Abstract

Paenibacillus antibioticophila strain GD11T sp. nov. is the type strain of a new species within the genus Paenibacillus. This strain, whose genome is described here, was isolated from human faeces of a 63-year-old woman with multidrug-resistant tuberculosis who was receiving numerous antibiotics at the time of stool collection. Paenibacillus antibioticophila is a Gram-positive aerobic bacterium. We describe here the features of this bacterium, together with the complete genome sequence and annotation. The 5 562 631 bp long genome contains 5084 protein-coding and 71 RNA genes. New Microbes and New Infections © 2015 The Authors. Organism information

Classification and features

A stool sample was collected from a 63-year-old woman with a pulmonary form of multidrug-resistant tuberculosis [2]. The study was approved by the ethics committee of the Institut Fédératif de Recherche IFR48, Faculty of Medicine, Marseille.
France, under agreement 09-002. The faecal specimen was preserved at ~80°C after collection. Strain GD11^T (Table 1) was isolated in March 2012 by cultivation on 5% sheep’s blood agar in aerobic conditions at 37°C after a 21-day preincubation in a blood culture bottle with sterile cow rumen fluid and sheep’s blood.

Strain GD11^T exhibited a 97.6% 16S rRNA sequence identity with P. puldeungensis (GenBank accession no. NR117451), the phylogenetically closest bacterial species with standing in nomenclature (Fig. 1). Its 16S rRNA sequence was deposited in GenBank under accession number KC158472. This value was lower than the 98.7% 16S rRNA gene sequence threshold recommended by Stackebrandt and Ebers [4] to delineate a new species without carrying out DNA-DNA hybridization.

Growth at different temperatures (25, 30, 37, 45 and 56°C) was tested; no growth was observed at 45°C or 56°C. Growth occurred between 25°C and 37°C, after 24 to 48 hours of incubation. Colonies were 0.5 μm in diameter on blood-enriched Columbia agar. Growth of the strain was tested in 5% sheep’s blood-enriched Columbia agar (bioMérieux, Marcy l’Etoile, France) under anaerobic and microaerophilic conditions using the GENbag anaer and GENbag microaer systems, respectively (bioMérieux), and under aerobic conditions using the GENbag anaer and GENbag microaer systems, respectively (bioMérieux), and under aerobic conditions, with or without 5% CO2. Growth was achieved only both aerobically and anaerobically. Gram staining showed Gram-positive bacilli (Fig. 2). A motility test was positive. Cells grown on agar were soft and translucent after 24 hours and had a mean width of 0.49 μm and mean length of 2.67 μm (Fig. 3).

Strain GD11^T exhibits neither catalase nor oxidase activity. Using an API ZYM strip (bioMérieux), positive reactions were observed for esterase (C4), esterase lipase (C8), naphthol-AS-BI-phosphohydrolase, β-galactosidase, α-galactosidase and α-glucosidase. Using rapid ID32A, positive reactions were observed for α-glucosidase, α-arabinosidase, β-glucuronidase, N-acetyl-β-glucosaminidase, nitrate reduction, glutamic acid decarboxylase, fermentation of mannose and raffinose.

Using an API 50 CH strip (bioMérieux), positive reactions were recorded for esculin hydrolysis and fermentation of L-arabinose, D-ribose, D-xyllose, methyl-β-D-xlylopyranoside, D-galactose, D-glucose, D-fructose, D-mannose, L-rhamnose, D-mannitol, N-acetyl-D-glucomamine, amygdalin, arbutin, salicin, D-cellobiose, D-maltose, L-lactose, D-melibiose, D-saccharose, D-trehalose, inulin, D-melezitose, D-raffinose, starch, glycogen and D-lyxose.

