k-kamada@L.chiba-u.ac.jp

Abstract

It has been generally assumed that a violation of island constraints indicates that the relevant syntactic phenomena involves movement. That is, if what look like displacements violate island constraints but remain acceptable, this means that they should not be derived by movement. A careful examination of postverbal constructions in Japanese reveals that no movement is involved in the derivation of the construction despite the fact that in some cases island effects are observed. The effects, which have up to now been dealt with purely in syntax, can receive a better account in terms of language processing. This suggests that the human parser should undertake explanations of part of the output of the competence system.

1 Introduction

Japanese is descriptively a verb-final language. In some cases, however, non-verbal elements come at the end of sentences, as shown in (1).1,2

(1) a. Taro-ga ano mise de tabe-ta yo, Taro-NOM that shop at eat-PAST FP sushi-A CC ‘Taro ate sushi at that shop.’
   b. Taro-ga sushi-A CC tabe-ta yo, Taro-NOM sushi-A CC eat-PAST FP, ano mise de. that shop at

In (1a), the object sushi-A ‘sushi-A CC’ appears in postverbal position, and in (1b), the adverbial phrase ano mise de ‘at that shop’ does so. I refer to these phenomena as the postverbal construction in Japanese (JPVC), and refer to elements in sentence-final position as postverbal elements (PVE).3

Some researchers (e.g., Endo, 1989; Kaiser, 1999; Whitman, 2000; Tanaka, 2001; and Abe, 2004) claim that the PVE is derived by movement because of the obedience of the PVE to island constraints such as the so-called Complex NP Constraint (CNPC), as shown in (2).

(2) *[NP [CP [e, Sonkeisiteiru] sensei]-ga respect teacher-NOM fueteimasu yo, gakuseitati-ga, increase FP students-NOM ‘The number of the teachers who they, respect increasing, students.’

In (2), the PVE is extracted out of the NP that contains the relative clause, thereby violating the CNPC. The example in (3), however, is acceptable although it violates the CNPC.

(3) [NP [CP e, Sonkeisiteiru] gakuseitati]-ga respect students -NOM fueteimasu yo, Tanaka sensei-o, increase FP Tanaka teacher-ACC ‘The number of the students who respect him, is increasing, Mr. Tanaka.’

It has been generally assumed that a violation of island constraints indicates that the relevant syntactic phenomena involves movement. That is, if what look like displacements violate island constraints but are still acceptable, this means that they should not be derived by movement.

3 I do not deal with the case in which clauses appear in postverbal position, as shown below.

(i) Watashi-wa sitteiru yo, Taro-ga sushi-A CC tabe-ta I -TOP know FP Taro-NOM sushi-A CC eat-PAST koto-o. that-ACC ‘I know that Taro ate sushi.’
The example in (3) is hence problematic for movement approaches. I therefore propose the statement given in (4) concerning the derivation of the JPVC:

(4) The PVE is adjoined to a CP via External Merge.

The purpose of this paper is to argue, through analysis of the island effect in the JPVC, that the human parser should undertake explanations of part of the output of the competence system. The outline of this paper is as follows. In section 2, I propose/adopt a licensing condition and interpretive rules for adjoined phrases, as well as two parsing strategies. In sections 3 and 4, I demonstrate that the presence or absence of the island effect observed in the JPVC can be accounted for in terms of the interaction of the licensing condition with the parsing strategies. Finally, in section 5, I deal with the case in which adjuncts appear in postverbal position.

2 Hypotheses

I propose the licensing condition for adjoined elements in (5).

(5) The licensing condition for adjoined phrases (where X= any syntactic category):
A phrase α adjoined to XP is licensed only if α is associated with β such that
(i) α c-commands β,\textsuperscript{6} and
(ii) α is non-distinct from β in terms of Case features.

