The coefficient $C_T$ of the conformal energy-momentum tensor two-point function is determined for the non-unitary scalar CFTs with four- and six-derivative kinetic terms. The results match those expected from large-$N$ calculations for the CFTs arising from the $O(N)$ non-linear sigma and Gross–Neveu models in specific even dimensions. $C_T$ is also calculated for the CFT arising from $(n-1)$-form gauge fields with derivatives in $2n+2$ dimensions. Results for $(n-1)$-form theory extended to general dimensions as a non-gauge-invariant CFT are also obtained; the resulting $C_T$ differs from that for the gauge-invariant theory. The construction of conformal primaries by subtracting descendants of lower-dimension primaries is also discussed. For free theories this also leads to an alternative construction of the energy-momentum tensor, which can be quite involved for higher-derivative theories.
1. Introduction

It is a truth almost universally acknowledged that there are no non-trivial unitary conformal field theories in more than six dimensions. Indeed for superconformal theories this is a long established result \cite{1}, and it is often conjectured that the superconformal (2, 0) theory in six dimensions is the one theory to rule them all and in the light bind them.

However, there is now good evidence that there are interacting conformal theories, which contain an energy-momentum tensor, in more than four dimensions and, indeed, for non-unitary CFTs, for dimensions larger than six. The $O(N)$ non-linear sigma model has a tractable $1/N$ expansion without restriction on the spatial dimension $d$ \cite{2}, defining a conformal theory with calculable scaling dimensions, at least for sufficiently large $N$ \cite{3}. This suggests a non-trivial five-dimensional CFT which is also accessible by $\varepsilon$-expansion methods starting from $4+\varepsilon$ and $6-\varepsilon$ dimensions. Generalisations to higher dimensions were recently explored in \cite{4,5}. To leading order in $1/N$ the non-linear sigma model comprises an $N$-component scalar $\varphi_i$ with dimension $\frac{1}{2}(d-2)$ and also a singlet $\sigma$ with dimension $2$, clearly violating the unitarity bound for scalars when $d > 6$.

Apart from the scaling dimensions for conformal primary operators and the parameters determining the three-point functions and, hence, the operator product expansion, crucial data defining a CFT are given by the correlation functions involving the energy-momentum tensor. In any CFT $C_T$, the coefficient of the two-point function which is fixed up to an overall constant by conformal invariance, plays a crucial role. The scale of the energy-momentum tensor is determined by Ward identities and with our conventions

$$S_d^2 \langle T^{\mu\nu}(x)T^{\sigma\rho}(0) \rangle = C_T \frac{1}{(x^2)^d} T^{\mu\nu,\sigma\rho}(x),$$

(1.1)

for $S_d = 2\pi^{\frac{d}{2}}/\Gamma(\frac{d}{2})$ and where $I$ is the inversion tensor for symmetric traceless tensors, constructed in terms of the inversion tensor $I$ for vectors

$$T^{\mu\nu,\sigma\rho} = \frac{1}{2}(I^{\mu\nu}I^{\sigma\rho} + I^{\mu\sigma}I^{\nu\rho}) - \frac{1}{d} \eta^{\mu\nu} \eta^{\sigma\rho}, \quad T^{\mu\nu}(x) = \eta^{\mu\nu} - \frac{2}{x^2} x^\mu x^\nu.$$

(1.2)

$C_T$ may be regarded as a measure of the number of degrees of freedom. It determines the contribution of the energy-momentum tensor in the conformal partial-wave expansion, and so is readily determined in bootstrap calculations. For the conventional free scalar and fermion theories $C_T$ was determined for arbitrary $d$ and for vector gauge theories for $d = 4$ some time ago in \cite{6}, and later $C_T$ was calculated for $(n-1)$-form gauge in $d = 2n$ dimensions in \cite{7}. For the $O(N)$ sigma model results for $C_T$ to first order in $1/N$ were obtained by Petkou \cite{8,9} by applying the operator product expansion to the four-point function for $\varphi_i$, and have recently been rederived by direct calculation and extended to the Gross–Neveu model in \cite{10}. In the non-linear sigma model

$$C_T^{O(N)} = C_{T,S}(N + C_{T,1}^{O(N)} + O(N^{-1})), \quad C_{T,S} = \frac{d - 1}{d - 1},$$

(1.3)

where $C_{T,S}$ is the result for a free scalar in $d$ dimensions. For general $d$, $C_{T,1}^{O(N)}$ depends on the digamma function, $\psi(x) = \Gamma'(x)/\Gamma(x)$ but for $d = 4 + 2p$ only the contribution of the
poles $\psi(x) \sim -1/(x+n)$, $n = 0, 1, \ldots$ for some $n$ are relevant. In consequence, the result for general $d$ reduces to

$$C_{T,1}^{O(N)}\big|_{d=4+2p} = (-1)^{p-1} \frac{4 (2p + 1)!}{(p - 1)! (p + 3)!},$$

which is a integer $[4]$. Thus, $C_{T,1}^{O(N)}\big|_{d=4} = 0$, since then the theory reduces to $N$ free scalars with $\sigma$ non-dynamical, whereas $C_{T,1}^{O(N)}\big|_{d=6} = 1$. The extra 1 was interpreted in $[3]$ as the contribution of the dynamical free scalar $\sigma$ and for $d = 6 - \varepsilon$ the $\varepsilon$-expansion defines a CFT at a fixed point starting from the renormalisable $O(N)$-invariant Lagrangian

$$\mathcal{L}_6 = -\frac{1}{2} \left( \partial^\mu \varphi_i \partial_\mu \varphi_i + \partial^\mu \sigma \partial_\mu \sigma + g \sigma \varphi_i \varphi_i \right) - \frac{1}{2} \lambda \sigma^4,$$

with $g, \lambda = O(\varepsilon)$. In higher even dimensions there are corresponding renormalisable Lagrangians with higher-derivative kinetic terms for $\sigma$. For $d = 8 - \varepsilon$ there is a perturbative fixed point starting from

$$\mathcal{L}_8 = -\frac{1}{2} \left( \partial^\mu \varphi_i \partial_\mu \varphi_i + \partial^\mu \sigma \partial_\mu \sigma + g \sigma \varphi_i \varphi_i + \lambda' \sigma^2 \partial^2 \sigma \right) - \frac{1}{24} \lambda \sigma^4.$$

The $\beta$ functions for the couplings $g, \lambda', \lambda$ have recently been calculated by Gracey $[5]$. In this case $C_{T,1}^{O(N)}\big|_{d=8} = -4$, which we show arises from the higher-derivative $\sigma$ contribution.

A similar narrative emerges for the Gross–Neveu model with $N$ fermion fields $\psi_i$. There is also a self-consistent $1/N$ expansion as a conformal field theory for any dimension $d$. To leading order $\psi_i$ has dimension $\frac{1}{2}(d - 1)$, and there is a singlet scalar field $\sigma$ with scale dimension 1, which is consequently below the unitary bound for $d > 4$. The leading $1/N$ correction to $C_T$ has been recently determined in $[10]$, and can be expressed in the form

$$C_{T,1}^{GN} = \frac{1}{2} d \text{tr}(1) N + C_{T,1}^{S} (C_{T,1}^{GN} + O(N^{-1})),

where $\frac{1}{2} d \text{tr}(1)$ is the contribution to $C_T$ for a single fermion with $\text{tr}(1)$ the sum over spinorial indices. For general $d$ the result $[10]$ for $C_{T,1}^{GN}$ is similar to that for the sigma model; for even dimensions it reduces to

$$C_{T,1}^{GN}\big|_{d=2+2p} = (-1)^{p-1} \frac{(2p + 1)!}{(p - 1)! (p + 2)!}.$$ In this case $C_{T,1}^{GN}\big|_{d=4} = 1$, representing the contribution of the dynamical scalar $\sigma$ whereas $C_{T,1}^{GN}\big|_{d=6} = -5$. For $d = 4 - \varepsilon$ equivalent results can be obtained as a perturbative $\varepsilon$ expansion at the RG fixed point starting from the renormalisable Lagrangian

$$\mathcal{L}_{GN,4} = -\bar{\psi} \not\partial \psi - \frac{1}{2} \partial^\mu \sigma \partial_\mu \sigma - g \sigma \bar{\psi} \psi - \frac{1}{24} \lambda \sigma^4,$

with $N$ Dirac fields $\psi$.

In this paper we calculate the contributions to $C_T$ corresponding to higher-derivative scalars, such as that for $\sigma$ in (1.6), for general $d$. The energy-momentum tensor is determined from the corresponding local Weyl-invariant actions on curved space quadratic in a scalar field $\varphi$. The construction of such actions is equivalent to obtaining conformal differential operators starting from powers of the Laplacian. We then determine $C_T$ for scalar theories
with kinetic terms with $2p$ derivatives for $p = 2, 3$, and conjecture a result for general $p$. The formula agrees with (1.4) and (1.8) for the relevant values of $d$.

In section 3 we consider $(n-1)$-form gauge theories with additional derivatives in $2n + 2$ dimensions when they also define a CFT and obtain $C_T$ in this case. Reflecting the lack of unitarity, $C_T < 0$. We also discuss in section 4 the $(n-1)$-form theory, without additional derivatives, extended to define a CFT away from $d = 2n$ dimensions when gauge invariance is lost.

The energy-momentum tensors in the higher-derivative theories are rather non-trivial. In section 5 we discuss an alternative construction which constructs a spin-two conformal primary by successively subtracting the descendants of lower-dimension primary operators. The final expressions thereby obtained are identical with those derived from curved-space Weyl-invariant actions; the subtractions are related to improvement terms which need to be added to the canonical energy-momentum tensor to obtain a tensor which is traceless as well as symmetric.

