1 – Biological assay protocols

Sulf-2 assay protocol

Compounds were screened using 4-MUS as a substrate for Sulf-2 according to a protocol described by Morimoto-Tomita et al. Briefly 293T cells were transiently transfected with pcDNA3.1/Myc-His(-)-HSulf-2 DNA (Addgene) and TransIT-LT1 Transfection Reagent (Mirus) using a transfection mixture at the ratio 1:3 (µg DNA: µL transfection reagent) in Opti-MEM I reduced serum medium (Gibco). Conditioned medium containing Sulf-2 was collected after 3 days and bound to HIS-Select Nickel affinity gel (Sigma) overnight at 4 °C. Beads were washed three times with washing buffer containing 50 mM HEPES (pH 7.5), 300 mM NaCl, 0.05% Tween 20, followed by washing once with washing buffer containing no tween. Beads were suspended in 50 mM Hepes (pH 7.5) and used in inhibition assays. 20 µL of bead slurry was incubated with 1 mM compound (in DMSO) plus 10X reaction buffer (500 mM HEPES pH 7.5, 100 mM CaCl₂) for 1 h at 37 °C. The reaction was started by the addition of 20 µL of 20 mM 4-MUS (final concentration of 8 mM) and incubated at 37 °C for 1 h. The reaction was stopped with 100 µL 1 M Tris buffer (pH 10.4) and read at 460 nm following excitation at 355 nm in FLUOstar Omega plate reader (BMG Labtech) using Omega data analysis software.

ARSA and ARSB assay protocols

Compounds were screened in a 96-well black plate (Sterilin) using 4-MUS as a substrate, using 50 µL reaction mixture containing 40 ng of the commercially available enzymes (ARSA or ARSB from R & D Systems), 50 mM HEPES (pH = 4.5), 10 mM CaCl₂, 1 mM test compound (dissolved in DMSO; final concentration of DMSO in reaction = 2%), and H₂O (45 µL). The assay mixture was incubated for 1 h at 37 °C, followed by addition of 5 µL of 4-MUS (Km = 1.6 mM for ARSA and 612 µM for ARSB), and incubation for a further 1 h at 37 °C. The reaction was stopped with 100 µL of 1 M Tris (pH = 10.5) and read at 460 nm following excitation at 355 nm in FLUOstar Omega plate reader (BMG Labtech) using Omega data analysis software.

3- Summary of Generic Analytical and Chromatographic Conditions

All commercial reagents were purchased from Sigma-Aldrich Chemical Company, Alfa Aesar, Apollo Scientific or Tokyo Chemical Industry UK Ltd. The chemicals were of the highest available purity. Unless otherwise stated, chemicals were used as supplied without further purification. Anhydrous solvents were obtained from AcroSeal™ or Aldrich SureSeal™ bottles and were stored under nitrogen. Petrol refers to the fraction with a boiling point between 40 and 60 °C.

Thin layer chromatography utilised to monitor reaction progress was conducted on plates pre-coated with silica gel Merck 60F$_{254}$ or Merck NH$_2$F$_{254S}$. The eluent was as stated (where this consisted of more than one solvent, the ratio is stated as volume:volume) and visualisation was either by short wave (254 nm) ultraviolet light, or by treatment with the visualisation reagent stated followed by heating. ‘Flash’ medium pressure liquid chromatography (MPLC) was carried out either on a Biotage SP4 automated purification system or a Varian 971-FP automated purification system, using pre-packed Varian or Grace silica or amino-bonded silica cartridges.

All reactions carried out in a microwave were performed in a Biotage Initiator with Sixty robot.

Melting points were determined using a VWR Stuart SMP40 apparatus and are uncorrected.

$^1$H, $^{13}$C and $^{19}$F nuclear magnetic resonance (NMR) spectra were obtained as either CDCl$_3$, CD$_3$OD or DMSO-$d_6$ solutions and recorded at 500 MHz, 126 MHz and 471 MHz, respectively, on a Bruker Avance III 500 spectrometer. Where $^{13}$C NMR data are not quoted, insufficient material was available or problems obtaining high resolution spectra were encountered. Chemical shifts are quoted in parts per million (δ) referenced to the appropriate deuterated solvent employed. Multiplicities are indicated by s (singlet), d (doublet), t (triplet), q (quartet), quin (quintet), m (multiplet), br (broad) or combinations thereof. Coupling constant values are given in Hz. Homonuclear and heteronuclear two dimensional NMR experiments were used where appropriate to facilitate assignment of chemical shifts.