In light of the condition in (5), I propose interpretive rules concerning adjoined phrases as shown informally in (6):

(6) Interpretive rules about adjoined phrases
Suppose that α is adjoined to XP (where X= any syntactic category), then
(i) α is construed as an argument sharing properties with β,\textsuperscript{7} only if
a. α is an NP or a CP, and
b. α is non-distinct from β in terms of referentiality,\textsuperscript{8} and
c. β is in A rgument)-position (i.e., subject and object).
(ii) α is construed as a potential modifier of β only if α is not construed as an argument.

With respect to parsing strategies, I first follow Pritchett (1992) in adopting the Generalized Theta Attachment formulated in (7):

(7) Generalized Theta Attachment:
Every principle of the Syntax attempts to be maximally satisfied at every point during processing. (Pritchett, 1992: 138)

Although the name of (7) contains theta attachment, Pritchett notes that this heuristic should be understood in the sense that the parser attempts to maximally satisfy all syntactic principles. Furthermore, I propose a condition applicable to reinterpretations in (8):

(8) Unconscious Reinterpretation Condition (UREC)
It is impossible for the human parser to associate a syntactic object X with α, if there is β such that α is similar to β and β is closer to X than α is.

“Similar” and “closer” are defined in (9) and (10), respectively:

(9) α is similar to β iff
a. α, β, and X are non-distinct in terms of categorial features (i.e., syntactic categories) and Case features (e.g., nominative, accusative), or
b. both α and β are potential modifiees of X.\textsuperscript{9}

(10) Suppose that X c-commands α and β. Then, β is closer to X than α is iff
a. β contains α, or
b. β c-commands α unless every phase (i.e., vP, CP) containing α contains β,\textsuperscript{10} or

\textsuperscript{4} See also Ackema and Neeleman (2002).
\textsuperscript{5} In Kamada (2009), I demonstrate that the licensing condition in (5) is applicable to English Rightward Movement constructions (ERMC) as well and account for island effects in ERMCs in terms of language processing.

\textsuperscript{6} C-command is defined as (i) based on contain as defined in (ii) (see Chomsky, 2001: 116):
(i) X c-commands Y if X is a sister of K that contains Y, where K may or may not be Y, (ii) K contains Y if K immediately contains Y or immediately contains L that contains Y.

\textsuperscript{7} α and β share properties including theta-roles and semantic features unless semantic conflicts occur.

\textsuperscript{8} α is non-distinct from β as long as they do not refer to different persons, things, or events. Hence, α can be construed as an argument even if it is non-referential (see footnote 15).

\textsuperscript{9} The problem of giving a precise formulation of potential modifiees will be left to future research.

\textsuperscript{10} The conditional clause in (10b) makes it difficult to unify the three relations in terms of a path between a PVE and the
c. otherwise (i.e., if \( \beta \) neither contains nor c-commands \( \alpha \), a path between \( \beta \) and \( X \) is shorter than the one between \( \alpha \) and \( X \).

To put it in another way, the UREC states that attempts can be made to associate \( X \) with \( \alpha \) without conscious efforts (i.e., in a low-cost manner) until an appropriate interpretation is given to \( X \) unless there are competing elements such as \( \beta \).

To show how the assumptions proposed above apply, I analyze the JPVC in (11).\(^{11,12}\)

\[(11) \text{ Taro-ga e, tabe-ta yo, susi-o} \]

\[\text{Taro-NOM cat-PAST FP, sushi-ACC} \]

\[\text{‘Taro ate it, sushi.’} \]

When encountering \( \text{Taro-ga ‘Taro-NOM,’} \) the parser classifies it as a nominative Case marked NP to which no theta-role is assigned.\(^{13}\)

According to (7), to maximally satisfy syntactic principles (e.g., the theta-criterion), \( \text{Taro-ga} \) is kept in storage (i.e., left unattached to anything) until a theta-role assigner (i.e., a predicate) is encountered; otherwise, the theta criterion would not be locally satisfied.\(^{14}\)

When encountering the verb \( \text{tabe-ta ‘ate,’} \) the parser identifies it as a verb that has two theta-roles. To maximally satisfy syntactic principles, the parser posts a gap as a null argument (i.e., object) while at the same time integrating \( \text{Taro-ga} \) as an argument so that \( \text{Taro-ga} \) can receive a theta-role from the verb.\(^{15,16}\)

