IRREVERSIBLE MODULES OVER FINITE SIMPLE LIE PSEUDOALGEBRAS I.
PRIMITIVE PSEUDOALGEBRAS OF TYPE $W$ AND $S$

BOJKO BAKALOV, ALESSANDRO D’ANDREA, AND VICTOR G. KAC

Abstract. One of the algebraic structures that has emerged recently in the
study of the operator product expansions of chiral fields in conformal field
theory is that of a Lie conformal algebra [K]. A Lie pseudoalgebra is a general-
ization of the notion of a Lie conformal algebra for which $\mathbb{C}[\partial]$ is replaced by
the universal enveloping algebra $H$ of a finite-dimensional Lie algebra [BDK].
The finite (i.e., finitely generated over $H$) simple Lie pseudoalgebras were clas-
sified in [BDK]. In a series of papers, starting with the present one, we classify
all irreducible finite modules over finite simple Lie pseudoalgebras.

1. Introduction

One of the algebraic structures that has emerged recently in the study of the operator product expansions of chiral fields in conformal field theory is that of a \textit{Lie conformal algebra} \cite{K}. Recall that this is a module $L$ over the algebra of polynomials $\mathbb{C}[\partial]$ in the indeterminate $\partial$, endowed with a $\mathbb{C}$-linear map $L \to \mathbb{C}[\partial]$, $a \otimes b \mapsto [a, b]$, satisfying axioms similar to those of a Lie algebra (see \cite{DK, K}).

Choosing a set of generators $\{a^i\}_{i \in I}$ of the $\mathbb{C}[\partial]$-module $L$, we can write:

$$[a^i(z), a^j(w)] = \sum_k Q_{ij}^k(\partial, \partial) a^k,$$

where $Q_{ij}^k$ are some polynomials in $\partial$. The commutators of the corresponding chiral fields $\{a^i(z)\}_{i \in I}$ then are:

$$[a^i(z), a^j(w)] = \sum_k Q_{ij}^k(\partial, \partial) (a^k(z) \delta(z - w)),$$

Letting $P_{k}^{ij}(x, y) = Q_{ij}^{k}(-x, x + y)$, we can rewrite this in a more symmetric form

$$[a^i(z), a^j(w)] = \sum_k P_{ij}^k(\partial, \partial) a^k(w) \delta(z - w))$$

We thus obtain an $H = \mathbb{C}[\partial]$-bilinear map (i.e., a map of $H \otimes H$-modules):

$$L \otimes L \to (H \otimes H) \otimes_H L, \quad a \otimes b \mapsto [a \ast b]$$

(where $H$ acts on $H \otimes H$ via the comultiplication map $\Delta(\partial) = \partial \otimes 1 + 1 \otimes \partial$), defined by

$$[a^i \ast a^j] = \sum_k P_{ij}^k(\partial \otimes 1, 1 \otimes \partial) \otimes_H a^k.$$

Hence the notion of a $\lambda$-bracket $[a, b]$ is equivalent to the notion of a $\ast$-bracket $[a \ast b]$, as introduced by Beilinson and Drinfeld \cite{BD}. For example, the Virasoro conformal algebra $\text{Vir} = \mathbb{C}[\partial] \ell$ with $[\ell, \ell] = (\partial + 2\lambda)\ell$ corresponds to the Virasoro $\ast$-bracket

$$[\ell \ast \ell] = (1 \otimes \partial - \partial \otimes 1) \otimes_{\mathbb{C}[\partial]} \ell.$$
A Lie pseudoalgebra is a generalization of the notion of a Lie conformal algebra for which $\mathbb{C}[\theta]$ is replaced by the Hopf algebra $H = U(\mathfrak{d})$, where $\mathfrak{d}$ is a finite-dimensional Lie algebra and $U(\mathfrak{d})$ is its universal enveloping algebra. It is defined as an $H$-module $L$ endowed with an $H$-bilinear map (1.1) subject to certain skew-symmetry and Jacobi identity axioms (see [BD, BDK] and Section 2.2 below). The name "pseudoalgebra" is motivated by the fact that this is an algebra in a pseudotensor category, as introduced in [L, BD]. Accordingly, the $*$-bracket is also called a pseudobracket.

In [BDK] we gave a complete classification of finite (i.e., finitely generated as an $H$-module) simple Lie pseudoalgebras. In order to state the result, we introduce a generalization of the Virasoro pseudoalgebra (1.2) defined for $H = \mathbb{C}[\theta]$, to the case $H = U(\mathfrak{d})$, where $\mathfrak{d}$ is any finite-dimensional Lie algebra. This is the Lie pseudoalgebra $W(\mathfrak{d}) = H \otimes \mathfrak{d}$ with the pseudobracket

$$[(1 \otimes a) \ast (1 \otimes b)] = (1 \otimes 1) \otimes_H (1 \otimes [a, b]) + (b \otimes 1) \otimes_H (1 \otimes a) - (1 \otimes a) \otimes_H (1 \otimes b).$$

It is shown in [BDK] that all subalgebras of the Lie pseudoalgebra $W(\mathfrak{d})$ are simple and, along with current Lie pseudoalgebras $\text{Cur} \mathfrak{g} = H \otimes \mathfrak{g}$ with pseudobracket

$$[(1 \otimes a) \ast (1 \otimes b)] = (1 \otimes 1) \otimes_H [a, b],$$

where $\mathfrak{g}$ is a simple finite-dimensional Lie superalgebra, they form a complete list of finite simple Lie pseudoalgebras.

The notion of a Lie pseudoalgebra is intimately related to the more classical notion of a differential Lie algebra. Let $L$ be a Lie pseudoalgebra, and let $Y$ be a commutative associative algebra with compatible left and right actions of the Hopf algebra $H$. Then we define a Lie algebra $A_Y L = Y \otimes_H L$ with the obvious left $H$-module structure and the following Lie bracket:

$$[x \otimes_H a, y \otimes_H b] = \sum_i (xf_i)(yg_i) \otimes_H c_i, \quad \text{if} \quad [a \ast b] = \sum_i (f_i \otimes g_i) \otimes_H c_i.$$

The main tool in the study of Lie pseudoalgebras and their representations is the annihilation algebra $A_X L$, where $X = H^*$ is the commutative associative algebra dual to the coalgebra $H$. In particular a module over a Lie pseudoalgebra $L$ is the same as a "conformal" module over the extended annihilation Lie algebra $\mathfrak{d} \ltimes A_X L$ (see [BDK] and Section 2.3 below).

The annihilation algebra of the Lie pseudoalgebra $W(\mathfrak{d})$ turns out to be isomorphic to the linearly compact Lie algebra of all formal vectors fields on a Lie group whose Lie algebra is $\mathfrak{d}$. This leads to a formalism of pseudofunctions, similar to the usual formalism of differential forms, which allows us to define three series of subalgebras $S(\mathfrak{d}, \chi)$, $H(\mathfrak{d}, \chi, \omega)$ and $K(\mathfrak{d}, \theta)$ of $W(\mathfrak{d})$. The annihilation algebras of the simple Lie pseudoalgebras $W(\mathfrak{d})$, $S(\mathfrak{d}, \chi, \omega)$, $H(\mathfrak{d}, \chi, \omega)$ and $K(\mathfrak{d}, \theta)$ are isomorphic to the four series of Lie–Cartan linearly compact Lie algebras $W_N$, $S_N$, $P_N$ (which is an extension of $H_N$ by a 1-dimensional center) and $K_N$, where $N = \dim \mathfrak{d}$. However, the Lie pseudoalgebras $S(\mathfrak{d}, \chi)$, $H(\mathfrak{d}, \chi, \omega)$ and $K(\mathfrak{d}, \theta)$ depend on certain parameters $\chi$, $\omega$ and $\theta$ due to inequivalent actions of $\mathfrak{d}$ on the annihilation algebra [BDK]. It is shown in [BDK] that these series of subalgebras along with their current generalizations, associated to subalgebras of $\mathfrak{d}$, exhaust all subalgebras of $W(\mathfrak{d})$.

The main goal of the present paper is to give a complete list and an explicit construction of all irreducible finite modules over the Lie pseudoalgebras $W(\mathfrak{d})$ and $S(\mathfrak{d}, \chi)$. A module will be called irreducible if it does not contain nontrivial
proper submodules and in addition the action of the Lie pseudoalgebra on it is not identically zero (see Section 2.2 below). Representation theory of the series $H(\mathfrak{d}, \chi, \omega)$ and $K(\mathfrak{d}, \theta)$ will be treated in sequel papers.

The simplest example of a nontrivial $W(\mathfrak{d})$-module is the module $\Omega^0(\mathfrak{d}) = H$ (of rank 1 over $H$) given by:

$$ (f \otimes a) \ast g = -(f \otimes ga) \otimes H 1, \quad f, g \in H, \quad a \in \mathfrak{d}. $$

The corresponding module over the annihilation Lie algebra is just the representation of the Lie algebra of all formal vector fields in the space of formal power series. As in the latter case, the $W(\mathfrak{d})$-module $\Omega^0(\mathfrak{d})$ is the first member of the pseudo de Rham complex

$$ 0 \rightarrow \Omega^0(\mathfrak{d}) \xrightarrow{\partial} \Omega^1(\mathfrak{d}) \xrightarrow{\partial} \cdots \xrightarrow{\partial} \Omega^N(\mathfrak{d}), $$

where $\Omega^n(\mathfrak{d}) = H \otimes \Omega^n, \Omega^n = \Lambda^n \mathfrak{d}^*, \text{ and } N = \dim \mathfrak{d}$ (see Section 5.2).

The $W(\mathfrak{d})$-modules $\Omega^n(\mathfrak{d})$ of pseudodifferential forms are special cases of tensor modules $T(U) = H \otimes \Gamma$ over $W(\mathfrak{d})$, associated to any $\mathfrak{g}\mathfrak{d}$-module $U$, given by:

\begin{equation}
(1.3)
(1 \otimes \partial_i) \ast (1 \otimes u) = (1 \otimes 1) \otimes_H (1 \otimes (ad \partial_i) u) + \sum_{j=1}^{N} (\partial_j \otimes 1) \otimes_H (1 \otimes e^j_i u)
- (1 \otimes \partial_i) \otimes_H (1 \otimes u),
\end{equation}

where $\{\partial_i\}$ is a basis of $\mathfrak{d}$ and $e^j_i \partial_k = \delta^j_k \partial_i$ (see Section 4.3). Then $\Omega^n(\mathfrak{d}) = T(\Omega^n)$.

Furthermore, for a finite-dimensional $\mathfrak{d}$-module $\Pi$ we define the twisting of $T(U)$ by $\Pi$ by $T(\Pi, U) = H \otimes (\Pi \otimes U)$ and by adding the term $(1 \otimes 1) \otimes_H (1 \otimes \partial_i u)$ in the right-hand side of (1.3). Then we have the $\Pi$-twisted pseudo de Rham complex of $W(\mathfrak{d})$-modules:

$$ 0 \rightarrow T(\Pi, \Omega^0) \xrightarrow{d_{\Pi}} T(\Pi, \Omega^1) \xrightarrow{d_{\Pi}} \cdots \xrightarrow{d_{\Pi}} T(\Pi, \Omega^N) $$

(see Section 5.3).

The first main result of the present paper (Theorem 6.6) states that:

(a) The $W(\mathfrak{d})$-module $T(\Pi, U)$ is irreducible if and only if $\Pi$ and $U$ are irreducible and $U$ is not isomorphic to one of the $\mathfrak{g}\mathfrak{d}$-modules $\Omega^n = \Lambda^n \mathfrak{d}^*$ for $1 \leq n \leq N = \dim \mathfrak{d}$;

(b) The $W(\mathfrak{d})$-submodule $d_{\Pi} T(\Pi, \Omega^n)$ of $T(\Pi, \Omega^{n+1})$ is irreducible, provided that $\Pi$ is irreducible, for all $0 \leq n \leq N - 1$;

(c) The irreducible $W(\mathfrak{d})$-modules listed in (a) and (b) exhaust all irreducible finite $W(\mathfrak{d})$-modules. (The isomorphic modules among these are $T(\Pi, \Omega^n) \simeq d_{\Pi} T(\Pi, \Omega^0).$)

The corresponding result for $S(\mathfrak{d}, \chi)$ is Theorem 7.6. We also describe the structure of submodules of the $W(\mathfrak{d})$- and $S(\mathfrak{d}, \chi)$-modules $T(\Pi, \Omega^n)$ (Lemmas 6.12 and 7.10).

As in the Lie algebra case, the main part of the problem is the computation of singular vectors. However, in the Lie pseudoalgebra framework the calculations are much simpler. In particular, we obtain simpler and more transparent proofs of the results of Rudakov [R1, R2].

In the case when $\mathfrak{d} = \mathfrak{k}\partial$ is 1-dimensional, the Lie pseudoalgebra $W(\mathfrak{k}\partial)$ is isomorphic to the Virasoro pseudoalgebra Vir with the pseudobracket (1.2). Now Theorem 6.6 states that every irreducible $W(\mathfrak{k}\partial)$-module is of the form $T(\Pi, U)$, where $\Pi$ is an irreducible $\mathfrak{k}\partial$-module and $U$ is an irreducible $\mathfrak{g}\mathfrak{k}$-module not isomorphic to $\Omega^1 = \mathfrak{d}^*$. The module $\Pi$ is 1-dimensional over $\mathfrak{k}$ and is determined by
the eigenvalue $\alpha \in k$ of $\partial$. Similarly, $U$ is 1-dimensional over $k$ and is determined by the eigenvalue of $\text{Id} \in \mathfrak{gl}_1$, which will be denoted by $\Delta - 1$. If we denote the corresponding $W(k\partial)$-module $T(\Pi, U)$ by $M(\alpha, \Delta)$, then the module $M(\alpha, \Delta)$ is irreducible iff $\Delta \neq 0$, and these are all nontrivial finite irreducible $W(k\partial)$-modules. Thus we recover the classification result of [CK].

Note that the category of representations of a Lie pseudoalgebra is not semi-simple in general, i.e., complete reducibility of modules does not hold. To study extensions of modules, as well as central extensions and infinitesimal deformations of Lie pseudoalgebras, one defines cohomology of Lie pseudoalgebras (see [BKV, BDK]). The cohomology of the Virasoro conformal algebra Vir was computed in [BKV]. The cohomology of $W(d)$ and its subalgebras will be computed in a future publication.

2. Basic Definitions

In this section, we review some facts and notation from [BDK], which will be used throughout the paper. We will work over an algebraically closed field $k$ of characteristic 0. Unless otherwise specified, all vector spaces, linear maps and tensor products will be considered over $k$. We will denote by $\mathbb{Z}_+$ the set of non-negative integers.

2.1. Preliminaries on Hopf Algebras. Let $H$ be a Hopf algebra with a coproduct $\Delta$, a counit $\varepsilon$, and an antipode $S$. We will use the following notation (cf. [Sw]):

$$\Delta(h) = h_{(1)} \otimes h_{(2)}, \quad \quad h \in H,$$

$$\Delta \otimes \text{id} \Delta(h) = (\text{id} \otimes \Delta)\Delta(h) = h_{(1)} \otimes h_{(2)} \otimes h_{(3)},$$

$$S \otimes \text{id} \Delta(h) = h_{(-1)} \otimes h_{(2)}, \quad \text{etc.}$$

Note that notation (2.2) uses coassociativity of $\Delta$. The axioms of antipode and counit can be written as follows:

$$h_{(-1)}h_{(2)} = h_{(1)}h_{(-2)} = \varepsilon(h),$$

$$\varepsilon(h_{(1)})h_{(2)} = h_{(1)}\varepsilon(h_{(2)}) = h,$$

while the fact that $\Delta$ is a homomorphism of algebras translates as:

$$(fg)(1) \otimes (fg)(2) = f(1)g(1) \otimes f(2)g(2), \quad f, g \in H.$$

Equations (2.4) and (2.5) imply the following useful relations:

$$h_{(-1)}h_{(2)} \otimes h_{(3)} = 1 \otimes h = h_{(1)}h_{(-2)} \otimes h_{(3)}.$$

Let $X = H^* := \text{Hom}_k(H, k)$ be the dual of $H$. Recall that $H$ acts on $X$ by the formula $\langle h, f \in H, x, y \in X \rangle$:

$$\langle hx, f \rangle = \langle x, S(h)f \rangle,$$

so that

$$\langle h(xy), f \rangle = \langle h_{(1)}x, h_{(2)}y \rangle.$$  

Moreover, $X$ is commutative when $H$ is cocommutative. Similarly, one can define a right action of $H$ on $X$ by

$$\langle xh, f \rangle = \langle x, fS(h) \rangle,$$
and then we have
\[(xy)h = (xh_{(1)}) (yh_{(2)}).\]

Associativity of $H$ implies that $X$ is an $H$-bimodule, i.e.,
\[(2.12) \quad f(xy) = (fx)g, \quad f, g \in H, \ x \in X.\]

Throughout the paper, $H = U(\mathfrak{g})$ will be the universal enveloping algebra of a finite-dimensional Lie algebra $\mathfrak{g}$. In this case,
\[(2.13) \quad \Delta(a) = a \otimes 1 + 1 \otimes a, \quad S(a) = -a, \quad a \in \mathfrak{g};\]
hence, $\Delta$ is cocommutative and $S^2 = \text{id}$. Set $N = \dim \mathfrak{g}$ and fix a basis $\{\partial_i\}_{i=1, \ldots, N}$ of $\mathfrak{g}$. Then
\[(2.14) \quad \partial^{(I)} = \partial_1^{i_1} \cdots \partial_N^{i_N} / i_1! \cdots i_N!, \quad I = (i_1, \ldots, i_N) \in \mathbb{Z}_+^N,\]
is a basis of $H$ (similar to the Poincaré–Birkhoff–Witt basis). Moreover, it is easy to see that
\[(2.15) \quad \Delta(\partial^{(I)}) = \sum_{J+K=I} \partial^{(J)} \otimes \partial^{(K)}.\]
For a multi-index $I = (i_1, \ldots, i_N)$, let $|I| = i_1 + \cdots + i_N$. Recall that the canonical increasing filtration of $H = U(\mathfrak{g})$ is given by
\[(2.16) \quad F^p U(\mathfrak{g}) = \text{span}_k \{\partial^{(I)} \mid |I| \leq p\}, \quad p = 0, 1, 2, \ldots\]
and does not depend on the choice of basis of $\mathfrak{g}$. This filtration is compatible with the structure of Hopf algebra (see, e.g., [BDK, Section 2.2] for more details). We have: $F^{-1} H = \{0\}$, $F^0 H = k$, $F^1 H = k \otimes \mathfrak{g}$.

We define a filtration of $H \otimes H$ in the usual way:
\[(2.17) \quad F^n (H \otimes H) = \sum_{i+j=n} F^i H \otimes F^j H.\]
The following lemma, which is a reformulation of [BDK, Lemma 2.3], plays an important role in the paper. (This lemma holds for any Hopf algebra $H$.)

**Lemma 2.1.** (i) The linear maps
\[H \otimes H \rightarrow H \otimes H, \quad f \otimes g \mapsto (f \otimes 1) \Delta(g)\]
and
\[H \otimes H \rightarrow H \otimes H, \quad f \otimes g \mapsto (1 \otimes f) \Delta(g)\]
are isomorphisms of vector spaces. These isomorphisms are compatible with the filtration (2.17).

