**Supplementary File 3: An index and notes on Supplementary Files 4 to 9**

Supplementary files 4 to 9 contain scattergrams of all the 1225 possible pairs of the 50 variables used in the analysis (main figure 2). This file contains notes on the format of the supplementary files as well as an index to them.

The original uncompressed supplementary file contained all 1225 scattergrams but was 204 Mbytes in length. *BioMedCentral* sets a limit of 20Mbytes for supplementary files and therefore the original file has been split into six files (Supplementary Files 4 to 9), each of which has also been compressed to below 20 Mbytes using *NXPowerlite* ([https://www.neuxpower.com/nxpowerlite-desktop](https://www.neuxpower.com/nxpowerlite-desktop)) which reduces file size without noticeably reducing image quality.

Supplementary File 3 also provides a detail listing of all of the graphs, page by page, and should be used in conjunction with Supplementary Files 4 to 9 to find appropriate graphs.

**Supplementary File 4**: Pages 1 to 35 (graphs 1 to 210)
**Supplementary File 5**: Pages 36 to 70 (graphs 211 to 420)
**Supplementary File 6**: Pages 71 to 105 (graphs 421 to 630)
**Supplementary File 7**: Pages 106 to 140 (graphs 631 to 840)
**Supplementary File 8**: Pages 141 to 175 (graphs 841 to 1050)
**Supplementary File 9**: Pages 176 to 205 (graphs 1051 to 1225)

An index of the 1225 plots is provided at the end of the present file. It is recommended that the index is opened in one window and a file of figures in a separate window.
Notes on the graphs.

The graphs are complicated and represent a lot of information about the measures at individual medical schools.

- **The main title** indicates:
  - The code number of the scattergram, in the form 10/56, where 56 indicates it is the 56th graph, and can be found on page 10, with six graphs per page, and 205 pages.
  - $Y_n$: indicates the nth Y variable name, and $X_n$: the nth X variable. Working through the plots, the Y variable varies more slowly and the X variable more quickly. The variables in $Y_n$ and $X_n$ are in the same order as the variables in main figure 2.
  - An index of the graphs is available at the end of the present file.

- **The sub-title** provides various information:
  - $N_{pairs}$ is the total number of medical school pairs
  - $N_{imputedPairs}$ is the number of data pairs with imputed values
  - $r(\text{all})$ is the Pearson correlation based on all pairs of data, raw and imputed, with $p$ the statistical significance.
  - $r(\text{NonImp})$ is the correlation for just non-imputed data.

- **Circles** of various colours represent named medical schools.
  - Names are shortened versions of abbreviations in the main papers
  - Data can either be raw data (i.e. an actual value is known) or imputed (the value has been imputed – see the main text).
  - Colours indicate the source of data:
    - Green: raw data is available for both the X and the Y axes
    - Salmon pink: X value only is imputed
    - Pale brown: Y value only is imputed
    - Grey: Both X and Y imputed.
    - Blue: Oxbridge and Cambridge (and for all cases X and Y values are raw data)
  - Yellow Squares behind circles indicate PBL schools

- **Regression lines** are shown by different colours
  - Thick, dark blue: All medical schools based on raw and imputed data
  - Thin, pale blue line: All medical schools based on raw, non-imputed, data.
  - Thin green line: All medical schools except Oxford and Cambridge, using raw and imputed data. Oxford and Cambridge are occasionally outliers in the UK educational system, and comparison with the dark blue line makes clear whether effects are also present when Oxbridge schools are omitted.

Notes and comments.

- Although three different regression lines are shown, mostly these don’t differ, particularly when the main regression line in blue is statistically significant. Imputing and including Oxbridge schools have therefore had little effect on relationships (but see figure 8 in the main paper).
- PBL schools, which can be visually identified easily by the layout of the yellow squares, often differ on many of the measures.
- Where measures are binary e.g. PBLschool, Post-2000, etc, the scattergrams are only included for completeness, and to give a visual sense of the data.
- Later variables in main figure 1 are always plotted as the Y variable and earlier variables as the X variable, as that is usually likely to indicate the probably causal direction.
| Page | Plot Number | Number On Page | X variable       | Y variable       | X number | Y number |
