ABSTRACT. In this paper, first, we study random best approximations to random sets, using fixed point techniques, obtaining this way stochastic analogues of earlier deterministic results by Browder-Petryshyn, KyFan and Reich. Then we prove two fixed point theorems for random multifunctions with stochastic domain that satisfy certain tangential conditions. Finally we consider a random differential inclusion with upper semicontinuous orientor field and establish the existence of random solutions.

KEY WORDS AND PHRASES. Random fixed point, Random solutions, Random Differential Inclusion and Abstract Differential Equations.

1980 AMS CLASSIFICATION CODE. 60H25, 47H10.

1. INTRODUCTION.

Random fixed point theorems are stochastic generalizations of classical fixed point theorems and are needed in the study of random equations. Their study was initiated by the Prague school of probabilists, with the works of Hans [1] and Spacek [2]. Recently the interest in these problems was revived by the survey article of Bharucha-Reid [3]. Since then, there has been a lot of activity in this area and several interesting results have appeared.

In this paper, we will study random fixed points in connection with random approximations and will derive stochastic analogues of some results by Browder-Petryshyn [4], KyFan [5] and Reich [6]. We also extend a random fixed point theorem proved by Engl [7] and finally we prove the existence of a solution for a random differential inclusion with an upper semicontinuous orientor field, extending this way an earlier result of the author [8] (theorem 5.1).

For the corresponding deterministic theory, we refer to the recent books of Goebel-Reich [9] for fixed points (in connection with the study of the geometry of the underlying space) and of Aubin-Cellina [10] for differential inclusions. Another nice work, bringing together the two main mathematical branches considered in this note, namely fixed point theory and differential equations, is the paper of Reich [11], where an interesting approach to fixed point theory is presented, through the existence theory of abstract differential equations.
2. PRELIMINARIES.

Let \((\Omega, \Sigma)\) be a measurable space and \(X\) a separable Banach space. Throughout this work, we will be using the following notations:

\[
P_f(c)(X) = \{A \subseteq X: \text{nonempty, closed (convex)}\}
\]
and

\[
P_{kc}(X) = \{A \subseteq X: \text{nonempty, compact, convex}\}
\]

Let \(K: \Omega \to P_f(X)\) be a multifunction. We say that \(K(.)\) is measurable, if for all \(U \subseteq X\) open, we have that \(K(U) = \{\omega \in \omega: K(\omega) \cap U \neq \emptyset\} \in \Sigma\). It can be shown – see Himmelberg [10] – that the above definition of measurability of \(K(.)\) is equivalent to saying that for any \(z \in X\), the map \(\omega \mapsto d(z, K(\omega)) = \inf \{\|z - x\|: x \in K(\omega)\}\) is measurable. Furthermore, if there exists a complete \(\sigma\)-finite measure on \(\Sigma\), then the above two properties are equivalent to saying that \(GrK(\sigma, x, x) \subseteq \sigma(X) = B(X)\), where \(B(X)\) is the Borel \(\sigma\)-field of \(X\). Following Schal [12] and Engl [7], we will say that \(K: \Omega \to P_f(X)\) is separable, if it is measurable and there exists a countable set \(D \subseteq X\) s.t. \(cl(D \ominus K(\omega)) = K(\omega)\). It is not difficult to show that if \(K(.)\) is measurable with nonempty, closed values and \(K(\omega) = cl(int K(\omega))\) for all \(\omega \in \omega\), then \(K(.)\) is a separable multifunction. This is the case for example, when \(K(.)\) has closed, convex, solid values.

Let \(Y, Z\) be two Hausdorff topological spaces and let \(G: Y \to Z\) be a multifunction. We say that \(G(.)\) is upper semicontinuous (u.s.c.), if for all \(U \subseteq Z\) open, \(G^{-1}(U) = \{y \in Y: G(y) \subseteq U\}\) is open in \(Y\). Also by \(h(., .)\) we will denote the Hausdorff metric on \(P_f(X)\). Recall that \((P_f(X), h)\) is a complete metric space.

