Diagnosis and management of two intrapelvic mislocated intrauterine contraceptive devices: A very rare case

Ritu Hooda, Parul Bhugra

CASE REPORT

A 22-year-old female presented in the gynecology outpatient department of our institute with the chief complaint of pain in the lower abdomen for 1 month. The pain was constant, dull aching and non-radiating. The patient visited a private practitioner for pain abdomen and missed multiload thread. The practitioner prescribed analgesics and inserted a new intrauterine contraceptive device (IUCD) assuming the expulsion of prior IUCD. The pain worsened and patient came to our department. There was no history of fever, burning micturition or bowel upsets. General physical and systemic examination revealed no abnormalities. On speculum examination the string of Cu-T was not visualized at the cervical os. On per-vaginum examination uterus was tender, firm and mobile. Right fornix was also tender and thickened. Ultrasound and X-ray of abdomen showed the presence of two intrauterine contraceptive devices in the pelvis. The patient was taken up for hysteroscopy. One IUCD was present in the omentum, other in the right adnexa, embedded in the adhesions. IUCDs were retrieved after breaking the adhesions. Postoperative period was uneventful and patient was discharged on fourth day. The patient was symptoms free on follow-up.

DISCUSSION

Intrauterine contraceptive device is a popular method of reversible contraception in developing countries due to its efficiency, low cost and non-interference with sexual activity. With increased use of IUCDs has come an increase in the number of related problems. The loss of the filament at the external os is a common problem. It may be due to, thread coiled inside, thread torn through, device expelled outside unnoticed by the patient, device pulled up by the growing uterus in pregnancy and device perforated the uterine wall and is lying in the peritoneal cavity. The most common symptoms of displaced IUCDs include abdominal pain and excessive bleeding. Uterine perforation is the most serious complication associated with displaced IUCD. Uterine perforation may further be
associated with bowel perforation, mesenteric perforation, urinary bladder perforation, rectal strictures and rectovaginal fistula formation [1].

The location of misplaced IUCD can be demonstrated with abdominal X-ray, ultrasound, computed tomography (CT) scan hysterosalpingography and hysteroscopy. Ultrasound can detect the IUCD either in the uterine cavity or in the peritoneal cavity. It is preferred to radiography. Plain abdominal X-rays may be useful. X-ray will not only reveal the presence or absence of the device but also exist its existence outside the uterine cavity [2]. The examination is simple, fast and is quite inexpensive [3]. Abdominal CT scan may be used to better define the anatomical locations and relationship of the IUCDs with neighboring structures [3]. Hysteroscopy is useful not only to locate it but also for its retrieval. Valle and Freeman advocated hysteroscopy as a primary method for locating and removing IUCDs with missing threads so as to avoid unnecessary X-ray exposure and injuries due to blind manipulations [4]. Siegler et al, however, recommended preliminary investigations for confirming the presence of IUCDs in the uterus before hysteroscopy [5].

The removal of misplaced intrauterine IUCDs is preferably done with hysteroscopy. The advantages with the use of hysteroscopy are complete removal especially in old fragmented and embedded devices, minimum hospital stay, lesser discomfort and early recovery. Similarly, the removal of extrauterine IUCDs can usually be done by endoscopic procedures. The removal should be done as soon as the diagnosis is made. World health organization (WHO) also recommends the removal of misplaced IUCD because of potential damage to adjacent organs and because of medico-legal problems [1]. In patients in whom the laparoscopic removal is difficult due to its location, adhesion or contraindications of laparotomy [6], laparotomy can be done in the same sitting.

CONCLUSION

A missing string during gynecological examination is the first sign of an intrauterine or intra-abdominal contraceptive device (IUCD). In developing countries where follow-up evaluations are irregular or absent, regular follow-up for visible threads would help in earlier detection of misplaced IUCDs. If a missing thread is found during examination proper investigations for the cause and early removal of the IUCD can prevent major complications.

Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.

Most Favored Author program
Join this program and publish any number of articles free of charge for one to five years.

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

We welcome you to interact with us, share with us, join us and of course publish with us.