LC-MS was carried out on a Waters Acquity UPLC system with PDA and ELSD employing positive or negative electrospray modes as appropriate to the individual
compound. Where LRMS data is not quoted, the mass was not recognised for that compound. High resolution mass spectrometry was performed by the EPSRC UK National Mass Spectrometry Facility, University of Wales Swansea, Singleton Park, Swansea, SA2 8PP.

FTIR spectra were recorded on either a Bio-Rad FTS 3000MX diamond ATR or an Agilent Cary 630 FTIR as a neat sample.

UV spectra were obtained using a U-2001 Hitachi Spectrophotometer with the sample dissolved in ethanol.

Data were compared with literature data for compounds which had been previously reported.
4- Experimental procedures

General synthetic procedures

**General procedure A:** To 3-bromophenyl bis(2,4-dimethoxybenzyl)sulfamate (1) in dimethoxyethane (7 mL/mmol of 3-bromophenyl sulfamate) was added a 2 M aq. solution of sodium bicarbonate (2 mol equiv.). The resulting solution was sparged with nitrogen for 15 min. The appropriate phenylboronic acid (1.2 mol equiv.) and [1,1’-bis(diphenylphosphino)ferrocene]dichloropalladium(II) complex with DCM (0.05 mol equiv.) were then added. The resulting mixture was heated at 80 °C for 20 min under microwave irradiation. Upon completion, the reaction mixture was diluted with water and EtOAc (10 mL, respectively), filtered through Celite and extracted with EtOAc (3 × 25 mL). The pooled organic extracts were washed with water and brine (30 mL, respectively), dried over MgSO$_4$ and concentrated \textit{in vacuo}. The crude product was purified by column chromatography.

**General procedure B:** The appropriate 2,4-dimethoxybenzyl protected sulfamate (1 mol equiv.) was solubilised in a 10% TFA/DCM mixture (10 mL/mmol of sulfamate). The resulting solution was stirred at RT for 2 h. Upon completion, the solvent was removed \textit{in vacuo}. The crude residue was dissolved in EtOAc (20 mL), washed with 10% aq. NaHCO$_3$ (20 mL) and extracted with EtOAc (3 × 25 mL). The combined organic extracts were washed with water (30 mL) and brine (30 mL), dried over MgSO$_4$ and concentrated \textit{in vacuo}. The crude product was purified by column chromatography.

**General procedure C:** To 3-hydroxyphenyl bis(2,4-dimethoxybenzyl)sulfamate (18) (1 mol equiv.) and potassium carbonate (1.2 mol equiv.) in N,N-dimethylformamide was added the appropriate fluorobenzene (2 mol equiv.). The resulting mixture was heated at 180 °C for 30 min under microwave irradiation. After cooling, the mixture was concentrated \textit{in vacuo}. The resulting residue was dissolved in saturated aq. NaHCO$_3$ (20 mL) and the mixture extracted with EtOAc (3 × 20 mL). The pooled organic extracts were washed with water (20 mL) and brine (20 mL), dried over MgSO$_4$ and concentrated \textit{in vacuo}. The crude product was purified by column chromatography.
**General procedure D:** The appropriate nitrobenzene in MeOH (15 mL/mmol of nitrobenzene) and THF (5 mL/mmol of nitrobenzene) was subjected to palladium-catalysed hydrogenation using an H-Cube® reactor and a 10% Pd/C CatCart under a full pressure of hydrogen. The reaction was conducted at RT for 8 h. Upon completion, the solvents were removed *in vacuo* and the crude product was purified by column chromatography if required.

**General procedure E:** To the appropriate aniline (1 mol equiv.) in DCM (10 mL/mmol of aniline) were added triethylamine (2 mol equiv.) and acetic anhydride (1.2 mol equiv.). The resulting solution was stirred at RT overnight. Upon completion, the reaction mixture was diluted with DCM (10 mL), washed with saturated aq. NaHCO₃ (20 mL) and extracted with DCM (3 × 20 mL). The combined organic extracts were washed with water (30 mL) and brine (30 mL), dried over MgSO₄ and concentrated *in vacuo*. The crude product was purified by column chromatography.