The postulated null object is also assigned a theta-role such as an overt counterpart. Then, \( \text{yo ‘COMP’} \) is encountered, and \( \text{C and TP} \) are merged.\(^{17}\) The parser thus contains a structure like (12).

\[(12) \]

\begin{center}
\begin{tikzpicture}
  \node (T) at (0,0) {\text{C}};
  \node (y0) at (0,-1) {\text{yo}};
  \node (v) at (0,-2) {\text{v}};
  \node (Taro) at (-1,-3) {\text{TP}};
  \node (v') at (0,-3) {\text{tabe-ta}};
  \node (NP) at (-2,-3) {\text{NP}};
  \node (V) at (-1,-4) {\text{V}};
  \node (P) at (-1,-5) {\text{NP}};
  \node (v'') at (0,-5) {\text{e}};
  \node (OP) at (-1,-6) {\text{OP}};
  \node (FP) at (-1,-7) {\text{FP}};
  \node (CC) at (-1,-8) {\text{CC}};
  \node (AST) at (-1,-9) {\text{AST}};
\end{tikzpicture}
\end{center}

When \( \text{susi-o ‘sushi-ACC’} \) is encountered, it is identified as an NP that has no theta-role assigned. However, it is impossible to make a structural reanalysis such that the PVE can receive a theta-role. Otherwise, word order would be rearranged. Thus, the NP is adjoined to a root \( \text{CP} \), and the licensing condition in (5) subsequently attempts to apply in order to assure that the PVE can be licensed. The final parse tree is given in (13).

---

\(^{11}\) It is assumed that in Japanese, nominative Case checking should be done in the specifier of \( \text{vP} \) without movement to the specifier of \( \text{TP} \) (see Fukui, 1995; Kuroda, 1992). That is, a subject does not move to the specifier position of \( \text{TP} \) unless \( \text{T} \) has an \( \text{EPP} \) feature (cf. Miyagawa, 2001).

\(^{12}\) Here, I assume that \( \text{T} (=\text{Tense}) \) must be amalgamated with \( \text{V} \) at the Interfaces.

\(^{13}\) For convenience, I take only the theta-theory into consideration.

\(^{14}\) In accordance with a head-driven parsing strategy, \( \text{T} \) in Japanese should not appear in the parse tree until a predicate is encountered.

\(^{15}\) The theta-theoretic principle: External Merge in theta-position is required of (and restricted to) arguments. Adapted from Chomsky (2000: 103)

\(^{16}\) It is not appropriate to assume that null arguments are \( \text{pro} \).

One of the reasons is that non-referential NPs such as idiom chunks can appear in postverbal position:

\[(i) \text{ Taro-wa e nage-ta yo, saji-o} \]

\[\text{Taro-TOP throw-PAST FP spoon-ACC} \]

\[\text{‘Taro gave up.’ [Lit. ‘Taro threw a spoon.’]} \]

---

The idiom chunk \( \text{saji} \) cannot be the antecedent of an overt pronoun \( \text{sore ‘it,’} \) as shown below:

\[(ii) *\text{Taro-wa saji-o nage-ta kedo Hanako wa sore-o nage-nakat-ta.} \]

\[\text{it-ACC throw-NEG-PAST} \]

\[\text{‘Taro gave up but Hanako did not give up.’} \]

Example (i) would hence be unacceptable in the idiomatic reading if the null argument \( \text{e} \) were \( \text{pro} \). The idiomatic interpretation, however, is available in (i). Accordingly, \( \text{pro} \) in (i) is inappropriate (pace Tanaka, 2001; Soshi & Hagisawa, 2004). Here, I assume that \( \text{e} \) is an unspecified null argument in the sense that it has no inherently specified features such as [+pronominal].

