GENERALISED APÉRY NUMBERS MODULO 9

C. KRATTENTHALER† AND T. W. MÜLLER∗

Abstract. We characterise the modular behaviour of (generalised) Apéry numbers modulo 9, thereby in particular establishing two conjectures in “A method for determining the mod-3k behaviour of recursive sequences” [arXiv:1308.2856].

1. Introduction

For non-negative integers \(r, s\) and \(n\), the (generalised) Apéry numbers \(a_n(r, s)\) are defined by

\[
a_n(r, s) = \sum_{k=0}^{n} \binom{n}{k} r^{n+k} \binom{n+k}{k}^s.
\]

(1.1)

The (classical) Apéry numbers \(a_n(2, 1)\) and \(a_n(2, 2)\) appear in Apéry’s proof [1] of the irrationality of \(\zeta(2)\) and \(\zeta(3)\) (cf. also [6]) as the leading coefficients in certain linear forms in \(\zeta(2)\) and 1, and in \(\zeta(3)\) and 1, respectively. Similarly, the Apéry numbers \(a_n(r, 1)\) appear as leading coefficients in linear forms in \(\zeta(r), \zeta(r-2), \ldots, 1\) in [2], where it is shown that infinitely many values among \(\zeta(3), \zeta(5), \zeta(7), \ldots\) are irrational.

In the past, the general Apéry numbers \(a_n(r, s)\) have been the object of numerous arithmetic investigations, see, for instance, [3, 5, 7, 12] for a highly non-exhaustive selection.

We point out that the Apéry numbers with second parameter \(s = 0\) have received special attention in the literature. It is simple to see that \(a_n(1, 0) = 2^n\) and \(a_n(2, 0) = \binom{2n}{n}\). The numbers \(a_n(3, 0)\) are also known under the name of “Franel numbers,” and the more general numbers \(a_n(r, 0)\) for \(r \geq 4\) as “extended” or “generalised Franel numbers.”

Given a prime number \(p\) and the \(p\)-adic expansion of \(n\), \(n = n_0 + n_1p + n_2p^2 + \cdots + n_mp^m\), Deutsch and Sagan [5, Theorem 5.9] show the factorisation

\[
a_n(r, s) \equiv \prod_{i=0}^{m} a_{n_i}(r, s) \pmod{p},
\]

(1.2)

and use it to characterise the congruence classes of \(a_n(r, s)\) modulo 3 in terms of precise conditions which the 3-adic expansion of \(n\) must satisfy. Gessel [7] obtains the above factorisation in the special case where \(r = s = 2\), and furthermore, in Theorem 3(iii) of that paper, proves that the factorisation (1.2) remains valid for \(r = s = 2\) with 9 in place of the modulus \(p\).

The goal of our paper is to determine the behaviour of the Apéry numbers \(a_n(r, s)\) modulo 9 for arbitrary positive integers \(r\) and non-negative integers \(s\). This will be

2010 Mathematics Subject Classification. Primary 05A15; Secondary 11A07.

Key words and phrases. Apéry numbers, congruences.

achieved by first deriving a Lucas-type result for binomial coefficients modulo 9 (see Lemma 1 in the next section), and using this to establish an analogue of formula (1.2) for the modulus 9; see Theorems 2 and 3 in Section 3. From these theorems, one easily derives explicit congruences for $a_n(r, s)$ depending on the congruence classes of $r$ and $s$ modulo 6; see Section 4. In particular, Corollaries 24 and 25 confirm Conjectures 65 and 66 from [10] concerning the explicit description of the classical Apéry numbers $a_n(2, 1)$ and $a_n(2, 2)$ modulo 9. As a side result, we obtain generalisations of Gessel’s mod-9 factorisation result for $a_n(2, 2)$ mentioned above; see the remark after (1.6).

We point out that Rowland and Yassawi [13] have also provided proofs for Conjectures 65 and 66 from [10] (among many other things), however using a completely different approach, based on extracting diagonals from rational power series and construction of automata. It is conceivable that their approach would also achieve proofs of the other results in this paper.

It should be clear that our approach could also be used to obtain explicit descriptions of the congruence classes of Apéry numbers modulo higher powers of 3, and the same applies to the approach from [13]. The analysis and the results would be more complex than the ones in this paper, though.

2. A Lucas-type theorem modulo 9

The classical result of Lucas in [11, p. 230, Eq. (137)] says that, if $p$ is a prime, $n = n_0 + n_1 p + n_2 p^2 + \cdots + n_m p^m$, and $k = k_0 + k_1 p + k_2 p^2 + \cdots + k_m p^m$, $0 \leq n_i, k_i \leq p - 1$, then

$$\binom{n}{k} \equiv \prod_{i=0}^{m} \binom{n_i}{k_i} \quad \text{(mod } p)\text{).}$$

Using the generating function approach proposed in [3, Sec. 6], we find an analogue of this formula for the modulus 9, which is different from the mod-9 cases of the generalisations of Lucas’ formula to prime powers given in [4] and [8].

**Lemma 1.** For all non-negative integers $n = n_0 + 3n_1 + 9n_2 + \cdots + 3^m n_m$ and $k = k_0 + 3k_1 + 9k_2 + \cdots + 3^m k_m$, where $0 \leq n_i, k_i \leq 2$ for all $i$, we have

$$\binom{n}{k} \equiv \binom{n_0}{k_0} \binom{n_1}{k_1} \cdots \binom{n_m}{k_m}$$

$$+ \sum_{\nu=1}^{m} 3\nu \chi(\nu-1 = 0) \binom{n_0}{k_0} \cdots \binom{n_{\nu-2}}{k_{\nu-2}} \binom{1}{k_{\nu-1} - 1} \binom{n_{\nu} - 1}{k_{\nu}} \binom{n_{\nu+1}}{k_{\nu+1}} \cdots \binom{n_m}{k_m}$$

$$+ \sum_{\nu=1}^{m} 3\nu \chi(\nu-1, k_{\nu-1} = 0) \binom{n_0}{k_0} \cdots \binom{n_{\nu-2}}{k_{\nu-2}} \binom{n_{\nu}}{k_{\nu}} \cdots \binom{n_m}{k_m}$$

$$- \sum_{\nu=1}^{m} 3\nu \chi(\nu-1 = 1) \binom{n_0}{k_0} \cdots \binom{n_{\nu-2}}{k_{\nu-2}} \binom{2}{k_{\nu-1}} \binom{n_{\nu} - 1}{k_{\nu}} \binom{n_{\nu+1}}{k_{\nu+1}} \cdots \binom{n_m}{k_m}$$

$$+ \sum_{\nu=1}^{m} 3\nu \chi(\nu-1 = 2, k_{\nu-1} = 1) \binom{n_0}{k_0} \cdots \binom{n_{\nu-2}}{k_{\nu-2}} \binom{n_{\nu}}{k_{\nu}} \cdots \binom{n_m}{k_m} \quad \text{(mod } 9)\text{)}.$$

where $\chi(S) = 1$ if $S$ is true and $\chi(S) = 0$ otherwise.
Proof. During this proof, given polynomials \( f(z) \) and \( g(z) \) with integer coefficients, we write
\[
f(z) = g(z) \text{ modulo } 9
\]
to mean that the coefficients of \( z^i \) in \( f(z) \) and \( g(z) \) agree modulo 9 for all \( i \). We use an analogous notation for the modulus 3.

An easy induction shows that
\[
(1 + z)^3^\nu = 1 + z^{3^\nu} + 3z^{3^\nu-1} \left(1 + z^{3^\nu-1}\right) \text{ modulo } 9.
\]
This implies the expansion
\[
(1 + z)^n = (1 + z)^{n_0} \left(1 + z^3\right)^{n_1} \left(1 + z^9\right)^{n_2} \cdots \left(1 + z^{3^m}\right)^{n_m}
\]
\[
= \prod_{\nu=1}^{m} \left(1 + z^{3^\nu}\right)^{n_\nu} + \sum_{\nu=1}^{m} 3n_\nu (1 + z)^{n_0} \cdots \left(1 + z^{3^{\nu-2}}\right)^{n_{\nu-2}}
\]
\[
\cdot z^{3^{\nu-1}} \left(1 + z^{3^{\nu-1}}\right)^{n_{\nu-1} + 1} \left(1 + z^{3^{\nu}}\right)^{n_{\nu-1}} \cdots \left(1 + z^{3^{m}}\right)^{n_m}
\]
modulo 9.

Now, in case \( n_{\nu-1} \geq 1 \), one applies the formulae
\[
z^{3^{\nu-1}} \left(1 + z^{3^{\nu-1}}\right)^2 = (1 + z^{3^{\nu}}) - \left(1 + z^{3^{\nu-1}}\right)^2 \text{ modulo } 3
\]
\[
z^{3^{\nu-1}} \left(1 + z^{3^{\nu-1}}\right)^3 = z^{3^{\nu-1}} (1 + z^{3^{\nu}}) \text{ modulo } 3
\]
to the terms involving \( 3^{\nu-1} \) in the sum, depending on whether \( n_{\nu-1} + 1 = 2 \) or \( n_{\nu-1} + 1 = 3 \). Finally, every binomial term \( (1 + z^{3^\nu})^{n_\nu} \) is expanded using the binomial theorem, and subsequently the coefficient of
\[
z^k = z^{k_0 + 3k_1 + 9k_2 + \cdots + 3^m k_m}
\]
is read off in all the terms. This leads directly to (2.1).

\[
\square
\]

3. The main theorems

Here we prove the actual main results of our paper, namely Theorems 2 and 3 below, which provide a refinement of (1.2) in the case where \( p = 3 \) to modulus 9. The explicit congruences for the Apéry numbers \( a_n(r, s) \) given in the next section are then simple consequences. We state the results for \( s \geq 1 \) and \( s = 0 \) separately in order to keep expressions at a moderate size.