**General procedure F:** To the appropriate aniline (1 mol equiv.) in THF (10 mL/mmol of aniline) was added 2,3-dimethyl-1-((2,2,2-trichloroethoxy)sulfonyl)-1H-imidazol-3-ium tetrafluoroborate (44) (3 mol equiv.). The resulting reaction mixture was heated at 67 °C for 30 h. Upon completion, the solvent was removed *in vacuo* to yield a crude product. The crude product was purified by column chromatography.

**General procedure G:** To the appropriate 2,2,2-trichloroethylsulfamoyloxyphenyl in MeOH (10 mL/mmol of phenyl) were added acetate buffer pH 4.65 (10 mL/mmol of protected aminophenyl) and zinc (10 mol equiv.). The resulting reaction mixture was heated at 60 ºC for 2 h. Upon completion, the heterogeneous mixture was filtered through Celite and washed with MeOH (10 mL). The filtrate was concentrated *in vacuo* to give a crude oil, which was dissolved in water (10 mL) and washed with ether (10 mL). The crude product was converted to the sodium salt by ion-exchange chromatography (DOWEX 50WX2 - Na⁺ form). The crude product was then subjected to column chromatography.

**General procedure H:** To the appropriate aniline (1 mol equiv.) in THF (10 mL/mmol of aniline), cooled in an ice bath, were added 4-(dimethylamino)pyridine (2.2 mol equiv.) and triethylamine (4 mol equiv.). The resulting solution was stirred at 0 ºC for
10 min, and then a solution 2,2,2-trichloro ethyl chlorosulfate (42) (4 mol equiv.) in 
THF (5 mL/mmol of aniline) was added dropwise over 15 min. The resulting solution 
was stirred in an ice bath for 1 h and allowed to warm to RT. The reaction mixture was 
left stirring for an additional 24 h. Upon completion, the mixture was diluted with 
EtOAc (20 mL), quenched by the cautious addition of saturated aq. NaHCO$_3$ (20 mL) 
and extracted with EtOAc (3 × 20 mL). The pooled organic extracts were washed with 
water and brine (40 mL, respectively), dried over MgSO$_4$ and concentrated in vacuo. 
The crude product was subjected to column chromatography.

1-((3-Bromophenoxy)sulfonyl)-2,3-dimethyl-1\textit{H}-imidazol-3-ium tetrafluoroborate, (S5)

To 3-bromophenyl 2-methyl-1\textit{H}-imidazole-1-sulfonate (S4) (5.5 g, 17.4 mmol) in DCM (70 mL), cooled at 0 °C, was added trimethyloxonium tetrafluoroborate (2.57 g, 17.4 mmol). The resulting solution was stirred at 0 °C for 1 h and allowed to warm to RT. Upon completion, the reaction was cooled in an ice bath. Cold petrol (120 mL) was added to the mixture, leading to the precipitation of S5. The white precipitate was filtered off, washed with cold petrol (60 mL) and dry under high vacuum. The white fluffy solid (6.20 g, 85%) was used in the next step without further purification; m.p. 149.5-151.5 °C; \(\lambda_{\text{max}}\) (EtOH)/nm 265.5; IR (neat) \(\nu_{\text{max}}\)/cm\(^{-1}\) 3159, 3103, 1594, 1580, 1447, 1229, 1214, 1149, 1031, 906; \(^1\)H NMR (500 MHz, MeOD) \(\delta\) 2.91 (3H, s, CH\(_3\)), 4.86 (3H, s, NC\(_2\)H\(_3\)), 7.29 (1H, ddd, \(J = 8.5, 2.5\) and 0.9 Hz, H-6), 7.45 (1H, dd, \(J = 8.2, 8.2\) Hz, H-5), 7.66 (1H, dd, \(J = 2.1, 2.1\) Hz, H-2), 7.72 – 7.68 (1H, m, H-4), 7.73 (1H, d, \(J = 7.5\) Hz, H-4’ or H-5’), 7.87 (1H, d, \(J = 7.5\) Hz, H-4’ or H-5’); \(^{13}\)C NMR (126 MHz, MeOD) \(\delta\) 11.9 (CH\(_3\)), 36.8 (NCH\(_3\)), 121.5 (C-6), 122.4 (C-4’ or C-5’), 124.3 (C-3), 125.0 (C-4’ or C-5’), 126.2 (C-2), 133.4 (C-5), 134.0 (C-4), 150.7 (C-1); \(^19\)F NMR (471 MHz, MeOD) \(\delta\) -154.4 (BF\(_4^-\)); LRMS (ES\(^+\)) \(m/z\) 331.1 [M(\(^79\)Br)-BF\(_4^-\)]\(^+\), 333.2 [M(\(^81\)Br)-BF\(_4^-\)]\(^+\); HRMS (ESI) calcd for C\(_{11}\)H\(_{12}\)BrN\(_2\)O\(_3\)S [M(\(^79\)Br)-BF\(_4^-\)]\(^+\) 330.9747, found 330.9751.