Let \(K: \Omega \to P_f(X)\) and let \(F: GrK + P_f(X)\). We say that \(F(., .)\) is a random multifunction with stochastic domain \(K(.)\), if \(K(.)\) is measurable and for all \(x \in X\) and \(U \subseteq X\) open, we have \(\{\omega \in \omega: x \in K(\omega), F(x, x) \cap U \neq \emptyset\} \in \Sigma\). Such an \(F(., .)\) is said to be u.s.c. (continuous, compact e.t.c.), if for all \(\omega \in \omega\), \(F(\omega, .)\) is u.s.c. (continuous, compact e.t.c.) on \(K(\omega)\). Maps with stochastic domain were introduced by Engl [7]. A random fixed point of \(F(., .)\) is a measurable map \(x: \Omega \to X\) s.t. for all \(\omega \in \omega\), \(x(\omega) \in K(\omega)\) and \(x(\omega) \in F(x, x(\omega))\).

Finally, if \(\mu(.)\) is a \(\sigma\)-finite measure on \(\Sigma\) and \(G: \Omega \to P_f(X)\) is measurable, we will denote by \(S_G^1\) the set of integrable selectors of \(G(.)\) i.e. \(S_G^1 = \{g \in L_1(X): g(\omega) \in G(\omega) \text{ a.e.}\}\). It is easy to check that this set is nonempty if and only if \(\omega \mapsto \inf \{\|x\|: x \in G(\omega)\}\) belongs in \(L_+^1\).

3. RANDOM APPROXIMATIONS AND RANDOM FIXED POINTS.

We will start with a random version of proposition 2.3 of Reich [6], which in turn was an extension of an earlier very interesting result of KyFan [5] (theorem 2).

In this section \((\Omega, \Sigma, \mu)\) is a complete \(\sigma\)-finite measure space. Also recall that a map \(f: X \to X\) is nonexpansive, if \(\|f(x) - f(y)\| < \|x - y\|\) for all \(x, y \in X\). It is well known (see for example Goebel-Reich [9]) that the metric projection on a closed, convex set in a Hilbert space, is nonexpansive. That's why in theorems 3.1, 3.2, 3.3
and 3.4, that follow and involve the metric projection (either in their statement or in their proof), we assume that the ambient space is a Hilbert space.

**THEOREM 3.1.** If $X$ is a separable Hilbert space, $K: \Omega \times P_{ac\omega}(X)$ is a separable multifunction and $f: GrK \times X$ is a random, nonexpansive map, with stochastic domain $K(.)$ s.t. for all $\omega \in \Omega$, $f(\omega, K(\omega))$ is bounded. Then there exists $x: \Omega + X$ measurable s.t. for all $\omega \in \Omega$, $x(\omega) \in K(\omega)$ and $\|x(\omega) - f(\omega, x(\omega))\| = d(f(\omega, x(\omega)), K(\omega))$.

**PROOF.** From theorem 3.4 of [13], we know that there exists $\hat{f}: \Omega \times X + X$ a Caratheodory extension of $f(., .)$ (i.e. $\omega + \hat{f}(\omega, x)$ is measurable, $x + \hat{f}(\omega, x)$ is continuous and $\hat{f}|_{GrK} = f$). Let $p(\omega): X + K(\omega)$ be the metric projection on $K(\omega)$. We have already mentioned that $p(\omega)(.)$ is nonexpansive and it is also easy to show (see [14]), that for every $z \in X$, $\omega + p(\omega)(z)$ is measurable. Let $C(\omega) = \text{conv}(p(\omega)(\omega, K(\omega)))$. Note that $C(\omega) = \text{conv} \bigcup_{Y \in D} (p(\omega)(\omega, Y))$, where $D$ is the countable set postulated from the separability of $K(.)$. Hence $\omega + C(\omega)$ is a measurable multifunction. For every $\omega \in \Omega$, $(p(\omega)(\omega, .)) : C(\omega) + C(\omega)$ and is nonexpansive. So from Broler [15], we know that it has a fixed point. Consider the multifunction $L: \Omega + P_{f}(X)$ defined by:

$$L(\omega) = \{x \in C(\omega):(p(\omega)(\omega, x) = x\}$$

$$C(\omega) = \{x \in C(\omega):(p(\omega)(\omega, x) = x\} \cap GrL$$

But $(\omega, x) + (p(\omega)(\omega, x)$ is measurable in $\omega$ and continuous in $x$. Hence it is jointly measurable. Also since $C(.)$ is measurable, $GrC \in EXB(X)$. Thus $GrL \in EXB(X)$.