**Theorem 2.** For all positive integers \( r \) and \( s \), and non-negative integers \( n = n_0 + 3n_1 + 9n_2 + \cdots + 3^m n_m \), where \( 0 \leq n_i \leq 2 \) for all \( i \), we have
\[
a_n(r, s) \equiv \prod_{i=0}^{m} a_{n_i}(r, s) + 3 \sum_{\nu=1}^{m} \left( \prod_{i=0 \atop i \neq \nu-1, \nu}^{m} a_{n_i}(r, s) \right) f(n_{\nu-1}, n_{\nu}; r, s) \text{ (mod } 9), \tag{3.1}
\]

\[

\]
where
\[
\begin{align*}
f(n_{\nu-1}, n_{\nu}; r, s) &= n_{\nu-1}(n_{\nu-1} + 1)n_{\nu}\left(s(n_{\nu} + 1) + (-1)^s(s(n_{\nu} - 1) + rn_{\nu})\right) \\
&+ \chi(r = 1)(n_{\nu-1} + 2)(n_{\nu-1} + 1)n_{\nu} \\
&+ \chi(s = 1)((-1)^r - 1)(n_{\nu-1} - 1)n_{\nu-1}n_{\nu}^2. \quad (3.2)
\end{align*}
\]

Proof. By the definition (1.1) of the Apéry numbers and the Chu–Vandermonde summation formula, we may write
\[
a_n(r, s) = \sum_{k=0}^{n} \binom{n}{k}^r \binom{n + k}{k}^s = \sum_{k=0}^{n} \binom{n}{k}^r \left( \sum_{\ell=0}^{n} \binom{n}{\ell} \binom{k}{\ell} \right)^s.
\]

Now we apply the Lucas-type congruence from Lemma 1 to all three binomial coefficients on the right-hand side of the above formula. Using the trivial congruences
\[
(a + 3b)^s \equiv a^s + 3a^{s-1}b \pmod{9}
\]
and
\[
(a + 3b)(c + 3d) \equiv ac + 3bc + 3ad \pmod{9},
\]
we expand the resulting expression. In this way, we obtain a large number of terms. Writing \(\ell = \ell_0 + 3\ell_1 + 9\ell_2 + \cdots + 3^m\ell_m\), the leading term is
\[
\sum_{0 \leq k_1, \ldots, k_m \leq 2} \left( \prod_{i=0}^{m} \binom{n_i}{k_i}^r \right) \left( \sum_{0 \leq \ell_1, \ldots, \ell_m \leq 2} \prod_{i=0}^{m} \binom{n_i}{\ell_i} \binom{k_i}{\ell_i} \right)^s,
\]
while one obtains 12 more terms which are similar. At this point, the summation over the \( \ell_i \)'s can be carried out easily, in all of the arising terms. This leads to the congruence

\[
a_n(r, s) \equiv \prod_{i=0}^{m} a_{n_i}(r, s) \\
+ 3r \sum_{\nu=1}^{m} \left( \prod_{i=0, i \neq \nu-1, \nu}^{m} a_{n_i}(r, s) \right) \left( \sum_{k_{\nu-1}=0}^{2} \left( \begin{array}{c} n_{\nu-1} - 1 \\ k_{\nu-1} \end{array} \right) \left( \begin{array}{c} 1 \\ k_{\nu-1} - 1 \end{array} \right) \left( \begin{array}{c} n_{\nu-1} + k_{\nu-1} \\ k_{\nu-1} \end{array} \right) \right) \\
\times \left( \sum_{k_{\nu}=0}^{2} \left( \begin{array}{c} n_{\nu} \\ k_{\nu} \end{array} \right) \left( \begin{array}{c} n_{\nu} + 1 \\ k_{\nu} \end{array} \right) \right) \chi(n_{\nu-1} = 0)n_{\nu} + \cdots \\
+ 3s \sum_{\nu=1}^{m} \left( \prod_{i=0, i \neq \nu-1, \nu}^{m} a_{n_i}(r, s) \right) \left( \sum_{k_{\nu-1}=0}^{2} \left( \begin{array}{c} n_{\nu-1} + 1 \\ k_{\nu-1} - 1 \end{array} \right) \left( \begin{array}{c} n_{\nu-1} \\ k_{\nu-1} \end{array} \right) \right) \left( \sum_{k_{\nu}=0}^{2} \left( \begin{array}{c} n_{\nu} \\ k_{\nu} \end{array} \right) \left( \begin{array}{c} n_{\nu} + 1 \\ k_{\nu} \end{array} \right) \right) \chi(n_{\nu-1} = 0)n_{\nu} + \cdots \\
+ 3s \sum_{\nu=1}^{m} \left( \prod_{i=0, i \neq \nu-1, \nu}^{m} a_{n_i}(r, s) \right) \left( \sum_{k_{\nu-1}=0}^{2} \left( \begin{array}{c} n_{\nu-1} + 1 \\ k_{\nu-1} - 1 \end{array} \right) \right) \left( \sum_{k_{\nu}=0}^{2} \left( \begin{array}{c} n_{\nu} \\ k_{\nu} \end{array} \right) \left( \begin{array}{c} n_{\nu} + 1 \\ k_{\nu} \end{array} \right) \right) \chi(n_{\nu-1} = 0)n_{\nu} + \cdots \pmod{9},
\]

where each of the dots \( \cdots \) represents three similar terms. (All the sums above over \( \nu \) come from the second line in (3.1).) The sums over \( k_{\nu-1} \) and \( k_{\nu} \) are written out explicitly. The resulting formula is then simplified using elementary congruences modulo 3. Namely, to simplify powers, we use

\[
n^a(n+1)^b \equiv (-1)^{b-1}n(n+1) \pmod{3}, \quad \text{for } a, b \geq 1.
\]

Furthermore, by

\[
\chi(n \equiv a \pmod{3}) \equiv -(n - a + 1)(n - a + 2) \pmod{3}, \quad (3.4)
\]

we may write

\[
n^a \equiv \chi(a = 0) + (1 - \chi(a = 0))(-n(n+1) - n(n-1)(-1)^a) \pmod{3}, \quad \text{for } a \geq 0.
\]

Finally, higher powers of \( n_{\nu-1} \) and \( n_{\nu} \) are lowered by use of the (Fermat) congruence

\[
n^3 \equiv n \pmod{3}.
\]

After these manipulations, one collects terms, to obtain a congruence of the form

\[
a_n(r, s) \equiv \prod_{i=0}^{m} a_{n_i}(r, s) + 3 \sum_{\nu=1}^{m} \left( \prod_{i=0, i \neq \nu-1, \nu}^{m} a_{n_i}(r, s) \right) f(n_{\nu-1}, n_{\nu}; r, s).
\]
Upon considerable simplification, one sees that the term $f(n_{\nu - 1}, n_{\nu}; r, s)$ can be written as the term in parentheses on the right-hand side of (3.1).

\[ f(n_{\nu - 1}, n_{\nu}; r, s) \equiv \chi(n_{\nu - 1} = 1)(s\chi(n_{\nu} = 1) + (-1)^s s\chi(n_{\nu} = 2) + (-1)^r (\chi(n_{\nu} = 0) - 1)) \]

\[ - \chi(r = 1)\chi(n_{\nu - 1} = 0)n_{\nu} + \chi(s = 1)((-1)^r - 1)\chi(n_{\nu - 1} = 2)\left(\chi(n_{\nu} = 0) - 1\right) \pmod{3}. \quad (3.5) \]

Remark. By applying (3.4) again several times (namely “backwards”), the term $f(n_{\nu - 1}, n_{\nu}; r, s)$ can alternatively be rewritten as

\[
\begin{align*}
    f(n_{\nu - 1}, n_{\nu}; r, s) &\equiv \chi(n_{\nu - 1} = 1)(s\chi(n_{\nu} = 1) + (-1)^s s\chi(n_{\nu} = 2) + (-1)^r (\chi(n_{\nu} = 0) - 1)) \\
    &\quad - \chi(r = 1)\chi(n_{\nu - 1} = 0)n_{\nu} + \chi(s = 1)((-1)^r - 1)\chi(n_{\nu - 1} = 2)\left(\chi(n_{\nu} = 0) - 1\right) \pmod{3}.
\end{align*}
\]

Following the same approach, we may establish an analogous result for the (generalised) Franel numbers; that is, for the case where $s = 0$.

