left(\frac{N}{q} - \frac{N}{p} - \frac{N}{(2q)}\right)} \left\| (\rho_0, \nu_0) \right\|_{p,q}, \\
\| \nabla \tilde{I}_2(t) \|_{L_p(\mathbb{R}^N)} &\leq Ct^{-\sigma_1(p,q,N)} \left\| (\rho_0, \nu_0) \right\|_{p,q}, \\
\| \nabla^2 \mathcal{P}_v \tilde{I}_2(t) \|_{L_p(\mathbb{R}^N)} &\leq Ct^{-\sigma_2(p,q,N)} \left\| (\rho_0, \nu_0) \right\|_{p,q}.
\end{align*}
\]
(6.22)

Bound of $\tilde{I}_3(t)$. According to Theorem 3.2 and the standard semigroup theory, we have
\[
\begin{align*}
\| \tilde{T}(t)(d, f) \|_{H_p^{1,0}(\mathbb{R}^N)} &\leq C \| (d, f) \|_{H_p^{1,0}(\mathbb{R}^N)}, \\
\| \nabla \tilde{T}(t)(d, f) \|_{L_p(\mathbb{R}^N)} &\leq Ct^{-1/2} \| (d, f) \|_{L_p(\mathbb{R}^N)}, \\
\| \nabla^2 \mathcal{P}_v \tilde{T}(t)(d, f) \|_{L_p(\mathbb{R}^N)} &\leq Ct^{-1/2} \| (d, f) \|_{H_p^{1,1}(\mathbb{R}^N)},
\end{align*}
\]
(6.23)

for $0 < t < 2$ and $(d, f) \in H_p^{1,1}(\mathbb{R}^N)$. In addition, (6.17) and (6.2) yield that
\[
\| (\tilde{d}, \tilde{f})(s) \|_{H_p^{1,0}(\mathbb{R}^N)} \leq C (\| (\tilde{d}, \tilde{f})(s) \|_{H_p^{1,0}(\Omega_{5R})} + \| v(t) \|_{H_p^2(\Omega_{5R})}) \leq Ct^{-N/(2q)} \| (\rho_0, \nu_0) \|_{p,q}
\]
(6.24)

for all $s \geq 2$. Thus we infer from (6.23) and (6.24) that
\[
\begin{align*}
\| \tilde{I}_3(t) \|_{L_p(\mathbb{R}^N)} &\leq C \int_{t-1}^t \| (\tilde{d}, \tilde{f})(s) \|_{H_p^{1,0}(\mathbb{R}^N)} ds \leq Ct^{-N/(2q)} \| (\rho_0, \nu_0) \|_{p,q}, \\
\| \nabla \tilde{I}_3(t) \|_{L_p(\mathbb{R}^N)} &\leq C \int_{t-1}^t (t-s)^{-1/2} \| (\tilde{d}, \tilde{f})(s) \|_{L_p(\mathbb{R}^N)} ds \\
&\leq Ct^{-N/(2q)} \| (\rho_0, \nu_0) \|_{p,q}, \\
\| \nabla^2 \mathcal{P}_v \tilde{I}_3(t) \|_{L_p(\mathbb{R}^N)} &\leq C \int_{t-1}^t (t-s)^{-1/2} \| (\tilde{d}, \tilde{f})(s) \|_{H_p^{1,1}(\mathbb{R}^N)} ds \\
&\leq Ct^{-N/(2q)} \| (\rho_0, \nu_0) \|_{p,q}.
\end{align*}
\]
(6.25)
At last, we combine (6.19), (6.20), (6.22) and (6.25),
\[ \|\tilde{\rho} - \tilde{\nu}\|_{L^p(R^N)} \leq C t^{-(N/q - N/p)/2}\| (\rho_0, \nu_0)\|_{p,q}, \]
\[ \|\nabla (\tilde{\rho} - \tilde{\nu})\|_{L^p(R^N)} \leq C t^{-\sigma_1(p,q,N)}\| (\rho_0, \nu_0)\|_{p,q}, \]
\[ \|\nabla^2 (\tilde{\nu})\|_{L^p(R^N)} \leq C t^{-\sigma_2(p,q,N)}\| (\rho_0, \nu_0)\|_{p,q}, \quad \forall \ t \geq 3. \tag{6.26} \]

Furthermore, we immediately infer from (6.26) that
\[ \| (\rho, \nu)\|_{L^p(\Omega \cap B_{5R})} \leq C t^{-(N/q - N/p)/2}\| (\rho_0, \nu_0)\|_{p,q}, \]
\[ \|\nabla (\rho, \nu)\|_{L^p(\Omega \cap B_{5R})} \leq C t^{-\sigma_1(p,q,N)}\| (\rho_0, \nu_0)\|_{p,q}, \]
\[ \|\nabla^2 (\nu)\|_{L^p(\Omega \cap B_{5R})} \leq C t^{-\sigma_2(p,q,N)}\| (\rho_0, \nu_0)\|_{p,q} \tag{6.27} \]

Then (6.2) and (6.26) yield the desired bound for \( t \geq 3 \). This completes the proof of Theorem 1.1.