Applying theorem 3 of Saint-Beuve [16], we get $x: \Omega + X$ measurable s.t. $x(\omega) \in L(\omega)$ for all $\omega \in \Omega$. Therefore we have: $x(\omega) \in K(\omega)$ and $\|x(\omega) - f(\omega, x(\omega))\| = d(f(\omega, x(\omega)), K(\omega))$

**REMARK 1.** If $K(.)$ is bounded values, the assumption of the range of $f(\omega, .)$ can be dropped.

**REMARK 2.** Another result in the direction of theorem 3.1 above with a different set of hypotheses, can be found in [17] (theorem 4).

We have a similar result for condensing maps. Recall that $f: X + X$ is said to be $Y$-condensing, if it is continuous and for all $B \in X$ nonempty, bounded s.t. $Y(B) > 0$, $Y(f(B)) < Y(B)$, where $Y(.)$ is the Kuratowski measure of noncompactness.

**THEOREM 3.2.** If $X$ is a separable Hilbert space, $K: \Omega + P_{ac\omega}(X)$ is separable and $f: GrK + X$ is a random condensing map with stochastic domain $K(.)$ s.t. for all $\omega \in \Omega$, $f(\omega, K(\omega))$ is bounded. Then there exists $x: \Omega + X$ measurable s.t. for all $\omega \in \Omega$ $x(\omega) \in K(\omega)$ and $\|x(\omega) - f(\omega, x(\omega))\| = d(f(\omega, x(\omega)), K(\omega))$.

**PROOF.** Is the same as in theorem 3.1, using this time the fixed point of Furi-Vignoli [18].

Using theorem 3.1, we can have the following random version of a fixed point due to Browder-Petryshyn [4].

**THEOREM 3.3.** If $X$ is a separable Hilbert space, $K: \Omega + P_{ac\omega}(X)$ is separable with bounded values and $f: GrK + X$ is a random, nonexpansive map with stochastic domain $K(.)$ s.t. for every $x \in \text{bd}K(\omega)$ for which $p(\omega, f(\omega, x)) = x$, we have $f(\omega, x) = x$. 
Then f(.,.) admits a random fixed point.

PROOF. From theorem 3.1 (see remark 1), we know that there exists x:Ω → X measurable s.t. ∥x(ω) − f(x(ω), x(ω))∥ = d(f(x(ω), x(ω)), K(ω)) = ∥f(x(ω), x(ω)) − f(x(ω), x(ω))∥.

Since the best approximation is unique, x(ω) = p(f(x(ω), x(ω))). If x(ω) ∈ bdK(ω), then by hypothesis x(ω) = f(x(ω), x(ω)). Otherwise we must have that

f(x(ω), x(ω)) ∈ K(ω) f(x(ω), x(ω)) = p(f(x(ω), x(ω))) = x(ω), \ ω ∈ Ω.

REMARK. In the previous theorem, we can instead assume that for all \ ω ∈ Ω f(x(ω), x(ω)) is condensing on K(ω). Then in the proof we have to use theorem 3.2.

Now we pass to multifunctions and prove the following random fixed point theorem.

THEOREM 3.4. If X is a separable Hilbert space, K:Ω → P(X) is separable and F:GrK + Pfc(X) is an h-continuous, γ-condensing, random multifunction with stochastic domain K(ω) s.t. for all ω ∈ Ω and for x ∈ bdK(ω), F(x, x) ∩ p⁻¹(x, x) ∈ K(ω) and F(x, x) is bounded. Then F(.,.) admits a random fixed point.

PROOF. Let G:RxPfc(X) be the multifunction defined by

G(x, x) = F(x, p(x, x)). From our hypotheses on F(.,.), we see that ω ∈ G(x, x) is measurable, while x ∈ G(x, x) is h-continuous. Also we claim that G(x, x) is γ-condensing. So let B(X) be nonempty, bounded, with γ(B) > 0. We have

