ABSTRACT
The genus *Himatanthus* Wild. ex Schult. (Apocynaceae) includes about 13 species and five subspecies widely distributed in South America, especially Brazil. The phytochemical reports on this genus have revealed mainly triterpenes and iridoids. The plants are traditionally used as anthelmintic, antitumor, and antiinflammatory agents. The most used parts of the plant are its bark, leaves, and latex. This review emphasizes the phytochemical constituents and medicinal properties, which may help in future research. The research was conducted with data obtained from books about medicinal plants, theses, dissertations, and articles in refereed journals.

Key words: Biological effects, botanical, ethnopharmacology, folk medicine, *Himatanthus*, phytochemistry

INTRODUCTION
The Apocynaceae family includes approximately 550 genera and 3700–5100 species distributed in all continents except Antarctica. It is a rich source of secondary metabolites, because of which many of the genera belonging to it, such as *Rauwolfia*, *Catharanthus*, *Allamanda*, *Strophantus*, and *Himatanthus*, are used on a large scale for medicinal use by small communities and/or pharmaceutical industry.[1]

In this review, we will be focused on the folk medicine uses, biological effects, and phytochemistry of the genus *Himatanthus* Wild. Ex Schult., in order to provide a basis for several different research areas, such as the botanic, pharmaceutical, medical, and chemical fields.

MATERIALS AND METHODS
The method used for this study was based on bibliographical research into books about medicinal plants, theses, dissertations, and articles in refereed journals. Presentations at conferences and symposia were not considered. We performed extensive research in the Periodicals Portal of Capes (Coordination for the Improvement of Higher Education Personnel), which has several databases such as Chemical Abstracts, PubMed, Web of Science and Science Direct (consultation period: February to May 2014). The key word used in the research was *Himatanthus*; information on the plant parts used, the uses in folk medicine, the biological activities, and the chemical constituents was collected.

Data were compiled and organized into a table [Table 1], and the *Himatanthus* species have been arranged in alphabetical order.

RESULTS AND DISCUSSIONS
The genus *Himatanthus* Wild. Ex Schult., initially included in the genus *Plumeria*, has large bracts involving the floral buttons, determinants for the separation of genus. The presence of these bracts has inspired the naming of this genus, which means “flower robe.”[16]

It encompasses 13 species: *H. articulatus* (Vahl) Woodson, *H. attenuatus* (Benth.) Woodson, *H. bracteatus* (A.DC.) Woodson, *H. dracicus* (Mart.) Plumel, *H. fallax* (Muell. Arg.) Plumel, *H. lancifolius* (Muell. Arg.) Woodson, *H. obovatus* (Muell. Arg.) Woodson, *H. phagoedanicus* (Mart.) Woodson, *H. semilunatus* Markgraf, *H. speciosus* (Muell. Arg.) Plumel, *H. stenophyllus* Plumel, *H. sucuba* (Spruce) Woodson, and *H. tarapotensis* (Schumann ex Markgraf) Plumel.[22,60] There are also five varieties of these species: *H. bracteatus* var. *bracteatus*, *H. bracteatus* var. *revolutus*, *H. obovatus* var. *obovatus*, *H. obovatus* var. *puberulus*, and *H. obovatus* var. *velutinus*. [22,60] They all occur in Brazil and some other countries in South and Central America.[22,60]

From among the 13 species of *Himatanthus*, four did not have any research records concerning their chemical composition and medicinal properties: *H. attenuatus*, *H. semilunatus*, *H. speciosus*, and *H. tarapotensis*. The research results with the other species are summarized in Table 1.

The *H. bracteatus*, *H. fallax*, and *H. stenophyllus* species have only reports of chemical composition studies, and the presence of the iridoid plumieride in the bark of these species is common.[12,21] This substance and the isopluvieride, generally, are present in the bark, latex, leaves, and/or roots of the species of *Himatanthus*.[2,10,21,23,36,41,59] This kind of spiro lactone iridoid is not commonly found in nature. Some studies revealed that plumieride exhibits antimicrobial[41] and antioxidant effects,[62] arrests spermatogenesis in male rats without noticeable side effects, and presents cytotoxicity.[14] The *H. articulatus*, *H. dracicus*, *H. lancifolius*, *H. obovatus*, *H. phagoedanicus*, and *H. sucuba* species presented chemical and biological studies, and in general the barks are the most studied, followed by the leaves.