A Principal of the linearization

A.1 Formulation via partial Lagrange coordinates

Let us define
\[ x = X_u(y,t) = y + \int_0^t \kappa(y) u(y,s) \, ds \in \Omega_t \cup \Gamma_t, \quad \forall \ y \in \Omega \cup \Gamma, \tag{A.1} \]
for some vector \( u = u(\cdot, s) \) defined in \( \Omega \cup \Gamma \), and \( 0 \leq t \leq T \). By assuming the condition
\[ \int_0^T \|\kappa(\cdot) u(\cdot, s)\|_{H^1_\kappa(\Omega)} \, ds \leq \delta < 1/2 \tag{A.2} \]
for small constant \( \delta > 0 \), we denote \( X_u^{-1}(\cdot, t) \) for the inverse of \( X_u(\cdot, t) \) in (A.1). Suppose that
\[ \rho(x,t) = \eta(X_u^{-1}(x,t), t), \quad v(x,t) = u(X_u^{-1}(x,t), t), \quad \Omega_t = \{ x = X_u(y,t) \mid y \in \Omega \}, \]
solve (1.1) for some function \( \eta \) defined in \( \Omega \). We will derive the equations formally satisfied by \( (\rho, u) \) in \( \Omega \) in what follows.

Assume that \( \Gamma \) is a compact hypersurface of \( C^2 \) class. The kinematic (non-slip) condition \( V_{\Gamma_t} = v \cdot n_t \) is automatically satisfied under the transformation \( X_u \), because \( \kappa = 1 \) near the boundary \( \Gamma \). The calculations for the rest equations in (1.1) are very similar to the full Lagrangian transformation case. Denote that
\[ \frac{\partial x}{\partial y} = \nabla_y X_u = I + \int_0^t \nabla_y (\kappa(y) u(y,s)) \, ds, \]
and \( J_u = \det(\nabla_y X_u) \). Then by the assumption (A.2), there exists the inverse of \( \nabla_y X_u \), that is,
\[ \frac{\partial y}{\partial x} = (\nabla_y X_u)^{-1} = I + V_0(k), \quad k = \int_0^t \nabla_y (\kappa(y) u(y,s)) \, ds, \]
where \( V_0(k) = [V_{0ij}(k)]_{N \times N} \) is a matrix-valued function given by
\[ V_0(k) = \sum_{j=1}^\infty (-k)^j. \]
In particular, \( V_0(0) = 0 \). By the chain rule, we introduce the gradient, divergence and stress tensor operators with respect to the transformation \( A, A \):

\[
\nabla u = (I + V_0(k)) \nabla_y, \quad \text{div}_u u = (I + V_0(k)) : \nabla_y u = J^{-1} \text{div}_y \left( J(I + V_0(k))^T \right),
\]

\[
D_u(u) = (I + V_0(k)) \nabla u + (\nabla u)^T (I + V_0(k))^T = D(u) + V_0(k) \nabla u + (V_0(k) \nabla u)^T,
\]

\[
S_u(u) = \mu D_u(u) + (\nu - \mu)(\text{div}_u u)I, \quad \text{div}_u A = J_u^{-1} \text{Div}_y \left( J_u A (I + V_0(k)) \right).
\]

In addition, the \( i \)th component of \( \text{div}_u A \) can be also written via

\[
(\text{Div}_u A)_i = \sum_{j,k=1}^N \left[ I + V_0(k) \right]_{jk} \partial_k A_{ij}, \quad \forall \ i = 1, \ldots, N. \tag{A.4}
\]

In particular, \( \text{div}_u A = 0 \) if \( A \) is a constant matrix. Then according to \( \text{A.3} \), \( (\rho, u) \) fulfills

\[
\begin{cases}
\partial_t \eta + (1 - \kappa)u \cdot \nabla u \eta + (\rho_e + \eta) \text{div}_u u = 0 & \text{ in } \Omega \times (0, T), \\
(\rho_e + \eta)(\partial_t u + (1 - \kappa)u \cdot \nabla u) - \text{div}_u (S_u(u) - P(\rho_e + \eta)I) = 0 & \text{ on } \Gamma \times (0, T), \\
(S_u(u) - P(\rho_e + \eta)I) \mathbf{n}_u = P(\rho_e) \mathbf{n}_u & \text{ in } \Omega,
\end{cases}
\]

where \( \mathbf{n}_\Gamma \) denotes for the unit normal vector to \( \Gamma \), and \( \mathbf{n}_u \) is defined by

\[
\mathbf{n}_u = \frac{(1 + V_0(k)) \mathbf{n}_\Gamma}{|(1 + V_0(k)) \mathbf{n}_\Gamma|}.
\]

It is clear that the boundary condition in \( \text{A.3} \) is equivalent to

\[
(S_u(u) - (P(\rho_e + \eta) - P(\rho_e))I) (I + V_0(k)) \mathbf{n}_\Gamma = 0. \tag{A.6}
\]