Using an API ZYM strip (bioMérieux), negative reactions were observed for acid phosphatase, alkaline phosphatase, leucine arylamidase, valine arylamidase, cystine arylamidase, lipase (C14), trypsin, α-chymotrypsin, β-glucosidase, α-mannosidase, and α-fucosidase. Using rapid API 32A, negative reactions were observed for arginine dihydrolase, urease, production of indole, leucine arylamidase, histidine arylamidase, phenylalanine arylamidase, tyrosin arylamidase, alanine arylamidase α-mannosidase, β-glucosidase, α-fucosidase. An API 50 CH strip (bioMérieux), negative reactions were recorded for fermentation of erythritol, D-arabinose, L-xyllose, D-adonitol, L-sorbose, dulcitol, inositol, D-sorbitol, xylitol, D-turanose, D-tagatose, D-fucose, L-fucose, L-arabitol, L-arabinol, potassium gluconate, potassium 2-ketogluconate, potassium 5-ketogluconate and potassium-5-ketogluconate.

Cells are susceptible to penicillin G, amoxicillin, amoxicillin–clavulanic acid, ceftriaxone, imipenem, vancomycin, rifampicin, erythromycin, gentamicin, ciprofloxacin and trimethoprim–sulfamethoxazole, but resistant to metronidazole.

By comparison with P. puldeungensis strain CAU 9324^T, its phylogenetically closest neighbor, P. antibioticophila differed in alkaline phosphates, acid phosphatase, oxidase and β-glucosidase (Table 2).

Extended features descriptions

Matrix-assisted laser desorption/ionization time-of-flight mass spectrometry (MALDI-TOF) protein analysis was carried out as previously described [48]. Briefly, using a pipette tip, one isolated bacterial colony from a culture on agar plate was transferred and spread as a thin film on a MSP 96 MALDI-TOF target plate (Bruker Daltonics, Leipzig, Germany). Twelve distinct deposits from 20 isolated colonies were performed for strain GD11^T. Each smear was overlaid with 2 μL of matrix solution (saturated solution of alpha-cyano-4-hydroxycinnamic acid) in 50% acetonitrile, 2.5% trifluoroacetic acid, and dried for 5 minutes. Microflex spectrometer (Bruker) was used for measurements, and spectra were then recorded in the positive linear mode for the mass range of 2000 to 20 000 Da (parameter settings: ion source 1 (IS1), 20 kV; IS2, 18.5 kV; lens, 7 kV). A spectrum was obtained after 240 shots with variable laser power. The 20 GD11^T spectra were imported into MALDI BioTyper 3.0 software (Bruker) and analysed by standard pattern matching (with default parameter settings) against the main spectra of 7379 bacteria, including 129 spectra from 70 Paenibacillus species. The method of identification included the m/z from 3000 to 15 000 Da. A maximum of 100 peaks were compared with spectra in the database for every spectrum. The resulting score enabled the identification of tested species (or not): a score of ≥2 with a validly published species enabled identification at the species level; a score of ≥1.7 but <2 enabled identification at the genus level; and a score of <1.7 did not enable any identification. No significant MALDI-TOF score was obtained for strain GD11^T against the Bruker.
The spectral differences with other members of the genus *Paenibacillus* strain GD11T according to MIGS recommendations [48].

aMIGS, minimum information about a genome sequence.

These evidence codes are as follows: IDA, inferred from direct assay; TAS, traceable author statement (i.e., a direct report exists in the literature); NAS, nontraceable author statement (i.e., not directly observed for the living, isolated sample, but based on a generally accepted property for the species or ancestral evidence). These evidence codes are from the Gene Ontology project (http://www.geneontology.org/GO.evidence.shtml) [47]. If the evidence code is IDA, then the property should have been directly observed, for the purpose of this specific publication, for a live isolate by one of the authors, or by an expert or reputable institution mentioned in the acknowledgments.

