Abstract

Objectives: 2-Nitropropane (2-NP) is a rat liver carcinogen. Curcumin has shown some therapeutic activities. This study aimed to investigate if curcumin has a synergistic effect on the 2-NP alterations on the IL-1β, IL-6 & TNFα in submandibular gland of Mice.

Methods and materials: The gene expression levels of TNF-α, IL-1β & IL-6 were tested in submandibular gland of mice by RT-qPCR. 30 adult BALB/c male mice were divided randomly into 3 equal groups. Group I, a control group (n=10), injected with vehicle alone (canola oil, 5mL/kg). The latter two groups (n=20) by intraperitoneal injection of 2-NP (100mg/kg body weight dissolved in canola oil) 2 time/week for 4 weeks. At the same time of 2-NP injection, mice of group III were orally drinking water supplemented with curcumin 50(Mg/Ml)/4weeks. Submandibular gland tissues were histologically studied.

Results: the gene expression analysis showed a statistically significant upregulation of TNF-α, IL-1β, and IL-6 in group II. While, group III showed significantly downregulated expression. The apparent histopathological changes manifested in group II was less in group III.

Conclusions: Curcumin may modulate the alterations of 2-NP by down-regulating proinflammatory cytokines IL-1β, IL6 and TNF α in BALB/c mice.

Keywords: Curcumin; 2-Nitropropane; IL-1; IL-6; TNFα; Submandibular salivary glands

Introduction

The submandibular glands are major salivary glands located beneath the floor of the mouth. Interleukins are a group of cytokines that expressed by leukocytes [1]. IL1 β is participating in the regulation of immune responses, inflammatory reactions, and hemetoipoiesis [2]. IL-6 plays a role in the final differentiation of B cells into immunoglobulin-secreting cells [3]. Several genetic modifications or mutations associated with dysregulated IL-1 activity and autoinflammatory disorders were identified [4]. Expression of IL-1 is up regulated in different tumor phenotypes and is implicated as an important factor in tumor progression via expression of metastatic, angiogenic genes and growth factors. Therefore, down regulation of expression of IL-1 may be able to inhibit cancer progression [5]. The miR146a and miR147b were associated with increased expression of genes related to the immune/inflammatory response. Overexpression of miR147b reduced the expression of the pro-inflammatory mediators IL-6 after IL-1β stimulation [6].

Nitropropane (2-NP) is a colorless, oily liquid with a mild odor. It is used as a solvent, principally in blends, and has many industrial applications [7]. Previously, severe liver damage, as well as some kidney damage, has been observed in workers fatally poisoned from acute inhalation exposure to high concentrations of 2-nitropropane [8]. The results indicated that 2-NP inflicted DNA damage in the bone marrow cells and thus could be leukemogenic [9]. Studies were carried out in the rat indicated that 2-NP induced chromosome aberrations as well as DNA repair in vivo [10].

Curcumin and its two related compounds are the main secondary metabolites of Curcuma longa [11]. Curcuma longa has been used in herbal medicines for the treatment of a variety of ailments such as rheumatism, diabetic ulcers, anorexia, cough and sinusitis. It has also been shown to have significant wound healing properties [12].

It has been reported to have anti-inflammatory, antioxidant, anti-rheumatoid, and anti-atherosclerosis role. It can also reduce lipid, eliminate free radicals and inhibit the growth of the tumor. Many reports had suggested that curcumin has shown great potential in the treatment of tumors by inducing apoptosis. Use of curcumin mouthwash has shown antiplaque and anti-gingivitis properties. It could be effectively used as an adjunct to scale and root planning [13]. Also, it showed that ultra-soluble curcumin
could prove useful as a therapeutic intervention in Sjögren’s syndrome [14]. Also, it inhibited IkB kinase β kinase activity in the saliva of head and neck squamous cell carcinoma cancer, and this inhibition correlated with reduced expression of several cytokines [15].

The aim of this study was to investigate if curcumin has a synergistic effect on the nitropropane alterations and the role of IL-1β, IL 6 and TNFα.

Material and Methods

Experimental design and doses

A total of 30 adult BALB/c male mice weighting 25-30g/each were used in this experiment. Mice were purchased from the Institute of Theodor Bilharz (Cairo, Egypt).

Ethical considerations

All experimental animals maintained and monitored in a specific pathogen-free environment. All experimental animal protocols were performed according to regulations set by the Institutional Animal Care and Use Committee and were approved by the ethical committee of faculty of veterinary medicine, Assiut University (approved by faculty council number 6, at 25/4/2018). All animal procedures were also performed according to the Declaration of Helsinki and the guidelines for the care and use of experimental animals established by the National Institutes of Health (NIH). All animals could acclimatize in plastic cages (five animals per cage) inside a well-ventilated room for one week prior to the experiment. The animals were maintained under standard laboratory conditions (temperature of 23 °C, relative humidity of 60-70%, and a 12h light/dark cycle) and were fed a diet of standard commercial pellets and water containing libitum. We made every effort to minimize animal stress.