Although the presence of alkaloids in the barks of *H. articulatus* is reported,[2] only from the barks of *H. lancifolius* were they isolated and identified,[24,25]...
Table 1: List of *Himatanthus* species and plant parts used, folk medicine uses, biological properties, and chemical constituents

| Species     | Plant parts used | Folk medicine uses                                                                 | Biological properties                                                                 | Chemical constituents                                                                                   | References |
|-------------|------------------|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|------------|
| *H. articulatus* | Latex            | Antifungal, antibacterial, antiulcerogenic, antitumor, antiinflammatory, analgesic, antisyphilitic, antimalarial, tonic, aphrodisiac | Inhibits *Candida albicans*; antigenotoxic effect (protective against ADN damage induced by hydrogen peroxide) | α-amyrin cinnamate and β-amyrin acetate, lupeol, lupeol cinnamate, cycloartenol                           | [2-9]      |
|              | Bark             | Vermifuge, laxative, antitussive, tonic, antisyphilitic, antiinflammatory, trypanocidal, leishmanicidal | Methanol extract inhibits *Bacillus subtilis*; Cytotoxic effect (antiproliferative activity against NCI-H460, HT-29, MCF-7, RXF-393, and OVCAR-3 cells); trypanocidal effect (*Trypanosoma cruzi*), leishmanicidal (*Leishmania donovani*) | Saponins, alkaloids, flavonoids, tannins. lupeol acetate, lupeol cinnamate, stigmasterol, sitosterol, plumericin, 1β-O-β-D-glucopyranosylplumieric acid, plumeride-1β-O-β-D-glucopyranosyl, isopluumericin, methyl-myo-inositol Ursolic acid |            |
|              | Leaf             | Vermifuge, laxative, antitussive, tonic, antiinflammatory, analgesic, antitumor, trypanocidal, leishmanicidal | Methanol extract inhibits *Staphylococcus aureus* and *B. subtilis*; trypanocidal effect (*T. cruzi*), leishmanicidal (*Leishmania donovani*) | Ursolic acid |            |
| *H. bracteatus* | Latex            | -                                                                                   | -                                                                                       | -                                                                                                       | [10]       |
|              | Bark             | -                                                                                   | -                                                                                       | -                                                                                                       |            |
|              | Leaf             | -                                                                                   | -                                                                                       | -                                                                                                       |            |
| *H. drasticus* | Latex            | Antitumor, gastric and intestinal disorders, worms, arthritis, irregular menstruation, female infertility, rheumatism, bruises, herpes | Antitumor (induced by ethanol and indomethacin); immunomodulator; antitumor activity of latex proteins (sarcoma 180 and Walker 256 carcinosarcoma); analgesic and antiinflammatory | Lupeol cinnamate, lupeol acetate, α-amyrin cinnamate, α-amyrin acetate, β-amyrin, plumieride, isopluumericid, protopluumericin A, cafeoilplumieride, acid derivative of 3-methoxy-3,4-dihydroplumieride | [1-11,20]  |
|              | Bark             | Antitumor, gastric and intestinal disorders, worms, arthritis                         | Cytotoxic against *Artemia salina*; antinociceptive                                      | -                                                                                                       |            |
|              | Leaf             | Antitumor, gastric and intestinal disorders, worms, arthritis                         | Methanol extract with antitumor activity and low toxicity                               | -                                                                                                       |            |
|              | Root             | Purgative and vermifuge                                                             | -                                                                                       | -                                                                                                       |            |
| *H. fallax*  | Bark             | -                                                                                   | -                                                                                       | -                                                                                                       | [21]       |
| *H. lancifolius* | Latex           | Skin diseases, asthma, syphilis, stimulating uterine contractions, assist conception, menstrual regulation, anthelmintic and febrifuge; constipation; if used in excess can cause menstrual cramps and gastrointestinal disorders; and children, diarrhea and dehydration | Alkaloidal fraction has antioxidant, cytotoxic action (tumor cells); antimicrobial, antulcer, antispasmodic, gastroprotective, antiinflammatory, immunomodulatory; inhibits acetylcholinesterase, inhibits *S. aureus* including MRSA strains, *Staphylococcus epidermidis*, *Entencoccus faecalis*, *Escherichia coli*, *Pantoea agglomerans*, *Acinetobacter baumannii*, and *S. aureus* canine | Uleine, yohimbine, epi-uleine, ajmaline, and demethoxyaspidospermine (indole alkaloids); sitosterol; glycosyplumieride | [22-35]    |
|              | Bark             | Febrifuge, stimulating menstruation, abortive                                        | Alkaloidal fraction has antioxidant, cytotoxic action (tumor cells); antimicrobial, antulcer, antispasmodic, gastroprotective, antiinflammatory, immunomodulatory; inhibits acetylcholinesterase, inhibits *S. aureus* including MRSA strains, *Staphylococcus epidermidis*, *Entencoccus faecalis*, *Escherichia coli*, *Pantoea agglomerans*, *Acinetobacter baumannii*, and *S. aureus* canine | Uleine, yohimbine, epi-uleine, ajmaline, and demethoxyaspidospermine (indole alkaloids); sitosterol; glycosyplumieride |            |
|              | Leaf             | Galactogogues                                                                       | -                                                                                       | -                                                                                                       | [1,5,22, 36,37] |
|              | Root             | Disoders of the uterus and ovaries                                                  | -                                                                                       | -                                                                                                       |            |
| *H. obovatus* | Latex            | Treatment of gastric ulcers                                                          | -                                                                                       | -                                                                                                       |            | Contd...