2,2,2-Trifluoroethyl chlorosulfate (S6)

To sulfuryl chloride (0.54 mL, 6.68 mmol) in Et\(_2\)O (5 mL), at -78°C, was added dropwise over 35 mins a solution of 2,2,2-trifluoroethanol (0.49 mL, 6.68 mmol) and pyridine (0.54 mL, 6.68 mmol) in Et\(_2\)O (5 mL). The resulting mixture was stirred at -78°C for 1 h. The reaction mixture was the allowed to warm to room temperature and stirred overnight. The salt by-product was filtered off and washed with Et\(_2\)O. The filtrate was dried \textit{in vacuo} to afford S6 as a clear oil (618 mg, 47%): \(^1\)H NMR (500 MHz, CDCl\(_3\)) \(\delta\) 4.72 (2H, q, \(J = 7.5\) Hz, CH\(_2\)).
2,2,2-Trifluoroethyl 2-methyl-1H-imidazole-1-sulfonate (S7)

To a suspension of 2-methylimidazole (372 mg, 4.53 mmol) in THF (3 mL), at 0°C, was added dropwise a solution of 2,2,2-trifluoroethyl chlorosulfate (S6) (300 mg, 1.51 mmol) in THF (3 mL). The resulting mixture was stirred for 1 hr at 0°C then allowed to warm to room temperature and stirred overnight. The remaining 2-methylimidazole was then filtered off, washed with THF and the filtrate was concentrated in vacuo. The crude residue was partitioned between EtOAc (50 mL) and water (50 mL). The aqueous layer was washed with further EtOAc (50 mL) and the organics were combined, washed with brine (50 mL), dried over MgSO4 and concentrated in vacuo to afford a clear oil (300 mg). This procedure was repeated and the two batches combined to afford crude product (706 mg). This was purified by column chromatography (silica gel, PE:EtOAc 3:2) to afford S7 as an off-white solid (587 mg, 77%): Rf = 0.36 (PE:EtOAc 3:2); mp: 52-56°C; \( \lambda_{\text{max}} \) = 218 nm; \(^1\)H NMR (500 MHz, CDCl3) \( \delta \) 2.63 (3H, s, CH\(_3\)), 4.46 (2H, q, \( J = 7.7 \) Hz, CH\(_2\)), 6.96 (1H, d, \( J = 1.9 \) Hz, H-4), 7.29 (1H, d, \( J = 1.9 \) Hz, H-5).

To a solution of 2,2,2-trifluoroethyl 2-methyl-1H-imidazole-1-sulfonate (S7) (558 mg, 2.28 mmol) in DCM (8 mL), at 0°C, was added trimethyloxonium tetrafluoroborate (337 mg, 2.28 mmol) portionwise over 15 min. The reaction mixture was stirred at 0°C for 1 h then allowed to warm to room temperature and stirred overnight. After approx. 20 h, the reaction mixture was dried in vacuo to afford S8 as a pale gum (600 mg, 76%); mp: 95-102°C; \( \lambda_{\text{max}} \) = 220 nm; IR (cm\(^{-1}\)) 3160, 2123, 1611, 1430; \(^1\)H NMR (500 MHz, DMSO) \( \delta \) 2.82 (3H, s, C-CH\(_3\)), 3.87 (3H, s, N-CH\(_3\)), 5.46 (2H, q, CH\(_2\)), 7.97 (1H, d, \( J = 2.5 \) Hz, H-5), 8.21 (1H, d, \( J = 2.5 \) Hz, H-4).

Sulfamoyl chloride, (S9)
Formic acid (1.07 mL, 1.3 g, 28.2 mmol) was added dropwise to chlorosulfonyl isocyanate (2.46 mL, 4.0 g, 28.2 mmol) in anhydrous acetonitrile (12 mL) at 0 °C. Gentle gas evolution was observed.