**Theorem 3.** For all positive integers $r$ and non-negative integers $n = n_0 + 3n_1 + 9n_2 + \cdots + 3^m n_m$, where $0 \leq n_i \leq 2$ for all $i$, we have

\[
a_n(r, 0) \equiv \prod_{i=0}^m a_{n_i}(r, s) + 3 \sum_{\nu=1}^m \left( \prod_{i=0}^m a_{n_i}(r, s) \right) f(n_{\nu - 1}, n_{\nu}; r, 0) \pmod{9}, \quad (3.6)
\]

where

\[
f(n_{\nu - 1}, n_{\nu}; r, 0) = \chi(r = 1)(n_{\nu} - \chi(n_{\nu} = 2))(\chi(n_{\nu - 1} = 2) - 1) \\
- (n_{\nu} + \chi(n_{\nu} = 2)(-1)^r)(\chi(n_{\nu - 1} = 1) - (-1)^r \chi(n_{\nu - 1} = 2)). \quad (3.7)
\]

4. **Explicit description of the Apéry numbers modulo 9**

We are now going to exploit Theorems 2 and 3 to obtain explicit congruences modulo 9 for the Apéry numbers $a_n(r, s)$, depending on the congruence classes of $r$ and $s$ modulo 6. In view of (3.1) and (3.6), we have to analyse the congruence behaviour modulo 9 of $a_n(r, s)$ for $n = 0, 1, 2$, as well as the behaviour modulo 3 of the terms $f(n_{\nu - 1}, n_{\nu}; r, s)$ given by (3.2) (or (3.5)) and (3.7).

We begin with the Apéry numbers for small indices. We have

\[
a_0(r, s) = 1, \quad (4.1)
\]

\[
a_1(r, s) = 1 + 2^s \equiv \begin{cases} 2 \pmod{9}, & \text{if } s \equiv 0 \pmod{6}, \\ 3 \pmod{9}, & \text{if } s \equiv 1 \pmod{6}, \\ 5 \pmod{9}, & \text{if } s \equiv 2 \pmod{6}, \\ 0 \pmod{9}, & \text{if } s \equiv 3 \pmod{6}, \\ 8 \pmod{9}, & \text{if } s \equiv 4 \pmod{6}, \\ 6 \pmod{9}, & \text{if } s \equiv 5 \pmod{6}, \end{cases} \quad (4.2)
\]
and

$$a_2(r, s) = 1 + 2^r 3^s + 6^s \equiv \begin{cases} 
3 \pmod{9}, & \text{if } r \equiv 0 \pmod{6} \text{ and } s = 0, \\
4 \pmod{9}, & \text{if } r \equiv 1 \pmod{6} \text{ and } s = 0, \\
6 \pmod{9}, & \text{if } r \equiv 2 \pmod{6} \text{ and } s = 0, \\
1 \pmod{9}, & \text{if } r \equiv 3 \pmod{6} \text{ and } s = 0, \\
0 \pmod{9}, & \text{if } r \equiv 4 \pmod{6} \text{ and } s = 0, \\
7 \pmod{9}, & \text{if } r \equiv 5 \pmod{6} \text{ and } s = 0, \\
1 \pmod{9}, & \text{if } r \equiv 0, 2 \pmod{3} \text{ and } s = 1, \\
4 \pmod{9}, & \text{if } r \equiv 1 \pmod{3} \text{ and } s = 1, \\
1 \pmod{9}, & \text{if } s \geq 2. 
\end{cases}$$

Distinguishing between the various cases which arise when \( r \) and \( s \) run through the congruence classes modulo 6, we obtain

$$f(n_{\nu-1}, n_{\nu}; r, s) \equiv \begin{cases} 
0 \pmod{3}, & \text{if } r \equiv 0 \pmod{3} \text{ and } s \equiv 0 \pmod{3}, \\
\chi(n_{\nu-1} = 1)n_{\nu} \pmod{3}, & \text{if } r \equiv 0 \pmod{6} \text{ and } s \equiv 1 \pmod{6}, \\
\chi(n_{\nu-1} = 1)(\chi(n_{\nu} = 0) - 1) \pmod{3}, & \text{if } r \equiv 0 \pmod{3} \text{ and } s \equiv 2 \pmod{6}, \\
\chi(n_{\nu-1} = 1)(1 - \chi(n_{\nu} = 0)) \pmod{3}, & \text{if } r \equiv 0 \pmod{3} \text{ and } s \equiv 4 \pmod{6}, \\
-\chi(n_{\nu-1} = 1)n_{\nu} \pmod{3}, & \text{if } r \equiv 0 \pmod{3} \text{ and } s \equiv 5 \pmod{6}, \\
\chi(n_{\nu-1} = 1)(\chi(n_{\nu} = 0) - 1) - \chi(n_{\nu-1} = 0)n_{\nu} \pmod{3}, & \text{if } r = 1 \text{ and } s \equiv 0 \pmod{3}, \\
-n_{\nu-1}\chi(n_{\nu} = 2) - n_{\nu} \pmod{3}, & \text{if } r = s = 1, 
\end{cases}$$

\[(4.4)\]
and
\begin{equation}
f(n_{\nu-1}, n_\nu; r, s) = \begin{cases} 
\chi(n_\nu = 1)n_{\nu-1} - n_\nu - (1 - \chi(n_{\nu-1} = 0))(1 - \chi(n_\nu = 0)) \pmod{3}, & \text{if } r = 1, s \equiv 1 \pmod{6}, \text{ and } s \geq 7, \\
\chi(n_{\nu-1} = 1)(1 - \chi(n_\nu = 0) - \chi(n_{\nu-1} = 0)n_\nu \pmod{3}, & \text{if } r = 1 \text{ and } s \equiv 2 \pmod{6}, \\
\chi(n_{\nu-1} = 1)(1 - \chi(n_\nu = 0)) - \chi(n_{\nu-1} = 0)n_\nu \pmod{3}, & \text{if } r = 1 \text{ and } s \equiv 3 \pmod{6}, \\
-\chi(n_{\nu-1} = 0)n_\nu \pmod{3}, & \text{if } r = 1 \text{ and } s \equiv 4 \pmod{6}, \\
(\chi(n_{\nu-1} = 2) - 1)n_\nu + \chi(n_{\nu-1} = 1)(1 - \chi(n_\nu = 0)) \pmod{3}, & \text{if } r = 1 \text{ and } s \equiv 5 \pmod{6}, \\
\chi(n_{\nu-1} = 1)(\chi(n_\nu = 0) - 1) \pmod{3}, & \text{if } r \equiv 1 \pmod{3}, r \geq 4, \text{ and } s \equiv 0 \pmod{6}, \\
\chi(n_{\nu-1} = 1)n_\nu + (1 - \chi(n_\nu = 0))n_{\nu-1} \pmod{3}, & \text{if } r \equiv 1 \pmod{6}, r \geq 7, \text{ and } s = 1, \\
-\chi(n_{\nu-1} = 1)\chi(n_\nu = 1) \pmod{3}, & \text{if } r, s \equiv 1 \pmod{6} \text{ and } r, s \geq 7, \\
\text{and if } r \equiv 4 \pmod{6} \text{ and } s \equiv 1 \pmod{6}, \\
\chi(n_{\nu-1} = 1)(1 - \chi(n_\nu = 0)) \pmod{3}, & \text{if } r \equiv 1 \pmod{3}, r \geq 4, \\
& \text{and } s \equiv 2, 3 \pmod{6}, \\
0 \pmod{3}, & \text{if } r \equiv 1 \pmod{3}, r \geq 4, \text{ and } s \equiv 4 \pmod{6}, \\
-\chi(n_{\nu-1} = 1)\chi(n_\nu = 2) \pmod{3}, & \text{if } r \equiv 1 \pmod{3}, r \geq 4, \text{ and } s \equiv 5 \pmod{6}, \\
\chi(n_{\nu-1} = 1)(1 - \chi(n_\nu = 0)) \pmod{3}, & \text{if } r \equiv 2 \pmod{3} \text{ and } s \equiv 0 \pmod{6}, \\
\chi(n_{\nu-1} = 1)\chi(n_\nu = 2) \pmod{3}, & \text{if } r \equiv 2 \pmod{6} \text{ and } s \equiv 1 \pmod{6}, \\
0 \pmod{3}, & \text{if } r \equiv 2 \pmod{3} \text{ and } s \equiv 2 \pmod{6}, \\
\chi(n_{\nu-1} = 1)(\chi(n_\nu = 0) - 1) \pmod{3}, & \text{if } r \equiv 2 \pmod{3} \text{ and } s \equiv 3 \pmod{6}, \\
\chi(n_{\nu-1} = 1)(\chi(n_\nu = 0) - 1) \pmod{3}, & \text{if } r \equiv 2 \pmod{3} \text{ and } s \equiv 4 \pmod{6}, \\
\chi(n_{\nu-1} = 1)\chi(n_\nu = 1) \pmod{3}, & \text{if } r \equiv 2 \pmod{3} \text{ and } s \equiv 5 \pmod{6}, \\
\chi(n_{\nu-1} = 2)(\chi(n_\nu = 0) - 1) + \chi(n_{\nu-1} = 1)n_\nu \pmod{3}, & \text{if } r \equiv 3 \pmod{6} \text{ and } s = 1, \\
\chi(n_{\nu-1} = 1)n_\nu \pmod{3}, & \text{if } r \equiv 3 \pmod{6}, s \equiv 1 \pmod{6}, \text{ and } s \geq 7, \\
\chi(n_{\nu-1} = 1)n_\nu - (1 - \chi(n_{\nu-1} = 0))(1 - \chi(n_\nu = 0)) \pmod{3}, & \text{if } r \equiv 5 \pmod{6} \text{ and } s = 1, \\
\chi(n_{\nu-1} = 1)\chi(n_\nu = 2) \pmod{3}, & \text{if } r \equiv 5 \pmod{6}, s \equiv 1 \pmod{6}, \text{ and } s \geq 7, \\
\end{cases}
\end{equation}
and
\[ f(n_\nu-1, n_\nu; r, s) \equiv \begin{cases} 
(\chi(n_{\nu-1} = 2) - \chi(n_{\nu-1} = 1)) \chi(n_{\nu} = 2) + n_\nu & \pmod{3}, \\
(1 + \chi(n_{\nu-1} = 1)) \chi(n_{\nu} = 2) - n_\nu & \pmod{3}, \\
(\chi(n_{\nu-1} = 1) + \chi(n_{\nu-1} = 2)) \chi(n_{\nu} = 2) - n_\nu & \pmod{3}, \\
(\chi(n_{\nu-1} = 2) - \chi(n_{\nu-1} = 1)) \chi(n_{\nu} = 2) + n_\nu & \pmod{3}, \\
\end{cases} \]
\hspace{1cm} \text{if } r \equiv 0 \pmod{6}, r \geq 6, \text{ and } s = 0,
\hspace{1cm} \text{if } r = 1 \text{ and } s = 0,
\hspace{1cm} \text{if } r \equiv 1, 3, 5 \pmod{6}, r \geq 3, \text{ and } s = 0,
\hspace{1cm} \text{if } r \equiv 2, 4 \pmod{6} \text{ and } s = 0.
\hspace{1cm} \text{ (4.6)}