γ(G(x, B)) = γ(F(x, p(x, B))) < γ(p(x, B)) < γ(B)

the last inequality being a consequence of the fact that p(x, x) is nonexpansive. Let C(x) = convF(x, x). Then clearly G(x, x): C(x) + C(x). Note that if \ {x_n} is the countable set postulated from the separability of K(ω) and exploiting the h-continuity of F(ω, .), we have that \ C(x) = conv ∪ n∈N F(ω, x_n) + C(x) is measurable. Then consider the multifunction defined by L(ω) = {x ∈ G(ω, x) : x ∈ G(ω, x)}. From theorem 1 of Himmelberg-Porter-Van Vleck [19], we know that for all \ ω ∈ Ω, L(ω) ≠ ∅. Also note that GrL = \ {x ∈ G(x, x) : d(x, G(x, x)) = 0} ⊆ GrC ∈ ExB(X). Again theorem 3 of Saint-Beuve [16], produces a measurable map x:Ω → X s.t. x(ω) ∈ L(ω), for all \ ω ∈ Ω. Let \ \hat{x}(x) = p(x, x(ω)). Clearly \ \hat{x} is measurable and \ \hat{x} ∈ bdK(ω). Then \ \hat{x}(x) = p⁻¹(x, x(ω)) and \ x(ω) ∈ G(x, x(ω)) = F(x, \hat{x}(x)) → x(ω) ∈ p⁻¹(x, \hat{x}(x)) ∩ F(x, \hat{x}(ω)) = \hat{x}(x) + x(ω) ∈ K(ω) and x(ω) ∈ F(x, x(ω)) i.e. \ \hat{x}(x) is the desired random fixed point.

REMARK. If there is no ω dependence of the data in the previous theorem (deterministic case), then we can relax the hypotheses on F(.,.) and simply assume that F(.,.) is closed, γ-condensing and with bounded range. Also in the deterministic case, the theorem can be proved for general Banach spaces, if we assume that K is approximatively w-compact and F(.,.) is w-u.s.c., with w-compact range. The proof is analogous to the random case and in the general Banach space, we have to use proposition 2.1 of Reich [6], which tells us that the metric projection on K is a w-u.s.c. multifunction and eventually apply the Kakutani-KyFan fixed point theorem. Both those deterministic versions of theorem 3.4, extend theorem 3.3 of Reich [6]. Note that the second deterministic result that was stated in general Banach spaces, can not be extended to the random case, since as it was illustrated with a counter example in [20], a multifunction \ G(x, x) which is measurable in x, w-u.s.c. in x, is not in general jointly measurable.
The next result extends theorem 8 of Engl [7]. Recall that a multifunction \( F: K \times 2^X \rightarrow \phi \) is compact, if \( F(K) \) is compact. Also if \( K \times X \) is convex, we define
\[
I(x, K) = \{ z \in X : z = x + \lambda(y - x) \text{ for some } y \in X \text{ and } \lambda > 0 \}.
\]
So \( I(x, K) \) is nothing else, but the translation to the point \( x \) of the well known from nonsmooth analysis, "Bouligand tangent cone" to \( K \) at \( x \) (see Aubin-Ekeland [21]). Since we do not need any more the nonexpansiveness of the metric projection, the result can be stated for general separable Banach spaces.

**THEOREM 3.5.** If \( X \) is separable Banach space, \( K: \Omega + P_{fc}(X) \) is separable and \( F: GrK + P_{fc}(X) \) is a compact, u.s.c., random multifunction with stochastic domain \( K(.) \) s.t. \( F(\cdot, x) \subset I(x, K(\omega)) \omega \in \Omega \). Then \( F(\cdot, \cdot) \) a random fixed point.

**PROOF.** From proposition 5 of Engl [7], we know that there exists a multifunction \( H: GrK + P_{fc}(X) \) s.t.
\[
\begin{align*}
(1) & \quad \text{for each } (\omega, x) \in GrK, \ H(\omega, x) \subset F(\omega, x) \\
(2) & \quad \text{for every } \omega \in \Omega, \ H(\omega, \cdot) \text{ is u.s.c. on } K(\omega) \\
(3) & \quad H(\cdot, \cdot) \text{ is jointly measurable}
\end{align*}
\]
Then let \( L: \Omega \times 2^X \) be defined by
\[
L(\omega) = \{ x \in K(\omega) : x \in H(\omega, x) \}
\]
From theorem 3.1 of Reich [6], we know that for all \( \omega \in \Omega \), \( L(\omega) \neq \emptyset \). Observe that:
\[
\begin{align*}
GrL &= \{(\omega, x) \in \Omega \times X : x \in K(\omega), x \in H(\omega, x) \} \\
&= \text{proj}_2 ((\Omega \times D) \cap GrH) \\
&\quad \cap \Omega \times X
\end{align*}
\]
where \( D = \{(x, y) \in X \times X : x = y \} \). But note that \( GrH \subseteq XV(X)) \cap xB(X) \). So \( (\Omega \times D) \cap GrH \subseteq xB(D) \). Then using the theorem in section 39.1V of Kuratowski [22], we get that \( \text{proj}_{\Omega \times X}(\Omega \times D) \cap GrH \subseteq xB(X) \). Hence \( GrH \subseteq xB(X) \). Once again, through theorem 3 Saint-Beuve [16], we get \( x: \Omega \times X \) measurable s.t. \( x(\omega) \in L(\omega), \omega \in \Omega \Rightarrow x(\omega) \in H(\omega, x(\omega)) \cap F(\omega, x(\omega)) \).