Grouping and experimental planning

After 1 week of acclimatization, mice were randomly categorized into three main groups (10 mice each).

a. Group I (control mice).

b. Group II (2- Nitropropane inject group mice).

c. Group III (2- Nitropropane inject group treated with curcumin).

Oral toxicity was induced in mice in the latter two groups (n = 20) by intraperitoneal (i.p.) injection of 2- Nitropropane (100mg/kg body weight dissolved in canola oil) 2 time/week for 4 weeks; mice in the control group were injected with vehicle alone (canola oil, 5mL/kg). At the same time of 2- NP injection, mice were orally drinking water supplemented with curcumin 50 (Mg/Ml)/ 4 weeks.

Sample collection

All animals were sacrificed at day 31 post- 2- NP injection. The submandibular salivary gland was removed and cut into small pieces in sterile saline. The pieces were suspended in Trizol for RNA extraction and gene expression analysis.

Histopathological analysis

The salivary gland pieces fixed in 10% formalin were micro-technically processed in order to obtain paraffinized tissue sections. The tissue sections were stained with hematoxylin and eosin (H&E) for morphological examination and viewed under light microscope.

Gene expression analyses

The effect of curcumin administration on nitropropane induced alterations in the inflammation and toxicity of oral mucosa were investigated using real-time quantitative PCR.

Primers used in RT-PCR

The primers used for quantitative real-time PCR analysis were designed using the Primer Express 1.5 software (Applied Biosystems). The mouse primers were designed as following:

a. TNF-α Forward: 5′- ATGAGCACACAAAGCATGA-3′, Reverse 3′-AGTAGACAGAAGAGCGTGGT- 5′.

b. IL-6 Forward: 5′- ACCGAGCTCTGTTGACAAG-3′, Reverse 3′- TCCTCGCCACACTCTTCCTT- 5′.

c. IL-1β Forward: 5′- GCACTACAGGCTCCGAGATGAAC-3′, Reverse 3′ TTGTCGTTGCTTGGTTCTCCTT- 5′ and normalized using GAPDH Forward: 5′- GTTGTCTCCTGCGACTTCA-3′, Reverse 3′- GGTGGTCCAGGGTTTCTTA - 5′.

Titration of mRNA for IL-1, IL-6, and TNFα by RT-PCR in tissues

After performing the indicated treatments, RNA was extracted and then the corresponding cDNA was prepared, and then real time PCR was applied for gene expression analysis as previously described [16]. In brief, all cDNA samples were processed in a 96-well plate using the following cycling conditions: 10 minutes at 95°C, and 40 cycles at 95°C for 15 seconds ended by one min. at 60°C. These data were analyzed according to Livak et al. [17].

Statistical analysis

We used one-way analysis of variance ANOVA for determination of the statistical significance of differences between mean values. A probability of ≤ 0.05 defined this significance.

Results

Histopathological results

Microscopically, the submandibular glands of BALB/c male mice of the control group appeared with a well-known histologic feature with no observable lesions. Mice in 2- Nitropropane treated group appeared with marked atrophy and degeneration of the acinar cells and ducts (Figure 1A). Glands in this group showed also cytoplasmic vacuolations (Figure 1B). Ductal...
Inflammatory cell foci in the submandibular glands were apparent in this group (Figure 1C). In animals treated with curcumin there was apparent improvement from the 2-NP deleterious effect. The acinar architecture of the gland appeared near normal (Figure 1D). However, this reversal of 2-NP effect did not acquire the full normal case of the gland.

Gene expression analyses results

Real time-PCR and mouse primers specific for IL-1β, IL-6 and TGFα were used to detect the presence of mRNAs. IL-1, IL-6 and TGFα could be detected in mouse submandibular gland in all groups. The data shown in Table 1 indicate a dramatic difference between different study groups. The means of IL-1β, IL-6 and TGFα levels demonstrated a significant increase in mice with 2-NP when compared to controls (p<0.001). In contrast, use of curcumin revealed that the relative mRNA levels of the IL-1β, IL-6 and TGFα decreased significantly compared with the 2-NP treated mice (Figures 2-4).
improvement from the 2-NP deleterious effect. Histologically, there was partial atrophy and degeneration of the acinar cells with cytoplasmic vacuolations and ductal inflammatory cell foci indicating focal inflammation. In addition, these cells showed cytoplasmic vacuolations and ductal inflammatory cell foci indicating focal inflammation. These changes were comparable to those demonstrated in other studies [18,19]. It was suggested that the liver damage induced by 2-NP is related to oxidative damage, lipid peroxidation [20]. Previous results indicated that 2-NP inflicted DNA damage in the bone marrow cells [9] and induced chromosome aberrations as well as DNA repair [10]. In contrast, the findings of this study suggested that the expression levels of IL-1β and TNF-α in the submandibular glands from mice treated with curcumin were significantly decreased. Histologically, there was partial improvement from the 2-NP deleterious effect.