**Remark.** By examining (4.4)–(4.6), one sees that Gessel’s result \([7, \text{ Theorem 3(iii)}]\), namely that
\[ a_n(r, s) \equiv \prod_{i=0}^{m} a_{n_i}(r, s) \pmod{9} \]
for \( r = s = 2, \) does not only hold in that case, but more generally for \( r \equiv 2 \pmod{3} \) and \( s \equiv 2 \pmod{6}, \) and also for \( r \equiv s \equiv 0 \pmod{3}, \) and for \( r \equiv 1 \pmod{3}, r \geq 4, \) and \( s \equiv 4 \pmod{6}. \)

If we combine Theorems \( 2 \) and \( 3 \) with (4.1)–(4.6), we obtain the following explicit descriptions of the mod-9 behaviour of \( a_n(r, s). \)

**Corollary 4.** If \( r \) \text{ and } s \text{ are positive integers with } r \equiv 0 \pmod{3} \text{ and } s \equiv 0 \pmod{6}, \text{ then the Apéry numbers } a_n(r, s) \text{ obey the following congruences modulo } 9:

(i) \( a_n(r, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains \( 6k \) digits \( 1 \), for some \( k \), and otherwise only 0’s and 2’s;

(ii) \( a_n(r, s) \equiv 2 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains \( 6k + 1 \) digits \( 1 \), for some \( k \), and otherwise only 0’s and 2’s;

(iii) \( a_n(r, s) \equiv 4 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains \( 6k + 2 \) digits \( 1 \), for some \( k \), and otherwise only 0’s and 2’s;

(iv) \( a_n(r, s) \equiv 5 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains \( 6k + 5 \) digits \( 1 \), for some \( k \), and otherwise only 0’s and 2’s;

(v) \( a_n(r, s) \equiv 7 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains \( 6k + 4 \) digits \( 1 \), for some \( k \), and otherwise only 0’s and 2’s;

(vi) \( a_n(r, s) \equiv 8 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains \( 6k + 3 \) digits \( 1 \), for some \( k \), and otherwise only 0’s and 2’s;

(vii) in the cases not covered by Items (i)–(vi), \( a_n(r, s) \) is divisible by 9; in particular, \( a_n(r, s) \not\equiv 3, 6 \pmod{9} \) for all \( n. \)

**Corollary 5.** If \( r \) \text{ and } s \text{ are positive integers with } r \equiv 0 \pmod{6} \text{ and } s \equiv 1 \pmod{6}, \text{ or with } r \equiv 3 \pmod{6}, s \equiv 1 \pmod{6}, \text{ and } s \geq 7, \text{ then the Apéry numbers } a_n(r, s) \text{ obey the following congruences modulo } 9:

(i) \( a_n(r, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains 0’s and 2’s only;
(ii) \( a_n(r, s) \equiv 3 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has exactly one occurrence of the string 01 (including an occurrence of a 1 at the beginning) or of the string 11 — but not both — and otherwise contains only 0’s and 2’s;
(iii) in the cases not covered by Items (i)–(ii), \( a_n(r, s) \) is divisible by 9; in particular, \( a_n(r, s) \not\equiv 2, 4, 5, 6, 7, 8 \pmod{9} \) for all \( n \).

**Corollary 6.** If \( r \) and \( s \) are positive integers with \( r \equiv 0 \pmod{3} \) and \( s \equiv 2 \pmod{6} \), or if \( r \equiv 1 \pmod{3} \), \( r \geq 4 \), and \( s \equiv 2 \pmod{6} \), then the Apéry numbers \( a_n(r, s) \) obey the following congruences modulo 9:

(i) \( a_n(r, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has 2\( d \) digits 1, 0\( 1 \) occurrences of the string 11, 0\( 2 \) occurrences of the string 21, and \( d + o_1 - o_2 \equiv 0 \pmod{3} \);
(ii) \( a_n(r, s) \equiv 2 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has 2\( d + 1 \) digits 1, 0\( 1 \) occurrences of the string 11, 0\( 2 \) occurrences of the string 21, and \( d + o_1 - o_2 \equiv 2 \pmod{3} \);
(iii) \( a_n(r, s) \equiv 4 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has 2\( d \) digits 1, 0\( 1 \) occurrences of the string 11, 0\( 2 \) occurrences of the string 21, and \( d + o_1 - o_2 \equiv 2 \pmod{3} \);
(iv) \( a_n(r, s) \equiv 5 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has 2\( d + 1 \) digits 1, 0\( 1 \) occurrences of the string 11, 0\( 2 \) occurrences of the string 21, and \( d + o_1 - o_2 \equiv 0 \pmod{3} \);
(v) \( a_n(r, s) \equiv 7 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has 2\( d \) digits 1, 0\( 1 \) occurrences of the string 11, 0\( 2 \) occurrences of the string 21, and \( d + o_1 - o_2 \equiv 1 \pmod{3} \);
(vi) \( a_n(r, s) \equiv 8 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has 2\( d + 1 \) digits 1, 0\( 1 \) occurrences of the string 11, 0\( 2 \) occurrences of the string 21, and \( d + o_1 - o_2 \equiv 1 \pmod{3} \);
(vii) in the cases not covered by Items (i)–(vi), \( a_n(r, s) \) is divisible by 9; in particular, \( a_n(r, s) \not\equiv 3, 6 \pmod{9} \) for all \( n \).

**Corollary 7.** If \( r \) and \( s \) are positive integers with \( r \equiv 0 \pmod{3} \) and \( s \equiv 3 \pmod{6} \), then the Apéry numbers \( a_n(r, s) \) obey the following congruences modulo 9:

(i) \( a_n(r, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains 0’s and 2’s only;
(ii) in all other cases \( a_n(r, s) \) is divisible by 9; in particular, \( a_n(r, s) \not\equiv 2, 3, 4, 5, 6, 7, 8 \pmod{9} \) for all \( n \).

**Corollary 8.** If \( r \) and \( s \) are positive integers with \( r \equiv 0 \pmod{3} \) and \( s \equiv 4 \pmod{6} \), then the Apéry numbers \( a_n(r, s) \) obey the following congruences modulo 9:

(i) \( a_n(r, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an even number of digits 1, and the difference of the number of occurrences of the string 11 and the number of occurrences of the string 21 is \( \equiv 0 \pmod{3} \);
(ii) \( a_n(r, s) \equiv 2 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an odd number of digits 1, and the difference of the number of occurrences of the string 11 and the number of occurrences of the string 21 is \( \equiv 2 \pmod{3} \);
(iii) \( a_n(r, s) \equiv 4 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an even number of digits 1, and the difference of the number of occurrences of the string 11 and the number of occurrences of the string 21 is \( \equiv 1 \pmod{3} \);
Corollary 9. If \( r \) and \( s \) are positive integers with \( r \equiv 0 \pmod{6} \) and \( s \equiv 5 \pmod{6} \), then the Apéry numbers \( a_n(r, s) \) obey the following congruences modulo 9:

(i) \( a_n(r, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains 0’s and 2’s only;
(ii) \( a_n(r, s) \equiv 6 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has exactly one occurrence of the string 01 (including an occurrence of a 1 at the beginning) or of the string 11 — but not both — and otherwise contains only 0’s and 2’s;
(iii) in the cases not covered by Items (i)–(ii), \( a_n(r, s) \) is divisible by 9; in particular, \( a_n(r, s) \not\equiv 3, 6 \pmod{9} \) for all \( n \).