(ii) For any $H$-module $V$, the linear maps
\[H \otimes V \rightarrow (H \otimes H) \otimes_H V, \quad h \otimes v \mapsto (h \otimes 1) \otimes_H v\]
and
\[H \otimes V \rightarrow (H \otimes H) \otimes_H V, \quad h \otimes v \mapsto (1 \otimes h) \otimes_H v\]
are isomorphisms of vector spaces. In addition, we have:
\[(F^n H \otimes k) \otimes_H V = F^n (H \otimes H) \otimes_H V = (k \otimes F^n H) \otimes_H V.\]
Let us define elements $x_I \in X$ by $(x_I, \partial^{(J)}) = \delta^J_I$, where, as usual, $\delta^J_I = 1$ if $I = J$ and $\delta^J_I = 0$ if $I \neq J$. Then (2.15) implies $x_J x_K = x_{J+K}$; hence,

$$x_I = (x^i)^{i_1} \cdots (x^N)^{i_N}, \quad I = (i_1, \ldots, i_N) \in \mathbb{Z}_+^N,$$

where

$$x^i = x_{\varepsilon_i}, \quad \varepsilon_i = (0, \ldots, 0, 1, 0, \ldots, 0), \quad i = 1, \ldots, N.$$

Therefore, $X$ can be identified with the ring $\mathcal{O}_N = k[[t^1, \ldots, t^N]]$ of formal power series in $N$ indeterminates. We have a ring isomorphism

$$\varphi: X \xrightarrow{\sim} \mathcal{O}_N, \quad \varphi(x^i) = t^i, \quad \varphi(x_I) = t_I,$$

where $t_I$ is given by a formula similar to (2.18).

Let $F_p X = (F^p H)^I$ be the set of elements from $X = H^*$ that vanish on $F^p H$. Then $\{F_p X\}$ is a decreasing filtration of $X$ such that $F_{-1} X = X, X/F_0 X \simeq k, F_0 X/F_1 X \simeq \mathfrak{d}^*$. Under the isomorphism (2.20), the filtration $\{F_p X\}$ becomes

$$F_p \mathcal{O}_N = (t^1, \ldots, t^N)^p \mathcal{O}_N, \quad p = -1, 0, 1, \ldots.$$

This filtration has the following properties:

$$\text{(2.22)} \quad (F_n X)(F_p X) \subset F_{n+p+1} X, \quad \mathfrak{d}(F_p X) \subset F_{p-1} X, \quad (F_p X)\mathfrak{d} \subset F_{p-1} X.$$

We can consider $x^i$ as elements of $\mathfrak{d}^*$; then $\{x^i\}$ is a basis of $\mathfrak{d}^*$ dual to the basis $\{\partial_i\}$ of $\mathfrak{d}$, i.e., $\langle x^i, \partial_j \rangle = \delta^j_i$.

We define a topology of $X$ by considering $\{F_p X\}$ as a fundamental system of neighborhoods of $0$. We will always consider $X$ with this topology, while $H$ and $\mathfrak{d}$ with the discrete topology. Then $X$ is linearly compact (see [BDK, Chapter 6]), and the multiplication of $X$ and the (left and right) actions of $\mathfrak{d}$ on it are continuous (see (2.22)).

**Example 2.1.** When $\mathfrak{d}$ is commutative, its left and right actions on $\mathcal{O}_N$ coincide and are given by $\partial_i \mapsto -\partial/\partial t^i$ for $i = 1, \ldots, N$.

The following lemma is well known (see also [Re, Section 6]).

**Lemma 2.2.** Let $c^j_{i k}$ be the structure constants of $\mathfrak{d}$ in the basis $\{\partial_i\}$, so that $[\partial_i, \partial_j] = \sum_{k<i} c^j_{i k} \partial_k$. Then we have the following formulas for the left and right actions of $\mathfrak{d}$ on $X$:

$$\partial_i x^j = -\delta^j_i - \sum_{k<i} c^j_{i k} x^k \pmod{F_1 X},$$

$$x^j \partial_i = -\delta^j_i + \sum_{k>i} c^j_{i k} x^k \pmod{F_1 X}.$$

In particular,

$$\partial_i x^j - x^j \partial_i = -\sum_k c^j_{i k} x^k \pmod{F_1 X}$$

is the coadjoint action of $\mathfrak{d}$ on $\mathfrak{d}^* \simeq F_0 X/F_1 X$. 

Proof. We will prove the first equality. The second one is proved in the same way, while the third follows from the other two. If we express $\partial_i x^j$ in the basis $\{x_K\}$ of $X$, we have

$$\partial_i x^j = \sum_{K \in \mathbb{Z}^n} a_K x_K \iff a_K = \langle \partial_i x^j, \partial^{(K)} \rangle,$$

where $\partial^{(K)}$ are from (2.14). Since we are interested in $\partial_i x^j \mod F_1 X$, we need to compute $a_K$ only for $|K| \leq 1$, i.e., only for $\partial^{(K)} = 1$ or $\partial^{(K)} = \partial_k$. Using (2.8), we obtain

$$\langle \partial_i x^j, 1 \rangle = -\langle x^j, \partial_i \rangle = -\delta_i^j,$$

$$\langle \partial_i x^j, \partial_k \rangle = -\langle x^j, \partial_i \partial_k \rangle = -\langle x^j, \partial_k \partial_i \rangle - \langle x^j, [\partial_i, \partial_k] \rangle.$$

If $i \leq k$, then $\partial_i \partial_k$ is (up to a constant) an element of the basis (2.14) and $\partial_i \partial_k \neq \partial_j$; hence, $\langle x^j, \partial_i \partial_k \rangle = 0$. If $i > k$, then by the same argument $\langle x^j, \partial_k \partial_i \rangle = 0$, while $\langle x^j, [\partial_i, \partial_k] \rangle = c^j_{ik}$. This completes the proof. 

2.2. Pseudoalgebras and Their Representations. In this subsection, we recall the definition of a pseudoalgebra from [BDK, Chapter 3]. Let $A$ be a (left) $H$-module. A pseudoproduct on $A$ is an $H$-bilinear map

$$A \otimes A \to (H \otimes H) \otimes_H A, \quad a \otimes b \mapsto a * b,$$

where we use the comultiplication $\Delta: H \to H \otimes H$ to define $(H \otimes H) \otimes_H A$. A pseudoalgebra is a (left) $H$-module $A$ endowed with a pseudoproduct (2.23). The name is motivated by the fact that this is an algebra in a pseudotensor category, as introduced in [L, BD] (see [BDK, Chapter 3]).

In order to define associativity of a pseudoproduct, we extend it from $A \otimes A \to H^{\otimes 2} \otimes_H A$ to $(H^{\otimes 2} \otimes_H A) \otimes A \to H^{\otimes 3} \otimes_H A$ and to $A \otimes (H^{\otimes 2} \otimes_H A) \to H^{\otimes 3} \otimes_H A$ by letting:

$$\langle h \otimes_H a \rangle \ast b = \sum (h \otimes 1) (\Delta \otimes \text{id})(g_i) \otimes_H c_i,$$

$$a \ast \langle h \otimes_H b \rangle = \sum (1 \otimes h) (\text{id} \otimes \Delta)(g_i) \otimes_H c_i,$$

where $h \in H^{\otimes 2}$, $a, b \in A$, and

$$a \ast b = \sum g_i \otimes_H c_i \quad \text{with} \quad g_i \in H^{\otimes 2}, c_i \in A.$$

Then the associativity property is given by the usual equality (in $H^{\otimes 3} \otimes_H A$):

$$\langle a \ast b \rangle \ast c = a \ast (b \ast c).$$

The main objects of our study are Lie pseudoalgebras. The corresponding pseudoproduct is conventionally called pseudobracket and denoted by $[a \ast b]$. A Lie pseudoalgebra is a (left) $H$-module equipped with a pseudobracket satisfying the following skew-commutativity and Jacobi identity axioms:

$$[b \ast a] = -\sigma (\otimes \text{id}) [a \ast b],$$

$$[[a \ast b] \ast c] = [a \ast [b \ast c]] - ([\sigma \otimes \text{id}] \otimes_H \text{id}) [b \ast [a \ast c]].$$

Here, $\sigma: H \otimes H \to H \otimes H$ is the permutation of factors, and the compositions $[[a \ast b] \ast c], [a \ast [b \ast c]]$ are defined using (2.24), (2.25).
Remark 2.1. Let $A$ be an associative pseudoalgebra with a pseudoproduct $a \ast b$. Define a pseudobracket on $A$ as the commutator

\begin{equation}
[a \ast b] = a \ast b - (\sigma \otimes \text{id}) (b \ast a).
\end{equation}

Then, with this pseudobracket, $A$ is a Lie pseudoalgebra.

Example 2.2. For any $k$-algebra $A$, let its associated current $H$-pseudoalgebra be $\text{Cur} A = H \otimes A$ with the pseudoproduct

\begin{equation}
(f \otimes a) \ast (g \otimes b) = (f \otimes g) \otimes_H (1 \otimes ab).
\end{equation}

Then the $H$-pseudoalgebra $\text{Cur} A$ is Lie (or associative) iff the $k$-algebra $A$ is.

The definitions of modules over Lie (or associative) pseudoalgebras are obvious modifications of the above. A module over a Lie pseudoalgebra $L$ is a left $H$-module $V$ together with an $H$-bilinear map

\begin{equation}
L \otimes V \to (H \otimes H) \otimes_H V, \quad a \otimes v \mapsto a \ast v
\end{equation}

that satisfies $(a, b \in L, v \in V)$

\begin{equation}
[a \ast b] \ast v = a \ast (b \ast v) - ((\sigma \otimes \text{id}) \otimes_H \text{id}) (b \ast (a \ast v)).
\end{equation}

An $L$-module $V$ will be called finite if it is finite (i.e., finitely generated) as an $H$-module. The trivial $L$-module is the set $\{0\}$.

A subspace $W \subset V$ is an $L$-submodule if it is an $H$-submodule and $L \ast W \subset (H \otimes H) \otimes_H W$. (Here $L \ast W$ is the linear span of all elements $a \ast w$, where $a \in L$ and $w \in W$.) A submodule $W \subset V$ is called proper if $W \neq V$. An $L$-module $V$ is irreducible (or simple) if it does not contain any nontrivial proper $L$-submodules and $L \ast V \neq \{0\}$.

Let $U$ and $V$ be two $L$-modules. A map $\beta: U \to V$ is a homomorphism of $L$-modules if $\beta$ is $H$-linear and it satisfies

\begin{equation}
((\text{id} \otimes \text{id}) \otimes_H \beta)(a \ast u) = a \ast \beta(u), \quad a \in L, u \in U.
\end{equation}

Remark 2.2. (i) Let $V$ be a module over a Lie pseudoalgebra $L$ and let $W$ be an $H$-submodule of $V$. By Lemma 2.1(ii), for each $a \in L, v \in V$, we can write

\begin{equation}
a \ast v = \sum_{i \in \mathbb{Z}_2^N} (\partial^{(1)} \otimes 1) \otimes_H v_i', \quad v_i' \in V,
\end{equation}

where the elements $v_i'$ are uniquely determined by $a$ and $v$. Then $W \subset V$ is an $L$-submodule iff it has the property that all $v_i' \in W$ whenever $v \in W$. This follows again from Lemma 2.1(ii).

(ii) Similarly, for each $a \in L, v \in V$, we can write

\begin{equation}
a \ast v = \sum_{i \in \mathbb{Z}_2^N} (1 \otimes \partial^{(1)}) \otimes_H v_i'', \quad v_i'' \in V,
\end{equation}

and $W$ is an $L$-submodule iff $v_i'' \in W$ whenever $v \in W$.

Example 2.3. Let $L$ be a Lie pseudoalgebra, and let $V$ be an $L$-module, which is finite dimensional (over $k$). Then the action of $L$ on $V$ is trivial, i.e., $L \ast V = \{0\}$. Indeed, since $\dim H = \infty$, every element $v \in V$ is torsion, i.e., such that $hv = 0$ for some nonzero $h \in H$. Then the statement follows from [BDK, Corollary 10.1].
2.3. Annihilation Algebras of Lie Pseudoalgebras. For a Lie \( H \)-pseudoalgebra \( L \), we set \( A(L) = X \otimes_H L \), where as before \( X = H^* \). We define a Lie bracket on \( \mathcal{L} = A(L) \) by the formula (cf. [BDK, Eq. (7.2))):

\[
(2.35) \quad [x \otimes_H a, y \otimes_H b] = \sum (xf_i)(yg_i) \otimes_H c_i, \quad \text{if} \quad [a \ast b] = \sum (f_i \otimes g_i) \otimes_H c_i.
\]

Then \( \mathcal{L} \) is a Lie algebra, called the annihilation algebra of \( L \) (see [BDK, Section 7.1]).

We define a left action of \( H \) on \( \mathcal{L} \) in the obvious way:

\[
(2.36) \quad h(x \otimes_H a) = hx \otimes_H a.
\]

In the case \( H = U(\mathfrak{d}) \), the Lie algebra \( \mathfrak{d} \) acts on \( \mathcal{L} \) by derivations. The semidirect sum \( \mathcal{L} = \mathfrak{d} \ltimes \mathcal{L} \) is called the extended annihilation algebra.

Similarly, if \( V \) is a module over a Lie pseudoalgebra \( L \), we let \( A(V) = X \otimes_H V \), and define an action of \( \mathcal{L} = A(L) \) on \( A(V) \) by:

\[
(2.37) \quad (x \otimes_H a)(y \otimes_H v) = \sum (xf_i)(yg_i) \otimes_H v_i, \quad \text{if} \quad a \ast v = \sum (f_i \otimes g_i) \otimes_H v_i.
\]

We also define an \( H \)-action on \( A(V) \) similarly to (2.36). Then \( A(V) \) is an \( \mathcal{L} \)-module [BDK, Proposition 7.1].

When \( L \) is a finite \( H \)-module, we can define a filtration on \( \mathcal{L} \) as follows (see [BDK, Section 7.4] for more details). We fix a finite-dimensional vector subspace \( L_0 \) of \( L \) such that \( L = HL_0 \), and set

\[
(2.38) \quad F_p \mathcal{L} = \{ x \otimes_H a \in \mathcal{L} \mid x \in F_p X, \ a \in L_0 \}, \quad p \geq -1.
\]

The subspaces \( F_p \mathcal{L} \) constitute a decreasing filtration of \( \mathcal{L} \), satisfying

\[
(2.39) \quad [F_n \mathcal{L}, F_p \mathcal{L}] \subset F_{n+p-\ell} \mathcal{L}, \quad \mathfrak{d}(F_p \mathcal{L}) \subset F_{p-1} \mathcal{L},
\]

where \( \ell \) is an integer depending only on the choice of \( L_0 \). Notice that the filtration just defined depends on the choice of \( L_0 \), but the topology it induces does not [BDK, Lemma 7.2]. We set \( \mathcal{L}_p = F_{p+\ell} \mathcal{L} \), so that \( \mathcal{L}_n, \mathcal{L}_p \subset \mathcal{L}_{n+p} \). In particular, \( \mathcal{L}_0 \) is a Lie algebra.

We also define a filtration of \( \mathcal{L} \) by letting \( F_{-1} \mathcal{L} = \mathcal{L} \), \( F_0 \mathcal{L} = F_p \mathcal{L} \) for \( p \geq 0 \), and we set \( \mathcal{L}_p = F_{p+\ell} \mathcal{L} \). An \( \mathcal{L} \)-module \( V \) is called conformal if every \( v \in V \) is killed by some \( \mathcal{L}_p \); in other words, if \( V \) is a topological \( \mathcal{L} \)-module when endowed with the discrete topology.

The next two results from [BDK] will play a crucial role in our study of representations (see [BDK], Propositions 9.1 and 14.2, and Lemma 14.4).

**Proposition 2.1.** Any module \( V \) over the Lie pseudoalgebra \( L \) has a natural structure of a conformal \( \mathcal{L} \)-module, given by the action of \( \mathfrak{d} \) on \( V \) and by

\[
(2.40) \quad (x \otimes_H a) \ast v = \sum \langle x, S(f_i g_{i(-1)}) \rangle g_{i(2)} v_i, \quad \text{if} \quad a \ast v = \sum (f_i \otimes g_i) \otimes_H v_i
\]

for \( a \in L, \ x \in X, \ v \in V \).

Conversely, any conformal \( \mathcal{L} \)-module \( V \) has a natural structure of an \( L \)-module, given by

\[
(2.41) \quad a \ast v = \sum_{I \in \mathcal{X}} (S(\partial^{(I)} \otimes 1) \otimes_H ((x_I \otimes_H a) \ast v).
\]

Moreover, \( V \) is irreducible as an \( L \)-module if and only if it is irreducible as an \( \mathcal{L} \)-module.
Lemma 2.3. Let $L$ be a finite Lie pseudoalgebra and $V$ be a finite $L$-module. For $p \geq -1 - t$, let

$$\ker_p V = \{ v \in V \mid L_p v = 0 \},$$

so that, for example, $\ker_{-1 - t} V = \ker V$ and $V = \bigcup \ker_p V$. Then all vector spaces $\ker_p V / \ker V$ are finite dimensional. In particular, if $\ker V = \{0\}$, then every vector $v \in V$ is contained in a finite-dimensional subspace invariant under $L_0$.

3. Primitive Lie Pseudoalgebras of Type $W$ and $S$

Here we introduce the main objects of our study: the primitive Lie pseudoalgebras $W(d)$ and $S(d, \chi)$ and their annihilation algebras $W$ and $S$ (see [BDK, Chapter 8]).

3.1. Definition of $W(d)$ and $S(d, \chi)$. We define the Lie pseudoalgebra $W(d)$ as the free $H$-module $H^d$ with the pseudobracket

$$[(f \otimes a) \ast (g \otimes b)] = (f \otimes g) \otimes_H (1 \otimes [a, b])$$

$$- (f \otimes ga) \otimes_H (1 \otimes b) + (fb \otimes g) \otimes_H (1 \otimes a).$$

There is a structure of a $W(d)$-module on $H$ given by:

$$(f \otimes a) \ast g = -(f \otimes ga) \otimes_H 1.$$

Let $\chi$ be a trace form on $d$, i.e., a linear functional from $d$ to $k$ that vanishes on $[d, d]$. Define an $H$-linear map $\text{div}^\chi : W(d) \to H$ by the formula:

$$\text{div}^\chi \left( \sum h_i \otimes \partial_i \right) = \sum h_i (\partial_i + \chi(\partial_i)).$$

Then

$$S(d, \chi) := \{ s \in W(d) \mid \text{div}^\chi s = 0 \}$$

is a subalgebra of the Lie pseudoalgebra $W(d)$. It was shown in [BDK, Proposition 8.1] that $S(d, \chi)$ is generated over $H$ by the elements

$$s_{ab} := (a + \chi(a)) \otimes b - (b + \chi(b)) \otimes a - 1 \otimes [a, b] \quad \text{for} \quad a, b \in d.$$

Pseudobrackets of the elements $s_{ab}$ are explicitly calculated in [BDK, Proposition 8.1]. Notice that when $\dim d > 2$, $S(d, \chi)$ is not free as an $H$-module, because the elements $s_{ab}$ satisfy the relations [BDK, Eq. (8.23)].

Remark 3.1. If $\dim d = 1$, then $S(d, \chi) = \{0\}$. If $\dim d = 2$, the Lie pseudoalgebra $S(d, \chi)$ is free as an $H$-module and it is isomorphic to a primitive Lie pseudoalgebra of type $H$ (see [BDK], Section 8.6 and Example 8.1).