| *H. sucuuba*     | Latex | Anthelmintic, skin disorders, especially in relieving the itch; antitumor; antifungal, antianemic, treatment of gastritis and arthritis | Selective cytotoxic; antimicrobial; analgesic and antiinflammatory; potent leishmanicidal activity against intracellular amastigotes of *Leishmania amazonensis*; immunoregulatory | Cis-polyisoprene; Na, Al, K, Mn, Fe, Se, Ti, V, Cr, Co, Ni, Cu, Zn, Ba, Zr, Th, Pb, Ca (354 μg/g), Mg (250 μg/g); xylose, arabinose, glucose, galactose; glutamic acid; myo-inositol; gallic acid; flavonoids myricetin and quercitin, catechol; fulvoplumierin, plumericin, isoplumericin, plumeride, isoplumericin, 15-desmethylophumieride acid, 15-demethylplumericin; α - and β-amyрин cinnamates, α- and β-amyрин acetates, lupeol cinematone, and lupeol acetate | [8,41-58] |
| Bark             | Wound healing, antitumor, antiarthritic, anthelmintic, laxative, and hallucinogen; antiluercerogenic, aphrodisiac; analgesic, antitussive; treatment of boils, edemas | Antimicrobial, cytotoxic, analgesic, antiinflammatory; selective inhibitor of monoamine oxidase B enzyme; healing, antibacterial against *Clostridium histolyticum* and *Bacteroides fragilis*; low reproductive and teratogenic toxicity in rats; immunoregulatory; action on blood pressure and smooth muscle; capillary permeability; Antitumor in different cell lines | Plumericinoid C; allamandin, fulvoplumierin, plumericin and plumericin; plumeride, isoplumericin, 15-desmethylophumieride acid; confluentic acid and 2’-O-methylperlatolic acid; vanillic acid, p-coumaric acid, 4-hydroxy-3-methoxybenzoic acid and 4-hydroxybenzoic acid (phenolic compounds); α- and β-amyрин cinnamates, lupeol cinematone, lupeol acetate, lupeol β-phenyl-propionate | Plumericin, isoplumericin, plumeride and isoplumericin; α- and β-amyрин cinnamates, α- and β-amyрин acetates, lupeol cinematone and lupeol acetate |            |
| Leaf             | Constipation, antitumor, antifungal, antianemic, anthelmintic, and in the treatment of gastritis and arthritis | Cytotoxic; mild analgesic activity in the abdominal contractions test                  |                                                                                        |                                                                                        |            |
these are indole and have antimicrobial, gastroprotective, antiinflammatory, and antioxidant properties and showing cytotoxic activity against tumor cells.[26–30] However, there are no data on the ethnomedical use of the plant as an antitumor agent.[23,30,31]

H. articulatus latex is popular as an antifungal and antitumor agent, these effects evidenced by biological studies.[4] Their bark showed cytotoxic and trypanocidal and leishmanicidal effects, also reported in folk medicine.[2,3,6] Leishmaniasis is a parasitic disease responsible for considerable mortality and morbidity, affecting many people every year.[4] *Leishmania donovani* is the causative agent of visceral leishmaniasis, which is fatal in the absence of treatment.[4] Its various side effects and resistance to available drugs, in addition to the increase in new cases, have led to an urgent need for new therapeutic agents. This activity was also determined in *H. articulatus* leaves, *H. obovatus* roots, and *H. sucuuba* latex,[4,34,36] which are certainly promising sources of treatment.

There are studies of *H. dracicus* latex evaluating its antulcerogenic, antitumor, analgesic, and antiinflammatory activities, which somehow justify their popular uses in the treatment of cancer, gastric disorders, rheumatism, and bruises.[1,11–18] *H. sucuuba* is the most studied species, with a record of chemical composition of the latex, bark, leaves, roots and leaves, and the presence of triterpene amyrin cinnaamate.[41,43–46] Latex, bark, and leaves have antitumor action, justifying the popular use for the same purpose.[41,46–50] The latex and bark showed antimicrobial and analgesic effects, which are reasons for some popular uses of the plant: In treatment of arthritis, boils, and edema.[41,46,48–50]

Biological studies on *H. obovatus* roots have no relation with the ethnobotanical information about the plant.[36] However, the popular use of the leaves as antitumor agent[36] can be justified by the presence of iridoids and triterpene esters.

The triterpenoids are considered promising anticancer drugs due to their diverse pharmacological activities, including antiangiogenic, antiinflammatory, and antioxidant effects and the ability to increase cell differentiation.[44] These compounds, along with iridoids, are certainly responsible for most of the plant's medicinal properties reported in both folk medicine and biological studies.

**CONCLUSION**

Among the nine species studied, six species were evaluated chemically and biologically. The most studied species was *H. sucuuba*.

In general, the species are traditionally used as an anthelmintic, antitumor, and antiinflammatory agent. There were no evaluation studies of anthelmintic activity for any species of the genus; however, there are several studies evaluating antitumor and antiinflammatory activities.

Regarding the chemical composition, the genus is distinguished by the presence of triterpene esters and iridoids, predominantly in the bark and leaves. These compounds exhibit valuable pharmacological properties such as antimicrobial, antioxidant, antiinflammatory, and antitumor properties, which warrant further exploration.

The chemical and pharmacological data presented in this study should inspire further study of the species of *Himatanthus* for future use in therapies, including treatment of leishmaniasis.