**2. Higher-derivative Scalar Theories**

The actions for higher-derivative free scalars considered here have the form

\[ S_4[\varphi] = -\int d^d x \frac{1}{2} \partial^2 \varphi \partial^2 \varphi, \quad S_6[\varphi] = -\int d^d x \frac{1}{2} \partial^\mu \partial^2 \varphi \partial_\mu \partial^2 \varphi. \]  

(2.1)

Theories starting from such actions were considered in [11]. A symmetric traceless energy-momentum tensor may be obtained by the usual Noether procedure or by extending (2.1) to a general curved space background so as to be invariant under Weyl rescalings of the metric. Assuming diffeomorphism invariance then reducing to flat space ensures that the resulting energy momentum tensor satisfies conformal Ward identities which ensure that it is a conformal primary.

For $S_4$ the extension to a Weyl invariant form on curved space is equivalent to constructing the Paneitz operator [12] (see also [13] and [14] for the $d = 4$ version of the Paneitz operator) and for $S_6$ this involves the generalisation of the $d = 6$ Branson operator [15] to general $d$. These operators provide extensions of $\nabla^2 \nabla^2$ and $-\nabla^2 \nabla^2 \nabla^2$ to conformal differential operators. A convenient form for the Branson operator for general $d$ was constructed in [16] by extending $S_6$ to a Weyl invariant form on an arbitrary curved background. A useful mathematical discussion for arbitrary powers of the Laplacian is contained in [17], such operators fail to exist in particular integer dimensions, for the Paneitz, Branson operators these are $d = 2, 4$.

Varying the metric about flat space gives (an alternative derivation based on a generalised

---

1. $C_{T,S}$ in [13] corresponds to $p = 1$.
2. See version 3 of [16].
3. This is then an obstruction to relating Weyl and conformal invariance [18], but it also prevents the existence of a symmetric traceless energy-momentum tensor which is a conformal primary. Related discussions are given in [19] and for $d = 2$ in [20].
Noether procedure is given in (21)

\[
T_{\varphi, A}^{\mu\nu} = 2 \partial^\mu \partial^\nu \varphi \partial^2 \varphi - \frac{1}{2} \eta^{\mu\nu} \partial^2 \varphi \partial^2 \varphi - \partial^\mu (\partial^\nu \varphi \partial^2 \varphi) - \partial^\nu (\partial^\mu \varphi \partial^2 \varphi) + \eta^{\mu\nu} \partial_\mu \partial_\nu \varphi \partial^2 \varphi
+ 2 D^{\mu\sigma\rho}(\partial_\sigma \varphi \partial_\rho \varphi) - \frac{1}{d-1}(\partial^\mu \partial^\nu - \eta^{\mu\nu} \partial^2)(\partial^\rho \varphi \partial_\rho \varphi - \frac{1}{2}(d-4) \partial^2 \varphi) ,
\]

for

\[
D^{\mu\sigma\rho} = \frac{1}{d-2} \left( \eta^{\mu\sigma} \partial^\rho + \eta^{\mu\rho} \partial^\sigma - \eta^{\rho\sigma} \partial^\mu \right)
- \frac{1}{(d-2)(d-1)} \left( \partial^\mu \partial^\nu - \eta^{\mu\nu} \partial^2 \right) \eta^{\rho\sigma} ,
\]

where \(\partial_\mu D^{\mu\sigma\rho} = 0\), \(\eta_{\mu\nu} D^{\mu\sigma\rho} = -\partial^\sigma \partial^\rho\), and

\[
T_{\varphi, 6}^{\mu\nu} = \partial^\mu \partial^2 \varphi \partial^\nu \partial^2 \varphi - 2 \partial_\mu \partial^\nu \partial^2 \varphi - 2 \partial^\mu \partial^\nu \partial^2 \varphi - \frac{1}{2} \eta^{\mu\nu} \partial^2 \varphi \partial^2 \varphi
+ \partial^\mu (\partial^\nu \partial^2 \varphi) + \partial^\nu (\partial^\mu \partial^2 \varphi) - \eta^{\mu\nu} \partial_\rho (\partial^\rho \varphi \partial^2 \varphi)
+ 8 D^{\mu\sigma\rho}(\partial_\sigma \partial_\rho \varphi) - \frac{1}{d-1}(\partial^\mu \partial^\nu - \eta^{\mu\nu} \partial^2)O
+ \lambda D_B^{\mu\sigma\rho}(\partial_\sigma \partial_\rho \varphi) ,
\]

where

\[
D_B^{\mu\sigma\rho} = D^{\mu\sigma\rho} \partial^2 - \frac{1}{d-1}(\partial^\mu \partial^\nu - \eta^{\mu\nu} \partial^2) \partial^\sigma \partial^\rho .
\]

It is useful to note that

\[
D_B^{\mu\sigma\rho}(\partial_\sigma v_\rho + \partial_\rho v_\sigma) = 0 , \quad D_B^{\mu\sigma\rho} \eta_{\sigma\rho} = 0 , \quad \partial_\mu D_B^{\mu\sigma\rho} = 0 , \quad \eta_{\mu\nu} D_B^{\mu\sigma\rho} = 0 .
\]

The terms in the expressions for \(T_{\varphi, 4}^{\mu\nu}\) and \(T_{\varphi, 6}^{\mu\nu}\) involving the second- and higher-order derivative operators \(D^{\mu\sigma\rho}\), \(\partial^\mu \partial^\nu - \eta^{\mu\nu} \partial^2\) and \(D_B^{\mu\sigma\rho}\) arise from explicit curvature-dependent terms in the curved-space action and represent improvement terms to be added to the canonical energy-momentum tensor. In particular the contribution involving \(D_B^{\mu\sigma\rho}\) comes from the reduction of a term in the curved-space result proportional to \(\partial_\mu \varphi \partial_\nu \varphi B^{\mu\nu}\), with \(B^{\mu\nu}\) the Bach tensor, and this gives

\[
\lambda = - \frac{8}{d-4} .
\]

The results for \(T_{\varphi, 4}^{\mu\nu}\) and \(T_{\varphi, 6}^{\mu\nu}\) in (2.2) and (2.4) obey the conservation and trace conditions,

\[
\partial_\mu T_{\varphi, 2p}^{\mu\nu} = (-1)^{p-1} (\partial^2)^p \varphi \partial^\nu \varphi , \quad \eta_{\mu\nu} T_{\varphi, 2p}^{\mu\nu} = (-1)^{p-1} \Delta_2 \partial^2 \varphi , \quad \Delta_2 = \frac{1}{2}(d-2p) ,
\]

which of course vanish on the relevant equations of motion \((\partial^2)^p \varphi = 0\).

Correlators and operator products in the free field theories are determined just by

\[
\langle \varphi(x) \varphi(0) \rangle_4 = \frac{1}{2(d-4)(d-2) S_d} \frac{1}{(x^2)^{\frac{1}{2}(d-4)}}, \quad \langle \varphi(x) \varphi(0) \rangle_6 = \frac{1}{8(d-6)(d-4)(d-2) S_d} \frac{1}{(x^2)^{\frac{1}{2}(d-6)}} .
\]
These are respectively singular when \( d \to 4, 6 \) but in (2.2), (2.4) the only terms not involving \( \partial \varphi \) have overall factors \( d - 4, d - 6 \) in each case. From this term, for both \( T_{\varphi,4}^{\mu \nu}, T_{\varphi,6}^{\mu \nu} \), we may verify for the leading term in the operator product

\[
S_d T_{\varphi,2p}^{\mu \nu}(x) \varphi(0) \sim -\frac{d \Delta_{2p}}{d-1} \frac{1}{(x^2)^{d-1}} \left( \frac{x^{\mu} x^{\nu}}{x^2} - \frac{1}{d} \eta^{\mu \nu} \right) \varphi(0). \tag{2.10}
\]

The coefficient is determined by Ward identities assuming \( T_{\varphi,2p}^{\mu \nu} \) is canonically normalised.

In free field theories any local operator formed from \( \varphi \) with derivatives at the same point can be decomposed in terms of conformal primaries and descendants, or derivatives, of conformal primaries of lower dimension. Since \( T^{\mu \nu} \) is a conformal primary the result in (1.1) is therefore unchanged for \( T^{\sigma \rho} \to T^{\sigma \rho} + \partial_{\rho} X^{\sigma \rho} \) for any local \( X^{\sigma \rho} \) expressible as a conformal primary or descendant. This ensures that, dropping also terms which vanish on the equations of motion,

\[
\langle T_{\varphi,4}^{\mu \nu}(x) T_{\varphi,6}^{\sigma \rho}(0) \rangle = 2 \langle T_{\varphi,4}^{\mu \nu}(x) \partial^\sigma \partial^\rho \varphi \partial^2 \varphi(0) \rangle,
\]

\[
\langle T_{\varphi,6}^{\mu \nu}(x) T_{\varphi,6}^{\sigma \rho}(0) \rangle = -3 \langle T_{\varphi,6}^{\mu \nu}(x) \partial^\sigma \partial^\rho \varphi \partial^2 \varphi(0) \rangle = 3 \langle T_{\varphi,6}^{\mu \nu}(x) \partial^\sigma \partial^2 \varphi \partial^\rho (\partial^2 \varphi(0) \rangle.
\]

We get, with \( \lambda \) as in (2.7),

\[
C_{T,\varphi,4} = -\frac{2d(d+4)}{(d-2)(d-1)}, \quad C_{T,\varphi,6} = \frac{3d(d+4)(d+6)}{(d-4)(d-2)(d-1)}. \tag{2.12}
\]

There is an obvious generalisation of (2.1) to actions with more derivatives, \( S_{2p} \) formed from \( (\partial^2)^p \varphi \) or \( \partial_{\mu} (\partial^2)^p \varphi \) for \( p = 2r \) or \( p = 2r + 1 \). On the basis of the results in (2.12) we may guess

\[
C_{T,\varphi,2p} = C_{T,S} \frac{p!(2d+2)p-1}{(-\frac{d}{2}+1)p-1}, \quad p = 1, 2, \ldots, \tag{2.13}
\]

where \( (a)_n = \Gamma(a+n)/\Gamma(a) \) is the Pochhammer symbol and \( C_{T,S} \) the free scalar result given in (1.3). The result (2.13) agrees with (1.2), (1.8) for the particular cases of \( d \).