Irreducible modules over primitive Lie pseudoalgebras of type $H$ will be studied in a sequel paper. From now on, whenever we consider the Lie pseudoalgebra $S(d, \chi)$, we will assume that $\dim d > 2$. 
3.2. Annihilation Algebra of $W(\mathfrak{d})$. Let $\mathcal{W} = \mathcal{A}(W(\mathfrak{d}))$ be the annihilation algebra of the Lie pseudoalgebra $W(\mathfrak{d})$. Since $W(\mathfrak{d}) = H \otimes \mathfrak{d}$, we have $\mathcal{W} = X \otimes_H (H \otimes \mathfrak{d}) \cong X \otimes \mathfrak{d}$, so we can identify $\mathcal{W}$ with $X \otimes \mathfrak{d}$. Then the Lie bracket (3.9) defines a Lie algebra homomorphism
\begin{equation}
\mathcal{W} \to \mathfrak{d}
\end{equation}
where $\mathfrak{d}$ is the Lie algebra of continuous derivations. Hence, (3.9) defines a Lie algebra homomorphism
\end{equation}
while the left action (2.36) of $H$ on $\mathcal{W}$ is given by: $h(x \otimes a) = hx \otimes a$. The Lie algebra $\mathfrak{d}$ acts on $\mathcal{W}$ by derivations. We denote by $\mathcal{W}$ the extended annihilation algebra $\mathfrak{d} \ltimes \mathcal{W}$, where
\begin{equation}
[\partial, x \otimes a] = \partial x \otimes a, \quad \partial, a \in \mathfrak{d}, \ x \in X.
\end{equation}

We choose $L_0 = k \otimes \mathfrak{d}$ as a subspace of $W(\mathfrak{d})$ such that $W(\mathfrak{d}) = HL_0$, and we obtain the following filtration of $\mathcal{W}$:
\begin{equation}
W_p = F_p W = F_p X \otimes_H L_0 = F_p X \otimes \mathfrak{d}.
\end{equation}
This is a decreasing filtration of $\mathcal{W}$, satisfying $W_{-1} = W$ and (2.39) for $\ell = 0$. Note that $\mathcal{W} / \mathcal{W}_0 \simeq k \otimes \mathfrak{d} \simeq \mathfrak{d}$ and $\mathcal{W}_0 / \mathcal{W}_1 \simeq \mathfrak{d}^* \otimes \mathfrak{d}$.

Let us fix a basis $\{\partial_i\}_{i=1,...,N}$ of $\mathfrak{d}$, and let $x^i \in X$ be given by (2.19). We can view $x^i$ as elements of $\mathfrak{d}^*$; then $\{x^i\}$ is a basis of $\mathfrak{d}^*$ dual to the basis $\{\partial_i\}$ of $\mathfrak{d}$. Let $e^i_1 \in \mathfrak{gl}\mathfrak{d}$ be given by $e^i_1 \partial_k = \delta^i_k \partial_i$; in other words, $e^i_1$ corresponds to $\partial_i \otimes x^j$ under the isomorphism $\mathfrak{gl}\mathfrak{d} \simeq \mathfrak{d} \otimes \mathfrak{d}^*$.

**Lemma 3.1.** In the Lie algebra $X \otimes \mathfrak{d}$, we have the following:
\begin{equation}
[x^i \otimes \partial_i, 1 \otimes \partial_k] = -\delta^i_k 1 \otimes \partial_i \mod \mathcal{W}_0,
\end{equation}
\begin{equation}
[x^i \otimes \partial_i, x^j \otimes \partial_k] = \delta^i_j x^j \otimes \partial_k - \delta^k_j x^j \otimes \partial_i \mod \mathcal{W}_1.
\end{equation}

**Proof.** This follows from (3.6) and Lemma 2.2. \hfill $\square$

**Corollary 3.1.** For $x \in F_0 X$, $a \in \mathfrak{d}$, the map
\begin{equation}
x \otimes a \mod \mathcal{W}_1 \mapsto -a \otimes (x \mod F_1 X)
\end{equation}
is a Lie algebra isomorphism from $\mathcal{W}_0 / \mathcal{W}_1$ to $\mathfrak{d} \otimes \mathfrak{d}^* \simeq \mathfrak{gl}\mathfrak{d}$. Under this isomorphism, the adjoint action of $\mathcal{W}_0 / \mathcal{W}_1$ on $\mathcal{W} / \mathcal{W}_0$ coincides with the standard action of $\mathfrak{gl}\mathfrak{d}$ on $\mathfrak{d}$.

**Proof.** The above map takes $x^i \otimes \partial_i \mod \mathcal{W}_1$ to $-e^i_1 \in \mathfrak{gl}\mathfrak{d}$. \hfill $\square$

The action of $W(\mathfrak{d})$ on $H$ induces a corresponding action of the annihilation algebra $\mathcal{W} = \mathcal{A}(W(\mathfrak{d}))$ on $\mathcal{A}(H) \equiv X$ given by (2.37):
\begin{equation}
(x \otimes a)y = -x(ya), \quad x, y \in X, \ a \in \mathfrak{d}.
\end{equation}
Recall from Section 2.1 that we have a ring isomorphism $\varphi: X \to \mathcal{O}_N$, which is compatible with the corresponding filtrations and topologies (see (2.20), (2.21)). Since $\mathfrak{d}$ acts on $X$ by continuous derivations, the Lie algebra $\mathcal{W}$ acts on $X$ by continuous derivations. Hence, (3.9) defines a Lie algebra homomorphism
\begin{equation}
\varphi: \mathcal{W} \to W_N \quad \text{such that} \quad \varphi(Ay) = \varphi(A) \varphi(y) \text{ for } A \in \mathcal{W}, \ y \in X,
\end{equation}
where $W_N$ is the Lie algebra of continuous derivations of $\mathcal{O}_N$.

There is a natural filtration of $W_N$ given by
\begin{equation}
F_p W_N = \{D \in W_N \mid D(\mathcal{F}_n \mathcal{O}_N) \subset \mathcal{F}_{n+p} \mathcal{O}_N \text{ for all } n\}, \quad p \geq -1.
\end{equation}
Explicitly, by (2.21), we have
\[
F_p W_N = \left\{ \sum_{i=1}^{N} f_i \frac{\partial}{\partial t^i} \mid f_i \in F_p \mathcal{O}_N \right\}.
\]
The filtration (3.11) has the following important property for \( D \in W_N \):
\[
[D, F_p W_N] \subset F_{p+n} W_N \iff D \in F_n W_N.
\]

**Proposition 3.1.** (i) We have:
\[
\varphi(x \otimes a) = \varphi(x)\varphi(1 \otimes a), \quad x \in X, \ a \in \mathfrak{d},
\]
\[
\varphi(1 \otimes \partial_i) = -\frac{\partial}{\partial t^i} \mod F_0 W_N, \quad i = 1, \ldots, N.
\]
(ii) The homomorphism (3.10) is an isomorphism and \( \varphi(W_p) = F_p W_N \) for all \( p \geq -1 \).

**Proof.** Part (i) follows from (3.10) and Lemma 2.2. Part (ii) follows from (i) and (3.8), (3.12).

The adjoint action of the Euler vector field
\[
E := \sum_{i=1}^{N} t^i \frac{\partial}{\partial t^i} \in F_0 W_N
\]
decomposes \( W_N \) as a direct product of eigenspaces \( W_{N,j} \) (\( j \geq -1 \)), on which the action of \( E \) is multiplication by \( j \). One clearly has:
\[
F_p W_N = \prod_{j \geq p} W_{N,j}, \quad F_p W_N / F_{p+1} W_N \simeq W_{N:p}.
\]
Notice that \( W_{N,0} = \ker(\text{ad} E) \) is a Lie algebra isomorphic to \( \mathfrak{gl}_N \) and each space \( W_{N,p} \) is a module over \( W_{N,0} \).

**Definition 3.1.** The preimage \( \mathcal{E} = \varphi^{-1}(E) \in \mathcal{W}_0 \) of the Euler vector field (3.14) under the isomorphism (3.10) will be called the \textit{Euler element} of \( \mathcal{W} \).

By Proposition 3.1 and Corollary 3.1, we have:
\[
\mathcal{E} = -\sum_{i=1}^{N} x^i \otimes \partial_i \mod W_1, \quad \text{i.e.,} \quad \mathcal{E} \mod W_1 = \text{Id} \in \mathfrak{gl} \mathfrak{d} \simeq \mathcal{W}_0 / W_1.
\]

3.3. The Normalizer \( \mathcal{N}_W \). In this subsection, we study the normalizer of \( W_p \) (\( p \geq 0 \)) in the extended annihilation algebra \( \widetilde{W} \). These results will be used later in our classification of finite irreducible \( \mathcal{W}(\mathfrak{d}) \)-modules.

We denote by \( \text{ad} \) the adjoint action of \( \mathfrak{d} \) on itself (or on \( H = U(\mathfrak{d}) \)), and by \( \text{coad} \) the coadjoint action of \( \mathfrak{d} \) on \( X = H^* \). For \( \partial \in \mathfrak{d} \), we will also consider \( \text{ad} \partial \) as an element of \( \mathfrak{gl} \mathfrak{d} \). Note that, by (2.8), (2.10), we have
\[
(\text{coad} \partial)x = \partial x - x \partial, \quad \partial \in \mathfrak{d}, \ x \in X.
\]
Since \( \text{ad} \partial \) preserves the filtration (2.16) of \( H \), it follows that \( \text{coad} \partial \) preserves the filtration \( \{F_p X\} \) of \( X \).
Lemma 3.2. (i) For \( \partial, a \in \mathfrak{d} \) and \( x \in X \), the following formula holds in \( \tilde{W} \):
\[
[\partial + 1 \otimes \partial, x \otimes a] = (\text{coad} \partial)x \otimes a + x \otimes [\partial, a].
\]
In particular, the adjoint action of \( \partial + 1 \otimes \partial \in \tilde{W} \) on \( W \subset \tilde{W} \) preserves the filtration \( \{W_p\} \).

(ii) The adjoint action of \( \partial + 1 \otimes \partial \) on \( W/W_0 \) coincides with the standard action of \( \text{ad} \partial \in \mathfrak{gl}(\mathfrak{d}) \) on \( \mathfrak{d} \simeq W/W_0 \).

Proof. Part (i) follows from (3.6)–(3.8), (3.17), and the above observation that \( \text{coad} \partial \) preserves the filtration \( \{W_p\} \). Part (ii) is obvious from (i).

It is well known that all derivations of \( W_N \) are inner. Since \( W \cong W_N \) and \( \mathfrak{d} \) acts on \( W \) by derivations (see (3.7)), there is an injective Lie algebra homomorphism
\[
(3.18) \quad \gamma: \mathfrak{d} \hookrightarrow W \quad \text{such that} \quad [\partial, A] = [\gamma(\partial), A], \quad \partial \in \mathfrak{d} \subset \tilde{W}, \ A \in W \subset \tilde{W}.
\]

Definition 3.2. For \( \partial \in \mathfrak{d} \), let \( \tilde{\partial} = \partial - \gamma(\partial) \in \tilde{W} \), where \( \gamma \) is given by (3.18). Let
\[
\mathfrak{d} = (1d - \gamma)(\mathfrak{d}) \subset W \text{ and } N_\mathfrak{d} = \mathfrak{d} + W_0 \subset \tilde{W}.
\]

Proposition 3.2. (i) The space \( \tilde{\mathfrak{d}} \) is a subalgebra of \( \tilde{W} \) centralizing \( W \), i.e., \( [\tilde{\mathfrak{d}}, W] = \{0\} \). The map \( \partial \mapsto \tilde{\partial} \) is a Lie algebra isomorphism from \( \mathfrak{d} \) to \( \tilde{\mathfrak{d}} \).

(ii) The space \( N_\mathfrak{d} \) is a subalgebra of \( \tilde{W} \), and it decomposes as a direct sum of Lie algebras, \( N_\mathfrak{d} = \mathfrak{d} \oplus W_0 \).

Proof. It follows from (3.18) that \([\tilde{\partial}, A] = 0 \) for all \( \partial \in \mathfrak{d}, A \in W \). Then for \( \partial, \partial' \in \mathfrak{d} \), we have
\[
[\partial, \partial'] = [\tilde{\partial} + \gamma(\partial), \tilde{\partial} + \gamma(\partial')] = [\tilde{\partial}, \tilde{\partial}'] + [\gamma(\partial), \gamma(\partial')],
\]
which implies \([\tilde{\partial}, \tilde{\partial}'] = [\partial, \partial'] \) since \( \gamma \) is a Lie algebra homomorphism. This proves (i). Part (ii) follows from (i) and Definition 3.2.

Lemma 3.3. For every \( \partial \in \mathfrak{d} \), the element \( \partial + 1 \otimes \partial - \tilde{\partial} \in \tilde{W} \) belongs to \( W_0 \). Its image in \( W_0/W_1 \) coincides with \( \text{ad} \partial \in \mathfrak{gl}(\mathfrak{d}) \cong W_0/W_1 \).

Proof. First note that \( \partial + 1 \otimes \partial - \tilde{\partial} = \gamma(\partial) + 1 \otimes \partial \) belongs to \( W \). By (3.18) and Lemma 3.2(i), the adjoint action of this element on \( W \) preserves the filtration \( \{W_p\} \). Therefore, by (3.13), \( \gamma(\partial) + 1 \otimes \partial \) belongs to \( W_0 \). By (3.18) and Lemma 3.2(ii), its image in \( W_0/W_1 \) coincides with \( \text{ad} \partial \).

Proposition 3.3. For every \( p \geq 0 \), the normalizer of \( W_p \) in the extended annihilation algebra \( \tilde{W} \) is equal to \( N_\mathfrak{d} \). In particular, it is independent of \( p \). There is a decomposition as a direct sum of subspaces, \( \tilde{W} = \mathfrak{d} \oplus N_\mathfrak{d} \).

Proof. First, to show that \( \tilde{W} = \mathfrak{d} \oplus N_\mathfrak{d} \), we have to check that \( \tilde{W} = \mathfrak{d} \oplus \tilde{\mathfrak{d}} \oplus W_0 \) is a direct sum of subspaces. This follows from Definition 3.2, Lemma 3.3 and the fact that \( \tilde{W} = \mathfrak{d} \oplus W, W = (k \otimes \mathfrak{d}) \oplus W_0 \) as vector spaces.

Next, it is clear that \( N_\mathfrak{d} \) normalizes \( W_p \), because \([\mathfrak{d}, W_p] = \{0\}\) and \( [W_0, W_p] \subset W_p \). Assume that an element \( \partial \in \mathfrak{d} \) normalizes \( W_p \). By (3.7), we obtain that in this case \( \partial(F_pX) \subset F_pX \). However, one can deduce from Lemma 2.2 that \( \partial(F_pX) = F_{p-1}X \), which is strictly larger than \( F_pX \). This contradiction shows that the normalizer of \( W_p \) is equal to \( N_\mathfrak{d} \).

\qed
In order to understand the irreducible representations of $N_W$, we need the following lemma, which appeared (in the more difficult super case) in [CK, Erratum].

**Lemma 3.4.** Let $\mathfrak{g}$ be a finite-dimensional Lie algebra, and let $\mathfrak{g}_0 \subset \mathfrak{g}$ be either a simple Lie algebra or a $1$-dimensional Lie algebra. Let $I$ be a subspace of the radical of $\mathfrak{g}$, stabilized by $\text{ad} \mathfrak{g}_0$ and having the property that $[\mathfrak{g}_0, a] = 0$ for $a \in I$ implies $a = 0$. Then $I$ acts trivially on any irreducible finite-dimensional $\mathfrak{g}$-module $V$.

**Proof.** By Cartan-Jacobson's Theorem (see, e.g., [Se, Theorem VI.5.1]), every $a \in \text{Rad} \mathfrak{g}$ acts by scalar multiplication on $V$. Let $J = \{ a \in I \mid a(V) = 0 \}$. Then $[\mathfrak{g}_0, I] \subset J$.

Now, if $\mathfrak{g}_0$ is simple, then $J$ is a $\mathfrak{g}_0$-submodule of $I$ and, by complete reducibility, $I \cong J \oplus J^\perp$ as $\mathfrak{g}_0$-modules for some complement $J^\perp$. Hence, $[\mathfrak{g}_0, J^\perp] = 0$, so $J^\perp = 0$ and $I = J$.

If instead $\mathfrak{g}_0 = \mathfrak{k}e$ is 1-dimensional, then $[e, I] \subset J$. If $J \neq I$, then $\text{ad} e : I \to J$ is not injective, which is a contradiction. We conclude that $J = I$. $\Box$

An $N_W$-module $V$ will be called **conformal** if it is conformal as a module over the subalgebra $\mathcal{W}_0 \subset N_W$, i.e., if every vector $v \in V$ is killed by some $\mathcal{W}_p$.

**Proposition 3.4.** The subalgebra $\mathcal{W}_1 \subset N_W$ acts trivially on any irreducible finite-dimensional conformal $N_W$-module. Irreducible finite-dimensional conformal $N_W$-modules are in one-to-one correspondence with irreducible finite-dimensional modules over the Lie algebra $N_W/\mathcal{W}_1 \cong \mathfrak{d} \oplus \mathfrak{gl} \mathfrak{d}$.

**Proof.** A finite-dimensional vector space $V$ is a conformal $N_W$-module iff it is an $N_W$-module on which $\mathcal{W}_p$ acts trivially for some $p \geq 0$, i.e., iff it is a module over the finite-dimensional Lie algebra $\mathfrak{g} = N_W/\mathcal{W}_p = \mathfrak{d} \oplus (\mathcal{W}_0/\mathcal{W}_p)$, where $\mathcal{E} \in \mathcal{W}_0$ is the Euler element (see Definition 3.1). Note that $I \subset \text{Rad} \mathfrak{g}$ and $[\mathcal{E}, I] \subset I$, because $[\mathcal{W}_i, \mathcal{W}_j] \subset \mathcal{W}_{i+j}$ for all $i, j$. The adjoint action of $\mathcal{E}$ is injective on $I$, because $\text{ad} \mathcal{E}$ is injective on $F_1 W_N/F_0 W_N = \prod_{j=1}^{p-1} W_{N,j}$ (see (3.15)). We conclude that $I$ acts trivially on any finite-dimensional conformal $N_W$-module. Hence, we can take $p = 1$. Then $\mathfrak{g} = \mathfrak{d} \oplus (\mathcal{W}_0/\mathcal{W}_1) \cong \mathfrak{d} \oplus \mathfrak{gl} \mathfrak{d}$, since $\mathfrak{d} \cong \mathfrak{d}$ and $\mathcal{W}_0/\mathcal{W}_1 \cong \mathfrak{gl} \mathfrak{d}$. $\Box$

### 3.4. Annihilation Algebra of $S(\mathfrak{d}, \chi)$

Assume that $N = \dim \mathfrak{d} > 2$. In this subsection, we study the annihilation algebra $\mathcal{S} = A(S(\mathfrak{d}, \chi)) := X \otimes_H S(\mathfrak{d}, \chi)$ of the Lie pseudoalgebra $S(\mathfrak{d}, \chi)$ defined in Section 3.1. Our treatment here is more detailed than in [BDK, Section 8.4].

We choose

$$L_0 = \text{span}_k \{ s_{ab} \mid a, b \in \mathfrak{d} \} \subset S(\mathfrak{d}, \chi)$$

as a subspace such that $S(\mathfrak{d}, \chi) = H L_0$, where the elements $s_{ab}$ are given by (3.5). We obtain a decreasing filtration of $\mathcal{S}$:

$$S_p = F_{p+1} S = F_{p+1} X \otimes_H L_0, \quad p \geq -2,$$

satisfying $S_{-2} = \mathcal{S}$ and (2.39) for $\ell = 1$. Then $[S_n, S_p] \subset S_{n+p}$ for all $n, p$. 

