Supplemental Material

Projecting Temperature-Attributable Mortality and Hospital Admissions due to Enteric Infections in the Philippines

Paul L.C. Chua, Chris Fook Sheng Ng, Lina Madaniyazi, Xerxes Seposo, Miguel Antonio Salazar, Veronika Huber, and Masahiro Hashizume

Table of Contents

Table S1. Regional sociodemographic profiles.

Table S2. Number and proportion of etiologies of mortality due to enteric infections by Philippine region in 2014–2017.

Table S3. Number and proportion of etiologies of hospital admissions due to enteric infections by Philippine region in 2014–2017.

Table S4. Number and proportion of mortality due to enteric infections by Philippine region and age-groups in 2014–2017.

Table S5. Number and proportion of hospital admissions due to enteric infections by Philippine region and age-groups in 2014–2017.

Table S6. Number and proportion of physician-attended and unattended mortality due to enteric infections by Philippine region in 2014–2017.

Table S7. Philippine-level projected general circulation model-ensemble mean temperatures by Representative Concentration Pathways (RCPs) and decade based on the Inter-Sectoral Impact Model Intercomparison Project 2b.

Table S8. Philippine-level projected mean annual population in millions by Shared Socioeconomic Pathways (SSPs) and decade based on the Inter-Sectoral Impact Model Intercomparison Project 2b.
**Table S9.** Heterogeneity of multivariate meta-regression models for Philippine temperature–enteric infection associations in 2014-2017.

**Table S10.** Relative risks of cumulative 2-metre temperature-enteric infections associations by high and low temperatures relative to minimum risk temperatures in 2014-2017.

**Table S11.** Philippines-level temperature-attributable fractions of deaths due to enteric infections relative to 2010-2019 with no population change by Representative Concentration Pathway (RCP) scenarios, temperature range, and decade.

**Table S12.** Philippines-level temperature-attributable fractions of hospital admissions due to enteric infections relative to 2010-2019 with no population change by Representative Concentration Pathway (RCP) scenarios, temperature range, and decade.

**Table S13.** Regional temperature-attributable fractions of deaths and hospital admissions due to enteric infections in 2090-2099 relative to 2010-2019 by representative concentration pathways and no population change.

**Table S14.** Regional temperature-attributable numbers of deaths and hospital admissions due to enteric infections in 2090-2099 relative to 2010-2019 by representative concentration pathways and no population change.

**Table S15.** Regional temperature-attributable numbers of deaths due to enteric infections in 2090-2099 relative to 2010-2019 by representative concentration pathways and shared socioeconomic pathways.

**Table S16.** Regional temperature-attributable numbers of hospital admissions due to enteric infections in 2090-2099 relative to 2010-2019 by representative concentration pathways and shared socioeconomic pathways.

**Figure S1.** Philippine administrative regions.

**Figure S2.** Annual deaths and hospital admissions due to enteric infections in the Philippines in 2006–2018.

**Figure S3.** Average 2-meter temperatures per administrative region.

**Figure S4.** Weather stations in the Philippines. Black dots have imputable mean temperature data and white dots have more than 10% missing data.

**Figure S5.** Likely and unlikely combinations of Shared Socioeconomic Pathways (SSP) and Representative Concentration Pathways (RCP) expressed in radiative forcing.

**Figure S6.** Decadal temperature difference relative to 2010–2019 according to representative concentration pathways (RCPs) shown by Philippine region.
Figure S7. Decadal population difference relative to 2010–2019 according to shared socioeconomic pathways (SSPs) shown by Philippine region.

Figure S8. Cumulative temperature–enteric infection mortality associations by Philippine region in 2014–2017. Solid lines refer to mean relative risks, dashed lines refer to minimum risk temperatures, shaded regions refer to 95% empirical confidence intervals, and grey histograms refer to distribution of daily temperatures.

Figure S9. Cumulative temperature–enteric infection hospital admissions associations by Philippine region in 2014–2017. Solid lines refer to mean relative risks, dashed lines refer to minimum risk temperatures, shaded regions refer to 95% empirical confidence intervals, and grey histograms refer to distribution of daily temperatures.

Figure S10. Regional cumulative temperature–enteric infection mortality associations for 2014–2017 adjusting to confounders (sensitivity analysis).

Figure S11. Regional cumulative temperature–enteric infection hospital admissions associations for 2014–2017 adjusting to confounders (sensitivity analysis).

Figure S12. Regional cumulative temperature–enteric infection mortality associations for 2014–2017 with population as offset (sensitivity analysis).

Figure S13. Regional cumulative temperature–enteric infection hospital admission associations for 2014–2017 with population as offset (sensitivity analysis).

Figure S14. Regional cumulative temperature–enteric infection mortality associations for 2014–2017 changing maximum lag days (sensitivity analysis).

Figure S15. Regional cumulative temperature–enteric infection hospital admissions associations for 2014–2017 changing maximum lag days (sensitivity analysis).

Figure S16. Regional cumulative temperature–enteric infection mortality associations for 2014–2017 changing degrees of freedom for time or day (sensitivity analysis).

Figure S17. Regional cumulative temperature–enteric infection hospital admissions associations for 2014–2017 associations changing degrees of freedom for time or day (sensitivity analysis).

Figure S18. Regional cumulative temperature–enteric infection mortality associations using weather stations daily mean temperatures for 2014–2017 (sensitivity analysis). Solid lines refer to mean relative risks, dashed lines refer to minimum risk temperatures, shaded regions refer to 95% empirical confidence intervals, and grey histograms refer to distribution of daily temperatures.
Figure S19. Regional cumulative temperature–enteric infection hospital admission associations using weather stations daily mean temperatures for 2014–2017 (sensitivity analysis). Solid lines refer to mean relative risks, dashed lines refer to minimum risk temperatures, shaded regions refer to 95% empirical confidence intervals, and grey histograms refer to distribution of daily temperatures.

Figure S20. General circulation model-ensemble temperature-attributable fractions of enteric infections relative to 2010–2019 by outcome in the Philippines using weather stations data (sensitivity analysis). Striped bars refer to high temperature-attributable enteric infections, dotted bars refer to low temperature-attributable enteric infections, black circles refer to total temperature-attributable enteric infections, and error bars refer to 95%eCI.