**Genome sequencing information**

**Genome project history**

As part of a culturomics study isolating all bacterial species from the human digestive flora from patients with multidrug-resistant tuberculosis and treated with broad-spectrum antibiotics, this organism was isolated and selected for sequencing on the basis of its phenotypic differences, phylogenetic position and 16S rRNA sequence similarity to other members of the genus *Paenibacillus*. It is the first sequenced genome of *P. antibioticophila* sp. nov. The GenBank Bioproject number is PRJEB1962 and consists of 131 large contigs in nine scaffolds. Table 3 shows the project information and its association with minimum information about a genome sequence (MIGS) 2.0 compliance [49].

**Growth conditions and DNA isolation**

*Paenibacillus antibioticophila* strain GD11T (DSM 28228 = CSUR P1358) was cultured aerobically on Columbia agar (bioMérieux). A total of 200 μL of bacterial suspension was diluted in 1 mL Tris-EDTA (TE) buffer for lysis treatment. After a lysisome incubation of 30 minutes at 37°C, the lysis was performed with laurylsarcosylb 1% final and RNaseA treatment at 50 μg/μL final concentration during 1 hour at 37°C, followed by an overnight proteinase K incubation at 37°C. The DNA was purified three times by phenol–chloroform extractions, and ethanol precipitation was performed at −20°C overnight. After centrifugation, the DNA was resuspended in 150 μL TE buffer. The concentration was measured by the Quant-it Picogreen kit (Invitrogen; Life Technologies, Carlsbad, CA, USA) on the Genios_Tecan fluorometer at 48 ng/μL.

**Genomic DNA of *Paenibacillus antibioticophila* strain GD11T was sequenced on 454_Roche_Titanium (Roche, Basel, Switzerland).**

A paired end library was pyrosequenced on the 454_Roche_Titanium. This project was loaded twice on a 1/4 region for the 5 kb insert libraries on PTP PicoTiterPlates. The library was constructed with 2.5 μg of DNA according to the 454_Roche_Titanium paired end protocol and manufacturer. It was mechanically fragmented on the Covaris device (KBioScience—LGC Genomics, Teddington, UK) through miniTUBE-Red 5 kb. The DNA fragmentation was visualized through the Agilent 2100 BioAnalyzer on a DNA labchip 7500, with an optimal size of 4.7 kb. The library was constructed according to the 454_Roche_Titanium paired end protocol and manufacturer. Circularization and nebulization were performed and generated a pattern with optimal at 490 bp. After PCR amplification through 17 cycles followed by double size selection, the library was then quantified on the Quant-it Ribogreen kit (Invitrogen) on the Genios_Tecan fluorometer at 759 pg/μL. The library concentration equivalence was calculated as 2.84 × 10⁹ molecules/μL. The library was stocked at −20°C until use.

The 5 kb paired end library was cloned amplified with 0.25 and 0.5 cpb in 4 emPCR reactions per condition, with the GS Titanium SV emPCR Kit (Lib-L) v2. The yield of the emPCR was 5.21% and 5.69%, respectively, according to the quality expected by the range of 5 to 20% from the Roche procedure.

Twice, 790 000 beads were loaded on the GS Titanium PicoTiterPlates PTP Kit 70 × 75 and sequenced with the GS Titanium Sequencing Kit XLR70.
The runs were performed overnight and then analysed through the gsRunBrowser and Newbler assembler _Roche_. The global 411,382 passed filter sequences generated 150.40 Mb with a length average of 354 bp. These sequences were assembled on the gsAssembler from Roche with 90% identity and 40 bp as overlap. It led to nine scaffolds and 131 large contigs (>1500 bp), generating a genome size of 5.6 Mb, which corresponds to a coverage of 19.96 genome equivalent.