It may be worth mentioning, in passing, that as one of the reviewers claims, the displacement of idiom chunks of the sort in (i) is usually evidence for movement because idioms are often assumed to be treated as non-compositional. However, I follow Nunberg, Sag and Wasow (1994) in arguing that idioms should be treated as compositional, i.e., an idiomatic meaning is composed from idiomatic interpretations of the parts of an idiom. For a detailed discussion, see Kamada (2009, chapter 4).

\(^{17}\) The parse tree in (12) is the same as that of a normal sentence which ends with the final particle, as shown in (i).
In (13), *susi-o c-commands e and it is non-distinct from e in terms of Case features. The PVE can hence be associated with e, and thus it is licensed, because in (13), there is no element corresponding to β in (8). Furthermore, according to the interpretive rules in (6), the PVE may be construed as if it is an argument of the verb *tabe-ta ‘ate’ because it is non-distinct from e in terms of referentiality.¹⁸

### 3. The Island Effect

In light of the UREC in (8), it is now possible to consider the island effect observed in the JPVC. For convenience, I will describe island effects according to the structural relation between α, the potential associate and β, a potential intervener, in (8) which is divided into three types in (10).

**3.1 Type I: β containing α**

I will begin with the type shown in (10a). Let us consider the example in (14) where a phrase containing a null argument is non-distinct, in the sense of (9a), from the PVE which is expected to be associated with the null argument.*²⁰

(14) *?NP [CP [e, sonkeisiteiru sensei]-ga] respect teacher-NOM
    fueteimasu yo, gakuseitati-ga. (=2)
    increase FP students-NOM
    ‘The number of the teachers who they respect is increasing, students.’

In (14), the matrix subject is the complex NP [NP [CP [e sonkeisiteiru sensei]-ga, which has nominative Case as well as contains a null argument. The nominative Case marked postverbal NP gakuseitati-ga ‘students-NOM’ c-commands the null argument and they are non-distinct with respect to Case features (see (5)). According to the UREC in (8), however, the complex NP has priority over the null argument for association with the PVE, because the complex NP contains the null argument and they are non-distinct in terms of categorial features and Case features. That is, the parser cannot associate the PVE with the null argument. Example (14a) is thus unacceptable.

**3.2 Type II: β c-commanding α**

I will now turn to the case of (10b) in which the association of a PVE with a null subject inside a complex NP is blocked by an element c-commanding the null subject.*²¹

(15) Ø[NP [CP e, Tanaka sensei-o sonkeisiteiru] respect
    Tanaka teacher-ACC respect
    toiu/ uwasa-o sitteiru yo, Taro-ga.]
    COMP rumor-ACC (I) know FP Taro-NOM
    ‘(I) know the rumor that he respects Mr.
    Tanaka, Taro.’

In (15), when the verb sonkeisiteiru ‘respect’ is encountered, a null subject is postulated, and

---

¹⁸ There is no way in my proposed analysis to exclude examples such as (i):

(i) *e: Kokoni ki-ta yo, Taro-o.
   here came FP Taro-ACC
   ‘Taro came here.’

Cf. e; Kokoni ki-ta yo, Taro-ga,
   here came FP Taro-NOM

In (i), the verb kita ‘came’ is an intransitive verb and an accusative Case marked NP Taro-o ‘Taro-ACC’ appears in postverbal position. The licensing condition would allow Taro-o to be associated with a null argument e in subject position because they are non-distinct in terms of Case features, and Taro-o would thus be licensed. Then, following the interpretive rules, Taro would share properties with the null argument, and hence the example would have the reading that Taro came. This, however, is contrary to fact. This problem seems to come from the assumption that the Case features of null arguments should be uninterpretable. If Case features in Japanese were interpretable whether or not they are morphologically realized, this problem would be dissolved. This possibility should be explored in future research.

²⁰ *? indicates relatively unacceptable examples.