### A.2 Modified equations from \( \text{A.5} \)

In this subsection, we derive another linearized form of \( \text{A.1} \) from \( \text{A.5} \). We assume that

\[
k = \int_0^t \nabla_y (\kappa(y) u(y, s)) \, ds
\]

satisfies \( \text{A.2} \). Given a smooth function

\[
G = G(k) : \mathbb{R}^{N \times N} \to \mathbb{R},
\]

we use Taylor’s theorem

\[
G(k) = G \left( \int_0^T \nabla_y (\kappa(y) u(y, s)) \, ds - \int_t^T \nabla_y (\kappa(y) u(y, s)) \, ds \right)
\]

\[
= G(K) + \sum_{|\ell| = 1, \beta \in \mathbb{N}_0^2} R_{\ell} \left( \int_t^T \nabla_y (\kappa(y) u(y, s)) \, ds \right)^\ell
\]

\[
= G(K) + \tilde{G},
\]

48
with $K = \int_0^T \nabla_y (\kappa(y)u(y,s)) \, ds$, $\tilde{G} = G(k) - G(K)$, and $R_\ell$ given by

$$R_\ell = -\int_0^1 \left( \partial_\ell G \right) \left( K - \theta \int_0^T \nabla_y (\kappa(y)u(y,s)) \, ds \right) d\theta.$$  

With this notation, we introduce that

$$J(K) = \left( \det (I + V_0(K)) \right)^{-1} = \det (\nabla_y X_u(T,y)), \quad \text{div}_T u = (I + V_0(K)) : \nabla_y u,$$

$$D_T(u) = (I + V_0(K)) \nabla u + (\nabla u)^T (I + V_0(K))^T,$$

$$S_T(u) = \mu D_T(u) + (\nu - \mu) (\text{div}_T u) I, \quad \text{Div}_T A = J(K)^{-1} \text{Div}_y \left( J(K) A (I + V_0(K)) \right),$$

Then the symbols in (A.3) are rewritten by noting (A.4) as follows,

$$\text{div}_u u = \text{div}_T u + \tilde{V}_0 : \nabla_y u, \quad D_u(u) = D_T(u) + \tilde{V}_0 \nabla u + (\tilde{V}_0 \nabla u)^T,$$

$$S_u(u) = S_T(u) + \mu (\tilde{V}_0 \nabla u + (\tilde{V}_0 \nabla u)^T) + (\nu - \mu) (\tilde{V}_0 : \nabla_y u) I,$$

$$\text{Div}_u A = \text{Div}_T A + (\tilde{V}_0 \nabla A),$$

where the ith component of $(B \nabla | A)$ equals to $\sum_{j,k} B_{jk} \partial_k A_{ij}$.

On the other hand, as $P(\cdot)$ is smooth, we infer from Taylor’s theorem that

$$P(\rho_\epsilon + \eta) - P(\rho_\epsilon) = P'(\rho_\epsilon) \eta + \frac{\eta^2}{2} \int_0^1 P''(\rho_\epsilon + \theta \eta)(1 - \theta) \, d\theta.$$  

Then we note from (A.9) that

$$S_u(u) - (P(\rho_\epsilon + \eta) - P(\rho_\epsilon)) I = S_T(u) - P'(\rho_\epsilon) \eta I + V_1(\eta, u),$$

Then thanks to (A.8) and (A.10), (A.3) with (A.6) can be reformulated by

\[
\begin{align*}
\partial_t \eta + \rho_\epsilon \text{div}_T u &= f(\eta, u) \quad \text{in } \Omega \times (0, T), \\
\rho_\epsilon \partial_t u - \text{Div}_T \left( S_T(u) - P'(\rho_\epsilon) \eta I \right) &= g(\eta, u) \quad \text{in } \Omega \times (0, T), \\
\left( S_T(u) - P'(\rho_\epsilon) \eta I \right)(I + V_0(K)) n &= h(\eta, u) \quad \text{in } \Gamma \times (0, T), \\
(\eta, u)_{|t=0} &= (\rho_0, v_0),
\end{align*}
\]

where the nonlinear terms on the r.h.s. of (A.11) are given by

$$f(\eta, u) = -(1 - \kappa) u \cdot \nabla \eta - \eta \text{div}_u u - \rho_\epsilon \tilde{V}_0 : \nabla_y u,$$

$$g(\eta, u) = -\eta \partial_t u - (\rho_\epsilon + \eta)(1 - \kappa) u \cdot \nabla u$$

$$+ \text{div}_u V_1(\eta, u) + (\tilde{V}_0 \nabla | S_T(u) - P'(\rho_\epsilon) \eta I),$$

$$h(\eta, u) = -\left( S_u(u) - (P'(\rho_\epsilon) \eta + \frac{\eta^2}{2} \int_0^1 P''(\rho_\epsilon + \theta \eta)(1 - \theta) \, d\theta) I \right) \tilde{V}_0 n$$

$$- V_1(\eta, u)(I + V_0(K)) n.$$  

At last, it is easy to see (1.3) from (A.11).