The canonical injection of the subalgebra $S(\mathfrak{g}, \chi)$ into $W(\mathfrak{g})$ induces a Lie algebra homomorphism $\iota: \mathcal{S} \to \mathcal{W}$. Explicitly, we have:

$$\iota(x \otimes_H s) = \sum x h_i \otimes \partial_i \in \mathcal{W} \equiv X \otimes \mathfrak{g}$$

(3.21)

for $x \in X$, $s = \sum h_i \otimes \partial_i \in S(\mathfrak{g}, \chi) \subset W(\mathfrak{g}) = H \otimes \mathfrak{g}$.

Here, as before, we identify $W = X \otimes_H W(\mathfrak{g})$ with $X \otimes \mathfrak{g}$.

We define a map $\text{div}^\chi: \mathcal{W} \to X$ by the formula (cf. (3.3)):

$$\text{div}^\chi \left( \sum y_i \otimes \partial_i \right) = \sum y_i (\partial_i + \chi(\partial_i)) .$$

(3.22)

It is easy to see that

$$\text{div}^\chi[A, B] = A(\text{div}^\chi B) - B(\text{div}^\chi A), \quad A, B \in \mathcal{W},$$

where the action of $W$ on $X$ is given by (3.9). This implies that

$$\mathfrak{F} := \{ A \in \mathcal{W} \mid \text{div}^\chi A = 0 \}$$

is a Lie subalgebra of $\mathcal{W}$. It was shown in [BDK, Section 8.4] that $\mathfrak{F}$ is isomorphic to the Lie algebra of divergence-zero vector fields

$$S_N := \left\{ \sum_{i=1}^N f_i \frac{\partial}{\partial t^i} \in W_N \mid \sum_{i=1}^N \frac{\partial f_i}{\partial t^i} = 0 \right\} .$$

Lemma 3.5. If $N = \dim \mathfrak{g} > 2$, the map (3.21) is an embedding of Lie algebras $\iota: \mathcal{S} \hookrightarrow \mathfrak{F}$.

Proof. It follows from (3.3), (3.21) and (3.22) that

$$x(\text{div}^\chi s) = \text{div}^\chi \iota(x \otimes_H s), \quad x \in X, \ s \in W(\mathfrak{g}).$$

Therefore, $\iota(\mathcal{S})$ is contained in $\mathfrak{F}$. Next, note that for $N > 2$, $\mathcal{S}$ is isomorphic to $S_N$ by [BDK, Theorem 8.2(i)]. It is well known that the Lie algebra $S_N$ is simple; hence, $\mathcal{S}$ is simple. Since $\iota$ is a nonzero homomorphism, it must be injective. □

Remark 3.2. When $N = \dim \mathfrak{g} = 2$, the Lie algebra $\mathcal{S}$ is isomorphic to $P_2$, which is an extension of $S_2 = H_2$ by a 1-dimensional center (cf. Remark 3.1). In this case, the homomorphism (3.21) has a 1-dimensional kernel.

We will prove in Proposition 3.5 below that, in fact, $\iota(\mathcal{S}) = \mathfrak{F}$. Recall that we have a Lie algebra isomorphism $\varphi: \mathcal{W} \xrightarrow{\sim} W_N$, given by (3.10). However, although $\mathfrak{F} \simeq S_N \subset W_N$, the image $\varphi(\mathfrak{F}) \subset W_N$ is not equal to $S_N$ in general. Instead, we will show that the images of $\varphi(\mathfrak{F})$ and $S_N$ coincide in the associated graded algebra of $W_N$ (see Proposition 3.6 below).

Lemma 3.6. For every $p \geq -1$, we have

$$\varphi(\mathfrak{F} \cap F_p W) \subset (S_N \cap F_p W) + F_{p+1} W_N .$$

Proof. Take an element $A = \sum y_i \otimes \partial_i \in F_p W$; then each $y_i \in F_p X$. By Proposition 3.1, we have $\varphi(A) = \sum f_i \varphi(1 \otimes \partial_i)$, where $f_i = \varphi(y_i) \in F_p \mathcal{O}_N$. Since $\varphi(1 \otimes \partial_i) = -\partial_i/\partial t^i \mod F_p W_N$, we have $\varphi(A) = -\sum f_i \partial_i/\partial t^i \mod F_{p+1} W_N$.

It follows from (3.22) and Lemma 2.2 that $\varphi(\text{div}^\chi A) = -\sum \partial f_i/\partial t^i \mod F_p \mathcal{O}_N$. If $A \in \mathfrak{F} \cap F_p W$, then $\sum \partial f_i/\partial t^i = 0 \mod F_p \mathcal{O}_N$. Then there exist elements $\tilde{f}_i \in F_p \mathcal{O}_N$ such that $\tilde{f}_i = f_i \mod F_{p+1} \mathcal{O}_N$ and $\sum \partial \tilde{f}_i/\partial t^i = 0$. This means that $A := -\sum \tilde{f}_i \partial_i/\partial t^i \in S_N \cap F_p W_N$ and $\varphi(A) = A \mod F_{p+1} W_N$. □
Consider the associated graded of $W$,

\[(3.26) \quad \text{gr } W := \bigoplus_{p=-1}^{\infty} \text{gr}_p W, \quad \text{gr}_p W := F_p W / F_{p+1} W.\]

Note that, by \((3.8)\), we have $\text{gr}_p W = (\text{gr}_p X) \otimes \mathfrak{o}$. Similarly, we have $\text{gr}_p W_N = \sum_{i=1}^{N} (\text{gr}_p \mathcal{O}_N) \partial / \partial t^i$. The maps $\varphi: X \to \mathcal{O}_N$ and $\varphi: W \to W_N$ (see \((2.20), (3.10)\)) preserve the corresponding filtrations and induce maps $\text{gr} \varphi: X \to \text{gr} \mathcal{O}_N$ and $\text{gr} \varphi: W \to \text{gr} W_N$. Note also that the map $\text{div}: W \to X$ takes $F_p W$ to $F_{p-1} X$, and hence induces a map $\text{gr} \text{div}: \text{gr} W \to \text{gr} X$ of degree $-1$. The same is true for the map $\text{div}: W_N \to \mathcal{O}_N$ given by $\text{div}(\sum f_i \partial / \partial t^i) := \sum \partial f_i / \partial t^i$. From the proof of Lemma 3.6 we deduce:

**Corollary 3.2.** The above maps satisfy

\[
(\text{gr} \varphi) \left( \sum_{i=1}^{N} \bar{y}_i \otimes \partial_i \right) = - \sum_{i=1}^{N} (\text{gr} \varphi)(\bar{y}_i) \frac{\partial}{\partial \bar{y}_i}, \quad \bar{y}_i \in \text{gr} X
\]

and

\[
\text{gr} \varphi \circ \text{gr} \text{div} = \text{gr} \text{div} \circ \text{gr} \varphi.
\]

The Lie algebra $\mathcal{S}$ has a filtration \((3.20)\), while $\mathfrak{S} \subset W$ has one obtained by restricting the filtration \((3.8)\) of $W$. Using Lemma 3.6, we can prove that $\iota$ is compatible with the filtrations.

**Proposition 3.5.** Let $\mathcal{S}$ be the annihilation algebra of $S(\mathfrak{o}, \chi)$, and let $\mathfrak{S} \subset W$ be defined by \((3.24)\). Then for $\dim \mathfrak{o} > 2$, the map \((3.21)\) is an isomorphism of Lie algebras $\iota: S \cong \mathfrak{S}$ such that $\iota(S_p) = \mathfrak{S} \cap W_p$ for all $p \geq 1$.

**Proof.** It is clear from definitions that

\[
\iota(S_p) = F_{p+1} X \otimes_H \text{span}_k \{s_{ab}\} \subset F_p X \otimes_H (k \otimes \mathfrak{o}) \equiv F_p X \otimes \mathfrak{o} = W_p.
\]

In addition, $\iota(S) \subset \mathfrak{S}$ by Lemma 3.5; hence, $\iota(S_p) \subset \mathfrak{S} \cap W_p$.

Conversely, let $A \in \mathfrak{S} \cap W_p$. By Lemma 3.6, we can find $\hat{A} \in S_N \cap F_p W_N$ such that $\varphi(A) = \hat{A}$ mod $F_{p+1} W_N$. Any element of $S_N \cap F_p W_N$ can be written in the form

\[
\hat{A} = \sum_{i,j=1}^{N} \frac{\partial f_{ij}}{\partial t^1} \frac{\partial}{\partial t^1} - \frac{\partial f_{ij}}{\partial t^a} \frac{\partial}{\partial t^a}, \quad f_{ij} \in F_{p+1} \mathcal{O}_N.
\]

Now consider the following element of $S_p$:

\[
\hat{A} := - \sum_{i,j=1}^{N} y_{ij} \otimes_H s_{a,b}, \quad y_{ij} := \varphi^{-1}(f_{ij}) \in F_{p+1} X.
\]

Then we have $\hat{A} \in S_p$ and $\iota(\hat{A}) = A$ mod $W_{p+1}$.

Let $A_1 = A - \iota(\hat{A})$; then $A_1 \in \mathfrak{S} \cap W_{p+1}$ and $A - A_1 \in \iota(S_p)$. By the above argument, we can find an element $\hat{A}_1 \in S_{p+1}$ such that $\iota(\hat{A}_1) = A_1$ mod $W_{p+2}$. Let $A_2 = A_1 - \iota(\hat{A}_1)$; then $A_2 \in \mathfrak{S} \cap W_{p+2}$ and $A - A_2 \in \iota(S_{p+1})$. Continuing this way, we obtain a sequence of elements $A_n \in \mathfrak{S} \cap W_{p+n}$ such that $A_n - A_{n+1} \in \iota(S_{p+n})$ for all $n \geq 0$, where $A_0 := A$. The sequence $A_n$ converges to 0 in $W$ and $A - A_n \in \iota(S_p)$ for all $n \geq 0$; therefore, $A \in \iota(S_p)$.

This proves that $\iota(S_p) = \mathfrak{S} \cap W_p$. Taking $p = -1$, we get $\iota(S) \supset \iota(S_{-1}) = \mathfrak{S}$, because $W_{-1} = W \supset \mathfrak{S}$. Now Lemma 3.5 implies that $\iota$ is an isomorphism. \(\square\)
Recall that any ring automorphism $\psi$ of $O_N$ induces a Lie algebra automorphism $\psi$ of $W_N = \text{Der } O_N$ such that $\psi(Ay) = \psi(A)\psi(y)$ for $A \in W_N$, $y \in O_N$. Any $\psi \in \text{Aut } O_N$ preserves the filtration, because $F_0 O_N$ is the unique maximal ideal of $O_N$ and $F_p O_N = (F_0 O_N)^{p+1}$ for $p \geq 0$ (see (2.21)). Then it follows from (3.11) that $\psi$ preserves the filtration $\{F_p W_N\}$.

**Proposition 3.6.** There exists a ring automorphism $\psi$ of $O_N$ such that the induced Lie algebra automorphism $\psi$ of $W_N$ satisfies $\varphi(\mathfrak{S}) = \psi(S_N)$ and

$$ (\psi - \text{id})(F_p W_N) \subset F_{p+1} W_N, \quad p \geq -1. $$

**Proof.** In [BDK, Remark 8.2] the image $\varphi(\mathfrak{S})$ is described as the Lie algebra of all vector fields annihilating a certain volume form. But any two volume forms are related by a change of variables, i.e., by a ring automorphism of $O_N$, and the subalgebra $S_N$ corresponds to the standard volume form $dt^1 \wedge \cdots \wedge dt^8$. Hence, there exists an automorphism $\psi$ of $O_N$ such that $\varphi(\mathfrak{S}) = \psi(S_N)$. Due to Corollary 3.2, we can choose $\psi$ such that

$$ \psi(t_i^t) = t_i^t \mod F_1 O_N, \quad i = 1, \ldots, N, $$

i.e., such that $\text{gr } \psi = \text{id}$. Since the latter is equivalent to (3.27), this completes the proof. \hfill \Box

**Corollary 3.3.** The Lie algebra isomorphism $\psi^{-1} : S \rightarrow S_N$ maps $S_p$ onto $S_N \cap F_p W_N$ for all $p \geq -1$. In particular, $S_{-2} = S_{-1} = S$.

**Proof.** By Proposition 3.5, $\iota(S_p) = \mathfrak{S} \cap W_p$. Then under the isomorphism $\varphi : W \rightarrow W_N$, we have $\varphi(S_p) = \varphi(\mathfrak{S}) \cap F_p W_N$. But, by Proposition 3.6, $\varphi(\mathfrak{S}) = \psi(S_N)$ and $\psi(F_p W_N) = F_p W_N$; hence, $\varphi(S_p) = \psi(S_N \cap F_p W_N)$.

Recall that $W_{N,p}$ is the subspace of $W_N$ on which the adjoint action of the Euler vector field (3.14) is multiplication by $p$. We let $S_{N,p} = S_N \cap W_{N,p}$. Since $S_N$ is preserved by $\text{ad } E$, it admits a decomposition similar to (3.15):

$$ (3.28) \quad S_N \cap F_p W_N = \prod_{j \geq p} S_{N,j}, \quad (S_N \cap F_{p+1} W_N) / (S_N \cap F_{p+1} W_N) \simeq S_{N,p}. $$

The following facts about the Lie algebra $S_N \subset W_N$ are well known.

**Lemma 3.7.** (i) The Lie algebra $S_{N,0}$ is isomorphic to $\mathfrak{sl}_N$.

(ii) For every $p \geq -1$, the $S_{N,0}$-module $S_{N,p}$ is isomorphic to the highest component of the $\mathfrak{sl}_N$-module $k^N \otimes (S^{p+1} k^N)^*$.

(iii) The normalizer of $S_N$ in $W_N$ is $S_N \oplus k E$.

**Definition 3.3.** We let $\tilde{E} = \psi(E) \in W_N$ and $\tilde{E} = \varphi^{-1}(\tilde{E}) \in W$, where $E$ is the Euler vector field (3.14), $\varphi$ is from (3.10) and $\psi$ is from Proposition 3.6.

Combining the above results with (3.16), we obtain the following corollary.

**Corollary 3.4.** (i) The Lie algebra $S_0/S_1$ is isomorphic to $\mathfrak{sl}_2$.

(ii) For every $p \geq -1$, the $(S_0/S_1)$-module $S_p/S_{p+1}$ has no trivial $\mathfrak{sl}_0$-components.

(iii) The normalizer of $\mathfrak{S}$ in $W$ is $\mathfrak{S} \oplus k E$.

(iv) $\tilde{E}$ belongs to $W_0$ and its image in $W_0/W_1$ coincides with $\text{Id} \in \mathfrak{gl}_2 \simeq W_0/W_1$. 
3.5. The Normalizer $N_S$. In this subsection, we study the normalizer of $S_p$ $(p \geq 0)$ in the extended annihilation algebra $\mathcal{S} = \mathfrak{d} \times \mathcal{S}$. We will use extensively the results and notation of Sections 3.3 and 3.4, and we will identify $\mathcal{S}$ with the subalgebra $\mathcal{S}$ of $W$ (see Proposition 3.5).

Recall that the filtration $\{S_p\}$ of $\mathcal{S}$ has the properties: $S_{-2} = S_{-1} = S$ and $[S_p, S_p] \subset S_{n+p}$ for all $n, p$. In addition, by Corollary 3.4, we have: $W_0 = S_0 + k\mathcal{E} + W_1$, where the element $\mathcal{E} \in W_0$ is from Definition 3.3.

Lemma 3.8. For every $\partial \in \mathfrak{d}$, we have: $1 \otimes \partial - (\chi(\partial)/N) \mathcal{E} \in S + W_1$.

Proof. As before, let $\{\partial_i\}_{i=1,\ldots,N}$ be a basis of $\mathfrak{d}$, and let $x^i \in X$ be given by (2.19). Denote by $c_{ij}^k$ the structure constants of $\mathfrak{d}$ in the basis $\{\partial_i\}$, and let $\chi_i = \chi(\partial_i)$ for short. Using (3.5), (3.21) and Lemma 2.2, we compute for $i < j$:

$$\iota(x^i \otimes_H s_{\partial_i, \partial_j}) = \chi_i x^i \otimes \partial_j - \chi_j x^j \otimes \partial_i - x^i \otimes [\partial_i, \partial_j] + x^i \partial_i \otimes \partial_j - x^i \partial_j \otimes \partial_i$$

$$= \chi_i x^i \otimes \partial_j - \chi_j x^j \otimes \partial_i - \sum_k c_{ij}^k x^i \otimes \partial_k - 1 \otimes \partial_j$$

$$+ \sum_{k > i} c_{ik} x^i \otimes \partial_j - \sum_{k > j} c_{jk} x^j \otimes \partial_i \mod W_1.$$ From here, we see that the element $\iota(x^i \otimes_H s_{\partial_i, \partial_j}) + 1 \otimes \partial_j$ belongs to $W_0$. Next, using Corollary 3.1, we find that the image of this element in $W_0/W_1 \cong \mathfrak{gl} \mathfrak{d}$ has trace $\chi_j$. Therefore, by Corollary 3.4 (i), (iv),

$$\iota(x^i \otimes_H s_{\partial_i, \partial_j}) + 1 \otimes \partial_j - (\chi_j/N) \mathcal{E} \in S_0 + W_1,$$

which implies $1 \otimes \partial_j - (\chi_j/N) \mathcal{E} \in S + W_1$. $\square$

Lemma 3.9. For every $\partial \in \mathfrak{d}$, we have: $\gamma(\partial) + 1 \otimes \partial - (\text{tr ad}(\partial)/N) \mathcal{E} \in S_0 + W_1$, where $\gamma$ is from (3.18).

Proof. By Lemma 3.3, $\gamma(\partial) + 1 \otimes \partial \in W_0$ and its image in $W_0/W_1$ coincides with $\text{ad} \partial \in \mathfrak{gl} \mathfrak{d}$. Now the statement follows from Corollary 3.4 (i), (iv). $\square$

Definition 3.4. For $\partial \in \mathfrak{d}$, let

$$\tilde{\gamma}(\partial) = \gamma(\partial) + ((\chi - \text{tr ad})(\partial)/N) \mathcal{E} \in W,$$

where $\gamma$ is given by (3.18). Let $\tilde{\partial} = \partial - \tilde{\gamma}(\partial)$, $\tilde{\partial} = (\text{id} - \tilde{\gamma})(\partial) \subset \tilde{W}$, and $N_\mathcal{S} = \tilde{\partial} + S_0 \subset \tilde{W}$.

Note that

$$\tilde{\partial} = \partial - ((\chi - \text{tr ad})(\partial)/N) \mathcal{E}, \quad \partial \in \mathfrak{d},$$

where $\tilde{\partial}$ is from Definition 3.2.

Proposition 3.7. (i) We have $\tilde{\gamma}(\mathfrak{d}) \subset \mathcal{S}$ and $\tilde{\partial} \in \tilde{S}$.

(ii) The map $\partial \mapsto \tilde{\partial}$ is a Lie algebra isomorphism from $\mathfrak{d}$ to $\tilde{\mathfrak{d}}$.

(iii) The Lie algebra $\tilde{\mathfrak{d}}$ normalizes $S_p$ for all $p \geq -1$.