Genome annotation
Open reading frames (ORFs) were predicted using Prodigal [50] with default parameters, but the predicted ORFs were excluded if they were spanning a sequencing gap region. The predicted bacterial protein sequences were searched against the GenBank database [51] and the Clusters of Orthologous Groups (COGs) database using BLASTP. The tRNAscanSE tool [52] was used to find tRNA genes, whereas ribosomal RNAs were found by using
RNAmmer [53] and BLASTn against the GenBank database. Lipoprotein signal peptides and the number of transmembrane helices were predicted using SignalP [54] and TMHMM [55], respectively. ORFans were identified if their BLASTP E value was lower than 1e-03 for alignment length greater than 80 aa. If alignment lengths were smaller than 80 aa, we used an E value of 1e-05. Such parameter thresholds have already been used in previous works to define ORFans. Here, we compared the genome sequence of *P. antibioticophila* strain GD11T with those of *Paenibacillus barengoltzii* strain G22 (GenBank accession no. ASSZ00000000.1), *Paenibacillus massiliensis* strain 2301065\(^T\) (GenBank accession no. ARIL00000000.1), *Paenibacillus panacisoli* strain DSM 21345 (GenBank accession no. AUFO00000000.1), *Paenibacillus polymyxa* strain ATCC 842\(^T\) (GenBank accession no. AFOX00000000.1), *Paenibacillus sanguinis* strain 2301083\(^T\) (GenBank accession no. ARGO00000000.1), *Paenibacillus senegalensis* strain JC66\(^T\) (GenBank accession no. CAES00000000.1), *Paenibacillus terrae* strain HPL-003 (GenBank accession no. CP003107.1) and *Paenibacillus xanthoxyl* strain JH29\(^T\) (GenBank accession no. ASSD00000000.1), which were identified using the Proteinortho software (version 1.4) [56] using a 30% protein identity and 1e-05 E value. The average percentage of nucleotide sequence identity (Table 4) between corresponding orthologous sets was determined using the Needleman-Wunsch algorithm global alignment technique. Artemis [57] was used for data management, and DNA Plotter [58] was used for visualization of genomic features. The Mauve alignment tool was used for multiple genomic sequence alignment and visualization [59]. PHAST (PHAge search Tool) was employed to identify phage sequences [60].

### Genome properties

The genome of *P. antibioticophila* strain GD11T is 5 562 631 bp long with a 49.1% G+C content (Fig. 6). Of the 5155 predicted genes, 5084 were protein-coding genes and three were RNAs. Three rRNA genes (one 16S rRNA, one 23S rRNA and one 5S rRNA) and 68 predicted tRNA genes were identified in the genome. A total of 3814 genes (73.98%) were assigned a putative function. One hundred forty-three genes (2.77%) were identified as ORFans. The remaining genes were annotated as hypothetical proteins. The properties and the statistics of the genome are summarized in Tables 5 and 6. The distribution of genes into COGs functional categories is presented in Table 5.

### Insights from genome sequence

+, positive result; −, negative result; NA, data not available.

*Paenibacillus zanthoxyli* strain JH29<sup>T</sup> (GenBank accession no. ASSD00000000.1). The draft genome of *P. antibioticophila* has a larger size than that of *P. barengoltzii*, *P. sanguinis* and *P. zanthoxyli* (5.56, 4.75, 4.8 and 5.05 Mb, respectively). The G+C content of *P. antibioticophila* is higher than those of *P. massiliensis*, *P. panacisoli*, *P. polymyxa*, *P. senegalensis* and *P. terrae* (49.1, 48.5, 48.3, 44.9, 48.2 and 46.8%, respectively) but less than that of *P. barengoltzii*, *P. sanguinis* and *P. zanthoxyli*.

**FIG. 4.** Reference mass spectrum from *Paenibacillus antibioticophila* strain GD11<sup>T</sup> (DSM 28228 = CSUR P1358). Spectra from 16 individual colonies were compared and reference spectrum generated.
The gene content of *P. antibioticophila* is larger than those of *P. barengoltzii*, *P. sanguinis*, *P. senegalensis* and *P. zanthoxyli* (5155, 4394, 4209, 4422 and 4878, respectively). However, the distribution of genes into COGs categories was similar in all nine compared genomes (Fig. 7). In addition, *P. antibioticophila* shared 5084, 4307, 5055, 5059, 5068, 4093, 4278, 5525 and 4676 orthologous genes with *P. barengoltzii*, *P. massiliensis*, *P. panacisoli*, *P. polymyxa*, *P. sanguinis*, *P. senegalensis*, *P. terrae* and *P. zanthoxyli*, respectively (Table 6). The average nucleotide sequence identity ranged from 96.47 to 66.74% between the species. Finally, no sequences coding for nonribosomal peptide synthetases or polyketide synthases were found within the *P. antibioticophila* genome. The analysis of virome revealed the presence of one intact phage of 20.8 kb, and other three incomplete phages, of, respectively, 17, 15.4 and 14.3 kb with 43.96, 50.60 and 49.84% G+C content (Table 7).