Corollary 10. If \( s \) is a positive integer with \( s \equiv 0 \pmod{6} \), then the Apéry numbers \( a_n(1, s) \) obey the following congruences modulo 9:

(i) \( a_n(1, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has 2d digits 1, \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, \( o_3 \) occurrences of the string 10, \( o_4 \) occurrences of the string 20, and \( d-o_1+o_2+o_3+o_4 \equiv 0 \pmod{3} \);
(ii) \( a_n(1, s) \equiv 2 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has \( 2d+1 \) digits 1, \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, \( o_3 \) occurrences of the string 10, \( o_4 \) occurrences of the string 20, and \( d+o_1-o_2+o_3+o_4 \equiv 0 \pmod{3} \);
(iii) \( a_n(1, s) \equiv 4 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has \( 2d \) digits 1, \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, \( o_3 \) occurrences of the string 10, \( o_4 \) occurrences of the string 20, and \( d-o_1+o_2+o_3+o_4 \equiv 1 \pmod{3} \);
(iv) \( a_n(1, s) \equiv 5 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has \( 2d+1 \) digits 1, \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, \( o_3 \) occurrences of the string 10, \( o_4 \) occurrences of the string 20, and \( d+o_1-o_2+o_3+o_4 \equiv 1 \pmod{3} \);
(v) \( a_n(1, s) \equiv 7 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has \( 2d+1 \) digits 1, \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, \( o_3 \) occurrences of the string 10, \( o_4 \) occurrences of the string 20, and \( d-o_1+o_2+o_3+o_4 \equiv 2 \pmod{3} \);
(vi) \( a_n(1, s) \equiv 8 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has \( 2d \) digits 1, \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, \( o_3 \) occurrences of the string 10, \( o_4 \) occurrences of the string 20, and \( d+o_1-o_2+o_3+o_4 \equiv 2 \pmod{3} \);
(vii) in the cases not covered by Items (i)–(vi), \( a_n(1, s) \) is divisible by 9; in particular, \( a_n(1, s) \not\equiv 3, 6 \pmod{9} \) for all \( n \).

Corollary 11. Let \( n_0 \) denote the 0-th digit in the 3-adic representation of the non-negative integer \( n \). The Apéry numbers \( a_n(1, 1) \) obey the following congruences modulo 9:
Corollary 12. If $s$ is a positive integer with $s \equiv 1 \pmod{6}$ and $s \geq 7$, then the Apéry numbers $a_n(1,s)$ obey the following congruences modulo 9:

(i) $a_n(1,s) \equiv 1 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only, and the number of maximal strings of 2’s is $\equiv n_0 \pmod{3}$;
(ii) $a_n(1,s) \equiv 3 \pmod{9}$ if, and only if, $n_0 = 1$;
(iii) $a_n(1,s) \equiv 4 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only, and the number of maximal strings of 2’s is $\equiv n_0 + 2 \pmod{3}$;
(iv) $a_n(1,s) \equiv 6 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has exactly one occurrence of the string 11 and otherwise contains only 0’s and 2’s;
(v) $a_n(1,s) \equiv 7 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only, and the number of maximal strings of 2’s is $\equiv n_0 + 1 \pmod{3}$;
(vi) in the cases not covered by Items (i)–(v), $a_n(1,1)$ is divisible by 9; in particular, $a_n(1,1) \not\equiv 2, 5, 8 \pmod{9}$ for all $n$.

Corollary 13. If $s$ is a positive integer with $s \equiv 2 \pmod{6}$, then the Apéry numbers $a_n(1,s)$ obey the following congruences modulo 9:

(i) $a_n(1,s) \equiv 1 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has 2$d$ digits 1, $o_1$ occurrences of the string 11, $o_2$ occurrences of the string 21, $o_3$ occurrences of the string 10, $o_4$ occurrences of the string 20, and $d - o_1 + o_2 - o_3 - o_4 \equiv 0 \pmod{3}$;
(ii) $a_n(1,s) \equiv 2 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has 2$d+1$ digits 1, $o_1$ occurrences of the string 11, $o_2$ occurrences of the string 21, $o_3$ occurrences of the string 10, $o_4$ occurrences of the string 20, and $d - o_1 + o_2 - o_3 - o_4 \equiv 2 \pmod{3}$;
(iii) $a_n(1,s) \equiv 4 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has 2$d$ digits 1, $o_1$ occurrences of the string 11, $o_2$ occurrences of the string 21, $o_3$ occurrences of the string 10, $o_4$ occurrences of the string 20, and $d - o_1 + o_2 - o_3 - o_4 \equiv 2 \pmod{3}$;
(iv) $a_n(1,s) \equiv 5 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has 2$d+1$ digits 1, $o_1$ occurrences of the string 11, $o_2$ occurrences of the string 21, $o_3$ occurrences of the string 10, $o_4$ occurrences of the string 20, and $d - o_1 + o_2 - o_3 - o_4 \equiv 0 \pmod{3}$;
(v) $a_n(1,s) \equiv 7 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has 2$d$ digits 1, $o_1$ occurrences of the string 11, $o_2$ occurrences of the string 21, $o_3$ occurrences of the string 10, $o_4$ occurrences of the string 20, and $d - o_1 + o_2 - o_3 - o_4 \equiv 0 \pmod{3}$;
(vi) $a_n(1,s) \equiv 8 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has 2$d+1$ digits 1, $o_1$ occurrences of the string 11, $o_2$ occurrences of the string 21, $o_3$ occurrences of the string 10, $o_4$ occurrences of the string 20, and $d - o_1 + o_2 - o_3 - o_4 \equiv 1 \pmod{3}$;
(vii) in the cases not covered by Items (i)–(vi), \( a_n(1, s) \) is divisible by 9; in particular, \( a_n(1, s) \not\equiv 3, 6 \pmod{9} \) for all \( n \).

**Corollary 14.** If \( s \) is a positive integer with \( s \equiv 3 \pmod{6} \), then the Apéry numbers \( a_n(1, s) \) obey the following congruences modulo 9:

(i) \( a_n(1, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains 0’s and 2’s only, and the number of occurrences of the string 20 is \( \equiv 0 \pmod{3} \);
(ii) \( a_n(1, s) \equiv 3 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has exactly one occurrence of the string 11, or exactly one occurrence of the string 21 but no occurrence of the string 11, and otherwise contains only 0’s and 2’s;
(iii) \( a_n(1, s) \equiv 4 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains 0’s and 2’s only, and the number of occurrences of the string 20 is \( \equiv 1 \pmod{3} \);
(iv) \( a_n(1, s) \equiv 6 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has exactly one occurrence of the string 10, no occurrences of the strings 11 or 21, and otherwise contains only 0’s and 2’s;
(v) \( a_n(1, s) \equiv 7 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains 0’s and 2’s only, and the number of occurrences of the string 20 is \( \equiv 2 \pmod{3} \);
(vi) in the cases not covered by Items (i)–(v), \( a_n(1, s) \) is divisible by 9; in particular, \( a_n(1, s) \not\equiv 2, 5, 8 \pmod{9} \) for all \( n \).

**Corollary 15.** If \( s \) is a positive integer with \( s \equiv 4 \pmod{6} \), then the Apéry numbers \( a_n(1, s) \) obey the following congruences modulo 9:

(i) \( a_n(1, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an even number of digits 1, and the sum of the number of occurrences of the string 10 and the number of occurrences of the string 20 is \( \equiv 0 \pmod{3} \);
(ii) \( a_n(1, s) \equiv 2 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an odd number of digits 1, and the sum of the number of occurrences of the string 10 and the number of occurrences of the string 20 is \( \equiv 2 \pmod{3} \);
(iii) \( a_n(1, s) \equiv 4 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an even number of digits 1, and the sum of the number of occurrences of the string 10 and the number of occurrences of the string 20 is \( \equiv 1 \pmod{3} \);
(iv) \( a_n(1, s) \equiv 5 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an odd number of digits 1, and the sum of the number of occurrences of the string 10 and the number of occurrences of the string 20 is \( \equiv 1 \pmod{3} \);
(v) \( a_n(1, s) \equiv 7 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an even number of digits 1, and the sum of the number of occurrences of the string 10 and the number of occurrences of the string 20 is \( \equiv 2 \pmod{3} \);
(vi) \( a_n(1, s) \equiv 8 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an odd number of digits 1, and the sum of the number of occurrences of the string 10 and the number of occurrences of the string 20 is \( \equiv 0 \pmod{3} \);
(vii) in the cases not covered by Items (i)–(vi), \( a_n(1, s) \) is divisible by 9; in particular, \( a_n(1, s) \not\equiv 3, 6 \pmod{9} \) for all \( n \).

**Corollary 16.** If \( s \) is a positive integer with \( s \equiv 5 \pmod{6} \), then the Apéry numbers \( a_n(1, s) \) obey the following congruences modulo 9:

(i) \( a_n(1, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains 0’s and 2’s only, and the number of strings 20 is \( \equiv 0 \pmod{3} \);
Corollary 18. If $n \equiv 0 \pmod{6}$, then the Apéry numbers $a_n \equiv 0 \pmod{2}$.