(iv) The Lie algebra $\tilde{\mathfrak{d}}$ centralizes $S_0/S_1$. 
Proof. (i) Combining Lemmas 3.8 and 3.9, we get \( \overline{\gamma}(\partial) \in \mathcal{S} + \mathcal{W}_1 \) for all \( \partial \in \mathfrak{d} \). On the other hand, we deduce from (3.18) and Corollary 3.4(iii) that \( \overline{\gamma}(\partial) \) normalizes \( \mathcal{S} \). Hence, again by Corollary 3.4(iii), \( \overline{\gamma}(\partial) \in \mathcal{S} + k\mathfrak{E} \). However, the intersection \( (\mathcal{S} + \mathcal{W}_1) \cap (\mathcal{S} + k\mathfrak{E}) \) is equal to \( \mathcal{S} \). This shows that \( \overline{\gamma}(\partial) \in \mathcal{S} \).

(ii) Recall from Section 3.3 that \( \partial \mapsto \overline{\partial} \) is a Lie algebra isomorphism and \( \overline{\mathfrak{d}} \subset \widetilde{\mathcal{W}} \) centralizes \( \mathcal{W} \). Then part (ii) follows from (3.29) and the fact that \( \chi - tr \mathfrak{d} \) is a trace form on \( \overline{\mathfrak{d}} \).

(iii) and (iv) follow from (3.29), Corollary 3.4 (iii), (iv) and \( [\overline{\mathfrak{d}}, \mathcal{W}] = 0 \).

It follows from Proposition 3.7 that \( \mathcal{N}_\mathcal{S} \) is a Lie subalgebra of \( \widetilde{\mathcal{S}} \), isomorphic to the semidirect sum \( \overline{\mathfrak{d}} \ltimes \mathcal{N}_0 \).

**Proposition 3.8.** For every \( p \geq 0 \), the normalizer of \( \mathcal{S}_p \) in the extended annihilation algebra \( \mathcal{S} \) is equal to \( \mathcal{N}_\mathcal{S} \). In particular, it is independent of \( p \). There is a decomposition as a direct sum of subspaces, \( \mathcal{S} = \mathfrak{d} \oplus \mathcal{N}_\mathcal{S} \).

**Proof.** The proof is similar to that of Proposition 3.3. \( \square \)

An \( \mathcal{N}_\mathcal{S} \)-module \( V \) is called conformal if it is conformal as a module over the subalgebra \( \mathcal{S}_0 \subset \mathcal{N}_\mathcal{S} \), i.e., if every vector \( v \in V \) is killed by some \( \mathcal{S}_p \).

**Proposition 3.9.** The subalgebra \( \mathcal{S}_1 \subset \mathcal{N}_\mathcal{S} \) acts trivially on any irreducible finite-dimensional conformal \( \mathcal{N}_\mathcal{S} \)-module. Irreducible finite-dimensional conformal \( \mathcal{N}_\mathcal{S} \)-modules are in one-to-one correspondence with irreducible finite-dimensional modules over the Lie algebra \( \mathcal{N}_\mathcal{S}/\mathcal{S}_1 \cong \mathfrak{d} \oplus \mathfrak{sl}\mathfrak{d} \).

**Proof.** As in Proposition 3.4, the \( \mathcal{N}_\mathcal{S} \)-action factors via the finite-dimensional Lie algebra \( \mathfrak{g} := \mathcal{N}_\mathcal{S}/\mathcal{S}_p \) for some \( p \geq 1 \). Recall that \( [\mathcal{S}_i, \mathcal{S}_j] \subset \mathcal{S}_{i+j} \) for all \( i, j \), so that \( I := \mathcal{S}_i/\mathcal{S}_p \) is contained in the radical of \( \mathfrak{g} := \mathcal{N}_0/\mathcal{S}_p \subset \mathfrak{g} \). Moreover, the quotient \( \mathfrak{g}/I \cong \mathcal{N}_0/\mathcal{S}_1 \) is isomorphic to the simple Lie algebra \( \mathfrak{sl}\mathfrak{d} \) by Corollary 3.4(i). Therefore, \( I \) coincides with the radical of \( \mathfrak{g} \), and we can lift \( \mathfrak{g}/I \) to a subalgebra \( \mathfrak{g}_0 \) of \( \mathfrak{g} \) isomorphic to \( \mathfrak{sl}\mathfrak{d} \). Then \( I \) is contained in the radical of \( \mathfrak{g} \), and the adjoint action of \( \mathfrak{g}_0 \) on \( \mathfrak{g} \) preserves it. Moreover, by Corollary 3.4(ii), \( I \) has no trivial \( \mathfrak{g}_0 \)-components. We can now apply Lemma 3.4 to deduce that \( I \) acts trivially on any irreducible finite-dimensional conformal \( \mathcal{N}_\mathcal{S} \)-module. Therefore, the \( \mathcal{N}_\mathcal{S} \)-action factors via \( \mathcal{N}_\mathcal{S}/\mathcal{S}_1 \). By Proposition 3.7(iv), \( \overline{\mathfrak{d}} \) centralizes \( \mathcal{S}_0/\mathcal{S}_1 \). Hence, \( \mathcal{N}_\mathcal{S}/\mathcal{S}_1 \) is isomorphic to a direct sum of Lie algebras \( \overline{\mathfrak{d}} \ltimes (\mathcal{S}_0/\mathcal{S}_1) \cong \mathfrak{d} \oplus \mathfrak{sl}\mathfrak{d} \). \( \square \)

4. **Pseudo Linear Algebra**

In this section, we generalize several linear algebra constructions to the pseudoagebra context. We introduce an important class of \( W(\mathfrak{d}) \)-modules called tensor modules.

4.1. **Pseudolinear Maps.** The definition of a module over a pseudoalgebra motivates the following definition of a pseudolinear map.

**Definition 4.1 ([BDK]).** Let \( V \) and \( W \) be two \( H \)-modules. An \( H \)-pseudolinear map from \( V \) to \( W \) is a \( k \)-linear map \( \phi: V \to (H \otimes H) \otimes_H W \) such that

\[
\phi(hv) = ((1 \otimes h) \otimes_H 1)\phi(v), \quad h \in H, v \in V.
\]
We denote the space of all such $\phi$ by Chom$(V,W)$. We will also use the notation $\phi * v \equiv \phi(v)$ for $\phi \in \text{Chom}(V,W)$, $v \in V$. We define a left action of $H$ on Chom$(V,W)$ by:

$$ (h\phi)(v) = ((h \otimes 1) \otimes_H 1) \phi(v). $$

When $V = W$, we set Cend$V = \text{Chom}(V,V)$.

**Example 4.1.** Let $A$ be an $H$-pseudoalgebra, and let $V$ be an $A$-module. Then for every $a \in A$ the map $m_a : V \to (H \otimes H) \otimes_H V$ defined by $m_a(v) = a \ast v$ is an $H$-pseudolinear map. Moreover, we have $h m_a = m_{ha}$ for $h \in H$.

**Remark 4.1.** Given two homomorphisms of left $H$-modules $\beta : V' \to V$ and $\gamma : W \to W'$, we define a homomorphism

$$ \text{Chom}(\beta, \gamma) : \text{Chom}(V,W) \to \text{Chom}(V',W') $$

by the formula

$$ \phi \mapsto (\id \otimes \id) \otimes_H \gamma \circ \phi \circ \beta. $$

Then we can view Chom$(-,-)$ as a bifunctor from the category of left $H$-modules to itself, contravariant in the first argument and covariant in the second one.

Recall from [BDK, Chapter 10] that when $V$ is a finite $H$-module, Cend$V$ has a unique structure of an associative pseudoalgebra such that $V$ is a module over it via $\phi \ast v = \phi(v)$. Denote by gc$V$ the Lie pseudoalgebra obtained from Cend$V$ by the construction of Remark 2.1. Then $V$ is also a module over gc$V$.

**Proposition 4.1 ([BDK]).** Let $L$ be a Lie pseudoalgebra, and let $V$ be a finite $H$-module. Then giving a structure of an $L$-module on $V$ is equivalent to giving a homomorphism of Lie pseudoalgebras from $L$ to gc$V$.

**Proof.** If $V$ is a finite $L$-module, we define a map $\rho : L \to \text{gc}V$ by $a \mapsto m_a$, where $m_a$ is from Example 4.1. Then $\rho$ is a homomorphism of Lie pseudoalgebras (cf. [BDK, Proposition 10.1]). Conversely, given a homomorphism $\rho : L \to \text{gc}V$, we define an action of $L$ on $V$ by $a \ast v = \rho(a) \ast v$. \hfill $\square$

In the case when $V$ is a free $H$-module of finite rank, one can give an explicit description of Cend$V$, and hence of gc$V$, as follows (see [BDK, Proposition 10.3]). Let $V = H \otimes V_0$, where $H$ acts trivially on $V_0$ and $\dim V_0 < \infty$. Then Cend$V$ is isomorphic to $H \otimes H \otimes \text{End}V_0$, with $H$ acting by left multiplication on the first factor, and with the following pseudoproduct:

$$ (f \otimes a \otimes A) \ast (g \otimes b \otimes B) = (f \otimes ga_{(1)}) \otimes_H (1 \otimes ba_{(2)} \otimes AB). $$

The action of Cend$V$ on $V = H \otimes V_0$ is given by:

$$ (f \otimes a \otimes A) \ast (h \otimes v) = (f \otimes ha) \otimes_H (1 \otimes Av). $$

The pseudobracket in gc$V$ is given by:

$$ [(f \otimes a \otimes A) \ast (g \otimes b \otimes B)] = (f \otimes ga_{(1)}) \otimes_H (1 \otimes ba_{(2)} \otimes AB) - (fb_{(1)} \otimes g) \otimes_H (1 \otimes ab_{(2)} \otimes BA). $$

The action of gc$V$ on $V$ is also given by (4.6).
Remark 4.2. Let $L$ be a Lie pseudoalgebra. Let $V = H \otimes V_0$ be a finite $L$-module, which is free as an $H$-module. For all $a \in L$, $v \in V_0$ we can write

$$a \ast (1 \otimes v) = \sum (f_i \otimes g_i) \otimes_H (1 \otimes A_i v),$$

where $f_i, g_i \in H$, $A_i \in \text{End} V_0$. Then the homomorphism $L \rightarrow gc V$ is given by $a \mapsto \sum f_i \otimes g_i \otimes A_i$. This follows from (4.6) and the proof of Proposition 4.1.

Example 4.2. (i) The action (3.2) of $W(\mathfrak{d})$ on $H$ gives an embedding of Lie pseudoalgebras $W(\mathfrak{d}) \hookrightarrow gc H = H \otimes H$, $f \otimes a \mapsto -f \otimes a$ ($f \in H$, $a \in \mathfrak{d} \subset H$).

(ii) Consider the semidirect sum $H \rtimes W(\mathfrak{d})$, where $H$ is regarded as a commutative Lie pseudoalgebra and $W(\mathfrak{d})$ acts on $H$ via (3.2). Then we have an embedding $H \rtimes W(\mathfrak{d}) \hookrightarrow gc H$ given by $g + f \otimes a \mapsto g \otimes 1 - f \otimes a$ for $f, g \in H$, $a \in \mathfrak{d} \subset H$.

Remark 4.3. For any Lie algebra $\mathfrak{g}$, we have a semidirect sum $\text{Cur} \mathfrak{g} \rtimes W(\mathfrak{d})$, where $\text{Cur} \mathfrak{g}$ is defined in Example 2.2 and $W(\mathfrak{d})$ acts on $\text{Cur} \mathfrak{g} = H \otimes \mathfrak{g}$ via

$$(f \otimes a) \ast (g \otimes B) = -(g \otimes ga) \otimes_H (1 \otimes B), \quad f, g \in H, \ a \in \mathfrak{d}, \ B \in \mathfrak{g}.$$ 

Let $V_0$ be a finite-dimensional $\mathfrak{g}$-module, and let $\rho$ be the corresponding homomorphism $\mathfrak{g} \rightarrow \mathfrak{gl}V_0$. Then we have a homomorphism of Lie pseudoalgebras $\text{Cur} \mathfrak{g} \rtimes W(\mathfrak{d}) \rightarrow gc(H \otimes V_0)$, given by

$$g \otimes B + f \otimes a \mapsto g \otimes 1 \otimes \rho(B) - f \otimes a \otimes \text{Id}.$$ 

4.2. Duals and Twistings of Representations. Let $L$ be a Lie $H$-pseudoalgebra, and let $\Pi$ be any finite-dimensional $\mathfrak{d}$-module. We consider $\Pi$ as an $L$-module equipped with the trivial action of $L$ and with the action of $H = U(\mathfrak{d})$ induced from the action of $\mathfrak{d}$. In particular, $k$ has the trivial action of both $L$ and $H$.

Lemma 4.1 ([BDK]). Let $L$ be a Lie pseudoalgebra, and let $V, W$ be finite $L$-modules. Then the formula $(a \in L, \ v \in V, \ \phi \in \text{Chom}(V, W))$

$$(a \ast \phi) \ast v = a \ast (\phi \ast v) - ((\sigma \otimes \text{id}) \otimes_H \text{id}) (\phi \ast (a \ast v))$$

provides $\text{Chom}(V, W)$ with the structure of an $L$-module.

Note that if $\beta : V' \rightarrow V$ and $\gamma : W \rightarrow W'$ are homomorphisms of $L$-modules, the map (4.3) is a homomorphism of $L$-modules.

Definition 4.2. (i) For any finite $L$-module $V$, the $L$-module $D(V) = \text{Chom}(V, k)$ is called the dual of $V$. If $\beta : V' \rightarrow V$ is a homomorphism of $L$-modules, we define a homomorphism $D(\beta) : D(V) \rightarrow D(V')$ as $D(\beta) = \text{Chom}(\beta, \text{id})$ (see Remark 4.1). Then $D$ is a contravariant functor from the category of finite $L$-modules to itself.

(ii) For any finite $L$-module $V$ and any finite-dimensional $\mathfrak{d}$-module $\Pi$, the $L$-module $T_\Pi(V) = \text{Chom}(D(V), \Pi)$ is called the twisting of $V$ by $\Pi$. If $\beta : V \rightarrow V'$ is a homomorphism of $L$-modules, we define a homomorphism $T_\Pi(\beta) : T_\Pi(V) \rightarrow T_\Pi(V')$ as $T_\Pi(\beta) = \text{Chom}(D(\beta), \text{id})$. Then $T_\Pi$ is a covariant functor from the category of finite $L$-modules to itself.

Now let $V$ be a free $H$-module of finite rank, $V = H \otimes V_0$, where $H$ acts by left multiplication on the first factor and $\dim V_0 < \infty$. Then for any $H$-module $W$ we can identify $\text{Chom}(V, W)$ with $H \otimes (W \otimes V_0')$, where $H$ acts on the first factor. Explicitly, by Lemma 2.1(ii), for any fixed $v \in V_0$, we can write

$$\phi(1 \otimes v) = \sum (h_i \otimes 1) \otimes_H w_i,$$
where \( h_i \in H, w_i \in W \). Then \( \phi \) corresponds to the \( k \)-linear map \( V_0 \to H \otimes W, v \mapsto \sum h_i \otimes w_i \).

In particular, we have isomorphisms \( D(V) \simeq H \otimes V_0^* \) and \( T_\Pi(V) \simeq H \otimes (\Pi \otimes V_0) \) as \( H \)-modules. Now we will describe the action of \( L \) on them.

**Proposition 4.2.** Let \( V = H \otimes V_0 \) be a finite \( L \)-module, which is free as an \( H \)-module. Let \( \{ v_i \} \) be a \( k \)-basis of \( V_0 \), and let \( \{ \psi_i \} \) be the dual basis of \( V_0^* \), so that \( \psi_i(v_j) = \delta_{ij} \). For a fixed \( a \in L \), write

\[
(4.12) \quad a \ast (1 \otimes v_i) = \sum_j (f_{ij} \otimes g_{ij}) \otimes_H (1 \otimes v_j)
\]

where \( f_{ij}, g_{ij} \in H \). Then the action of \( L \) on \( D(V) \simeq H \otimes V_0^* \) is given by

\[
(4.13) \quad a \ast (1 \otimes \psi_k) = -\sum_j (f_{jk}g_{jk(-1)} \otimes g_{jk(-2)}) \otimes_H (1 \otimes \psi_j) .
\]

The action of \( L \) on \( T_\Pi(V) \simeq H \otimes (\Pi \otimes V_0) \) is given by

\[
(4.14) \quad a \ast (1 \otimes u \otimes v_i) = \sum_j (f_{ij} \otimes g_{ij(1)}) \otimes_H (1 \otimes g_{ij(-2)}u \otimes v_j) .
\]

Both (4.13) and (4.14) can be easily derived from the following lemma.

**Lemma 4.2.** Under the assumptions of Proposition 4.2, the action of \( L \) on \( \text{Chom}(V, \Pi) \simeq H \otimes (\Pi \otimes V_0^*) \) is given by

\[
(4.15) \quad a \ast (1 \otimes u \otimes \psi_k) = -\sum_j (f_{jk}g_{jk(-1)} \otimes g_{jk(-2)}) \otimes_H (1 \otimes g_{jk(3)}u \otimes \psi_j) .
\]

**Proof.** First, note that by (4.11), we have

\[
(4.16) \quad (1 \otimes u \otimes \psi_k) \ast (1 \otimes v_i) = (1 \otimes 1) \otimes_H \delta_{ki}u .
\]

We will compute \((a \ast (1 \otimes u \otimes \psi_k)) \ast (1 \otimes v_i)\) using (4.10). The first term in the right-hand side of (4.10) vanishes because the action of \( L \) on \( \Pi \) is trivial. By (2.25), (4.12) and (4.16), the second term is equal to

\[
-((\sigma \otimes \text{id}) \otimes_H \text{id}) ((1 \otimes u \otimes \psi_k) \ast (a \ast (1 \otimes v_i)))
\]

\[
= -\sum_j (\sigma \otimes \text{id}) (1 \otimes f_{ij} \otimes g_{ij}) \otimes_H \delta_{ki}u
\]

\[
= -(f_{ik} \otimes 1 \otimes g_{ik}) \otimes_H u
\]

\[
= -(f_{ik}g_{ik(-1)} \otimes g_{ik(-2)} \otimes 1) \otimes_H g_{ik(3)}u ,
\]

where we used (2.7) in the last equality. We will obtain the same result if we apply the right-hand side of (4.15) to \( 1 \otimes v_i \) and use (2.24) and (4.16).

**Example 4.3.** Consider \( H \) as a \( W(\mathfrak{d}) \)-module via (3.2). Then \( T_\Pi(H) = H \otimes \Pi \) with the following action of \( W(\mathfrak{d}) \):

\[
(4.17) \quad (1 \otimes a) \ast (1 \otimes u) = (1 \otimes 1) \otimes_H (1 \otimes au) - (1 \otimes a) \otimes_H (1 \otimes u)
\]

for \( a \in \mathfrak{d}, u \in \Pi \).

**Remark 4.4.** There is an embedding of Lie pseudoalgebras

\[
(4.18) \quad W(\mathfrak{d}) \hookrightarrow \text{Cur} \otimes W(\mathfrak{d}) , \quad 1 \otimes a \mapsto 1 \otimes a + 1 \otimes a .
\]
where the first summand is in $\text{Cur} \mathfrak{d} = H \otimes \mathfrak{d}$, and the second one is in $W(\mathfrak{d}) = H \otimes \mathfrak{d}$. By Remark 4.3, the representation of $\mathfrak{d}$ on $\Pi$ gives rise to a homomorphism $\text{Cur} \mathfrak{d} \times W(\mathfrak{d}) \rightarrow \text{gc}(H \otimes \Pi)$. Composing (4.9) with (4.18), we obtain a homomorphism $W(\mathfrak{d}) \rightarrow \text{gc}(H \otimes \Pi)$, which corresponds to the $W(\mathfrak{d})$-module $T_\Pi(H)$ from Example 4.3 (see Remark 4.2).