²¹ Ø indicates that a PVE is associated with a wrong element, resulting in a different interpretation from what is intended.
subsequently the null subject and Tanaka sensei-o ‘Mr. Tanaka-ACC’ have theta-roles assigned, respectively. On reaching toi ‘COMP’, the parser reanalyzes the main clause as an embedded clause, and hence keeps it in storage until a theta-role assigner appears. When uwasa-o ‘rumor-ACC’ is encountered, it is merged to the embedded clause, creating a complex NP. The complex NP does not have a theta-role, and therefore it is kept in storage. As soon as the parser encounters the matrix verb sitteiru ‘know,’ it postulates a null argument as a matrix subject. Then, the null matrix subject and the stored complex NP are integrated and theta-roles are assigned. Afterwards, the final particle yo is merged with the matrix TP, and the postverbal NP is adjoined to the root CP. The final parse tree is informally represented in (16).

\[
\text{(16)}
\]

\[
\begin{array}{c}
\text{CP} \\
\text{CP} \\
\text{TP} \\
\text{C} \\
\text{yo} \\
\text{vP} \\
\text{T} \\
\text{v' sit-teiru} \\
\text{VP} \\
\text{V} \\
\text{NP-o V} \\
\text{TP} \\
\text{C} \\
\text{toiu} \\
\text{vP} \\
\text{T} \\
\text{(a=) e} \\
\text{v' sonkeisi-teiru} \\
\text{VP} \\
\text{V} \\
\text{Tanaka sensei-o V} \\
\text{\textit{Mr. Tanaka-ACC}} \\
\end{array}
\]

In (16), the null subject \(e (=\beta)\) in the main clause c-commands the null subject \(e (=\alpha)\) in the embedded clause. They are non-distinct in terms of Case features. Thus, the matrix subject has priority over the embedded counterpart for association with the PVE. Therefore, (15) would have the reading that \textit{Taro knows the rumor that someone respects Mr. Tanaka}, which is different from what is expected.

3.3 Type III: \(\beta\) neither containing nor c-commanding \(\alpha\)

Let us then consider the type shown in (10c) (i.e., the case where \(\beta\) neither contains nor c-commands \(\alpha\)). Observe (17), where the PVE has an accusative Case, the matrix subject is a complex NP containing a null object, and the matrix object appears in the initial position of a sentence by undergoing the operation of scrambling.

\[
\text{(17) Minna-o [NP[CP Taro-ga e, sonkeisiteiru Everyone-ACC Tar-NOM respect toiu] uwasa-ga odorokaseta yo, Comp rumor-NOM surprised FP Tanaka sensei-o, Tanaka teacher-ACC \text{\textquoteleft The rumor that Taro respects him, surprised everyone, Mr. Tanaka.\textquoteright}}}
\]

In (17), when the embedded verb sonkeisiteiru ‘respect’ is encountered, the parser incorrectly analyzes minna-o ‘everyone-ACC’ and Taro-ga ‘Taro-NOM’ as arguments of the embedded clause verb. The parse tree at this point thus contains no null arguments. Minna-o should also be construed as a scrambled element.

On reaching toi ‘COMP,’ the parser amends the main clause analysis such that the clause can be assigned a theta-role, and thereby the clause is kept in storage until a theta-role assigner appears.

When encountered, the theta-role assigner uwasa-ga ‘rumor-NOM’ is merged to the stored clause, and assigns the clause a theta-role. Thus, the complex NP is created. However, the complex NP has no theta-role at this stage, and hence it is stored.

When reaching a matrix verb, the parser postulates a null object as an argument of the matrix verb, and subsequently integrates both the null object and the complex NP to the matrix verb, so that both of them can be assigned theta-roles.

As soon as the postverbal NP is attached to a root CP, the licensing condition attempts to apply in order to guarantee that the postverbal NP is licensed. The parse tree at this point is illustrated in (18). There, the PVE Tanaka sensei-o ‘Mr. Tanaka-ACC’ fails to be associated with the embedded object \(t_1 (=\alpha)\), which is incorrectly analyzed as the trace of the scrambled object minna-o ‘everyone-ACC.’ Furthermore, the null object \(e (=\beta)\) of the matrix verb is closer to the PVE than any other element non-distinct from it.
The matrix object hence takes precedence over such elements for association with the PVE. The alternative analysis would reattach *minna-o* to the matrix TP as a scrambled element. This reanalysis, however, is costly. The PVE in the above example is hence difficult to associate with the null object within the complex NP.