3. Higher-order \((n-1)\)-Form Gauge Theories

In \( d = 2n \) dimensions free conformal theories can be formed from \((n-1)\)-form gauge fields \( A_{\mu_1 \ldots \mu_{n-1}} \) with \( n \)-form field strengths \( F_{\mu_1 \ldots \mu_n} = n \partial_{[\mu_1} A_{\mu_2 \ldots \mu_n]} \) with the gauge invariant action \( S_{n,0}[A] = -\frac{1}{2n!} \int d^{2n+2}x \; F_{\mu_1 \ldots \mu_n} F_{\mu_1 \ldots \mu_n} \), generalising the conformal invariant Maxwell theory in four dimensions. Here we consider the corresponding theory with two additional derivatives given by the action in \( d = 2n + 2 \) dimensions

\[
S_{n,2}[A] = -\frac{1}{2n!} \int d^{2n+2}x \; \partial^\lambda F_{\mu_1 \ldots \mu_n} \partial_\lambda F_{\mu_1 \ldots \mu_n}
= -\frac{1}{2(n-1)!} \int d^{2n+2}x \; \partial^\lambda F_{\mu_1 \ldots \mu_{n-1}} \partial_\lambda F_{\rho \mu_1 \ldots \mu_{n-1}}. \tag{3.1}
\]
This may be extended to a general curved background metric $\gamma_{\mu\nu}$ so as to be invariant under Weyl rescalings in the form

$$S_{n,2}[A] = - \frac{1}{2n!} \int d^{2n+2}x \sqrt{-\gamma} \left( \nabla^\lambda F_{\mu_1 \cdots \mu_n} \right) \nabla_\lambda F_{\mu_1 \cdots \mu_n}
+ \left( 2n P_{\lambda \rho} + (n + 2) \gamma_{\lambda \rho} \hat{R} \right) F^{\lambda \mu_1 \cdots \mu_{n-1}} F_{\mu_1 \cdots \mu_{n-1}}
+ c_W n(n - 1) W_{\mu\nu\lambda\rho} F^{\mu\nu\mu_1 \cdots \mu_{n-2}} F^{\rho}_{\mu_1 \cdots \mu_{n-2}}$$

(3.2)

where $P_{\lambda \rho} = \frac{1}{2n^2} (R_{\lambda \rho} - \gamma_{\lambda \rho} \hat{R})$ is the Schouten tensor, $\hat{R} = \frac{1}{2(d-1)} R$ a rescaled scalar curvature and $W_{\mu\nu\lambda\rho}$ the Weyl tensor. The Weyl tensor term is invariant under Weyl rescaling by itself and so, for $n > 1$, has an arbitrary coefficient. The expression for the action may be written in various forms with the aid of the identity, for $d$ arbitrary,

$$n \nabla_\lambda \nabla_\nu \left( F^{\lambda \mu_1 \cdots \mu_{n-1}} F_{\mu_1 \cdots \mu_{n-1}} + \nabla^\lambda F^{\mu_1 \cdots \mu_{n-1}} \right)
= - \nabla^\lambda F^{\mu_1 \cdots \mu_{n-1}} \nabla_\lambda F_{\mu_1 \cdots \mu_{n-1}}
+ \nabla^\lambda F^{\lambda \mu_1 \cdots \mu_{n-1}} \nabla_\lambda F_{\mu_1 \cdots \mu_{n-1}}
+ n (d - 2n) P_{\lambda \rho} + (n + 2) \gamma_{\lambda \rho} \hat{R}
+ c_W n(n - 1) W_{\mu\nu\lambda\rho} F^{\mu\nu\mu_1 \cdots \mu_{n-2}} F^{\rho}_{\mu_1 \cdots \mu_{n-2}},$$

(3.3)

depending on the Bianchi identity for $F^4$. Varying the metric in (3.3) determines the corresponding flat space energy momentum tensor for $(n - 1)$-form gauge fields involving two derivatives

$$n! T^{\mu\nu}_{n,2} = n \partial^\lambda F^{\mu_1 \cdots \mu_{n-1}} \partial_\lambda F^{\nu}_{\mu_1 \cdots \mu_{n-1}} + \partial^\mu F^{\mu_1 \cdots \mu_{n-1}} \partial^\nu F_{\mu_1 \cdots \mu_{n-1}}
- \frac{1}{2} \eta^{\mu\nu} \partial^\lambda F^{\mu_1 \cdots \mu_{n-1}} \partial_\lambda F_{\mu_1 \cdots \mu_{n-1}} + 2n \partial_\lambda \left( F^{\lambda \mu_1 \cdots \mu_{n-1}} \partial_\mu \left( F_{\mu_1 \cdots \mu_{n-1}} \right) \right)
- \frac{1}{2} n \partial^2 \left( F^{\mu_1 \cdots \mu_{n-1}} F_{\mu_1 \cdots \mu_{n-1}} \right) + n D^{\mu\nu\sigma\rho} \left( F^{\mu_1 \cdots \mu_{n-1}} F_{\rho_1 \cdots \rho_{n-1}} \right)
+ c_W n(n - 1) \varepsilon_W^{\mu_1 \cdots \mu_{n-2}} \partial_\sigma \partial_\rho \left( F_{\epsilon_1 \cdots \epsilon_{n-2}} F_{\kappa \mu_1 \cdots \mu_{n-2}} \right).$$

(3.4)

where $\partial = \frac{1}{2}(\partial - \bar{\partial})$. In the last line $\varepsilon_W$ is the projector for traceless tensors satisfying the symmetries of the Weyl tensor and has the properties $\varepsilon_W^{\mu_1 \cdots \mu_{n-2}} \epsilon^{\mu_1 \cdots \mu_{n-2}} = \varepsilon_W^{\mu_1 \cdots \mu_{n-2}} \epsilon^{\mu_1 \cdots \mu_{n-2}} = \varepsilon_W^{\mu_1 \cdots \mu_{n-2}} \epsilon^{\mu_1 \cdots \mu_{n-2}} = 0$. The energy-momentum tensor in (3.4) satisfies, using the Bianchi identity,

$$n! \partial_\mu T^{\mu\nu}_{n,2} = - n \partial^2 \partial_\mu F^{\mu_1 \cdots \mu_{n-1}} F_{\nu_{\mu_1 \cdots \mu_{n-1}}}, \quad n! \eta_{\mu\nu} T^{\mu\nu}_{n,2} = 0,$$

(3.5)

and so $T^{\mu\nu}_{n,2}$ is conserved subject to the equation of motion $\partial^2 \partial_\mu F^{\mu_1 \cdots \mu_{n-1}} = 0$.  

4In $d$-dimensions there is a conformal scalar

$$(4n + 2 - d) \left( (d - 2n) \nabla^\lambda F^{\mu_1 \cdots \mu_{n-1}} \nabla_\lambda F_{\mu_1 \cdots \mu_{n-1}} \right)
= - (n + 1) \left( (d - 2n) \nabla^2 + 2n \hat{R} \right) F^{\mu_1 \cdots \mu_{n-1}} F_{\mu_1 \cdots \mu_{n-1}},$$

which generalises an expression obtained by Parker and Rosenberg [22]. For $d = 4n + 2$ this is just the conformal Laplacian acting on $F^4$. 

6
In a Feynman type gauge the action (3.1) reduces to
\[ S_{n,2}[A] = - \frac{1}{2(n-1)!} \int d^{2n+2}x \, \partial^2 A_{\mu_1 \ldots \mu_{n-1}} \partial^2 A_{\mu_1 \ldots \mu_{n-1}}, \] (3.6)
so that in this gauge
\[ \langle A_{\mu_1 \ldots \mu_{n-1}}(x) A_{\nu_1 \ldots \nu_{n-1}}(0) \rangle = \frac{(n-2)!}{8n S_{2n+2}} \frac{1}{(x^2)^n} E^{(n-1)}_{\mu_1 \ldots \mu_{n-1}, \nu_1 \ldots \nu_{n-1}}, \] (3.7)
where
\[ E^{(n)}_{\mu_1 \ldots \mu_{n-1}, \nu_1 \ldots \nu_{n-1}} = \delta_{[\mu_1} \ldots \delta_{\mu_{n-1}]} \delta_{\nu_{n-1}]}^{\nu_1} \ldots \delta_{\nu_n]}, \] (3.8)
is the projector on to rank \( n \) antisymmetric tensors. Then, with \( F \) defined in (3.1), the
two-point function for \( F \), which is gauge independent, is given by
\[ \langle F_{\mu_1 \ldots \mu_n}(x) F_{\nu_1 \ldots \nu_n}(0) \rangle = \frac{n!}{4 S_{2n+2}} \frac{1}{(x^2)^n} E^{(n)}_{\mu_1 \ldots \mu_n, \lambda_1 \ldots \lambda_n I_{\lambda_1 \nu_1}(x) \ldots I_{\lambda_n \nu_n}(x)}, \] (3.9)
with \( I_{\lambda \nu}(x) \) determined by (1.2). The result (3.9) has the expected form for \( F_{\mu_1 \ldots \mu_n} \) a conformal primary of dimension \( n \).