Corollary 17. If $r$ and $s$ are positive integers with $r \equiv 1 \pmod{3}$, $r \geq 4$, and $s \equiv 0 \pmod{6}$, then the Apéry numbers $a_n(r, s)$ obey the following congruences modulo 9:

(i) $a_n(r, s) \equiv 1 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has exactly one occurrence of the string 10 or of the string 21 — but not both, and otherwise contains only 0’s and 2’s;

(ii) $a_n(r, s) \equiv 3 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has exactly one occurrence of the string 10 or of the string 21 — but not both, and otherwise contains only 0’s and 2’s;

(iii) $a_n(r, s) \equiv 4 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only, and the number of maximal strings 20 is $\equiv 1 \pmod{3}$;

(iv) $a_n(r, s) \equiv 6 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has exactly one occurrence of 1 but no occurrence of the strings 10 or 21, and otherwise contains only 0’s and 2’s;

(v) $a_n(r, s) \equiv 7 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only, and the number of strings 20 is $\equiv 2 \pmod{3}$;

(vi) in the cases not covered by Items (i)–(v), $a_n(1, s)$ is divisible by 9; in particular, $a_n(1, s) \not\equiv 2, 5, 8 \pmod{9}$ for all $n$.

Corollary 18. If $r$ is a positive integer with $r \equiv 1 \pmod{6}$ and $r \geq 7$, then the Apéry numbers $a_n(r, 1)$ obey the following congruences modulo 9:

(i) $a_n(r, 1) \equiv 1 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only, and the number of maximal strings of 2’s is $\equiv 0 \pmod{3}$;

(ii) $a_n(r, 1) \equiv 3 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only, and the number of maximal strings of 2’s is $\equiv 0 \pmod{3}$;

(iii) $a_n(r, 1) \equiv 4 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only, and the number of maximal strings of 2’s is $\equiv 1 \pmod{3}$;

(iv) $a_n(r, 1) \equiv 6 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only, and the number of maximal strings of 2’s is $\equiv 1 \pmod{3}$;

(v) $a_n(r, 1) \equiv 7 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only, and the number of maximal strings of 2’s is $\equiv 2 \pmod{3}$;

(vi) in the cases not covered by Items (i)–(v), $a_n(r, 1)$ is divisible by 9; in particular, $a_n(r, 1) \not\equiv 3, 6 \pmod{9}$ for all $n$. 
(v) $a_n(r, 1) \equiv 7 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only, and the number of maximal strings of 2’s is $\equiv 2 \pmod{3}$;

(vi) in the cases not covered by Items (i)–(v), $a_n(r, 1)$ is divisible by 9; in particular, $a_n(r, 1) \not\equiv 2, 5, 8 \pmod{9}$ for all $n$.

**Corollary 19.** If $r$ and $s$ are positive integers with $r, s \equiv 1 \pmod{6}$ and $r, s \geq 7$, or with $r \equiv 4 \pmod{6}$ and $s \equiv 1 \pmod{6}$, then the Apéry numbers $a_n(r, s)$ obey the following congruences modulo 9:

(i) $a_n(r, s) \equiv 1 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only;

(ii) $a_n(r, s) \equiv 3 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains exactly one 1, and otherwise only 0’s and 2’s;

(iii) $a_n(r, s) \equiv 6 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has exactly one occurrence of the string 11 and otherwise contains only 0’s and 2’s;

(iv) in the cases not covered by Items (i)–(iii), $a_n(r, s)$ is divisible by 9; in particular, $a_n(r, s) \not\equiv 2, 4, 5, 6, 7, 8 \pmod{9}$ for all $n$.

The case where $r \equiv 1 \pmod{3}$, $r \geq 4$, and $s \equiv 2 \pmod{6}$ has already been treated in Corollary 6.

**Corollary 20.** If $r$ and $s$ are positive integers with $r \equiv 1 \pmod{3}$, $r \geq 4$, and $s \equiv 3 \pmod{6}$, then the Apéry numbers $a_n(r, s)$ obey the following congruences modulo 9:

(i) $a_n(r, s) \equiv 1 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only;

(ii) $a_n(r, s) \equiv 3 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has exactly one occurrence of the string 11 or of the string 21 — but not both — and otherwise contains only 0’s and 2’s;

(iii) in the cases not covered by Items (i)–(ii), $a_n(r, s)$ is divisible by 9; in particular, $a_n(r, s) \not\equiv 2, 4, 5, 6, 7, 8 \pmod{9}$ for all $n$.

**Corollary 21.** If $r$ and $s$ are positive integers with $r \equiv 1 \pmod{3}$, $r \geq 4$, and $s \equiv 4 \pmod{6}$, then the Apéry numbers $a_n(r, s)$ obey the following congruences modulo 9:

(i) $a_n(r, s) \equiv 1 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains an even number of digits 1, and otherwise only 0’s and 2’s;

(ii) $a_n(r, s) \equiv 8 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains an odd number of digits 1, and otherwise only 0’s and 2’s;

(iii) in the cases not covered by Items (i)–(ii), $a_n(r, s)$ is divisible by 9; in particular, $a_n(r, s) \not\equiv 2, 3, 4, 5, 6, 7 \pmod{9}$ for all $n$.

**Corollary 22.** If $r$ and $s$ are positive integers with $r \equiv 1 \pmod{3}$, $r \geq 4$, and $s \equiv 5 \pmod{6}$, then the Apéry numbers $a_n(r, s)$ obey the following congruences modulo 9:

(i) $a_n(r, s) \equiv 1 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains 0’s and 2’s only;

(ii) $a_n(r, s) \equiv 3 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has exactly one occurrence of the string 21 and otherwise contains only 0’s and 2’s;

(iii) $a_n(r, s) \equiv 6 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ has exactly one occurrence of the string 01 (including an occurrence of a 1 at the beginning) and otherwise contains only 0’s and 2’s;
Corollary 23. If \( r \) and \( s \) are positive integers with \( r \equiv 2 \) (mod 3) and \( s \equiv 0 \) (mod 6), then the Apéry numbers \( a_n(r, s) \) obey the following congruences modulo 9:

(i) \( a_n(r, s) \equiv 1 \) (mod 9) if, and only if, the 3-adic expansion of \( n \) has 2\( d \) digits 1, \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, and \( d + o_1 - o_2 \equiv 0 \) (mod 3);

(ii) \( a_n(r, s) \equiv 2 \) (mod 9) if, and only if, the 3-adic expansion of \( n \) has 2\( d + 1 \) digits 1, \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, and \( d + o_1 - o_2 \equiv 0 \) (mod 3);

(iii) \( a_n(r, s) \equiv 4 \) (mod 9) if, and only if, the 3-adic expansion of \( n \) has 2\( d \) digits 1, \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, and \( d + o_1 - o_2 \equiv 1 \) (mod 3);

(iv) \( a_n(r, s) \equiv 5 \) (mod 9) if, and only if, the 3-adic expansion of \( n \) has 2\( d + 1 \) digits 1, \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, and \( d + o_1 - o_2 \equiv 1 \) (mod 3);

(v) \( a_n(r, s) \equiv 7 \) (mod 9) if, and only if, the 3-adic expansion of \( n \) has 2\( d \) digits 1, \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, and \( d + o_1 - o_2 \equiv 2 \) (mod 3);

(vi) \( a_n(r, s) \equiv 8 \) (mod 9) if, and only if, the 3-adic expansion of \( n \) has 2\( d + 1 \) digits 1, \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, and \( d + o_1 - o_2 \equiv 1 \) (mod 3);

(vii) in the cases not covered by Items (i)–(vi), \( a_n(r, s) \) is divisible by 9; in particular, \( a_n(r, s) \not\equiv 3, 6 \) (mod 9) for all \( n \).

Corollary 24. If \( r \) and \( s \) are positive integers with \( r \equiv 2 \) (mod 6) and \( s \equiv 1 \) (mod 6), or with \( r \equiv 5 \) (mod 6), \( s \equiv 1 \) (mod 6), and \( s \geq 7 \), then the Apéry numbers \( a_n(r, s) \) obey the following congruences modulo 9:

(i) \( a_n(r, s) \equiv 1 \) (mod 9) if, and only if, the 3-adic expansion of \( n \) contains 0’s and 2’s only;

(ii) \( a_n(r, s) \equiv 3 \) (mod 9) if, and only if, the 3-adic expansion of \( n \) has exactly one occurrence of the string 01 (including an occurrence of a 1 at the beginning) and otherwise contains only 0’s and 2’s;

(iii) \( a_n(r, s) \equiv 6 \) (mod 9) if, and only if, the 3-adic expansion of \( n \) has exactly one occurrence of the string 21 and otherwise contains only 0’s and 2’s;

(iv) in the cases not covered by Items (i)–(iii), \( a_n(r, s) \) is divisible by 9; in particular, \( a_n(r, s) \not\equiv 2, 4, 5, 7, 8 \) (mod 9) for all \( n \).

For \( r = 2 \) and \( s = 1 \), this corollary establishes Conjecture 65 in [10].