Next, we will describe explicitly the homomorphisms $D(\beta)$ and $T_\Pi(\beta)$ from Definition 4.2.

**Proposition 4.3.** Let $V = H \otimes V_0$ and $V' = H \otimes V'_0$ be finite free $H$-modules. Let $\{v_i\}$ (respectively $\{v'_i\}$) be a $k$-basis of $V_0$ (respectively $V'_0$), and let $\{\psi_i\}$ (respectively $\{\psi'_i\}$) be the dual basis of $V_0^*$ (respectively $(V'_0)^*$). For a homomorphism of $H$-modules $\beta: V \rightarrow V'$, write
\begin{equation}
\beta(1 \otimes v_i) = \sum_j h_{ij} \otimes v'_j
\end{equation}
where $h_{ij} \in H$. Then we have:
\begin{equation}
D(\beta)(1 \otimes \psi'_k) = \sum_j S(h_{jk}) \otimes \psi_j
\end{equation}
and
\begin{equation}
T_\Pi(\beta)(1 \otimes u \otimes v_i) = \sum_j h_{ij(1)} \otimes h_{ij(-2)} u \otimes v'_j.
\end{equation}

By linearity, Proposition 4.3 follows from the following special case, which we formulate as a lemma for future reference.

**Lemma 4.3.** Let $V = H \otimes V_0$ and $V' = H \otimes V'_0$ be finite free $H$-modules. For fixed $h \in H$, $B \in \text{Hom}_k(V_0, V'_0)$, consider the homomorphism of $H$-modules $\beta: V \rightarrow V'$ given by
\begin{equation}
\beta(1 \otimes v) = h \otimes Bv, \quad v \in V_0.
\end{equation}
Then we have:
\begin{equation}
D(\beta)(1 \otimes \psi') = S(h) \otimes (\psi' \circ B), \quad \psi' \in (V'_0)^* = \text{Hom}_k(V'_0, k)
\end{equation}
and
\begin{equation}
T_\Pi(\beta)(1 \otimes u \otimes v) = h(1) \otimes h(-2) u \otimes Bv, \quad u \in \Pi, \quad v \in V_0.
\end{equation}

**Proof.** The proof is straightforward from definition, and it is left to the reader. \qed

4.3. **Tensor Modules for $W(\mathfrak{d})$.** The adjoint representation of $W(\mathfrak{d}) = H \otimes \mathfrak{d}$ gives rise to the following homomorphism of Lie pseudoalgebras $W(\mathfrak{d}) \rightarrow \text{gc}(H \otimes \mathfrak{d})$ (see (3.1) and Remark 4.2):
\begin{equation}
1 \otimes a \mapsto 1 \otimes 1 \otimes \text{ad} a - 1 \otimes a \otimes \text{Id} + \varepsilon_a,
\end{equation}
where the pseudolinear map $\varepsilon_a$ is given by
\begin{equation}
\varepsilon_a(g \otimes b) = (b \otimes g) \otimes_H (1 \otimes a), \quad g \in H, \quad b \in \mathfrak{d}.
\end{equation}
In (4.25) we have identified $\text{gc}(H \otimes \mathfrak{d})$ with $H \otimes H \otimes \text{End} \mathfrak{d}$; in this identification

\begin{equation}
\varepsilon_{\partial_i} = \sum_{j=1}^{N} \partial_j \otimes 1 \otimes e_i^j,
\end{equation}

where \( \{\partial_i\}_{i=1,\ldots,N} \) is a basis of \( \mathfrak{d} \) and \( e_i^j(\partial_k) = \delta_i^j \partial_k \).

**Lemma 4.4.** The map

\begin{equation}
1 \otimes \partial_i \mapsto \left( 1 \otimes \text{ad} \partial_i + \sum_{j=1}^{N} \partial_j \otimes e_i^j \right) + 1 \otimes \partial_i
\end{equation}

is an embedding of Lie pseudoalgebras $W(\mathfrak{d}) \hookrightarrow (\text{Cur} \mathfrak{g} \mathfrak{l}(\mathfrak{d}) \times W(\mathfrak{d}))$.

**Proof.** The image of $W(\mathfrak{d})$ under the embedding (4.25) is contained in $H \otimes k \otimes \text{End} \mathfrak{d} + H \otimes \mathfrak{d} \otimes \text{id} \subset H \otimes H \otimes \text{End} \mathfrak{d}$, which is isomorphic to $(\text{Cur} \mathfrak{g} \mathfrak{l}(\mathfrak{d}) \times W(\mathfrak{d}))$ by Remark 4.3. □

By Remark 4.3, for any finite-dimensional $\mathfrak{g} \mathfrak{l} \mathfrak{d}$-module $V_0$, we have a homomorphism of Lie pseudoalgebras $(\text{Cur} \mathfrak{g} \mathfrak{l}(\mathfrak{d}) \times W(\mathfrak{d})) \to \text{gc}(\mathfrak{d})$, where $V = H \otimes V_0$. After composing it with the embedding from Lemma 4.4, we obtain a homomorphism $W(\mathfrak{d}) \to \text{gc}V$, i.e., a representation of $W(\mathfrak{d})$ on $V$. Explicitly, the action of $W(\mathfrak{d})$ on $V$ is given by:

\begin{equation}
(1 \otimes \partial_i) \ast (1 \otimes v) = (1 \otimes 1) \otimes_H (1 \otimes \text{ad} \partial_i)v + \sum_{j=1}^{N} (\partial_j \otimes 1) \otimes_H (1 \otimes e_i^j v)
\end{equation}

\begin{equation}
- (1 \otimes \partial_i) \otimes_H (1 \otimes v),
\end{equation}

Now let \( \Pi \) be any finite-dimensional \( \mathfrak{d} \)-module. The twisting of $V$ by \( \Pi \) is $T_{\Pi}(V) = H \otimes (\Pi \otimes V_0)$ with the following action of $W(\mathfrak{d})$ (see Proposition 4.2):

\begin{equation}
(1 \otimes \partial_i) \ast (1 \otimes w) = (1 \otimes 1) \otimes_H (1 \otimes \text{ad} \partial_i)w + \sum_{j=1}^{N} (\partial_j \otimes 1) \otimes_H (1 \otimes e_i^j w)
\end{equation}

\begin{equation}
- (1 \otimes \partial_i) \otimes_H (1 \otimes w) + (1 \otimes 1) \otimes_H (1 \otimes \partial_i w)
\end{equation}

for $w \in \Pi \otimes V_0$, where $\mathfrak{d}$ acts on the factor $\Pi$ and $\mathfrak{g} \mathfrak{l} \mathfrak{d}$ acts on $V_0$.

**Definition 4.3.** Let \( \mathfrak{g}_1 \) and \( \mathfrak{g}_2 \) be Lie algebras, and let $U_i$ be a \( \mathfrak{g}_i \)-module \( (i = 1, 2) \). Then we will denote by $U_1 \boxtimes U_2$ the \( (\mathfrak{g}_1 \oplus \mathfrak{g}_2) \)-module $U_1 \otimes U_2$, where $\mathfrak{g}_1$ acts on the first factor and $\mathfrak{g}_2$ acts on the second one.

The above formulas (4.29), (4.30) motivate the introduction of an important class of $W(\mathfrak{d})$-modules.

**Definition 4.4.** (i) Let $W_0$ be a finite-dimensional $(\mathfrak{d} \oplus \mathfrak{g} \mathfrak{l}(\mathfrak{d}))$-module. The $W(\mathfrak{d})$-module $H \otimes W_0$, with the action of $W(\mathfrak{d})$ given by (4.30) for $w \in W_0$, is called a tensor module and is denoted as $T(W_0)$.

(ii) Let $W_0 = \Pi \boxtimes V_0$, where \( \Pi \) is a finite-dimensional \( \mathfrak{d} \)-module and $V_0$ is a finite-dimensional $\mathfrak{g} \mathfrak{l} \mathfrak{d}$-module. Then the tensor module $T(W_0)$ will also be denoted as $T(\Pi, V_0)$.

(iii) Occasionally, we will denote $T(\Pi, V_0)$ also by $T(\Pi, V_0, c)$, where $V_0$ is viewed as a module over $\mathfrak{sl} \mathfrak{d} \subset \mathfrak{g} \mathfrak{l} \mathfrak{d}$, and $c \in k$ denotes the scalar action of Id $\in \mathfrak{g} \mathfrak{l} \mathfrak{d}$ on $V_0$. 

In (4.25) we have identified $\text{gc}(H \otimes \mathfrak{d})$ with $H \otimes H \otimes \text{End} \mathfrak{d}$; in this identification

\begin{equation}
\varepsilon_{\partial_i} = \sum_{j=1}^{N} \partial_j \otimes 1 \otimes e_i^j,
\end{equation}

where \( \{\partial_i\}_{i=1,\ldots,N} \) is a basis of \( \mathfrak{d} \) and \( e_i^j(\partial_k) = \delta_i^j \partial_k \).
Remark 4.5. By definition, we have $T(\Pi, V_0) = T(\Pi(T(k, V_0))$.

Remark 4.6. Combining the embeddings (4.18) and (4.28), we get an embedding of Lie pseudoalgebras $W(\mathfrak{d}) \hookrightarrow \text{Cur}(\mathfrak{d} \oplus \mathfrak{gl}(\mathfrak{d}) \rtimes \mathfrak{d})$.

(4.31) 
$$1 \otimes \partial_i \mapsto \left(1 \otimes \partial_i + 1 \otimes \text{ad} \partial_i + \sum_{j=1}^{N} \partial_j \otimes e_j^i\right) + 1 \otimes \partial_i .$$

Given a $(\mathfrak{d} \oplus \mathfrak{gl}(\mathfrak{d}))$-module $W_0$, the $W(\mathfrak{d})$-module obtained from it by Remark 4.3 is exactly the tensor module $T(W_0) = H \otimes W_0$ corresponding to $W_0$.

5. Tensor Modules of de Rham Type

Throughout this section, $\mathfrak{d}$ will be an $N$-dimensional Lie algebra. We fix a basis $\{\partial_i\}_{i=1}^{N}$ of $\mathfrak{d}$ with structure constants $c^k_{ij}$: $[\partial_i, \partial_j] = \sum c^k_{ij} \partial_k$. Define elements $e_j^i \in \mathfrak{gl}(\mathfrak{d})$ by $e_j^i(\partial_k) = \delta^i_k \partial_j$.

5.1. Forms with Constant Coefficients. The material in this subsection is completely standard; our purpose is just to fix the notation. For $0 \leq n \leq N$, let

(5.1) 
$$\Omega^n = \bigwedge^n \mathfrak{d}^* , \quad \Omega = \bigwedge^\bullet \mathfrak{d}^* = \bigoplus_{n=0}^{N} \Omega^n .$$

Set $\Omega^0 = \{0\}$ if $n < 0$ or $n > N$. We will think of the elements of $\Omega^n$ as skew-symmetric $n$-forms, i.e., linear maps from $\bigwedge^n \mathfrak{d}$ to $k$.

Consider the cohomology complex of $\mathfrak{d}$ with trivial coefficients,

(5.2) 
$$0 \rightarrow \Omega^0 \xrightarrow{d_0} \Omega^1 \xrightarrow{d_0} \cdots \xrightarrow{d_0} \Omega^N ,$$

where the differential $d_0$ is given by the formula $(\alpha \in \Omega^n, a_i \in \mathfrak{d})$:

(5.3) 
$$(d_0 \alpha)(a_1 \wedge \cdots \wedge a_{n+1}) = \sum_{i<j} (-1)^{i+j} \alpha([a_i, a_j] \wedge a_1 \wedge \cdots \wedge \widehat{a_i} \wedge \cdots \wedge \widehat{a_j} \wedge \cdots \wedge a_{n+1})$$

if $n \geq 1$, and $d_0 \alpha = 0$ for $\alpha \in \Omega^0 = k$. Here a hat over $a_i$ means that the term $a_i$ is omitted in the wedge product.

For $a \in \mathfrak{d}$, define operators $\iota_a : \Omega^n \rightarrow \Omega^{n-1}$ by

(5.4) 
$$\iota_a(\alpha)(a_1 \wedge \cdots \wedge a_{n-1}) = \alpha(a \wedge a_1 \wedge \cdots \wedge a_{n-1}) , \quad a_i \in \mathfrak{d} .$$

For $A \in \mathfrak{gl}(\mathfrak{d})$, denote by $A \cdot$ its action on $\Omega$; explicitly,

(5.5) 
$$(A \cdot \alpha)(a_1 \wedge \cdots \wedge a_n) = \sum_{i=1}^{n} (-1)^{i} \alpha(Aa_i \wedge a_1 \wedge \cdots \wedge \widehat{a_i} \wedge \cdots \wedge a_n) .$$

Then we have the following Cartan formula for the coadjoint action of $\mathfrak{d}$:

(5.6) 
$$(\text{ad} a) = d_0 \iota_a + \iota_a d_0 .$$

This, together with $d_0^2 = 0$, implies that $(\text{ad} a)\cdot$ commutes with $d_0$. 
5.2. **Pseudo de Rham Complex.** Following [BDK, Section 8.3], we define the spaces of pseudoforms $\Omega^p(\mathfrak{g}) = H \otimes \Omega^p$ and $\Omega(\mathfrak{g}) = H \otimes \mathbb{N}^\mathfrak{g} = \bigoplus_{n=0}^\infty \Omega^n(\mathfrak{g})$. They are considered as $H$-modules, where $H$ acts on the first factor by left multiplication. We can identify $\Omega^p(\mathfrak{g})$ with the space of linear maps from $\bigwedge^n \mathfrak{g}$ to $H$, and $H^{\otimes 2} \otimes H \Omega^n(\mathfrak{g})$ with $\text{Hom}(\bigwedge^n \mathfrak{g}, H^{\otimes 2})$. Note that $\Omega^n(\mathfrak{g}) = \{0\}$ if $n < 0$ or $n > N$.

Let us consider $H = U(\mathfrak{g})$ as a left $\mathfrak{g}$-module with respect to the action $a \cdot h = -ha$, where $ha$ is the product of $a \in \mathfrak{g} \subset H$ and $h \in H$ in $H$. Consider the cohomology complex of $\mathfrak{g}$ with coefficients in $H$:

\begin{equation}
(5.7)
0 \to \Omega^0(\mathfrak{g}) \xrightarrow{d} \Omega^1(\mathfrak{g}) \xrightarrow{d} \cdots \xrightarrow{d} \Omega^N(\mathfrak{g}).
\end{equation}

Explicitly, the differential $d$ is given by the formula ($\alpha \in \Omega^n(\mathfrak{g})$, $a_i \in \mathfrak{g}$):

\begin{equation}
(5.8)
(d\alpha)(a_1 \wedge \cdots \wedge a_{n+1}) = \sum_{i<j} (-1)^{i+j} \alpha([a_i, a_j] \wedge a_1 \wedge \cdots \wedge \widehat{a_i} \wedge \cdots \wedge \widehat{a_j} \wedge \cdots \wedge a_{n+1}) + \sum_i (-1)^i \alpha(a_1 \wedge \cdots \wedge \widehat{a_i} \wedge \cdots \wedge a_{n+1}) a_i \quad \text{if } n \geq 1,
\end{equation}

\begin{equation}
(d\alpha)(a_1) = -aa_1 \quad \text{if } \alpha \in \Omega^0(\mathfrak{g}) = H,
\end{equation}

where a hat over $a_i$ means that the term $a_i$ is omitted. Notice that $d$ is $H$-linear.

**Proposition 5.1 ([BDK]).** The $n$-th cohomology of the complex $(\Omega(\mathfrak{g}), d)$ is trivial for $n \neq N = \dim \mathfrak{g}$ and 1-dimensional for $n = N$. In particular, the sequence (5.7) is exact.

**Proof.** By Poincaré duality $H^n(\mathfrak{g}, U(\mathfrak{g})) \simeq H^{N-n}(\mathfrak{g}, U(\mathfrak{g})^*)$. But $H^n(\mathfrak{g}, U(\mathfrak{g})^*) \simeq H_{n}(\mathfrak{g}, U(\mathfrak{g}))^*$ is trivial for $n > 0$ and 1-dimensional for $n = 0$; see, e.g., [F]. \qed

**Definition 5.1.** The sequence (5.7) is called the *pseudo de Rham complex*.

The following lemma provides another formula for the differential (5.8), which will be useful later.

**Lemma 5.1.** For every $\alpha \in \Omega^n$, $n \geq 0$, and $i = 1, \ldots, N$, consider the element $1 \otimes \iota_{\partial_i} \alpha \in \Omega^{n-1}(\mathfrak{g})$. Then we have:

\begin{equation}
(5.9)
d(1 \otimes \iota_{\partial_i} \alpha) = \sum_{k=1}^N \partial_k \otimes c^k_i \alpha - \sum_{j,k,l=1}^N 1 \otimes c^j_k e^l_i \alpha - \sum_{k,l=1}^N 1 \otimes c^k_l e^l_i \alpha,
\end{equation}

where the action of $\mathfrak{gl}(\mathfrak{g})$ on $\Omega^n$ is given by (5.5).

**Proof.** For $n = 0$, both sides of (5.9) are trivial; so we can assume that $n \geq 1$. Denote the three terms in the right-hand side of (5.9) by $\beta_1$, $\beta_2$, $\beta_3$. Using (5.5), we compute for $1 \leq i_1 < \cdots < i_n \leq N$:

$$
\beta_1(\partial_{i_1} \wedge \cdots \wedge \partial_{i_n}) = \sum_{k=1}^n \sum_{r=1}^n \partial_k \otimes (-1)^r \delta^k_{i_r} \alpha(\partial_{i_1} \wedge \cdots \wedge \widehat{\partial_{i_r}} \wedge \cdots \wedge \partial_{i_n})
$$
\[
\beta_2(\partial_{i_1} \wedge \cdots \wedge \partial_{i_n}) = \sum_{j,k,l=1}^{N} \sum_{k<l}^{n} 1 \otimes (-1)^{r+s+1} \delta^k_r \delta^l_s c_{kl}^i \alpha(\partial_i \wedge \partial_j \wedge \partial_{i_1} \wedge \cdots \\
\wedge \partial_{i_r} \wedge \cdots \wedge \partial_{i_s} \wedge \cdots \wedge \partial_{i_n}) \\
+ \sum_{j,k,l=1}^{N} \sum_{k<l}^{n} 1 \otimes (-1)^{r+s+1} \delta^k_r \delta^l_s c_{kl}^i \alpha(\partial_i \wedge \partial_{i_1} \wedge \cdots \wedge \partial_{i_s} \wedge \cdots \wedge \partial_{i_n}).
\]

Similarly,
\[
\beta_3(\partial_{i_1} \wedge \cdots \wedge \partial_{i_n}) = \sum_{j,k,l=1}^{N} \sum_{k<l}^{n} 1 \otimes (-1)^s \delta^l_s c_{kl}^i \alpha(\partial_i \wedge \partial_{i_1} \wedge \cdots \wedge \partial_{i_s} \wedge \cdots \wedge \partial_{i_n}).
\]

These formulas, together with (5.8), (5.4) and the equation
\[
\sum_{j,k,l=1}^{N} \delta^k_r \delta^l_s c_{kl}^i \partial_j = [\partial_{i_r}, \partial_{i_s}], \quad r < s, \quad i_r < i_s,
\]

imply that \(d(1 \otimes \partial \alpha) = \beta_1 - \beta_2 - \beta_3. \)

Next, we introduce \(H\)-bilinear maps
\[
(5.10) \quad *_1 : W(\mathfrak{d}) \otimes \Omega^0(\mathfrak{d}) \rightarrow H^\otimes 2 \otimes_H \Omega^{n-1}(\mathfrak{d}),
\]
\[
(5.11) \quad * : W(\mathfrak{d}) \otimes \Omega^n(\mathfrak{d}) \rightarrow H^\otimes 2 \otimes_H \Omega^n(\mathfrak{d}),
\]

by the formulas:
\[
(5.12) \quad (f \otimes \alpha) * (g \otimes \alpha) = (f \otimes g) \otimes_H \iota_0 \alpha,
\]
\[
(5.13) \quad w * \gamma = ((id \otimes id) \otimes_H \partial)(w *_{\iota_0} \gamma) + w *_{\iota_0} (d \gamma),
\]

for \(w = f \otimes a \in W(\mathfrak{d}), \gamma = g \otimes \alpha \in \Omega^n(\mathfrak{d})\). Eq. (5.13) is an analog of Cartan’s formula (5.6). Explicitly, we have (see [BDK, Eq. (8.7)]):
\[
(w * \gamma)(a_1 \wedge \cdots \wedge a_n) = -(f \otimes ga) \alpha(a_1 \wedge \cdots \wedge a_n)
\]
\[
+ \sum_{i=1}^{n} (-1)^i (fa_i \otimes a) \alpha(a_1 \wedge \cdots \wedge \tilde{a}_i \wedge \cdots \wedge a_n)
\]
\[
+ \sum_{i=1}^{n} (-1)^i (f \otimes a) \alpha([a, a_i] \wedge a_1 \wedge \cdots \wedge \tilde{a}_i \wedge \cdots \wedge a_n) \in H^\otimes 2
\]

for \(n \geq 1\), and \(w * \gamma = -f \otimes ga\) for \(\gamma = g \in \Omega^0(\mathfrak{d}) = H\). Note that the latter coincides with the action (3.2) of \(W(\mathfrak{d})\) on \(H\).