For this theory the two-point function of the energy-momentum tensor is determined from
\[ \langle T^{\mu \nu}_{n,2}(x) T^{\rho \sigma}_{n,2}(0) \rangle = \langle T^{\mu \nu}_{n,2}(x) X^\rho_\sigma(0) \rangle, \] (3.10)
for, discarding total derivatives and terms which vanish on the equations of motion,
\[ n! X^\rho_\sigma = n \partial^\lambda F^{\mu_1 \ldots \mu_{n-1}} \partial_\lambda F_{\rho_1 \ldots \rho_n} + \partial^\rho F^{\mu_1 \ldots \mu_{n-1}} \partial_\rho F_{\mu_1 \ldots \mu_n}. \] (3.11)
The \( c_V \) contribution in (3.4) can also be dropped since this term is a conformal primary descendant of a conformal primary and does not contribute to (3.10). Using the two-point function (3.9) the combinatorics for arbitrary \( n \) can be handled with the identities
\[ E^{(n)}_{\mu_1 \ldots \mu_n, \sigma_1 \ldots \sigma_p \lambda_1 \ldots \lambda_n-p} E^{(n)}_{\mu_1 \ldots \mu_n, \rho_1 \ldots \rho_p \lambda_1 \ldots \lambda_n-p} = E^{(n)}_{\sigma_1 \ldots \sigma_p \lambda_1 \ldots \lambda_n-p \rho_1 \ldots \rho_n \lambda_1 \ldots \lambda_n-p}, \]
and, if \( n \geq 1 \),
\[ E^{(n)}_{\mu_1 \ldots \mu_n-1, \sigma_1 \ldots \sigma_p \lambda_1 \ldots \lambda_n-p} E^{(n)}_{\nu_1 \ldots \nu_{n-1}, \rho_1 \ldots \rho_p \lambda_1 \ldots \lambda_n-p} = B^{(n)}_{p} \delta_\mu^\nu \delta_\lambda^\lambda \ E^{(p)}_{\sigma_1 \ldots \sigma_p \lambda_1 \ldots \lambda_{p-1}} E^{(p)}_{\rho_1 \ldots \rho_p \lambda_1 \ldots \lambda_{p-1}} + C^{(n)}_{p} \eta_{\mu \nu} E^{(p)}_{\sigma_1 \ldots \sigma_p \rho_1 \ldots \rho_p}, \] (3.13)
where
\[ B^{(n)}_{p} = \frac{p! p!}{n! \Gamma(d-p)} = \frac{(n-p)! p!}{(n-n)! \Gamma(d-n+1)}, \]
Consistency requires \( B^{(n)}_{p} + d C^{(n)}_{p-1} = A^{(n)}_{p}, \)
Evaluating (3.10) then gives
\[ C^{\text{gauge}}_{T,n,2} = - \frac{2n(n+1)(n+3)(2n)!}{(n+2)n!2}. \] (3.15)
Note that $C_{T,n}^{\text{gauge}} = C_{T,\varphi,n}^4$ for $d = 4$.

Large $N$ methods, similar to those for the $O(N)$ and Gross–Neveu models, have been extended to an Abelian gauge theory coupled to $N$ fermions [23]. For $d = 4 + 2p$, $p = 0, 1, \ldots$, this becomes equivalent to a renormalisable theory with $N$ fermions and a higher-derivative gauge theory with a Lagrangian $-\frac{1}{4} F^{\mu\nu}(-\partial^2)^p F_{\mu\nu}$. Using the large $N$ results for $C_T$ and subtracting the free fermion contribution [23], in the notation used above, predicted that for the free gauge theory $C_{T,2}^{\text{gauge}} = (-1)^p 2(p + 2)(2p + 4)/(p + 1)!((p + 3)!)$.

For $p = 0$ this is the standard result and the case $p = 1$ agrees with (3.15) when $n = 2$.

4. $(n-1)$-Form Theories away from Integer Dimensions

The usual gauge invariant action for $(n-1)$-form gauge fields is only conformally invariant in $d = 2n$ dimensions although it may be extended, as in the previous section, in higher even dimensions with additional derivatives. However abandoning gauge invariance the action may be extended to be conformal for general $d$. The corresponding Weyl-invariant action on a curved-space background was obtained by Erdmenger [24], following from the construction of a conformal second-order differential operator on $k$-forms obtained by Branson [15], and the corresponding flat-space action for vector fields or one-forms was given in [24].

The curved-space action obtained in [24] may be expressed, with a similar notation to (3.2), as

$$S_{n,0}[A] = -\frac{1}{2n!} \int d^n x \sqrt{-\gamma} \left( F^{\mu_1 \ldots \mu_n} F_{\mu_1 \ldots \mu_n} + \alpha \nabla_\lambda A^{\lambda \mu_1 \ldots \mu_{n-2}} \nabla_{\rho} A^\rho_{\mu_1 \ldots \mu_{n-2}} \right) + \frac{1}{2} n(n - 2)(\gamma_\rho \mathcal{R} - 2(n - 1) P_{\lambda\rho}) A^{\lambda \mu_1 \ldots \mu_{n-2}} A^\rho_{\mu_1 \ldots \mu_{n-2}}$$

$$\alpha = n(n - 1) \frac{d - 2n}{d - 2n + 4}.$$  

On flat space this is tantamount to a particular choice of a covariant gauge fixing term [25].

The flat space energy-momentum tensor is then

$$n! T_{\mu\nu}^{n,0} = n F^{\mu_1 \ldots \mu_{n-1}} F^\nu_{\mu_1 \ldots \mu_{n-1}} - \frac{1}{2} \eta^{\mu\nu} F^{\mu_1 \ldots \mu_n} F_{\mu_1 \ldots \mu_n}$$

$$+ (n - 2) \alpha \partial_\lambda A^{\lambda \mu_1 \ldots \mu_{n-3}} \partial_\nu A^\nu_{\mu_1 \ldots \mu_{n-3}} - 2 \alpha A^{\mu_1 \mu_2 \ldots \mu_{n-2}} \partial_\nu A^\nu_{\mu_1 \ldots \mu_{n-2}}$$

$$- \frac{1}{2} n(n - 1)(d - 2n) D^{\mu\nu\sigma\rho} (A^{\mu_1 \ldots \mu_{n-2}} A_{\rho_{\mu_1 \ldots \mu_{n-2}}})$$

$$- \frac{n(d - 2n)}{4(d - 1)} (\partial_\nu \partial_\sigma - \eta_{\nu\sigma} \partial^2) (A^{\mu_1 \ldots \mu_{n-1}} A_{\mu_1 \ldots \mu_{n-1}}).$$

This satisfies

$$n! \partial_\mu T_{\mu\nu}^{n,0} = \left( n \partial_\mu F^{\mu_1 \ldots \mu_{n-1}} + \alpha \partial_\mu A^{\mu_2 \ldots \mu_{n-1}} \right) F^\nu_{\mu_1 \ldots \mu_{n-1}} - \alpha \partial_\mu A^{\mu_1 \ldots \mu_{n-2}} A^\nu_{\mu_1 \ldots \mu_{n-2}},$$

$$n! \eta_{\mu\nu} T_{\mu\nu}^{n,0} = - \frac{1}{4} (d - 2n) \left( n \partial_\mu F^{\mu_1 \ldots \mu_{n-1}} + \alpha \partial_\mu A^{\mu_2 \ldots \mu_{n-1}} \right) A_{\mu_1 \ldots \mu_{n-1}}.$$
and so the energy-momentum tensor is conserved and traceless on the equations of motion. Of course for \( d = 2n \), \( T_{\mu\nu}^{\mu\nu} \) reduces to the usual gauge invariant form.

The two-point function for the \((n-1)\)-form field determined by the action \( \mathcal{A} \) on flat space was calculated in \cite{24} by inverting the Fourier transform of the kinetic differential operator and then returning to \( x \)-space giving

\[
\langle A_{\mu_1...\mu_{n-1}}(x) A_{\nu_1...\nu_{n-1}}(0) \rangle = \frac{(n-1)!}{(d-2n)} \frac{1}{S_d} \frac{1}{(x^2)^{(d-2)/2}} \mathcal{E}^{(n-1)}_{\mu_1...\mu_{n-1},\lambda_1...\lambda_{n-1}} I_{\lambda_1 \nu_1}(x) \ldots I_{\lambda_{n-1} \nu_{n-1}}(x),
\]

which has the form required by conformal invariance for \( A_{\mu_1...\mu_{n-1}} \) a conformal primary. From \cite{44}

\[
\langle F_{\mu_1...\mu_0}(x) A_{\nu_1...\nu_{n-1}}(0) \rangle = \frac{n!}{(d-2n)} \frac{1}{S_d} \frac{1}{(x^2)^{(d-2)/2}} \delta_\eta \frac{1}{(x^2)^{d/2}} x^\eta \mathcal{E}^{(n)}_{\mu_1...\mu_{n-1},\lambda_1...\lambda_{n-2}} I_{\lambda_1 \nu_1 \ldots \nu_{n-1}},
\]

and

\[
\langle F_{\mu_1...\mu_n}(x) F_{\nu_1...\nu_n}(0) \rangle = \frac{n!}{S_d} \partial_\rho \left( \frac{1}{(x^2)^{d/2}} x^\rho \right) \mathcal{E}^{(n)}_{\mu_1...\mu_{n-1},\lambda_1...\lambda_{n-1}} \mathcal{E}^{(n)}_{\rho \lambda_1...\lambda_{n-1},\nu_1...\nu_n}
\]

This has the conformally invariant form in terms of the inversion tensor only when \( d = 2n \) and is identical in this case to the expression obtained for gauge choices for \( A_{\mu_1...\mu_{n-1}} \) other than that implicit in \cite{14} \cite{21}.