Corollary 25. If \( r \) and \( s \) are positive integers with \( r \equiv 2 \) (mod 3) and \( s \equiv 2 \) (mod 6), then the Apéry numbers \( a_n(r, s) \) obey the following congruences modulo 9:

(i) \( a_n(r, s) \equiv 1 \) (mod 9) if, and only if, the 3-adic expansion of \( n \) contains 6\( k \) digits 1, for some \( k \), and otherwise only 0’s and 2’s;

(ii) \( a_n(r, s) \equiv 2 \) (mod 9) if, and only if, the 3-adic expansion of \( n \) contains 6\( k + 5 \) digits 1, for some \( k \), and otherwise only 0’s and 2’s;

(iii) \( a_n(r, s) \equiv 4 \) (mod 9) if, and only if, the 3-adic expansion of \( n \) contains 6\( k + 4 \) digits 1, for some \( k \), and otherwise only 0’s and 2’s;
Corollary 27. If \( a \), then the Ap\'ery numbers \( \) 

Corollary 26. If \( r \) and \( s \) are positive integers with \( r \equiv 2 \pmod{3} \) and \( s \equiv 3 \pmod{6} \), then the Ap\'ery numbers \( a_{n}(r, s) \) obey the following congruences modulo 9:

(i) \( a_{n}(r, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains 0’s and 2’s only;

(ii) \( a_{n}(r, s) \equiv 6 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has exactly one occurrence of the string 11 or of the string 21 — but not both — and otherwise contains only 0’s and 2’s;

(iii) in the cases not covered by Items (i)–(ii), \( a_{n}(r, s) \) is divisible by 9; in particular, \( a_{n}(r, s) \not\equiv 3, 6 \pmod{9} \) for all \( n \).

For \( r = s = 2 \), this corollary establishes Conjecture 66 in [10].

Corollary 27. If \( r \) and \( s \) are positive integers with \( r \equiv 2 \pmod{6} \) and \( s \equiv 4 \pmod{6} \), then the Ap\'ery numbers \( a_{n}(r, s) \) obey the following congruences modulo 9:

(i) \( a_{n}(r, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains 0’s and 2’s only;

(ii) \( a_{n}(r, s) \equiv 2 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an even number of digits 1, and the difference of the number of occurrences of the string 11 and the number of occurrences of the string 21 is \( \equiv 0 \pmod{3} \);

(iii) \( a_{n}(r, s) \equiv 4 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an even number of digits 1, and the difference of the number of occurrences of the string 11 and the number of occurrences of the string 21 is \( \equiv 1 \pmod{3} \);

(iv) \( a_{n}(r, s) \equiv 5 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an odd number of digits 1, and the difference of the number of occurrences of the string 11 and the number of occurrences of the string 21 is \( \equiv 2 \pmod{3} \);

(v) \( a_{n}(r, s) \equiv 7 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an even number of digits 1, and the difference of the number of occurrences of the string 11 and the number of occurrences of the string 21 is \( \equiv 1 \pmod{3} \);

(vi) \( a_{n}(r, s) \equiv 8 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has an odd number of digits 1, and the difference of the number of occurrences of the string 11 and the number of occurrences of the string 21 is \( \equiv 0 \pmod{3} \);

(vii) in the cases not covered by Items (i)–(vi), \( a_{n}(r, s) \) is divisible by 9; in particular, \( a_{n}(r, s) \not\equiv 3, 6 \pmod{9} \) for all \( n \).

Corollary 28. If \( r \) and \( s \) are positive integers with \( r \equiv 2 \pmod{3} \), \( s \equiv 5 \pmod{6} \), and \( r, s > 1 \), then the Ap\'ery numbers \( a_{n}(r, s) \) obey the following congruences modulo 9:

(i) \( a_{n}(r, s) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains 0’s and 2’s only;
(ii) \(a_n(r, s) \equiv 3 \pmod{9}\) if, and only if, the 3-adic expansion of \(n\) has exactly one occurrence of the string 11 and otherwise contains only 0’s and 2’s;

(iii) \(a_n(r, s) \equiv 6 \pmod{9}\) if, and only if, the 3-adic expansion of \(n\) contains exactly one 1, and otherwise only 0’s and 2’s;

(iv) in the cases not covered by Items (i)–(iii), \(a_n(r, s)\) is divisible by 9; in particular, \(a_n(r, s) \not\equiv 2, 4, 5, 7, 8 \pmod{9}\) for all \(n\).

**Corollary 29.** If \(r\) is a positive integer with \(r \equiv 3 \pmod{6}\), then the Apéry numbers \(a_n(r, 1)\) obey the following congruences modulo 9:

(i) \(a_n(r, 1) \equiv 1 \pmod{9}\) if, and only if, the 3-adic expansion of \(n\) contains 0’s and 2’s only, and the number of maximal strings of 2’s is \(\equiv 0 \pmod{3}\);

(ii) \(a_n(r, 1) \equiv 3 \pmod{9}\) if, and only if, the 3-adic expansion of \(n\) has exactly one occurrence of 1 but no occurrences of the strings 12 or 21, or it has exactly one occurrence of the string 11, and otherwise it contains only 0’s and 2’s;

(iii) \(a_n(r, 1) \equiv 4 \pmod{9}\) if, and only if, the 3-adic expansion of \(n\) contains 0’s and 2’s only, and the number of maximal strings of 2’s is \(\equiv 1 \pmod{3}\);

(iv) \(a_n(r, 1) \equiv 6 \pmod{9}\) if, and only if, the 3-adic expansion of \(n\) has exactly one occurrence of the string 212 and otherwise contains only 0’s and 2’s;

(v) \(a_n(r, 1) \equiv 7 \pmod{9}\) if, and only if, the 3-adic expansion of \(n\) contains 0’s and 2’s only, and the number of maximal strings of 2’s is \(\equiv 2 \pmod{3}\);

(vi) in the cases not covered by Items (i)–(v), \(a_n(r, 1)\) is divisible by 9; in particular, \(a_n(r, 1) \not\equiv 2, 5, 8 \pmod{9}\) for all \(n\).

The case where \(r \equiv 3 \pmod{6}\), \(s \equiv 1 \pmod{6}\), and \(s \geq 7\) has already been treated in Corollary 24.

**Corollary 30.** If \(r\) is a positive integer with \(r \equiv 5 \pmod{6}\), then the Apéry numbers \(a_n(r, 1)\) obey the following congruences modulo 9:

(i) \(a_n(r, 1) \equiv 1 \pmod{9}\) if, and only if, the 3-adic expansion of \(n\) contains 0’s and 2’s only, and the number of maximal strings of 2’s is \(\equiv 0 \pmod{3}\);

(ii) \(a_n(r, 1) \equiv 3 \pmod{9}\) if, and only if, the 3-adic expansion of \(n\) has exactly one occurrence of 1 but no occurrences of the strings 012 or 210, and otherwise it contains only 0’s and 2’s;

(iii) \(a_n(r, 1) \equiv 4 \pmod{9}\) if, and only if, the 3-adic expansion of \(n\) contains 0’s and 2’s only, and the number of maximal strings of 2’s is \(\equiv 1 \pmod{3}\);

(iv) \(a_n(r, 1) \equiv 6 \pmod{9}\) if, and only if, the 3-adic expansion of \(n\) has exactly one occurrence of the string 210 (including an occurrence of a string 21 at the end) and otherwise contains only 0’s and 2’s;

(v) \(a_n(r, 1) \equiv 7 \pmod{9}\) if, and only if, the 3-adic expansion of \(n\) contains 0’s and 2’s only, and the number of maximal strings of 2’s is \(\equiv 2 \pmod{3}\);

(vi) in the cases not covered by Items (i)–(v), \(a_n(r, 1)\) is divisible by 9; in particular, \(a_n(r, 1) \not\equiv 2, 5, 8 \pmod{9}\) for all \(n\).

The case where \(r \equiv 5 \pmod{6}\), \(s \equiv 1 \pmod{6}\), and \(s \geq 7\), has already been treated in Corollary 24.

The Apéry numbers \(a_n(1, 0)\) are not interesting in our context, since \(a_n(1, 0) = 2^n\). This is the reason why we ignore the value \(r = 1\) in the following corollary.
Corollary 31. Let $s(n)$ denote the sum of digits in the $3$-adic expansion of $n$. If $r$ is a positive integer with $r \equiv 1 \pmod{6}$ and $r \geq 7$, then the Apéry numbers $a_n(r,0)$ obey the following congruences modulo 9:

(i) $a_n(r,0) \equiv 1 \pmod{9}$ if, and only if, the 3-adic expansion contains $o_1$ occurrences of the string 11, $o_2$ occurrences of the string 21, $o_3$ occurrences of the string 12, $o_4$ occurrences of the string 22, and $s(n) + 2(-o_1 + o_2 + o_3 - o_4) \equiv 0 \pmod{6}$;

(ii) $a_n(r,0) \equiv 2 \pmod{9}$ if, and only if, the 3-adic expansion contains $o_1$ occurrences of the string 11, $o_2$ occurrences of the string 21, $o_3$ occurrences of the string 12, $o_4$ occurrences of the string 22, and $s(n) + 2(-o_1 + o_2 + o_3 - o_4) \equiv 2 \pmod{6}$;

(iii) $a_n(r,0) \equiv 4 \pmod{9}$ if, and only if, the 3-adic expansion contains $o_1$ occurrences of the string 11, $o_2$ occurrences of the string 21, $o_3$ occurrences of the string 12, $o_4$ occurrences of the string 22, and $s(n) + 2(-o_1 + o_2 + o_3 - o_4) \equiv 4 \pmod{6}$;

(iv) $a_n(r,0) \equiv 5 \pmod{9}$ if, and only if, the 3-adic expansion contains $o_1$ occurrences of the string 11, $o_2$ occurrences of the string 21, $o_3$ occurrences of the string 12, $o_4$ occurrences of the string 22, and $s(n) + 2(-o_1 + o_2 + o_3 - o_4) \equiv 5 \pmod{6}$;

(v) $a_n(r,0) \equiv 7 \pmod{9}$ if, and only if, the 3-adic expansion contains $o_1$ occurrences of the string 11, $o_2$ occurrences of the string 21, $o_3$ occurrences of the string 12, $o_4$ occurrences of the string 22, and $s(n) + 2(-o_1 + o_2 + o_3 - o_4) \equiv 7 \pmod{6}$;

(vi) $a_n(r,0) \equiv 8 \pmod{9}$ if, and only if, the 3-adic expansion contains $o_1$ occurrences of the string 11, $o_2$ occurrences of the string 21, $o_3$ occurrences of the string 12, $o_4$ occurrences of the string 22, and $s(n) + 2(-o_1 + o_2 + o_3 - o_4) \equiv 8 \pmod{6}$;

(vii) in the cases not covered by Items (i)–(vi), $a_n(r,s)$ is divisible by 9; in particular, $a_n(r,s) \not\equiv 3, 6 \pmod{9}$ for all $n$.