**Theorem 5.1.** The maps (5.11) provide each \(\Omega^n(\mathfrak{d})\) with a structure of a tensor \(W(\mathfrak{d})\)-module corresponding to the \((\mathfrak{d} \otimes \mathfrak{gl}\mathfrak{d})\)-module \(k \otimes \Omega^n, \) i.e., \(\Omega^n(\mathfrak{d}) = \mathcal{F}(k, \Omega^n)\). The differential \(d: \Omega^n(\mathfrak{d}) \rightarrow \Omega^{n+1}(\mathfrak{d})\) is a homomorphism of \(W(\mathfrak{d})\)-modules.
Proof. Comparing (5.14) with (5.5), we obtain for \( \alpha \in \Omega^p \):

\[
(1 \otimes \partial_k) \ast (1 \otimes \alpha) = -(1 \otimes \partial_k) \otimes_H (1 \otimes \alpha) \\
+ \sum_{j=1}^{N} (\partial_j \otimes 1) \otimes_H (1 \otimes c^j_k \alpha) + (1 \otimes 1) \otimes_H (1 \otimes (\text{ad} \partial_k) \alpha).
\]

But this is exactly (4.29); hence, \( \Omega^p(\mathfrak{g}) = T(k, \Omega^\ast) \).

To prove that \( d \) is a homomorphism, we have to check that it satisfies (2.34). This follows from (5.13) and \( d^2 = 0 \). Indeed, replacing \( w \) with \( d \) in (5.13), we get

\[
(w \ast (d \gamma)) = ((\text{id} \otimes \text{id}) \otimes_H d)(w \ast d \gamma),
\]

while applying \((\text{id} \otimes \text{id}) \otimes_H d\) to both sides of (5.13) gives

\[
((\text{id} \otimes \text{id}) \otimes_H d)(w \ast \gamma) = ((\text{id} \otimes \text{id}) \otimes_H d)(w \ast d \gamma).
\]

This completes the proof.

5.3. Twisting of the Pseudo de Rham Complex. As before, let \( \Pi \) be a finite-dimensional \( \mathfrak{g} \)-module, which we consider as an \( H \)-module. We will apply the twisting functor \( T_\Pi \) (see Definition 4.2(ii)) to the pseudo de Rham complex (5.7). Note that, by Theorem 5.1 and Remark 4.5, we have \( T_\Pi(\Omega^p(\mathfrak{g})) = T(\Pi, \Omega^p(\mathfrak{g})) \). We obtain a complex of \( W(\mathfrak{g}) \)-modules

\[
0 \rightarrow T(\Pi, \Omega^0) \xrightarrow{d_1} T(\Pi, \Omega^1) \xrightarrow{d_2} \cdots \xrightarrow{d_n} T(\Pi, \Omega^N), \quad d_n \equiv T_\Pi(d),
\]

which we call the \( \Pi \)-twisted pseudo de Rham complex.

It follows from (5.8) and Proposition 4.3 that the complex (5.15) coincides with the cohomology complex of \( \mathfrak{g} \) with coefficients in \( H \otimes \Pi \) considered with the action

\[
a \cdot (h \otimes u) = -ha \otimes u + h \otimes au, \quad a \in \mathfrak{g}, \ h \in H, \ u \in \Pi.
\]

Lemma 5.2. The \( \mathfrak{g} \)-module \( H \otimes \Pi \), equipped with the action (5.16), is isomorphic to \( H \otimes \Pi \) with \( \mathfrak{g} \) acting only on \( H \) via

\[
a(h \otimes u) = -ha \otimes u, \quad a \in \mathfrak{g}, \ h \in H, \ u \in \Pi.
\]

In other words, \( H \otimes \Pi \) is isomorphic to a direct sum of \( \dim \Pi \) copies of the \( \mathfrak{g} \)-module \( H \).

Proof. Consider the linear map

\[
F: H \otimes \Pi \rightarrow H \otimes \Pi, \quad h \otimes u \mapsto h_{(1)} \otimes h_{(-2)} u.
\]

From (2.7) it is easy to see that \( F \) is a linear isomorphism and

\[
F^{-1}(h \otimes u) = h_{(1)} \otimes h_{(-2)} u
\]

(see [BDK, Section 2.3] for a similar argument). Using (2.6) and (2.13), we compute

\[
F(-ha \otimes u) = -(ha)_{(1)} \otimes (ha)_{(-2)} u
= -h_{(1)}a \otimes h_{(-2)} u + h_{(1)} \otimes ah_{(-2)} u = a \cdot F(h \otimes u).
\]

This shows that \( F \) is an isomorphism of the corresponding \( \mathfrak{g} \)-modules.

Now Proposition 5.1 and Lemma 5.2 immediately imply:

**Proposition 5.2.** The sequence (5.15) is exact. The image of \( d_\Pi \) in \( T(\Pi, \Omega^N) \) has codimension \( \dim \Pi \).
Finally, let us give a formula for the differential $d_{\Pi}$, which is similar to (5.9).

**Lemma 5.3.** For every $\alpha \in \Omega^n$, $n \geq 0$, $u \in \Pi$, and $i = 1, \ldots, N$, we have:

\[
d_{\Pi}(1 \otimes u \otimes \iota_{\partial_i} \alpha) = \sum_{k=1}^{N} \partial_k \otimes u \otimes e_i^k \alpha - \sum_{k=1}^{N} 1 \otimes \partial_k u \otimes e_i^k \alpha - \sum_{j,k \leq 1, k < l} 1 \otimes u \otimes c_{kl}^j e_i^k e_j^l \alpha,\]

(5.17)

where the action of $\mathfrak{gl}\mathfrak{d}$ on $\Omega^n$ is given by (5.5).

**Proof.** For a fixed $i$, extend by $H$-linearity the map $\iota_{\partial_i}$ to a map from $\Omega^n(\mathfrak{d})$ to $\Omega^n(\mathfrak{d})$. Note that, by Proposition 4.3 (or Lemma 4.3), we have

\[
(T_{\Pi}(\iota_{\partial_i}))(1 \otimes u \otimes \alpha) = 1 \otimes u \otimes \iota_{\partial_i} \alpha.
\]

Consider the $H$-linear map $\mathfrak{d} \circ \iota_{\partial_i} : \Omega^n(\mathfrak{d}) \to \Omega^n(\mathfrak{d})$. This map sends $1 \otimes \alpha$ to the right-hand side of (5.9). Hence, by Proposition 4.3, $(T_{\Pi}(\mathfrak{d} \circ \iota_{\partial_i}))(1 \otimes u \otimes \alpha)$ is given by the right-hand side of (5.17). On the other hand, we have

\[
T_{\Pi}(\mathfrak{d} \circ \iota_{\partial_i}) = T_{\Pi}(\mathfrak{d}) \circ T_{\Pi}(\iota_{\partial_i}),
\]

which gives $d_{\Pi}(1 \otimes u \otimes \iota_{\partial_i} \alpha)$ when applied to $1 \otimes u \otimes \alpha$. □

6. Classification of Irreducible Finite $W(\mathfrak{d})$-Modules

In this section we provide a complete classification of all irreducible finite $W(\mathfrak{d})$-modules. Our main result is Theorem 6.6.

### 6.1. Singular Vectors and Tensor Modules

Recall that the annihilation algebra $W$ of $W(\mathfrak{d})$ has a decreasing filtration $\{W_p\}_{p \geq -1}$ given by (3.8). For a $W$-module $V$, we denote by $\text{ker} V$ the set of all $v \in V$ that are killed by $W_p$. Then a $W$-module $V$ is conformal if $V = \bigcup \text{ker} V$. Recall also that the extended annihilation algebra is defined as $\widetilde{W} = \mathfrak{d} \ltimes W$, where $\mathfrak{d}$ acts on $W$ by (3.7). By Proposition 2.1, any $W(\mathfrak{d})$-module has a natural structure of a conformal $\widetilde{W}$-module and vice versa.

For every $p \geq 0$, the normalizer of $W_p$ in $\widetilde{W}$ is equal to $N_{\widetilde{W}}$ (see Definition 3.2 and Proposition 3.3). Therefore, each $\text{ker} W_p$ is an $N_{\widetilde{W}}$-module. In fact, $\text{ker} W_p$ is a module over the finite-dimensional Lie algebra $N_{\widetilde{W}}/W_p = \tilde{\mathfrak{d}} \ltimes (W_0/W_p)$. The Lie algebra $N_{\widetilde{W}}/W_1$ is isomorphic to the direct sum of Lie algebras $\mathfrak{d} \otimes \mathfrak{gl}\mathfrak{d}$.

**Definition 6.1.** For a $W(\mathfrak{d})$-module $V$, a **singular vector** is an element $v \in V$ such that $W_1 \cdot v = 0$. The space of singular vectors in $V$ will be denoted by $\text{sing} V$. We will denote by $\rho_{\text{sing}} : \mathfrak{d} \otimes \mathfrak{gl}\mathfrak{d} \to \mathfrak{gl} (\text{sing} V)$ the representation obtained from the $N_{\widetilde{W}}$-action on $\text{sing} V \equiv \text{ker} W_1$ via the isomorphism $N_{\widetilde{W}}/W_1 \cong \mathfrak{d} \otimes \mathfrak{gl}\mathfrak{d}$.

Recall that $\text{ker} V \equiv \text{ker} W_1$ is the space of all $v \in V$ such that $W_1 \cdot v = 0$. Then, obviously, $\text{ker} V \subset \text{sing} V$. Note also that $\text{ker} V = \{0\}$ when $V$ is irreducible.

**Theorem 6.1.** For any nontrivial finite $W(\mathfrak{d})$-module $V$, we have $\text{sing} V \neq \{0\}$ and the space $\text{sing} V/\text{ker} V$ is finite dimensional.

**Proof.** The second statement is a special case of Lemma 2.3. To show that $\text{sing} V \neq \{0\}$, we can assume without loss of generality that $\text{ker} V = \{0\}$. Since $V$ is a conformal $W$-module, $\text{ker} W_p \neq \{0\}$ for some $p \geq 1$. By Lemma 2.3, the space $\text{ker} W_p$ is finite dimensional. Let us choose a minimal $N_{\widetilde{W}}$-submodule $R$ of $\text{ker} W_p$. 

Then $R$ is an irreducible $\mathcal{W}_1$-module; hence, by Proposition 3.4, $\mathcal{W}_1$ acts trivially on $R$. This means that $R \subset \text{sing } V$. \hfill \Box

**Remark 6.1.** It follows from (3.8) and Proposition 2.1 that a vector $v \in V$ is singular if and only if

\[(6.1) \quad (1 \otimes \partial) \ast v \in (F^1 H \otimes \mathfrak{k}) \otimes_H V, \quad \partial \in \mathfrak{d},
\]

where $F^1 H = \mathfrak{k} \oplus \mathfrak{d}$. Similarly, by Lemma 2.1(ii), a vector $v \in V$ is singular if and only if

\[(6.2) \quad (1 \otimes \partial) \ast v \in (\mathfrak{k} \otimes F^1 H) \otimes_H V, \quad \partial \in \mathfrak{d}.
\]

As before, let $\{\partial_i\}_{i=1,...,N}$ be a basis of $\mathfrak{d}$, and let $x^j \in X$ be given by (2.19). We view $x^j$ as elements of $\mathfrak{d}^\ast$; then $\{x^j\}$ is a basis of $\mathfrak{d}^\ast$ dual to the basis $\{\partial_i\}$ of $\mathfrak{d}$. Let $e_i^j \in \mathfrak{g}(\mathfrak{d})$ be given by $e_i^j \partial_k = \delta_i^k \partial_j$; in other words, $e_i^j$ corresponds to $\partial_i \otimes x^j$ under the isomorphism $\mathfrak{g}(\mathfrak{d}) \simeq \mathfrak{d} \otimes \mathfrak{d}^\ast$.

Note that, by Definition 3.2 and Corollary 3.1, we have

\[(6.3) \quad \rho_{\text{sing}}(\partial) v = \tilde{\partial} \cdot v, \quad \rho_{\text{sing}}(e_i^j) v = -(x^j \otimes \partial_i) \cdot v, \quad \partial \in \mathfrak{d}, v \in \text{sing } V.
\]

**Lemma 6.1.** Let $V$ be a $W(\mathfrak{d})$-module. Then for every singular vector $v \in \text{sing } V$, the action of $W(\mathfrak{d})$ on $v$ is given by

\[(6.4) \quad (1 \otimes \partial_i) \ast v = \sum_{j=1}^N (\partial_j \otimes 1) \otimes_H \rho_{\text{sing}}(e_i^j) v - (1 \otimes 1) \otimes_H \partial_i v
\]

\[+ (1 \otimes 1) \otimes_H \rho_{\text{sing}}(\partial_i + \text{ad } \partial_i) v.
\]

**Proof.** Since $\mathcal{W}_1 \cdot v = 0$, it follows from Proposition 2.1 that for $\partial \in \mathfrak{d}$

\[(1 \otimes \partial) \ast v = (1 \otimes 1) \otimes_H (1 \otimes \partial) \cdot v - \sum_j (\partial_j \otimes 1) \otimes_H (x^j \otimes \partial) \cdot v,
\]

while Lemma 3.3 implies

\[\quad (\partial + 1 \otimes \partial - \tilde{\partial}) \cdot v = \rho_{\text{sing}}(\text{ad } \partial) v.
\]

Combining the above equations with (6.3) proves (6.4). \hfill \Box

**Corollary 6.1.** Let $V$ be a $W(\mathfrak{d})$-module and let $R$ be a nontrivial $(\mathfrak{d} \oplus \mathfrak{g}(\mathfrak{d}))$-submodule of $\text{sing } V$. Denote by $HR$ the $H$-submodule of $V$ generated by $R$. Then $HR$ is a $W(\mathfrak{d})$-submodule of $V$. In particular, if $V$ is irreducible, then $V = HR$.

**Proof.** It follows from (6.4) that $W(\mathfrak{d}) \ast R \subset (H \otimes H) \otimes_H HR$. Then, by $H$-bilinearity, $W(\mathfrak{d}) \ast HR \subset (H \otimes H) \otimes_H HR$, which means that $HR$ is a $W(\mathfrak{d})$-submodule of $V$.

Let $R$ be a finite-dimensional $(\mathfrak{d} \oplus \mathfrak{g}(\mathfrak{d}))$-module, with an action denoted as $\rho_R$. Let $V = H \otimes R$ be the free $H$-module generated by $R$, where $H$ acts by left multiplication on the first factor. We define a pseudoproduct

\[(6.5) \quad (1 \otimes \partial_i) \ast (1 \otimes u) = \sum_{j=1}^N (\partial_j \otimes 1) \otimes_H (1 \otimes \rho_R(e_i^j) u) - (1 \otimes 1) \otimes_H (\partial_i \otimes u)
\]

\[+ (1 \otimes 1) \otimes_H (1 \otimes \rho_R(\partial_i + \text{ad } \partial_i) u), \quad u \in R,
\]

and then extend it by $H$-bilinearity to a map $*: W(\mathfrak{d}) \otimes V \rightarrow (H \otimes H) \otimes_H V$. 

Lemma 6.2. Let $R$ be a finite-dimensional $(\mathfrak{d} \oplus \mathfrak{gl}(\mathfrak{d}))$-module with an action $\rho_R$. Then formula (6.5) defines a structure of a $W(\mathfrak{d})$-module on $V = H \otimes R$. We have $k \otimes R \subset \text{sing} \, V$ and

$$\rho_{\text{sing}}(A)(1 \otimes u) = 1 \otimes \rho_R(A)u, \quad A \in \mathfrak{d} \oplus \mathfrak{gl}(\mathfrak{d}), \ u \in R. \quad (6.6)$$

Proof. The fact that $V$ is a $W(\mathfrak{d})$-module can be proved by a straightforward computation, using (2.33) and (3.1). Instead, we will show that $V$ is a tensor module (see Definition 4.4). Let us compare (6.5) to (4.30), keeping in mind that, by definition,

$$(1 \otimes 1) \otimes_H (\partial_i \otimes u) = (\partial_i \otimes 1) \otimes_H (1 \otimes u) + (1 \otimes \partial_i) \otimes_H (1 \otimes u).$$

We see that $V = H \otimes R$ coincides with the tensor module $T(R)$, where $R$ is equipped with the following modified action of $\mathfrak{d} \oplus \mathfrak{gl}(\mathfrak{d})$:

$$\partial u = (\rho_R(\partial) + \text{tr}(\text{ad} \partial))u, \quad \partial \in \mathfrak{d}, \ u \in R, \quad (6.7)$$

$$Au = (\rho_R(A) - \text{tr} A)u, \quad A \in \mathfrak{gl}(\mathfrak{d}), \ u \in R. \quad (6.8)$$

The fact that $k \otimes R \subset \text{sing} \, V$ follows from Remark 6.1, and (6.6) follows from comparing (6.4) with (6.5). This completes the proof. □

Definition 6.2. (i) Let $R$ be a finite-dimensional $(\mathfrak{d} \oplus \mathfrak{gl}(\mathfrak{d}))$-module with an action $\rho_R$. Then the $W(\mathfrak{d})$-module $H \otimes R$, with the action of $W(\mathfrak{d})$ given by (6.5), will be denoted as $V(R)$.

(ii) Let $R = \Pi \otimes U$, where $\Pi$ is a finite-dimensional $\mathfrak{d}$-module and $U$ is a finite-dimensional $\mathfrak{gl}(\mathfrak{d})$-module. Then the module $V(R)$ will also be denoted as $V(\Pi, U)$.