As in other cases, evaluating the energy-momentum tensor two-point function can be simplified to

\[
\langle T_{\mu\nu}^{\mu\nu}(x) T_{\alpha\beta}^{\alpha\beta}(0) \rangle = \langle T_{\mu\nu}^{\mu\nu}(x) Y_{n}^{\alpha\beta}(0) \rangle, \quad n! Y_{n}^{\alpha\beta} = n F_{\sigma}^{\mu_1...\mu_{n-1}} F_{\mu_1...\mu_{n-1}} + (n-2) \alpha \partial_\lambda A^{\sigma \mu_1...\mu_{n-3}} \partial_\rho A^{\alpha \mu_1...\mu_{n-3}} - 2 \alpha A^{\sigma \mu_1...\mu_{n-2}} \partial_\rho A^{\alpha \mu_1...\mu_{n-2}}.
\]

This then determines

\[
C_{T,n} = \frac{d}{d-1} \frac{(d-n+2)_n}{(n-1)!}, \quad n = 1, 2, \ldots.
\]

As expected \( C_{T,1} = C_{T,2} \). The corresponding result for \((n-1)\)-form gauge fields in \( d = 2n \) dimensions, whose energy-momentum tensor is obtained just from the \( FF \) terms in \cite{13}, is

\[
C_{T,n,0}^{\text{gauge}} = \frac{2n^2(2n-2)!}{(n-1)!^2}, \quad \text{[21].}
\]

This is not equal to \( C_{T,n} \) in \cite{18} when \( d = 2n \), although \cite{12} apparently reduces to the required form for this \( d \). The difference arises since

\[\text{If the energy-momentum tensor \cite{12} is restricted to the gauge-invariant FF terms and we use \cite{13} then the resulting two-point function is not of the required conformal form \cite{11}. If \( C_T \) is identified through the coefficient of the \( \ldots \) term for \( n = 2 \) then \( C_{T,2} = \frac{1}{4} d^2 (d-2) \) as obtained in \cite{23}. This prescription in general gives \( C_{T,n} = \frac{1}{4} d^2 (d-2) \ldots (d-n)/(n-1)! \).}
the \(AA\) two-point function in (4.4) is also singular when \(d = 2n\). The representation of the conformal group generated from a conformal primary \(A_{\mu_1...\mu_{n-1}}\) is reducible when \(d = 2n\) and an irreducible representation for the associated gauge theory is obtained by quotienting by the invariant subspace corresponding to gauge transformations. Since \(C_T\) is related to the number of degrees of freedom it is expected to differ between the gauge theory and that corresponding to the \((n-1)\)-form \(A_{\mu_1...\mu_{n-1}}\).

To demonstrate this further we may consider the Fourier transform of the two-point function in (4.4) letting \(1/2(d-2)\to \Delta, k = n-1\) and also setting the overall coefficient to 1,

\[
\pi^{\frac{d}{2}} \frac{\Gamma(\Delta - \frac{1}{2}d + 1)}{\Gamma(\Delta + 1)} F(p^2) A_{\mu_1...\mu_k, \nu_1...\nu_k}(p), \quad F(p^2) = -\frac{\pi}{\sin \pi(\Delta - \frac{1}{2}d)} \left(\frac{1}{2}p^2\right)^{\frac{1}{2}d},
\]

\[
A_{\mu_1...\mu_k, \nu_1...\nu_k}(p) = \left((\Delta - k) \delta^\rho_\nu - 2k(\Delta - \frac{1}{2}d) \frac{1}{p^2} \rho_\nu\right) E^{(k)}(\mu_1...\mu_k, \nu_1...\nu_k). \tag{4.9}
\]

Noting that \((F(p^2) - i\epsilon) - F(p^2 + i\epsilon))/2\pi\epsilon = \theta(-p^2) \left(-\frac{1}{2}p^2\right)^{\frac{1}{2}d}\) unitarity requires that the matrix \(A_{\mu_1...\mu_k, \nu_1...\nu_k}(p)\) should be positive definite for \(p^2 < 0\). The eigenvalues are \(\Delta - k,\ d - \Delta - k\), but for the the second case the eigenvectors \(p_{\mu_1, \epsilon_{\mu_2...\mu_k}}\) have negative norm for \(p^2 < 0\) so that we must have, for a unitary CFT of \(k\)-forms,

\[
\Delta > k, \quad \Delta > d - k. \tag{4.10}
\]

When \(\Delta = k\) or \(\Delta = d-k\) there are zero modes related to the reducibility of the representation. For the case of interest above \(\Delta = \frac{1}{2}(d-2)\) and \(\Delta = k\) corresponds to \(d = 2n\). For \(d\) an integer it should be noted that the conditions (4.10) are invariant under duality \(A_{\mu_1...\mu_k} \to (^*A)_{\mu_1...\mu_{d-k}}\).

5. Conformal Primary Operators

The energy-momentum tensor is a conformal primary operator. The detailed expressions in (2.2) and (2.4) are necessary to ensure this and we show here how they can be recovered by requiring \(T_{\varphi,\mu_1...\mu_k}\) to be a conformal primary, and that this determines the parameter \(\lambda\) in accord with (2.7), although this term is conserved and traceless by itself.

For a local tensor operator \(X_{\alpha_1...\alpha_n}\) formed from multinomials in \(\varphi\) and derivatives at \(x = 0\) we define

\[
[K_\mu, \partial_\mu] X_{\alpha_1...\alpha_n} = b_\mu D X_{\alpha_1...\alpha_n} + \sum_i \left( b_{\alpha_i} X_{\alpha_1...\mu...\alpha_n} - \eta_{\mu\alpha_i} b^\lambda X_{\alpha_1...\lambda...\alpha_n}\right), \tag{5.1}
\]

with

\[
D \partial_\mu = \partial_\mu (D + 1), \quad D X_{\alpha_1...\alpha_n} = \Delta_X X_{\alpha_1...\alpha_n}, \tag{5.2}
\]

where \(\Delta_X\) is determined just by counting the number of derivatives and fields \(\varphi\) in \(X_{\alpha_1...\alpha_n}\). For any conformal primary \(X_A, A = \{\alpha_1...\alpha_n\}\), then \(K_\mu X_A = 0\) (this is of course the usual condition \(K_\mu X_A(0) = 0\)). Otherwise \(X_A\) is not a conformal primary and generates
a reducible representation of the conformal group. Acting with \( K_b \) removes derivatives so that for some finite \( N \), \( K_b^{N+1} X_A = 0 \) and hence we can write \( K_b^N X_A = \sum_{r,l} f_{A,r,l}(b) O_l \), where \( \{ O_l \} \) is a basis of conformal primaries with \( \Delta_{O_l} = \Delta_X - N \) and \( f_{A,r,l}(b) = O(b^N) \). For \( Y_A = \sum_{r,l} D_{A,r,l}(\partial) O_l \) then \( K_b^N (X_A - Y_A) = 0 \) gives \( \sum_{s,l} M_{l,s,l} D_{A,s,l}(b) = f_{A,r,l}(b) \). Extending \( \{ f_{A,r,l}(b) \} \) to include all possible rotationally covariant forms, with \( f_{A,r,l} = 0 \) for some \( r \) if necessary, \( M \) is a square matrix and we may solve for \( D_{A,r,l}(b) \) unless \( \{ O_l \} \) have conformal primary descendants with \( N \) derivatives so that \( \det M = 0 \). For generic \( \Delta_X \) this does not arise. Iterating this construction then gives the conformal primary descendants with \( N \) derivatives so that \( \det M = 0 \). For particular \( \Delta_X \), the representation space obtained from \( X_A \) is reducible but not decomposable.

The result (5.11) can be extended successively to multiple derivatives. For a scalar conformal primary \( \varphi \) with scale dimension \( \delta \), so that \( D \varphi = \delta \varphi \), and an arbitrary vector \( a \), we have
\[
K_b (a \cdot \partial)^n \varphi = n(n+1) a \cdot b (a \cdot \partial)^{n-1} \varphi - \frac{1}{2} n(n-1) a^2 b \cdot \partial (a \cdot \partial)^{n-2} \varphi , \tag{5.3}
\]
from which, by acting with \( \partial_a \cdot \partial_a \),
\[
K_b (a \cdot \partial)^n \partial^2 \varphi = n(n+1) a \cdot b (a \cdot \partial)^{n-1} \partial^2 \varphi + (2\delta + 2 - d) b \cdot \partial (a \cdot \partial)^n \varphi - \frac{1}{2} n(n-1) a^2 b \cdot \partial (a \cdot \partial)^{n-2} \varphi . \tag{5.4}
\]
From (5.3) then
\[
\Phi_n(a) = a^{\mu_1} \ldots a^{\mu_n} \Phi_{\mu_1 \ldots \mu_n} = \sum_{r=0}^{n} \binom{n}{r} (-1)^r (\delta) \partial^{n-r} \varphi (a \cdot \partial)^{n-r} \varphi \tag{5.5}
\]
satisfies \( K_b \Phi_n(a) = O(a^2) \) and so taking \( a^2 = 0 \), which projects out the traces, this demonstrates that \( \Phi_n(a) \) defines a symmetric traceless conformal primary with \( \Delta_{\Phi_n} = 2\delta + n \) and twist \( 2\delta \) [20]. For higher twist results are more complicated. In the following we will work out \( O(a^2) \) terms in a few examples and obtain some results for higher twist. Note that (5.5) of course gives \( \Phi_n(a) = 0 \) for \( n \) odd.

In the remainder of this section we apply the procedure outlined above for constructing conformal primaries. Initially we construct a conformal primary starting from \( \partial_{\mu} \varphi \partial_{\nu} \varphi \). Using (5.1) we get
\[
K^2_b (\partial_{\mu} \varphi \partial_{\nu} \varphi) = 2\delta^2 b_{\mu} b_{\nu} \varphi^2 , \tag{5.6}
\]
and also
\[
K^2_b (\partial_{\mu} \partial_{\nu} \varphi^2) = 2\delta (2\delta + 1) b_{\mu} b_{\nu} - \eta_{\mu \nu} b^2 \varphi^2 . \tag{5.7}
\]
Hence, a symmetric tensor conformal primary with dimension \( \Delta_{O_{2,\mu \nu}} = 2\delta + 2 \) and twist \( 2\delta \) is given by
\[
O_{2,\mu \nu} = \partial_{\mu} \varphi \partial_{\nu} \varphi - \frac{\delta}{2(2\delta + 1)} \left( \partial_{\mu} \partial_{\nu} + \frac{1}{4\delta + 2 - d} \eta_{\mu \nu} \partial^2 \right) \varphi^2
\]
\[
= - \partial_{\mu} \partial_{\nu} \varphi + \frac{1}{2(2\delta + 1)} \left( (\delta + 1) \partial_{\mu} \partial_{\nu} - \frac{\delta}{4\delta + 2 - d} \eta_{\mu \nu} \partial^2 \right) \varphi^2 , \tag{5.8}
\]
so that $K_b O_{2,\mu\nu} = 0$. A scalar conformal primary is then

$$\eta^{\mu\nu} O_{2,\mu\nu} = -\partial^2 \varphi + \frac{2\delta + 2 - d}{2(4\delta + 2 - d)} \partial^2 \varphi^2. \tag{5.9}$$