**Conclusions**

On the basis of phenotypic, phylogenetic and genomic analyses, we formally propose the creation of *Paenibacillus antibioticophila* sp. nov. The strain has been isolated from the stool sample of a 63-year-old woman with multidrug-resistant tuberculosis in Marseille, France. Several other previously undescribed bacterial species were also cultivated from different faecal samples through diversification of culture conditions [1,8–36], thus suggesting that the human faecal flora of humans remains partially unknown.
**Description of Paenibacillus antibioticophila strain GD11T sp. nov.**

Paenibacillus antibioticophila strain GD11T (= DSM 28228 = CSUR P1358) is the type strain of the genus Paenibacillus. It was isolated from the stool samples of a 63-year-old woman with a

Average percentage similarity of nucleotides corresponding to orthologous protein shared between genomes (below diagonal) and numbers of proteins per genome (bold).
pulmonary form of multidrug-resistant tuberculosis hospitalized in an infectious diseases ward in Marseille, France. The main scope of the culturomics study is to cultivate all the species within the human faeces. *P. antibioticophila* is a Gram-positive bacilli that does not exhibit catalase nor oxidase activity. Colonies were 0.5 mm in diameter, and cells have a mean width of 0.49 μm and a mean length of 2.67 μm. Esterase (C4), esterase lipase (C8), naphthol-AS-Bl-phosphohydrolase, β-galactosidase, α-galactosidase and α-glucosidase, β-glucuronidase, N-acetyl-β-glucosaminidase, nitrate reduction, glutamic acid decarboxylase, fermentation L-arabinose, D-ribose, D-xylose, methyl-β-D-xlophanoside, D-galactose, D-glucose, D-fructose, D-mannose, L-rhamnose, D-mannitol, N-acetylglucosamine, amygdalin, arbutin, salicin, D-cellulobiose, D-maltose, D-lactose, D-melibiose, D-saccharose, D-xylose, inulin, D-melezitose, D-raffinose, starch, glycogen and D-fucopentose were positive. Acid phosphatase, alkaline phosphatase, leucine arylamidase, valine arylamidase, cystine arylamidase, lipase (C14), trypsin, α-chymotrypsin, β-glucosidase, α-mannosidase, α-fucosidase, arginine dehydrolase, urease, production of indole, leucine arylamidase, histidine arylamidase, phenylalanine arylamidase, tyrosin arylamidase, alanine arylamidase α-mannosidase, fermentation erythritol, D-arabinose, L-xyllose, D-ribitol, L-sorbitol, inositol, D-sorbitol, xylitol, D-turanose, D-tagatose, D-fucose, L-fucose, D-arabitol, L-arabitol, potassium gluconate, potassium 2-ketogluconate, potassium 5-ketogluconate and potassium-5-ketogluconate were negative. Cells are susceptible to penicillin G, amoxicillin, amoxicillin–clavulanic acid, ceftriaxone, imipenem, vancomycin, rifampicin, erythromycin, gentamicin, ciprofloxacin and trimethoprim–sulfamethoxazole and resistant to metronidazole.

The G+C content of the genome is 49.1%. The 16S rRNA gene sequence and whole-genome shotgun sequence of *P. antibioticophila* strain GD11T is deposited in GenBank under accession number KC158472. The type strain is GD11T (= DSM 28228 = CSUR P1358).