These results may be correlated with several studies which evidenced possible health benefits of curcumin. A few studies had shown that curcumin can be prevention and a chemotherapeutic agent for colon, skin, oral and intestinal cancers. Curcumin was also well known for its ant inflammatory and antioxidant, anti-coagulant and anti-infective effects [12,21,22]. The anticancer effect of curcumin is attributed to activation of apoptotic pathways in cancer cells, as well as inhibition of inflammation and angiogenesis in the tumor microenvironment and suppression of tumor metastasis. Several reports had demonstrated that curcumin inhibits angiogenesis in a wide variety of tumor cells through the modulation of various cell signaling pathways which involve transcription factors, protein kinases, growth factors and enzymes [23]. Oral administration of curcumin beneficially modulates many diseases including diabetes, fatty liver disease, atherosclerosis, arthritis, cancer and neurological disorders [24]. Curcumin given 24 hours before irradiation reduced the structural damage to the salivary glands [25].

In respect to the role of cytokines, expression of IL-1 is up regulated in different tumor phenotypes and is implicated as an important factor in tumor progression via expression of metastatic, angiogenic genes and growth factors. Therefore, down regulation of expression of IL-1 may be able to inhibit cancer progression [5].

Similarly, Interleukin 6 (IL6) and TNF α are involved in a wide variety of biological functions. Tumor necrosis factor receptor-1 (TNFR1) is involved in apoptosis through extrinsic pathway initiation. The level of soluble TNFR1 is reported increased in primary Sjögren’s syndrome patients [26].

Furthermore, it was found that stimulation with IL-1β and TNF-α increased submucosal gland secretion in a concentration-dependent manner. The cytokine effect was dependent on cAMP. Most importantly, IL-1β- and TNF-α-stimulated secretion was blocked by the cystic fibrosis transmembrane conductance regulator (CFTR) blocker. Also, during bacterial infections and resulting release of proinflammatory cytokines, the glands are stimulated to secrete fluid, and this response is mediated by cAMP activated CFTR, a process that would fail in patients with CF [27]. It was demonstrated that IL6 pretreatment prevented both

**Table 1: Comparison of the mRNA expression of IL-1β, IL-6 and TNFα in BALB/c mouse submandibular salivary glands using real time PCR.**

|                | Group I (Control Group) | Group II (2-NP-Treated Group) | Group III (Curcumin Treated Group) |
|----------------|-------------------------|-------------------------------|-----------------------------------|
| IL-1β          | 1                       | 5.94592                       | 1.35287                           |
| IL-6           | 1                       | 8.567106                      | 4.819248                          |
| TNFα           | 1                       | 7.00216                       | 2.309851                          |

Figure 2 shows that expression of mRNA for IL-1β genes steadily increased with the administration of 2-NP (P < 0.001). Significantly lower levels were observed with curcumin treatment P < 0.05. As shown in Figure 4, the expression of IL-6 in tissue samples was significantly lower after curcumin. The differences in mean IL-6 expression appeared statistically significant, with a P<0.01. However, tissue expressions of IL-6 in 2-NP treated group had risen. As shown in Figure 4 expressions of TNFα were significantly lower (P< 0.05) after curcumin administration.
senescence and salivary gland hypofunction via a mechanism involving enhanced DNA damage repair. It was indicated that cellular senescence is a fundamental mechanism driving radiation-induced damage in the salivary gland and suggested that IL6 pretreatment may represent a promising therapeutic strategy to preserve salivary gland function in head and neck cancer patients undergoing radiotherapy [28].

Additionally higher expression of IL-6 was found in salivary gland cancer. There was a high association of cytomegalovirus CMV antigen presence with the presence of IL-6, and with the IL-6 expression intensity. Positive expression of CMV antigens in a high percentage of SGC cells suggested that it might play an important role in carcinogenesis by increasing IL-6 production and leading to inhibition of apoptosis and tumor development [29].

Likewise, protein expression levels of IL-17 and IL-6 were detected parotids and submandibular glands by ELISA. Compared with the normal group, mRNA transcriptional levels and protein expression levels of IL-17 and IL-6 were significantly up-regulated after administration of deionized water [30].

In this study there was a strong association between administration of curcumin and the expression levels of IL-1β, IL-6 and TNF-α which can be interpreted by many authors. Elevated expression and protein level of IL-1α and IL-1β were found in lymphoma bearing mice, which were significantly down regulated by curcumin treatment. Similarly, curcumin treatment down regulated activation of IL-1α and IL-1β via AP-1 and NF-IL-6 respective (5). It has been shown to interfere with multiple cell signaling pathways, including cell cycle, apoptosis, proliferation, survival, invasion, angiogenesis, metastasis and inflammation [31].

Finally, the findings of this study conclude that curcumin may attenuate the alterations of 2-NP by down-regulating proinflammatory cytokines IL-1β, IL-6 and TNF α in BALB/c mice.