For $\delta = \frac{1}{2}(d - 2)$ we have

$$T_{\varphi, 2,\mu\nu} = O_{2,\mu\nu} - \frac{1}{2} \eta_{\mu\nu} O_{2,\sigma\sigma}. \tag{5.10}$$

With more derivatives the construction becomes more lengthy as the descendants of more conformal primaries have to be subtracted. To construct conformal primary symmetric tensors with four derivatives we start from

$$K_b^4 ((a \cdot \partial)^4 \varphi \varphi) = 6\delta(\delta + 1)(4(\delta + 2)(\delta + 3)(a \cdot b)^4 - 12(\delta + 2)(a \cdot b)^2a^2b^2 + 3(a^2b^2)^2)\varphi^2. \tag{5.11}$$

This can be cancelled by terms involving four derivatives acting on $\varphi^2$ so that

$$K_b^4 ((a \cdot \partial)^4 \varphi \varphi - D_{4,\varphi^2} \varphi^2) = -6(\delta + 2)(2(\delta + 3)(a \cdot b)^2 - a^2b^2)O_{2,aa} + 24(\delta + 2)a \cdot b a^2 O_{2,ab} + 6(a^2)^2 O_{2,bb}, \tag{5.12}$$

where

$$D_{4,\varphi^2} = \frac{1}{4(2\delta + 1)(2\delta + 3)} \left( (\delta + 2)(\delta + 3)(a \cdot \partial)^4 - \frac{6\delta(\delta + 2)}{4\delta + 2 - d} a^2(a \cdot \partial)^2 \partial^2 + \frac{3\delta(\delta + 1)}{(4\delta + 2 - d)(4\delta + 4 - d)} (a^2)^2(\partial^2)^2 \right), \tag{5.13}$$

and $O_{2,aa} = a^\mu a^\nu O_{2,\mu\nu}$ with $O_{2,\mu\nu}$ the conformal primary given by (5.8). By adding extra contributions with two derivatives acting on $O_{2,\mu\nu}$ the remaining terms in (5.12) may be cancelled so as to obtain a four index conformal primary

$$a^\mu a^\nu a^\sigma a^\rho O_{4,\mu\nu\sigma\rho} = (a \cdot \partial)^4 \varphi \varphi - D_{4,\varphi^2} \varphi^2 - D_{4}^{\mu\nu} O_{2,\mu\nu}, \tag{5.14}$$

where

$$D_{4}^{\mu\nu} = -\frac{3}{2\delta + 5} (\delta + 3)(a \cdot \partial)^2 - \frac{\delta + 2}{4\delta + 6 - d} a^2 \partial^2 a^\mu a^\nu + \frac{3}{(2\delta + 5)(4\delta + 6 - d)} (a^2 a^\mu \partial a^\nu) + \frac{1}{2\delta + 3 - d} (a^2)^2 \partial^2 \eta^{\mu\nu}. \tag{5.15}$$

It is straightforward to check that $K_b O_{4,\mu\nu\sigma\rho} = 0$, as guaranteed by the fact that there are no primaries with three derivatives and two $\varphi$’s. By acting with $\partial_a \cdot \partial_a$ we obtain a spin-two
primary with twist $2\delta + 2$,

$$\eta^\rho a^\mu a^\nu O_{4,\mu\nu\rho\sigma} = (a \cdot \partial)^2 \partial^\alpha \varphi$$

$$= \frac{2\delta + 2 - d}{4(2\delta + 1)(4\delta + 2 - d)} ((\delta + 2)(a \cdot \partial)^2 \partial^2 - \frac{\delta}{4\delta + 4 - d} a^2 (\partial^2)^2) \varphi^2$$

$$+ \frac{1}{2(4\delta + 6 - d)} ((2\delta + 2 - d)(\partial^2 a^\mu a^\nu + \frac{2}{2\delta + 3 - d} a^2 \partial^\mu \partial^\nu) O_{2,\mu\nu}$$

$$+ \frac{1}{2(2\delta + 3)(4\delta + 6 - d)} \left( (2(\delta + 1)(2\delta + 5) - d(\delta + 2)) (a \cdot \partial)^2 \right.$$ 

$$\left. - \frac{2\delta^2 + 5\delta + 5 - d(\delta + 1)}{2\delta + 3 - d} a^2 \partial^\alpha \varphi \right) \eta^\mu_\nu O_{2,\mu\nu} ,$$

as well as a scalar primary,

$$\eta^\rho_\mu \eta^\sigma_\nu O_{4,\mu\nu\rho\sigma} = (\partial^2)^2 \varphi \varphi - \frac{(\delta + 1)(2\delta + 2 - d)(2\delta + 4 - d)}{2(2\delta + 1)(4\delta + 2 - d)(4\delta + 4 - d)} (\partial^2)^2 \varphi^2$$

$$+ \frac{2\delta + 4 - d}{2\delta + 3 - d} \left( \partial^\mu \partial^\nu + \frac{2\delta + 2 - d}{4\delta + 6 - d} \partial^2 \eta^\mu_\nu \right) O_{2,\mu\nu} .$$

For $\delta = \frac{1}{2}(d - 4)$,

$$T_{\varphi,4,\mu\nu} = 2 O_{4,\mu\nu\sigma\rho} - \frac{1}{2} \eta_{\mu\nu} O_{4,\sigma\rho\sigma\rho} .$$

In this case $4\delta + 6 - d = d - 2$ and the construction of $T_{4,\mu\nu}$ fails when $d = 2$ since then $O_{2,\mu\nu}$ has a spin two conformal primary descendant with two derivatives.

For six derivatives (5.11) is extended to

$$K_4^6 ((a \cdot \partial)^6 \varphi \varphi) = 90\delta(\delta + 1)(\delta + 2)(8(\delta + 3)(\delta + 4)(\delta + 5)(a \cdot b)^6$$

$$- 60(\delta + 3)(\delta + 4)(a \cdot b)^3 a^2 b^2$$

$$+ 90(\delta + 3)(a \cdot b)^2(a^2 b^2)^2 - 15(a^2 b^2)^3) \varphi^2 .$$

Then,

$$K_4^6 ((a \cdot \partial)^6 \varphi \varphi - D_{6,\nu\varphi\sigma} \varphi^2)$$

$$= - 90(\delta + 2)(\delta + 3) \left( (a \cdot b)^2(\delta + 4)(\delta + 5)(a \cdot b)^2 - 3 a^2 b^2) O_{2,aa}$$

$$+ 3(a^2 b^2)^2 O_{2,aa} - 8 a \cdot b a^2 (2(a \cdot b)^2 - 3 a^2 b^2) O_{2,ab}$$

$$+ 6(a^2)^2 (2(\delta + 3)(a \cdot b)^2 - a^2 b^2) O_{2,ab} ,$$

(5.19)
with
\[ D_{6,\varphi^2} = \frac{1}{8(2\delta + 5)} \left( (\delta + 3)(\delta + 4) \left( \frac{\delta + 5}{(2\delta + 1)(2\delta + 3)} (a \cdot \partial)^2 - \frac{15\delta}{(4\delta(\delta + 2) + 3)(4\delta + 2 - d)} a^2 \partial^2 \right) (a \cdot \partial)^4 \right. \]
\[ + \left. \frac{15\delta(\delta + 1)}{(4\delta + 2 - d)(4\delta + 4 - d)} \left( \frac{3(\delta + 3)}{4\delta(\delta + 2) + 3} (a \cdot \partial)^2 - \frac{\delta + 2}{(2\delta + 1)(2\delta + 3)(4\delta + 6 - d)} a^2 \partial^2 \right) (a^2 \partial^2)^2 \right). \]
\[
(5.21)
\]

Further, we have
\[ K_b^2 \left( (a \cdot \partial)^6 \partial \varphi - D_{6,\varphi^2} O_{2,\mu\nu} - D_{6,\varphi^2} \varphi^2 \right) \]
\[ = 15(\delta + 4)(2(\delta + 5)(a \cdot b)^2 - a^2 b^2) O_{4,aaaaa} - 120(\delta + 4) a \cdot b a^2 O_{4,aabbb} + 90(a^2)^2 O_{4,aaaab}, \]
\[
(5.22)
\]

with
\[ D_{6}^{\mu\nu} = -\frac{15}{4(2\delta + 5)(2\delta + 7)} \left( (\delta + 4)(\delta + 5)(a \cdot \partial)^4 - \frac{6(\delta + 2)(\delta + 4)}{4\delta + 6 - d} a^2 (a \cdot \partial)^2 \partial^2 \right. \]
\[ + \left. \frac{3(\delta + 2)(\delta + 3)}{(4\delta + 6 - d)(4\delta + 8 - d)} (a^2)^2 (\partial^2)^2 a^\mu a^\nu \right. \]
\[ - \left. \frac{45}{(2\delta + 5)(2\delta + 7)(4\delta + 6 - d)} \left( (\delta + 4)(a \cdot \partial)^2 - \frac{\delta + 2}{4\delta + 8 - d} a^2 \partial^2 \right) a^2 a \cdot \partial a(\mu \partial \nu) \right) \]
\[ - \left. \frac{45}{2(2\delta + 5)(2\delta + 7)(2\delta + 3 - d)(4\delta + 6 - d)(4\delta + 8 - d)} \right. \]
\[ \times \left. \left( 4\delta^2 + 26\delta + 36 - d(\delta + 5) \right) (a \cdot \partial)^2 - (\delta + 2) a^2 \partial^2 \right) (a^2)^2 \partial^2 \partial^\nu \]
\[ + \left. \frac{45}{2(2\delta + 3)(2\delta + 5)(2\delta + 7)(4\delta + 6 - d)} \right. \]
\[ \left. \left( (\delta + 4)(a \cdot \partial)^4 - \frac{2\delta^2 + 19\delta + 30 - 3d}{(2\delta + 3 - d)(4\delta + 8 - d)} a^2 (a \cdot \partial)^2 \partial^2 \right) \right. \]
\[ - \left. \frac{\delta + 2}{(2\delta + 3 - d)(4\delta + 8 - d)} (a^2)^2 (\partial^2)^2 \right) a^2 \eta^{\mu \nu}. \]
\[
(5.23)
\]