4. RANDOM DIFFERENTIAL INCLUSIONS.

Let \( (\Omega, \Sigma, \omega) \) be a complete probability space, \( T = [0, b] \) a nonempty, closed, bounded interval in \( R_+ \), \( X \) a finite dimensional Banach space and \( x_0: \Omega \times X \) measurable. We consider the following random differential inclusion:
\[
\begin{align*}
x(\omega, t) &\in F(\omega, t, x(\omega, t)) \text{ a.e., for all } \omega \in \Omega \\
x(\omega, 0) &= x_0(\omega)
\end{align*}
\]
By random solution of (*), we understand a stochastic process \( x: \Omega \times T \times X \), with absolutely continuous realizations, satisfying (*) a.e. in \( t \), for all \( \omega \in \Omega \).

In this section we present a theorem on the existence of random solutions of (*),
that generalizes theorem 5.1 of [8].

**THEOREM 4.1.** If $F: \mathbb{R} \times \mathbb{R} \times X \times \mathbb{R}$ is a multifunction s.t.

1. $(\omega, t, x) + F(\omega, t, x)$ is measurable
2. for all $(\omega, t) \in \mathbb{R} \times T$, $x + F(\omega, t, x)$ is u.s.c.
3. $|F(\omega, t, x)| \leq a(\omega, t) + b(\omega, t) \| x \|_{\xi}$, for all $\omega \in \Omega$, with $a(\cdot, \cdot), b(\cdot, \cdot)$ measurable and $a(\omega, \cdot), b(\omega, \cdot) \in L^1$. Then $(*)$ admits a random solution.

**PROOF.** We will by determining an a priori bound for the random solutions of $(*)$ So let $x(\cdot, \cdot)$ be a random solution. Fixing $\omega \in \Omega$, we have:

$$x(\omega, t) = x_0(\omega) + \int_0^t f(s) ds, \quad t \in T, \quad \| F(\omega, \cdot, x(\cdot, \cdot)) \|_1 \leq \int_0^1 \| f(\cdot) \| ds$$

Applying Gronwall's inequality, we get that:

$$\| x(\omega, t) \| \leq \| x_0(\omega) \| + \int_0^t \| f(\cdot) \| ds$$

It is easy to check that $(\cdot, \cdot, \cdot)$ has the same measurability and semicontinuity properties as $F(\cdot, \cdot, \cdot)$ and furthermore we have that $|\hat{F}(\omega, t, x)| \leq a(\omega, t) + b(\omega, t) \| x \|_{\xi}$

$= \phi(\omega, t)$, with $\phi(\cdot, \cdot)$ measurable and $\| \phi(\cdot, \cdot) \|_{L^1}$. We will consider $(*)$ with the random orientor field $\hat{F}(\cdot, \cdot, \cdot)$.