Corollary 32. If $r$ is a positive integer with $r \equiv 2 \pmod{6}$, then the Apéry numbers $a_n(r,0)$ obey the following congruences modulo 9:

(i) $a_n(r,0) \equiv 1 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains no 2, has an even number of digits 1, and the number of maximal strings of 1’s is $\equiv 0 \pmod{3}$;

(ii) $a_n(r,0) \equiv 2 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains no 2, has an odd number of digits 1, and the number of maximal strings of 1’s is $\equiv 1 \pmod{3}$;

(iii) $a_n(r,0) \equiv 3 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains the string 02 (including an occurrence of a 2 at the beginning), no other digit 2, and an odd number of digits 1;

(iv) $a_n(r,0) \equiv 4 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains no 2, has an even number of digits 1, and the number of maximal strings of 1’s is $\equiv 2 \pmod{3}$;

(v) $a_n(r,0) \equiv 5 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains no 2, has an odd number of digits 1, and the number of maximal strings of 1’s is $\equiv 2 \pmod{3}$;

(vi) $a_n(r,0) \equiv 6 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains the string 02, no other digit 2, and an even number of digits 1;

(vii) $a_n(r,0) \equiv 7 \pmod{9}$ if, and only if, the 3-adic expansion of $n$ contains no 2, has an even number of digits 1, and the number of maximal strings of 1’s is $\equiv 1 \pmod{3}$;
Corollary 33. If \( a \equiv 0 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains no 2, has an odd number of digits 1, and the number of maximal strings of 1’s is \( \equiv 0 \pmod{3} \);

(iii) \( a \equiv 0 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains at least two digits 2 or the string 12.

In the special case of this corollary where \( r = 2 \), we obtain the Apéry numbers \( a_n(2, 0) = \binom{2n}{n} \), that is, the sequence of central binomial coefficients. The above result was found earlier in [10, Cor. 33] in an equivalent form.

Corollary 34. If \( r \) is a positive integer with \( r \equiv 3 \pmod{6} \), then the Apéry numbers \( a_n(r, 0) \) obey the following congruences modulo 9:

(i) \( a_n(r, 0) \equiv 1 \pmod{9} \) if, and only if, the number of digits 1 in the 3-adic expansion is \( \equiv 0 \pmod{6} \);

(ii) \( a_n(r, 0) \equiv 2 \pmod{9} \) if, and only if, the number of digits 1 in the 3-adic expansion is \( \equiv 1 \pmod{6} \);

(iii) \( a_n(r, 0) \equiv 4 \pmod{9} \) if, and only if, the number of digits 1 in the 3-adic expansion is \( \equiv 2 \pmod{6} \);

(iv) \( a_n(r, 0) \equiv 5 \pmod{9} \) if, and only if, the number of digits 1 in the 3-adic expansion is \( \equiv 5 \pmod{6} \);

(v) \( a_n(r, 0) \equiv 7 \pmod{9} \) if, and only if, the number of digits 1 in the 3-adic expansion is \( \equiv 4 \pmod{6} \);

(vi) \( a_n(r, 0) \equiv 8 \pmod{9} \) if, and only if, the number of digits 1 in the 3-adic expansion is \( \equiv 3 \pmod{6} \);

(vii) in the cases not covered by Items (i)–(vi), \( a_n(r, s) \) is divisible by 9; in particular, \( a_n(r, s) \neq 3, 6 \pmod{9} \) for all \( n \).

Corollary 34. If \( r \) is a positive integer with \( r \equiv 4 \pmod{6} \), then the Apéry numbers \( a_n(r, 0) \) obey the following congruences modulo 9:

(i) \( a_n(r, 0) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains no 2, and has \( s_1 \) digits 1 and \( s_2 \) maximal strings of 1’s with \( 2o_2 - s_1 \equiv 0 \pmod{6} \);

(ii) \( a_n(r, 0) \equiv 2 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains no 2, and has \( s_1 \) digits 1 and \( s_2 \) maximal strings of 1’s with \( 2o_2 - s_1 \equiv 1 \pmod{6} \);

(iii) \( a_n(r, 0) \equiv 3 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has exactly one occurrence of the string 12, an odd number of digits 1, and otherwise contains only 0’s;

(iv) \( a_n(r, 0) \equiv 4 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains no 2, and has \( s_1 \) digits 1 and \( s_2 \) maximal strings of 1’s with \( 2o_2 - s_1 \equiv 2 \pmod{6} \);

(v) \( a_n(r, 0) \equiv 5 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains no 2, and has \( s_1 \) digits 1 and \( s_2 \) maximal strings of 1’s with \( 2o_2 - s_1 \equiv 5 \pmod{6} \);

(vi) \( a_n(r, 0) \equiv 6 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) has exactly one occurrence of the string 12, an even number of digits 1, and otherwise contains only 0’s;

(vii) \( a_n(r, 0) \equiv 7 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains no 2, and has \( s_1 \) digits 1 and \( s_2 \) maximal strings of 1’s with \( 2o_2 - s_1 \equiv 4 \pmod{6} \);

(viii) \( a_n(r, 0) \equiv 8 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains no 2, and has \( s_1 \) digits 1 and \( s_2 \) maximal strings of 1’s with \( 2o_2 - s_1 \equiv 3 \pmod{6} \);
(ix) \( a_n(r, 0) \equiv 0 \pmod{9} \) if, and only if, the 3-adic expansion of \( n \) contains at least two digits 2 or the string 02.

**Corollary 35.** Let \( \bar{s}(n) \) denote the number of digits 1 in the 3-adic expansion of \( n \) minus 2 times the number of digits 2 in the same expansion. If \( r \) is a positive integer with \( r \equiv 5 \pmod{6} \), then the Apéry numbers \( a_n(r, 0) \) obey the following congruences modulo 9:

(i) \( a_n(r, 0) \equiv 1 \pmod{9} \) if, and only if, the 3-adic expansion contains \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, \( o_3 \) occurrences of the string 12, \( o_4 \) occurrences of the string 22, and \( \bar{s}(n) + 2(o_1 - o_2 - o_3 + o_4) \equiv 0 \pmod{6} \);

(ii) \( a_n(r, 0) \equiv 2 \pmod{9} \) if, and only if, the 3-adic expansion contains \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, \( o_3 \) occurrences of the string 12, \( o_4 \) occurrences of the string 22, and \( \bar{s}(n) + 2(o_1 - o_2 - o_3 + o_4) \equiv 2 \pmod{6} \);

(iii) \( a_n(r, 0) \equiv 4 \pmod{9} \) if, and only if, the 3-adic expansion contains \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, \( o_3 \) occurrences of the string 12, \( o_4 \) occurrences of the string 22, and \( \bar{s}(n) + 2(o_1 - o_2 - o_3 + o_4) \equiv 0 \pmod{6} \);

(iv) \( a_n(r, 0) \equiv 5 \pmod{9} \) if, and only if, the 3-adic expansion contains \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, \( o_3 \) occurrences of the string 12, \( o_4 \) occurrences of the string 22, and \( \bar{s}(n) + 2(o_1 - o_2 - o_3 + o_4) \equiv 5 \pmod{6} \);

(v) \( a_n(r, 0) \equiv 7 \pmod{9} \) if, and only if, the 3-adic expansion contains \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, \( o_3 \) occurrences of the string 12, \( o_4 \) occurrences of the string 22, and \( \bar{s}(n) + 2(o_1 - o_2 - o_3 + o_4) \equiv 3 \pmod{6} \);

(vi) \( a_n(r, 0) \equiv 8 \pmod{9} \) if, and only if, the 3-adic expansion contains \( o_1 \) occurrences of the string 11, \( o_2 \) occurrences of the string 21, \( o_3 \) occurrences of the string 12, \( o_4 \) occurrences of the string 22, and \( \bar{s}(n) + 2(o_1 - o_2 - o_3 + o_4) \equiv 4 \pmod{6} \);

(vii) In the cases not covered by Items (i)–(vi), \( a_n(r, s) \) is divisible by 9; in particular, \( a_n(r, s) \neq 3, 6 \pmod{9} \) for all \( n \).