A two-derivative operator on $O_{4,\mu\nu\sigma\rho}$ can now be constructed to obtain a conformal primary with six indices, namely
\[ a^\mu a^\nu a^\rho a^\tau a^\omega O_{6,\mu\nu\rho\sigma\tau\omega} = - (a \cdot \partial)^6 \varphi \varphi + D_{6,\varphi^2} \varphi^2 + D_{6}^{\mu\nu} O_{2,\mu\nu} + D_{6}^{\mu\nu\rho} O_{4,\mu\nu\rho}, \]
\[
(5.24)
\]
where
\[
\mathcal{D}_{\rho \sigma \mu \nu} = \frac{15}{2(2\delta + 9)} \left( (\delta + 5)(a \cdot \partial)^2 - \frac{\delta + 4}{4\delta + 10 - d} a^2 \partial^2 \right) a^\mu a^\nu a^\sigma a^\rho \\
+ \frac{30}{(2\delta + 9)(4\delta + 10 - d)} a \cdot \partial a^\mu a^\nu a^\sigma a^\rho \\
+ \frac{45}{(2\delta + 9)(2\delta + 3 - d)(4\delta + 10 - d)} (a^2)^2 a^\mu a^\nu a^\rho \\
- \frac{45}{(2\delta + 7)(2\delta + 9)(4\delta + 10 - d)} (a \cdot \partial)^2 + \frac{1}{2\delta + 3 - d} a^2 \partial^2 a^\mu a^\nu \eta^{\sigma \rho}) \\
- \frac{180}{(2\delta + 7)(2\delta + 9)(2\delta + 3 - d)(4\delta + 10 - d)} (a^2)^2 a \cdot \partial a^\mu a^\nu \eta^{\sigma \rho} \\
- \frac{90}{(2\delta + 7)(2\delta + 9)(2\delta + 3 - d)(2\delta + 5 - d)(4\delta + 10 - d)} (a^2)^2 \partial (\mu a^\nu \eta^{\sigma \rho}) \\
+ \frac{90}{(2\delta + 5)(2\delta + 7)(2\delta + 9)(2\delta + 3 - d)(4\delta + 10 - d)} \\
\times (a \cdot \partial)^2 + \frac{1}{2\delta + 5 - d} a^2 \partial^2 (a^2)^2 \eta^{\mu \nu \eta^{\sigma \rho}}.
\] (5.25)

We have \( K_\varphi O_{6, \mu \nu \sigma \rho \tau \omega} = 0 \) since there are no conformal primaries with five derivatives and two \( \varphi \)'s.

A four-index as well as a two-index and a scalar conformal primary can be obtained from \( O_6 \) by acting with \( \partial_a \cdot \partial_a \). To avoid even more lengthy expressions we only list here the scalar primary,

\[
\eta^{\mu \nu} \eta^{\sigma \rho} \eta^{\tau \omega} O_{6, \mu \nu \sigma \rho \tau \omega} = -(\partial^2)^3 \varphi \\
+ \frac{(\delta + 2)(2\delta + 2 - d)(2\delta + 4 - d)(2\delta + 6 - d)}{4(2\delta + 1)(2\delta + 2 - d)(4\delta + 4 - d)(4\delta + 6 - d)} (\partial^2)^3 \varphi^2 \\
- \frac{3(2\delta + 4 - d)(2\delta + 6 - d)}{2(2\delta + 3 - d)(4\delta + 6 - d)} (\partial^2 \eta^{\mu \nu}) \\
\quad + \frac{2\delta^2 + 5\delta + 1 - (\delta + 2)d}{(2\delta + 3)(4\delta + 8 - d)} \partial^2 \eta^{\mu \nu} \partial^2 O_{2, \mu \nu} \\
+ \frac{3(2\delta + 6 - d)}{2(2\delta + 5 - d)} (2 \partial^2 \eta^{\mu \nu} + \frac{2\delta + 3 - d}{4\delta + 10 - d} \partial^2 \eta^{\mu \nu}) O_{4, \mu \nu \sigma \rho}.
\] (5.26)

For \( \delta = \frac{1}{2}(d - 6) \) we can express

\[
T_{\varphi, 6, \mu \nu} = 3 O_{6, \mu \nu \sigma \rho \rho} - \frac{1}{2} \eta_{\mu \nu} O_{6, \tau \tau \sigma \rho \rho}, \quad \text{if} \quad \lambda = -\frac{8}{d - 4}.
\] (5.27)

Thus, we see that the requirement that \( T_{\varphi, 6, \mu \nu} \) be a conformal primary determines \( \lambda \), independently and consistently with the result (2.7) obtained from the curved-space action contribution of the Bach tensor.

The poles in (5.13), (5.15), (5.21), (5.22), (5.23) at \( 4\delta = 4 - 2k \), for \( k = 1, 2, \ldots \), arise for these \( \delta \) since there are corresponding differential operators generating conformal primary
descendants given by, for $O_{\mu_1...\mu_\ell}$ a symmetric traceless tensor,

$$D_{n,\ell}^{\mu_1...\mu_\ell} O_{\mu_1...\mu_\ell} = \sum_{r=0,-n}^\ell (-1)^r \frac{(\frac{1}{2} d + \ell + n - 1)_r}{2r! (\ell - r)! (n + r)!} (a \cdot \partial)^{\ell-r} (\partial^2)^{n+r} a^{\mu_1} \ldots a^{\mu_r} \partial^{\mu_{r+1}} \partial^{\mu_\ell} O_{\mu_1...\mu_\ell},$$

$$a^2 = 0, \quad n + \ell \geq 1, \quad \Delta_O = \frac{1}{2} d - n - \ell,$$

(5.28)
is a conformal primary symmetric traceless tensor of rank $\ell$ and $\Delta = \frac{1}{2} d + n$. Thus $(\partial^2)^n O$ is a conformal primary scalar for $\Delta_O = \frac{1}{2} d - n$. The poles (5.15), (5.23), (5.25) at $2\delta = d - n$ for $n = 3, 5$ correspond to conformal primary descendants

$$\partial^{\mu_k} \ldots \partial^{\mu_\ell} O_{\mu_1...\mu_\ell}, \quad k = 1, \ldots, \ell, \quad \Delta_O = d + k - 2,$$

(5.29)

which are symmetric traceless tensors of rank $\ell - k$. There are also conformal primary traceless tensor descendants of the form

$$(a \cdot \partial)^k a^{\mu_1} \ldots a^{\mu_\ell} O_{\mu_1...\mu_\ell}, \quad a^2 = 0, \quad k = 1, 2, \ldots, \quad \Delta_O = 1 - \ell - k,$$

(5.30)
of rank $k + \ell$ and correspond to the poles at $2\delta = -n$ for $n = 1, 3, \ldots$.

6. Conclusion

In this paper we have computed $C_T$ for various free field theories outside the usual range. Although such theories involving higher derivatives in general correspond to non-unitary quantum field theories, they appear to be relevant in understanding some CFTs for large $N$ numbers of component fields where the $1/N$ expansion remains valid for arbitrary dimension $d$. Of course there are additional parameters, such as those associated with the energy-momentum tensor three-point function, one of which is related to $C_T$ by Ward identities. For the usual free CFTs these were also calculated in [6]. The theories discussed here might also be extended to determine the energy-momentum tensor three-point function, but the complexity of the expressions for $T_{\mu\nu}$ makes this a rather formidable task, as are the corresponding large $N$ calculations.

In general in even dimensions $C_T$ in a CFT is related to a particular term quadratic in the Weyl tensor in the energy-momentum tensor trace on a curved space background. In four and six dimensions, where the trace anomaly coefficients are $c$ and $c_3$, the relations are [16]

$$C_T = \frac{4}{3} \times 5! \, c, \quad C_T = \frac{3}{5} \times 7! \, c_3,$$

(6.1)

with a normalisation chosen so that for conventional free field theories $c, c_3$ are given by $5! \, c = n_S + 3 n_W + 12 n_A$, $7! \, c_3 = 2 n_S + 40 n_W + 180 n_B$ with $n_S$ scalars, $n_W$ Weyl fermions and $n_A, n_B$ the number of vector, 2-form gauge fields in four, six dimensions. There is of course complete agreement between the results for $C_T$ and the curved space results based on using the heat kernel for second-order conformal differential operators. The results obtained here allow some contributions to the heat kernel for higher-order operators on curved backgrounds to be obtained. These have been discussed for Ricci flat backgrounds in [27].
Heat kernel techniques allow a perturbation expansion for arbitrary curved backgrounds so as to determine the leading corrections to \( c, c_3 \). In six dimensions for a cubic interaction \( \frac{1}{6} \lambda_{ijk} \phi_i \phi_j \phi_k \) then results in [16][25] give to lowest order

\[
7! c_{3,1} = -\frac{7}{36} \hat{\lambda}_{ijk} \hat{\lambda}_{ij}, \quad \hat{\lambda}_{ijk} = \lambda_{ijk}/(4\pi)^{\frac{d}{2}}.
\]