In (19), *Hanako-ga* ‘Hanako-NOM’ is incorrectly analyzed as an element in the embedded clause. In other words, *Hanako-ga* is construed as an argument of *sonkeiseiteiru* ‘respect.’ Thus, there are no appropriate elements with which the PVE can be associated. That is, the PVE is difficult to associate with the null object in the embedded clause.

4. The Absence of the Island Effect

In this section, I will discuss acceptable examples where PVEs can be associated with null arguments that are contained embedded clauses such as complement clauses and relative clauses. These examples are grouped into three types as listed below:

Type A: Phrases containing null arguments are different from PVEs with respect to categorial features.

Type B: Phrases containing null arguments are different from PVEs with respect to Case features.

Type C: Phrases containing null arguments are different from PVEs with respect to both categorial features and Case features.

These three types will be presented in turn.

4.1 Type A: Different Categorial Features

I will first consider Type A: phrases containing null arguments that are different from PVEs with respect to categorial features.

In (20), a nominative Case marked NP *Taro-ga* ‘Taro-NOM’ appears in postverbal position. It is different in terms of categorial features from the clause [*CP Tanaka sensei-o sonkeiseiteiru koto*-ga] ‘[that respect Mr. Tanaka]-NOM,’ which contains a null argument. That is, the clause is not similar to the null argument in the sense of (9). Thus, the clause does not prevent the PVE from being associated with the null argument, and hence (20) is acceptable.

---

22 The example in (i) is unacceptable, probably because the complex NP containing a null argument has the same type of Case as the PVE:

(i) *Hanako-wa* [CP Taro-ga *e* sonkeiseiteiru toiu] *Hanako-NOM* Taro-NOM respect COMP rumor-ACC sitteiru yo, *Tanaka sensei-o.*

23 I will turn to another example in which an incorrect syntactic-analysis leads to the wrong association. Consider the sentence in (19).

(19) * Hanako-ga *NP[CP Taro-ga *e*, Hanako-NOM *Taro-NOM sonkeiseiteiru toiu*] *uwasa*-o respect COMP rumor-ACC sitteiru yo, *Tanaka sensei-o.*

‘Hanako knows the rumor that Taro respects him, Mr. Tanaka.’
4.2 Type B: Different Case Features

Next, I will consider Type B: phrases containing null arguments that are different from PVEs with respect to Case features.

Let us look at the examples in (21).

(21) \[\text{NP } [\text{CP} e \text{ Sonkeseiteiri] gakuseitaiti-ga respect}\] students -NOM

fueteimasu yo. Tanaka sensei-o. (=3)

increase FP Tanaka teacher-ACC

‘The number of the students who respect him is increasing, Mr. Tanaka.’

In (21), an accusative Case marked NP Tanaka sensei-o ‘Mr. Tanaka-Acc’ appears in postverbal position. It is different in terms of Case features from the complex NP \[\text{NP } [\text{CP} \text{ Sonkeseiteiri]} gakuseitaiti-ga ‘the students who respect e-NOM’

which contains a null argument. In other words, the complex NP is not similar to the null argument in the sense of (9). Thus, the complex NP does not block the PVE from being associated with the null argument, and hence (21) is acceptable.\(^{23}\)

4.3 Type C: Different Categorial and Case Features

Now let us turn to Type C. Observe the example in (22).

(22) \[\text{[CP} Tarog-a e, sonkeseiteiri kuto-ga respect}\] Comp -NOM

hontoo dat-ta yo, Tanaka sensei-o true was FP Tanaka teacher-ACC

‘That Tarō respects him, was true, Mr. Tanaka.’