Let $W(\omega) \subset C(T, X)$ be defined by:

$$W(\omega) = \{ x \in C(T, X) : x(t) = x_0(\omega) + \int_0^t g(s) ds, \quad t \in T, \quad \| g(t) \| < \phi(\omega, t) \text{ a.e.} \}$$

Define $\hat{T} : \Omega \times C(T, X) \times L^1(X) \times C(T, X)$ by:

$$\hat{T}(\omega, x, g)(t) = x_0(\omega) + \int_0^t g(s) ds - x(t)$$

Clearly $\hat{T}(\cdot, \cdot, \cdot)$ is measurable in $\omega$ and continuous in $(x, g)$. So is jointly measurable. Also if $B(\omega) = B(0, \| \phi(\omega, \cdot) \|)$ is the closed ball in $L^1(X)$, centered at the origin with radius $\| \phi(\omega, \cdot) \|_1$, then $B(.)$ is measurable and

$$G_{\omega} = \{ (\omega, x) \in \Omega \times C(T, X) : \| \hat{T}(\omega, x, g) \|_1 = 0, \quad d(g, \hat{B}(\omega)) = 0 \}$$

$G_{\omega} \in C(T, X)$, (since $g = x$, see Kuratowski [22], 39.IV).
Furthermore, a simple application of the Arzela-Ascoli theorem, tells us that for every $\omega \in \Omega$, $W(\omega)$ is a compact subset of $C(T,X)$.

Next let $\tilde{R} : R \times C(T,X) \times L^1(T) \to [0, \infty)$ be defined by:

$$\tilde{R}(\omega, x) = \{ (y, f) \in C(T,X) \times L^1(T) : y(t) = x_0(\omega) + \int_0^t f(s) \, ds, \, t \in T, \, f \in L^1(T) \}$$

Define $\tilde{G} : \tilde{R} : C(T,X) \times L^1(T) \to [0, \infty)$ by:

$$\tilde{G}(\omega, x, f) = \int_0^1 f(s) \, ds \tilde{F}(\omega, x(\cdot))$$

Note that:

$$d(f, s^1) = \inf_{\tilde{F}(\omega, x(\cdot))} \{ \| f - h \|_1 : h \in L^1(T) \}$$

But by hypothesis (1), $\omega, t, y + d(z, \tilde{F}(\omega, t, y))$ is measurable and $z + d(z, \tilde{F}(\omega, t, y))$ is continuous. Hence $\omega, t, y, z + d(z, \tilde{F}(\omega, t, y))$ is measurable. Also the evaluation map $(t, x(\cdot)) + e(x(\cdot)) = x(t)$, is continuous from $T \times C(T,X)$ into $X$. Hence we deduce that $(\omega, t, x(\cdot)) + d(\tilde{F}(\omega, t, x(t)))$ is measurable from $\tilde{G}(T \times C(T,X))$ into $[0, \infty)$. Rewrite $\tilde{R}(\omega, x)$ as follows:

$$\tilde{R}(\omega, x) = \{ (y, f) \in C(T,X) \times L^1(T) : \| \tilde{F}(\omega, y, t) \| = 0, \tilde{G}(\omega, x, f) = 0 \}$$

Let $P \subseteq C(T,X) \times L^1(T)$ be defined by $P = \{ (y, f) : y = f \}$. Then the projection to the first variable is one-to-one, continuous. Thus by Kuratowski [22] (39.1V):

$$\tilde{G}(T \times C(T,X)) \subseteq \tilde{R}(\omega, x) \subseteq \tilde{G}(T \times C(T,X)) \subseteq \tilde{R}(\omega, x)$$

So if $R(\omega, x) = \tilde{R}(\omega, x)$, then $Gr\tilde{F}(\omega, x) \subseteq C(T,X) \times L^1(T)$. Note that for fixed $\omega$, $R(\omega, x)$ is closed. We claim that it is u.s.c. To show this, since $W(\omega) \subseteq C(T,X)$ is compact, it suffices to show that $Gr\tilde{F}(\omega, x)$ is closed in $C(T,X) \times L^1(T)$. So let $(x_n, y_n) \in Gr\tilde{F}(\omega, x)$, $n \geq 1$ s.t. $(x_n, y_n)$ converges to $(x, y)$. By definition:

$$y_n(t) = x_0(\omega) + \int_0^t f(s) \, ds, \, t \in T, \, f \in L^1(T) \tilde{F}(\omega, x_n(\cdot))$$

From the Dunford-Pettis compactness criterion, we deduce that $\{ f_n \}_{n=1}^\infty$ is sequentially w-compact in $L^1(T)$. So by passing to a subsequence if necessary, we
may assume that $f_\approx f$ in $L^1(X)$. Using theorem 3.1 of [23], we have that:

$$f(t) \in \operatorname{conv} \lim_{n \to \infty} f_n(t) \subseteq \operatorname{conv} \lim_{n \to \infty} F(\omega,t,x_n(\omega)) \quad \text{a.e.}$$

The last inclusion being a consequence of the upper semi-continuity and the convexity of the values of $\hat{F}(\cdot,\cdot,\cdot)$. So $f \in S$. Also

$$y(t) = x_0(\omega) + \int_0^t f(s)ds, \quad t \in T$$

$(x,y) \in \operatorname{Gr}_R(\omega,\cdot)$

$R(\omega,\cdot)$ is u.s.c. from $W(\omega)$ into $W(\omega)$.