For the theory defined by (1.5), where \( \phi_i \rightarrow (\sigma, \varphi_i) \), \( \hat{\lambda}_{ijk} \hat{\lambda}_{ij} = 3N \hat{g}^2 + \hat{\lambda}^2 \) and to lowest order \( \beta_g = -\frac{1}{2} \epsilon \hat{g} + \frac{1}{112} (N - 8) \hat{g}^3 - \hat{g}^2 \hat{\lambda} + \frac{1}{12} \hat{g} \hat{\lambda}^2 \), \( \beta_{\hat{\lambda}} = -\epsilon \hat{\lambda} - N \hat{g}^2 + \frac{1}{12} N \hat{g}^2 \hat{\lambda} - \frac{3}{4} \hat{\lambda}^3 \), so that at the fixed point, to leading order in \( \epsilon, 1/N \), \( \hat{g}^2 = 6\epsilon/N \), \( \hat{\lambda}^2 = 6^3\epsilon/N \) and hence in (1.3), (1.5) gives for the CFT at \( d = 6 - \epsilon \) for large \( N \)

\[
C_{T,1} = 1 - \frac{7}{9} \epsilon,
\]

agreeing with the perturbative flat space calculation in [10] and also the expansion of the large \( N \) result. The corresponding results for four-dimensional renormalisable theories were obtained some time ago. For \( n_A \) gauge fields, with a simple gauge group and coupling \( g \), Dirac fermions and Yukawa, scalar interactions \( \bar{\psi} Y \psi \phi_i \), \( \frac{1}{2} \hat{\lambda}_{ijkl} \bar{\phi}_i \phi_j \phi_k \phi_l \) the results obtained in [29] by expanding about flat space and, using heat kernel methods for a curved background, [30][31] give

\[
c_1 = -\frac{2}{9} \left( C - \frac{7}{8} R_{\psi} - \frac{1}{4} R_{\phi} \right) n_A \hat{g}^2 - \frac{1}{21} \text{tr}(\hat{Y}_i \hat{Y}_i) - \frac{1}{32 \times 27} \hat{\lambda}_{ijkl} \hat{\lambda}_{ijkl},
\]

for \( \hat{g} = g/4\pi, \hat{Y}_i = Y_i/4\pi, \hat{\lambda}_{ijkl} = \lambda_{ijkl}/16\pi^2 \) and we take the spinorial trace \( \text{tr}(\mathbb{1}) = 4 \). The conventions in (6.3) for \( C, R_{\psi}, R_{\phi} \) are such that the lowest order gauge \( \beta \)-function becomes \( \beta_g = -\frac{1}{2} \epsilon \hat{g} + \frac{1}{9}(11C - 4R_{\psi} - \frac{1}{2} R_{\phi}) \hat{g}^3 \). For the \( O(N) \) scalar theory, with interaction \( \frac{1}{8} \lambda (\varphi^2)^2 \) and \( \beta_{\hat{\lambda}} = -\epsilon \hat{\lambda} + (N + 8) \hat{\lambda}^2 \), this was shown in [9] to give a \( O(\epsilon^2) \) contribution to \( c \) at the RG fixed point in \( 4 - \epsilon \) dimensions, \( 5! c_1 = -\frac{5}{12} N(N + 2)/(N + 8)^2 \epsilon^2 \), consistent with large \( N \) results. For the Gross–Neveu model starting from (1.9) the one-loop \( \beta \)-functions are \( \beta_g = -\frac{1}{2} \epsilon \hat{g} + (2N + 3) \hat{g}^3 \), \( \beta_{\hat{\lambda}} = -\epsilon \hat{\lambda} + 3 \hat{\lambda}^2 + 8N \hat{g}^2 - 48N \hat{g}^4 \). At the fixed point to leading order for large \( N \) from the Yukawa terms in (6.4) \( 5! c_1 = -5N/(4N + 6) \epsilon \), which agrees with explicit calculations and the expansion of the large \( N \) Gross–Neveu result for \( C_T \) in [10].

For scalar and fermion theories large \( N \) methods allow non-trivial CFTs to be formally defined for general dimensions \( d \) which interpolate between physical theories for \( d \) an integer. The situation is less clear for gauge theories since maintaining conformal invariance and gauge invariance is more difficult, as was demonstrated in section 4. For a gauge-invariant quantum field theory the energy-momentum tensor in general contains contributions arising from the gauge fixing and ghost terms in the action. However these are BRS exact and do not contribute to correlation functions for gauge-invariant operators so that the calculations of \( C_T \) in [6][7] did not take account of them. In section 4 the gauge fixing terms made a contribution to the energy-momentum tensor (1.2) whose effect did not disappear in correlation functions when they notionally decoupled. It is an open question whether the ghost contributions to \( T^{\mu\nu} \)

---

\[6\] In terms of some previous literature \( c = -16\pi^2 \beta_{\eta} \). In [30] in the final result a misprint in (4.16) is corrected by taking \( \frac{1}{3} \rightarrow \frac{2}{3} \).
could be extended to general $d$ while maintaining conformal invariance. Their contributions to $C_T$ should account for the difference between $C_T$ in (4.8) and the corresponding gauge theory result when $d = 2n$.

**Note Added**

For higher-derivative scalar theories calculations of $C_T$ have also been carried out by Guerrieri et al. [32], who further considered the theory with eight derivatives. Promted by their discussion there is a quick derivation of $C_{T,\varphi,2p}$, agreeing with (2.13) for any $p$, based on known results for conformal partial-wave expansions of four-point functions as a sum over conformal primaries. Using Mellin transform methods Fitzpatrick and Kaplan [33] obtained a conformal partial-wave expansion for the four-point function of generalised free fields in any dimension $d$. Their results give the expansion

$$u^\delta = \sum_{\ell,\tau=0}^\infty c_{\tau,\ell} G_{2\delta+2\tau+\ell,\ell}(u,v),$$  \hspace{1cm} (6.5)

where $u, v$ are the standard conformal invariants and $G_{\Delta,\ell}(u, v)$ are the conformal partial waves for a conformal primary operator with scaling dimension $\Delta$ and spin $\ell$ and its descendants. The partial waves are normalised here so that $G_{\Delta,\ell}(u, v) \sim u^{\frac{\Delta}{2} - \ell}(-1 + v)^\ell$ as $u \to 0$, $v \to 1$. From [33],

$$c_{\tau,\ell} = \frac{\binom{(\Delta - \frac{d}{2} + 1) \tau}{\frac{d}{2} \tau (\ell + \frac{d}{2} \tau) (2\Delta + \tau - d + 1)} (2\Delta + \ell + \tau - \frac{d}{2} \tau)(2\Delta + 2\tau + \ell - 1)_{\ell}}. \hspace{1cm} (6.6)$$

The four-point function for free fields $\langle \varphi(x_1) \varphi(x_2) \varphi(x_3) \varphi(x_4) \rangle$ defines a function of the conformal invariants $F(u, v) = N_\varphi^2(1 + u^{\Delta_\varphi} + (u/v)^{\Delta_\varphi})$, where $N_\varphi$ is the coefficient for the two-point function, which may be expanded in terms of conformal partial waves using (6.5), for $u \to u/v$ $c_{\tau,\ell} \to (-1)^\ell c_{\tau,\ell}$. Corresponding to the operator product (2.11),

$$\varphi(x) \varphi(0) \sim -\frac{N_\varphi}{C_{T,\varphi}} \frac{d \Delta_\varphi}{d - 1} \frac{1}{x_\mu x_\nu T^{\mu\nu}_{\varphi}(0)} \hspace{1cm} (6.7)$$

Since $x_{12}x_{34} I^{\mu\nu}(x_{24})/(x_{12}^2 x_{34}^2)^{\frac{d}{2}} \sim -(1 - v)/(2\sqrt{u})$ as $x_{12}, x_{34} \to 0$, we must have

$$c_{\tau,\ell} = \frac{d \Delta_\varphi}{d - 1} \frac{1}{8 C_{T,\varphi,2p}} = (-1)^{p-1} \frac{d(d - 2p)^2}{32 p(d - 1)} \frac{(\frac{1}{2} d - p + 1)_{p-1}}{\left(\frac{d}{2} + 2\right)_{p-1}}. \hspace{1cm} (6.8)$$

This gives a result for $C_{T,\varphi,2p}$ identical to that in (2.13). The restriction on $\delta$ is of course necessary to ensure that the expansion contains a conformal primary contribution which may be identified with the energy-momentum tensor, for this case in (6.5) $\tau \leq p - 1$ and the operators which contribute have $\Delta - \ell = d + 2(\tau - p)$ and are expressible as $\varphi(\partial^\tau \varphi)$.

These results can easily be extended to consider the differing conserved currents present in these free theories. If we allow $\varphi \to \varphi_1$, there is a conserved current $J^{\mu}_{\varphi,ij} = -J^{\mu}_{\varphi,j\varphi}$ with

$$\langle J^{\mu}_{\varphi,ij}(x) J^{\nu}_{\varphi,kl}(0) \rangle = C_{J,\varphi} \frac{1}{(x^2)^{d-1}} I^{\mu\nu}(x) \delta_{ik} \delta_{jl} - \delta_{il} \delta_{jk}. \hspace{1cm} (6.9)$$

18
For its contribution in the operator product expansion we have
\[
\varphi_i(x) \varphi_j(0) \sim -N \varphi^C_{J,\varphi} \frac{1}{C_{J,\varphi}(x^2) \Delta \varphi} \frac{x_{\mu} J_{\varphi,ij}^\mu(0)}{2d+1}.
\] (6.10)

The four-point function now has the form
\[
F_{ijkl}(u,v) = N_\varphi \varphi^2 \left( \delta_{ij} \delta_{kl} + \delta_{ik} \delta_{jl} u^\Delta \varphi + \delta_{il} \delta_{jk} (u/v)^\Delta \varphi \right),
\]
and using (6.5) we find
\[
\frac{1}{C_{J,\varphi,2p}} = 2c_{p-1,1} \left| \delta = \frac{1}{2}(d-2p) \right| = (-1)^{p-1} \frac{1}{p} \left( \frac{1}{2}d - p \right)_p.
\] (6.11)

Acknowledgments
For some of our computations we have used Mathematica with the package FeynCalc [34]. AS would like to thank Brian Henning, David Poland, and Siddharth Prabhu for useful discussions. The research of AS is supported in part by the National Science Foundation under Grant No. 1350180.