In (22), an accusative Case marked NP Tanaka sensei-o ‘Mr. Tanaka-Acc’ appears in postverbal position. The PVE is different from the clause

\[\text{Taro-ga sonkeseiteiru koto-ga ‘[Taro respects e-NOM’ which contains a null argument with respect to not only categorial features but also Case features. Hence, the clause is not similar to the null argument in the sense of (9), resulting in failure to block the association of the PVE with the null argument. Thus, (22) is acceptable.}\]

5. Postverbal Adjuncts

In this section, I will deal with the case where adjuncts appear in postverbal position. Let us consider the example in (23) that displays island effects.

(23) \[\text{[Shoshou-ga kinoo at-ta Prime minister-Nom yesterday met with Josei-o mitanda yo, Shinhashinono-woman-Acc saw FP Shinhashi-Gen ryoutei-de. Japanese-style restaurant at ‘(I) saw the woman whom [the prime minister met with at a Japanese-style restaurant in Shinhashi yesterday].’}\]

(Soshi and Hagiwara (2004: 423))

In (23), after encountering the postverbal PP, the parser realizes that there are no following elements, and it then starts to associate the PVE with a modifiee. The matrix verb mita ‘saw’ can be modified by the locative PP, and it also contains the complex NP that includes the other verb atta ‘met with,’ hence, the matrix verb is chosen as a modifiee over the embedded one. In other words, the postverbal locative PP is difficult to associate with the verb atta ‘met with’ within the relative clause.

Finally, I discuss the case where evidence is given for the necessity of the conditional clause in (10b). Let us consider the example in (24) where, although a subject asymmetrically c-commands an object, the former has no priority over the latter for association (see footnote 10):

(24) \[\text{Kyooju-ga kuruma-o kat-ta yo, Professor-Nom car -ACC bought FP, yuumei-na well-known ‘A professor bought a car, well-known.’}\]

Example (24) has two readings: the postverbal adjective yuumei-na ‘well-known’ may modify kyooju-ga ‘professor-NOM’ or kuruma-o ‘car-ACC’. This ambiguity can be derived from the UREC in (8). That is, the subject does not block

\(^{23}\) The example in (i) is less acceptable than that in (21) although the postverbal phrase is different from the complex NP that contains a null argument in terms of Case features:

(i) *? John-ga [\text{WP}[\text{CP} Mary-ga e age-ta] hon-o] nusunda John-NOM Mary-NOM gave book-ACC stole yo, Bill-ni FP Bill-DAT

‘John stole a book that Mary gave to him, to Bill.’

The reason that (i) is unacceptable may be that an NP marked with a dative particle ni is likely to be analyzed as a locative PP, and that Bill-ni ‘Bill-DAT’ is interpreted as a potential modifier of the matrix predicate.
the association between the object and the PVE because the subject is contained in every phase (i.e., vP) that contains the object (note that kyooju-ga occupies the specifier position of vP). Hence, yuumei-na may be associated with both arguments without conscious efforts. This account is further supported by the following unambiguous example in (25).

(25) Kuruma-o kyooju-ga ti kat-ta yo, car-ACC Professor-Nom bought FP, yuumei-na well-known ‘A car, a professor bought ti, well-known.’

In (25), the object kuruma-o ‘car-ACC’ is moved to the specifier position of TP by scrambling. The scrambled NP c-commands kyooju-ga ‘professor-NOM,’ and is not contained in every phase that contains kyooju-ga. Hence, kuruma-o has priority over kyooju-ga for association with the PVE yuumei-na, resulting in the absence of ambiguity.

6. Conclusion

In this paper, I first proposed that the PVE is adjoined to a CP via External Merge given the assumption that the derivation of the JPVC involves no movement. Then, I demonstrated that the presence or absence of the island effect observed in the JPVC can be accounted for in terms of the interaction of the licensing condition with the parsing strategies I have proposed/adopted here. This analysis suggested that the human parser should undertake explanations of part of the output of the competence system.

Acknowledgments

An earlier version of this paper was read at the 27th meeting of the Sophia University Linguistic Society held at Sophia University, Tokyo on July 21, 2012. I would like to thank the participants in the meeting as well as the three PACLIC 27 reviewers for their comments.