Let $L : \Omega \to 2^{C(T,X)}$ be defined by:

$$L(\omega) = \{ x \in C(T,X) : x \in R(\omega,\cdot), x \in W(\omega) \}$$

Since for fixed $\omega \in \Omega$, $R(\omega,\cdot): W(\omega) \to W(\omega)$ is u.s.c., from the Kakutani-KyFan fixed point theorem, we have that $L(\omega) \neq \emptyset$, for every $\omega \in \Omega$. Then as in the proof of theorem 3.5, we have:

$$\operatorname{Gr} L = \{ x \in C(T,X) : x \in R(\omega,\cdot), x \in W(\omega) \}$$

where $D = \{ (x,y) \in C(T,X) x \in C(T,X) : x = y \}$. Apply theorem 3 of Saint-Beuve [16], to get $r : \Omega \to C(T,X)$ measurable, s.t. for all $\omega \in \Omega$, $r(\omega) \in L(\omega)$. Set $x(\omega,t) = r(\omega)(t)$. Clearly this is a random solution of (*) with orientor field $F$. But from the definition of $F$, we see that $\frac{d}{dt} x(\omega,t) = F(\omega,t,x(\omega,t))$ a.e., for all $\omega \in \Omega$ and as in the beginning of the proof, through Gronwall's inequality, we get that

$$|x(\omega,t)| \leq M(\omega) + \hat{F}(\omega,t,x(\omega,t)) = F(\omega,t,x(\omega,t)) = x(\omega,t)$$

is the desired random solution of (*).

**Acknowledgement.** The author would like to express his gratitude to the referee for his helpful suggestions and remarks.

Special Issue on
Intelligent Computational Methods for
Financial Engineering

Call for Papers

As a multidisciplinary field, financial engineering is becoming increasingly important in today’s economic and financial world, especially in areas such as portfolio management, asset valuation and prediction, fraud detection, and credit risk management. For example, in a credit risk context, the recently approved Basel II guidelines advise financial institutions to build comprehensible credit risk models in order to optimize their capital allocation policy. Computational methods are being intensively studied and applied to improve the quality of the financial decisions that need to be made. Until now, computational methods and models are central to the analysis of economic and financial decisions.

However, more and more researchers have found that the financial environment is not ruled by mathematical distributions or statistical models. In such situations, some attempts have also been made to develop financial engineering models using intelligent computing approaches. For example, an artificial neural network (ANN) is a nonparametric estimation technique which does not make any distributional assumptions regarding the underlying asset. Instead, ANN approach develops a model using sets of unknown parameters and lets the optimization routine seek the best fitting parameters to obtain the desired results. The main aim of this special issue is not to merely illustrate the superior performance of a new intelligent computational method, but also to demonstrate how it can be used effectively in a financial engineering environment to improve and facilitate financial decision making. In this sense, the submissions should especially address how the results of estimated computational models (e.g., ANN, support vector machines, evolutionary algorithm, and fuzzy models) can be used to develop intelligent, easy-to-use, and/or comprehensible computational systems (e.g., decision support systems, agent-based system, and web-based systems).

This special issue will include (but not be limited to) the following topics:

- **Application fields**: asset valuation and prediction, asset allocation and portfolio selection, bankruptcy prediction, fraud detection, credit risk management
- **Implementation aspects**: decision support systems, expert systems, information systems, intelligent agents, web service, monitoring, deployment, implementation

Authors should follow the Journal of Applied Mathematics and Decision Sciences manuscript format described at the journal site http://www.hindawi.com/journals/jamds/. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/, according to the following timetable:

| Event                     | Date            |
|---------------------------|-----------------|
| Manuscript Due            | December 1, 2008|
| First Round of Reviews    | March 1, 2009   |
| Publication Date          | June 1, 2009    |