Remark 6.2. If $R$ is a finite-dimensional $(\mathfrak{d} \oplus \mathfrak{gl}(\mathfrak{d}))$-module, we can define an action of $\mathcal{N}_V$ on it by letting $W_i$ act as zero. Then as a $\check{V}$-module, $V(R)$ is isomorphic to the induced module $\text{Ind}^\check{V}_{\mathcal{N}_V} R$. This follows from the fact that $\check{V} = \mathfrak{d} \oplus \mathcal{N}_V$ as a vector space (see Proposition 3.3).

For a Lie algebra $\mathfrak{g}$ and a trace form $\chi$ on $\mathfrak{g}$, we denote by $k_\chi$ the 1-dimensional $\mathfrak{g}$-module such that each $a \in \mathfrak{g}$ acts as the scalar $\chi(a)$. Then (6.7) and (6.8) are equivalent to:

$$V(R) = T(R \otimes (k_{\text{tr ad}} \boxtimes k_{-\text{tr}})), \quad T(R) = V(R \otimes (k_{-\text{tr ad}} \boxtimes k_{\text{tr}})) \quad (6.9)$$

This can also be written as follows (cf. Definition 4.4(iii)):

$$V(\Pi, U) = T(\Pi \otimes k_{\text{tr ad}} \boxtimes U \otimes k_{-\text{tr}}), \quad T(\Pi, U) = V(\Pi \otimes k_{-\text{tr ad}} \boxtimes U \otimes k_{\text{tr}}) \quad (6.10)$$

Theorem 6.2. Let $V$ be an irreducible finite $W(\mathfrak{d})$-module, and let $R$ be an irreducible $(\mathfrak{d} \oplus \mathfrak{gl}(\mathfrak{d}))$-submodule of $\text{sing} \, V$. Then $V$ is a homomorphic image of $V(R)$. In particular, every irreducible finite $W(\mathfrak{d})$-module is a quotient of a tensor module.

Proof. By Corollary 6.1, we have $V = HR$. Consider the natural projection

$$\pi: V(R) = H \otimes R \to HR = V, \quad h \otimes u \mapsto hu.$$ 

Note that $\pi$ is $H$-linear. Comparing (6.4) with (6.5), we see that

$$(\text{id} \otimes id) \otimes_H \pi((1 \otimes \partial_i) * (1 \otimes u)) = (1 \otimes \partial_i) * u, \quad i = 1, \ldots, N, \ u \in R. \quad (6.11)$$

By $H$-bilinearity, this leads to

$$(\text{id} \otimes id) \otimes_H \pi(a * v) = a * \pi(v), \quad a \in W(\mathfrak{d}), \ v \in V(R),$$

which means that $\pi$ is a homomorphism of $W(\mathfrak{d})$-modules (cf. (2.34)). □
6.2. Filtration of Tensor Modules. Let $\mathcal{V}(R)$ be a tensor $W(\mathfrak{d})$-module, as defined in Definition 6.2(i). Recall the canonical increasing filtration $\{F^p H\}$ of $H$ given by (2.16). We introduce an increasing filtration of $\mathcal{V}(R) = H \otimes R$ as follows:

\[(6.11) \quad F^p \mathcal{V}(R) = F^p H \otimes R, \quad p = -1, 0, \ldots .\]

Note that $F^{-1} \mathcal{V}(R) = \{0\}$, $F^0 \mathcal{V}(R) = k \otimes R$.

The associated graded space of $\mathcal{V}(R)$ is

\[(6.12) \quad \text{gr} \mathcal{V}(R) = \bigoplus_{p \geq 0} F^p \mathcal{V}(R), \quad \text{gr}^p \mathcal{V}(R) = (F^p H \otimes R)/(F^{p-1} H \otimes R).\]

We have isomorphisms of vector spaces:

\[(6.13) \quad \text{gr}^p \mathcal{V}(R) \simeq \text{gr}^p H \otimes R \simeq S^p \mathfrak{d} \otimes R,\]

where $S^p \mathfrak{d}$ is the $p$-th symmetric power of the vector space $\mathfrak{d}$.

Next, we study the action of the extended annihilation algebra $\overline{\mathcal{W}}$ on the filtration (6.11).

**Lemma 6.3.** For every $p \geq 0$, we have:

1. $\mathfrak{d} \cdot F^p \mathcal{V}(R) \subset F^{p+1} \mathcal{V}(R)$,
2. $\mathcal{N}_W \cdot F^p \mathcal{V}(R) \subset F^p \mathcal{V}(R)$,
3. $W_1 \cdot F^p \mathcal{V}(R) \subset F^{p-1} \mathcal{V}(R)$.

**Proof.** Part (i) is obvious from definitions, since

\[\partial \cdot (h \otimes u) = \partial h \otimes u, \quad \partial \in \mathfrak{d}, \ h \in H, \ u \in R.\]

We will prove parts (ii) and (iii) by induction on $p$. For $p = 0$, we have $F^0 \mathcal{V}(R) = k \otimes R \subset \text{sing} \mathcal{V}(R)$; hence, (ii) and (iii) hold by the definition of a singular vector. Now assume that (ii) is satisfied for some $p \geq 0$. Then it is enough to show that

\[A \cdot (\partial v) \in F^{p+1} \mathcal{V}(R) \quad \text{for all} \quad A \in \mathcal{N}_W, \ \partial \in \mathfrak{d}, \ v \in F^p \mathcal{V}(R).\]

Note that, since $\overline{\mathcal{W}} = \mathfrak{d} + \mathcal{N}_W$ (see Proposition 3.3), statements (i) and (ii) imply $\overline{\mathcal{W}} \cdot v \subset F^{p+1} \mathcal{V}(R)$. Then we have

\[A \cdot (\partial v) = \partial \cdot (A \cdot v) + [A, \partial] \cdot v \in \mathfrak{d} \cdot (\mathcal{N}_W \cdot v) + \overline{\mathcal{W}} \cdot v \subset F^{p+1} \mathcal{V}(R),\]

by part (i) and the inductive assumption. This proves (ii).

Similarly, assume that (iii) holds for some $p \geq 0$. Then we want to show that

\[B \cdot (\partial v) \in F^p \mathcal{V}(R) \quad \text{for all} \quad B \in W_1, \ \partial \in \mathfrak{d}, \ v \in F^p \mathcal{V}(R).\]

We have

\[B \cdot (\partial v) = \partial \cdot (B \cdot v) + [B, \partial] \cdot v \in \mathfrak{d} \cdot (W_1 \cdot v) + \mathcal{N}_W \cdot v \subset F^p \mathcal{V}(R),\]

by (i), (ii) and the inductive assumption, because $[B, \partial] \in W_0 \subset \mathcal{N}_W$. This completes the proof.

Lemma 6.3(ii) implies that the Lie algebra $\mathcal{N}_W$ acts on the associated graded space $\text{gr} \mathcal{V}(R)$. By Lemma 6.3(iii), the same is true for the Lie algebra $\mathcal{N}_W/W_1 = \mathfrak{d} \oplus (W_0/W_1) \simeq \mathfrak{d} \oplus \mathfrak{gl} \mathfrak{d}$. This action is described in the next two lemmas.

**Lemma 6.4.** For every $\partial \in \mathfrak{d}, \ h \in F^p H, \ u \in R$, we have

\[\partial \cdot (h \otimes u) = h \otimes R(\partial)u \mod F^{p-1} \mathcal{V}(R).\]
Proof. The proof is by induction on \( p \) and is similar to that of Lemma 6.3(ii). First, for \( p = 0 \), we have \( F^0 H = k \) and \( 1 \otimes u \in \text{sing} \mathcal{V}(R) \). Hence, \( \partial \cdot (1 \otimes u) = 1 \otimes \rho_R(\partial)u \) by (6.3), (6.6).

Now assume the statement holds for \( h \in F^p H \), and consider \( \partial' \) \( \otimes u \) for \( \partial' \in \mathfrak{d} \). Note that, by Proposition 3.2(i), we have: \( [\partial, \partial'] = [\partial, \partial' + \gamma(\partial')] = [\partial, \partial'] \in \mathfrak{d} \). From the inductive assumption, we get \( [\partial, \partial'] \cdot (h \otimes u) \in F^p \mathcal{V}(R) \). Therefore,

\[
\tilde{\partial} \cdot (\partial' h \otimes u) = \partial' \cdot (\tilde{\partial} \cdot (h \otimes u)) \mod F^p \mathcal{V}(R) = \partial' h \otimes \rho_R(\partial)u \mod F^p \mathcal{V}(R)
\]

by the inductive assumption. \( \square \)

**Lemma 6.5.** The action of \( \mathfrak{gl} \mathfrak{d} \simeq \mathcal{W}_0/\mathcal{W}_1 \) on the space \( \text{gr}^p \mathcal{V}(R) \simeq S^p \mathfrak{d} \otimes R \) is given by

\[
A \cdot (f \otimes u) = Af \otimes u + f \otimes \rho_R(A)u, \quad A \in \mathfrak{gl} \mathfrak{d}, \ f \in S^p \mathfrak{d}, \ u \in R,
\]

where \( Af \) is the standard action of \( \mathfrak{gl} \mathfrak{d} \) on \( S^p \mathfrak{d} \).

**Proof.** The proof uses the same argument as in Lemmas 6.3(ii) and 6.4, and the fact that via the isomorphisms \( \mathcal{W}_0/\mathcal{W}_1 \simeq \mathfrak{gl} \mathfrak{d} \) and \( W/\mathcal{W}_0 \simeq \mathfrak{d} \) the adjoint action \( [A, \partial] \) becomes the standard action of \( \mathfrak{gl} \mathfrak{d} \) on \( \mathfrak{d} \) (see Corollary 3.1). \( \square \)

When \( R = \Pi \otimes U \), the above two lemmas can be summarized as follows.

**Corollary 6.2.** We have \( \text{gr}^p \mathcal{V}(\Pi, U) \simeq \Pi \otimes (S^p \mathfrak{d} \otimes U) \) as \( (\mathfrak{d} \oplus \mathfrak{gl} \mathfrak{d}) \)-modules.

6.3. **Submodules of Tensor Modules.** Let \( \mathcal{T}(R) = H \otimes R \) be a tensor module (see Definition 4.4). We will assume that \( R \) is an irreducible finite-dimensional \( (\mathfrak{d} \oplus \mathfrak{gl} \mathfrak{d}) \)-module. Then \( R = \Pi \otimes U \), where \( \Pi \) (respectively \( U \)) is an irreducible finite-dimensional module over \( \mathfrak{d} \) (respectively \( \mathfrak{gl} \mathfrak{d} \)). In this case, \( \mathcal{T}(R) = \mathcal{T}(\Pi, U) \).

As usual, we fix a basis \( \{ \partial_i \} \) of \( \mathfrak{d} \). Recall that the action of \( 1 \otimes \partial_i \in W(\mathfrak{d}) \) on an element \( 1 \otimes u \in k \otimes R \subset \mathcal{T}(R) \) is given by (4.30). For us, it will be convenient to rewrite (4.30) as follows (making use of (2.13)):

\[
(1 \otimes \partial_i) \ast (1 \otimes u) = (1 \otimes 1) \otimes H (1 \otimes (\partial_i + \text{ad} \partial_i)u)
\]

\[
+ \sum_{j=1}^N (1 \otimes 1) \otimes H (\partial_j \otimes c^j_i u) - \sum_{j=1}^N (1 \otimes \partial_j) \otimes H (1 \otimes (c^j_i + \delta^j_i)u).
\]

(6.14)

Introduce the following notation:

\[
s(\partial_i, u) = \sum_{j=1}^N \partial_j \otimes c^j_i u, \quad u \in R, \ i = 1, \ldots, N.
\]

(6.15)

By linearity, we define \( s(\partial, u) \) for all \( \partial \in \mathfrak{d} \). Then \( s(\partial, u) \) does not depend on the choice of basis \( \{ \partial_i \} \) of \( \mathfrak{d} \) (cf. (4.26), (4.27)).

Since \( \mathcal{T}(R) = H \otimes R \), any element \( v \in \mathcal{T}(R) \) can be written uniquely in the form

\[
v = \sum_{i \in \mathbb{Z}_+^N} \partial^{(i)} \otimes v_I, \quad v_I \in R,
\]

(6.16)
where \( \partial^{(I)} \in H \) are given by (2.14). Note that the above sum is finite, i.e., \( v_I \neq 0 \) only for finitely many \( I \). From (6.14)–(6.16) and \( H \)-bilinearity, we find

\[
(1 \otimes \partial_i) \ast v = \sum_I (1 \otimes \partial^{(I)}) \otimes_H (1 \otimes (\partial_i + \text{ad} \partial_i) v_I) + \sum_I (1 \otimes \partial^{(I)}) \otimes_H s(\partial_i, v_I) - \sum_I \sum_{j=1}^N (1 \otimes \partial^{(j)} \partial_i) \otimes_H (1 \otimes (e_i^j + \delta_i^j) v_I).
\]  

(6.17)

**Definition 6.3.** The nonzero elements \( v_I \) in the expression (6.16) are called coefficients of \( v \in T(R) \). For a submodule \( M \subset T(R) \), we denote by \( \text{coeff } M \) the subspace of \( R \) linearly generated by all coefficients of elements of \( M \).

Recall that \( T(R) \) has a filtration given by \( F^p T(R) = F^p H \otimes R \) (cf. (6.11) and (6.9)). We have: \( F^{-1} T(R) = \{0\} \), \( F^0 T(R) = k \otimes R \) and \( F^1 T(R) = (k + \mathfrak{g}) \otimes R \).

**Lemma 6.6.** *For any nontrivial proper \( W(\mathfrak{d}) \)-submodule \( M \) of \( T(R) \), we have \( M \cap F^0 T(R) = \{0\} \).*

**Proof.** Let \( M_0 \) be the set of all \( u \in R \) such that \( 1 \otimes u \in M \). By (6.14) and Remark 2.2(i), we have:

\[
(\partial_i + \text{ad} \partial_i) u \in M_0, \quad (e_i^j + \delta_i^j) u \in M_0 \quad \text{for all} \quad i, j = 1, \ldots, N, \quad u \in M_0.
\]

This means that \( M_0 \) is a \( (\mathfrak{d} \oplus \mathfrak{gl} \mathfrak{d}) \)-submodule of \( R \). Since \( R \) is irreducible, either \( M_0 = \{0\} \) or \( M_0 = R \). In the latter case, we obtain \( M \supset H \otimes M_0 = T(R) \), which is a contradiction. Therefore, \( M \cap (k \otimes R) = \{0\} \). \( \square \)

**Corollary 6.3.** *If \( \text{sing } T(R) = F^0 T(R) \), then the tensor \( W(\mathfrak{d}) \)-module \( T(R) \) is irreducible.***

**Proof.** If \( M \subset T(R) \) is a nontrivial proper submodule, then by Theorem 6.1 it contains a nonzero singular vector. This contradicts Lemma 6.6. \( \square \)

Corollary 6.3 will play a crucial role in our classification of irreducible finite \( W(\mathfrak{d}) \)-modules.

**Lemma 6.7.** *For any nontrivial proper \( W(\mathfrak{d}) \)-submodule \( M \) of \( T(R) \), we have \( \text{coeff } M = R \).***

**Proof.** Pick a nonzero element \( v \in M \) and write in the form (6.16). Then, for fixed \( I \), the coefficient multiplying \( 1 \otimes \partial^{(I)} \) in the right-hand side of (6.17) equals

\[
(6.18) \quad s(\partial_i, v_I) + 1 \otimes \partial_i v_I + \text{terms in } k \otimes (\mathfrak{gl} \mathfrak{d} + k)(\text{coeff } M).
\]

By Remark 2.2(ii), this is an element of \( M \). Hence, for each coefficient \( v_I \) of \( v \), we have \( e_i^j v_I \in \text{coeff } M \). Then from (6.18) we also get \( \partial_i v_I \in \text{coeff } M \). Therefore, \( \text{coeff } M \) is a nontrivial \( (\mathfrak{d} \oplus \mathfrak{gl} \mathfrak{d}) \)-submodule of \( R \). But \( R \) is irreducible; hence, \( \text{coeff } M = R \). \( \square \)

**Lemma 6.8.** *Let \( M \) be a nontrivial proper \( W(\mathfrak{d}) \)-submodule of \( T(R) \). Then for every \( \partial \in \mathfrak{d} \) and \( u \in R \), there is a unique element \( s_M(\partial, u) \in M \) such that

\[
(6.19) \quad s_M(\partial, u) = s(\partial, u) \mod F^0 T(R),
\]

\( \square \)
where \( s(\partial, u) \) is given by (6.15). The element \( s_M(\partial, u) \) depends linearly on both \( \partial \) and \( u \).

**Proof.** Uniqueness follows from Lemma 6.6. From uniqueness we deduce that \( s_M(\partial, u) \) depends linearly on \( \partial \) and \( u \). Then, to prove existence, it is enough to consider the case \( \partial = \partial_i \) and \( u = v_I \) for some \( v \in M \) (because \( R = \text{coeff } M \) by Lemma 6.7). In this case \( s_M(\partial_i, v_I) \) is exactly the element (6.18).

Elements \( s_M(\partial, u) \) will be used in the next subsection to determine all singular vectors of \( M \).

### 6.4. Computation of Singular Vectors

In this subsection, we continue to use the notation of Section 6.3. Our goal is to find all singular vectors of \( T(R) = T(\Pi, U) \). Given a nontrivial proper \( \mathfrak{d} \)-submodule \( M \) of \( T(R) \), we also find all singular vectors of \( M \). These results will be used in Section 6.5 to classify irreducible \( \mathfrak{d} \)-modules.

First, we consider the case when the \( \text{gl} \mathfrak{d} \)-action on \( R \) is trivial.

**Proposition 6.1.** For any irreducible finite-dimensional \( \mathfrak{d} \)-module \( \Pi \), we have:

(i) \( \text{sing } T(\Pi, k) = F^0 T(\Pi, k) \);

(ii) \( T(\Pi, k) \) is an irreducible \( W(\mathfrak{d}) \)-module.

**Proof.** Pick a singular vector \( v \in T(\Pi, k) \), and write it in the form (6.16). Then, by (6.17),

\[
(1 \otimes \partial_i) * v = \sum_I (1 \otimes \partial^{(I)}) \otimes_H (1 \otimes \partial_i v_I) - \sum_I (1 \otimes \partial^{(I)} \partial_i) \otimes_H (1 \otimes v_I).
\]

Now Remark 6.1 implies that \( v_I = 0 \) whenever \( |I| \geq 1 \). This proves (i).

(ii) follows from (i) and Corollary 6.3.

**Lemma 6.9.** For any irreducible finite-dimensional \( \mathfrak{d} \oplus \text{gl} \mathfrak{d} \)-module \( R \), the tensor \( W(\mathfrak{d}) \)-module \( T(R) \) satisfies

\[
F^0 T(R) \subset \text{sing } T(R) \subset F^1 T(R).
\]

**Proof.** First of all, by Proposition 6.1(i), we can assume that the \( \text{gl} \mathfrak{d} \)-action on \( R \) is nontrivial. Since \( F^0 T(R) = k \otimes R \), the first inclusion follows from (6.14) and Remark 6.1. To prove the second one, pick a nonzero singular vector \( v \) and write in the form (6.16). Then \( (1 \otimes \partial_i) * v \) is given by formula (6.17). The coefficient multiplying \( 1 \otimes \partial^{(I)} \) in (6.17) is given by (6.18). By Remark 6.1, this coefficient must vanish whenever \( |I| > 1 \). Hence, \( s(\partial_i, v_I) = 0 \) for all \( i \), which implies \( (\text{gl} \mathfrak{d}) v_I = 0 \). Therefore, \( v_I = 0 \). This proves that \( \text{sing } T(R) \subset F^1 T(R) \).

**Lemma 6.10.** An element

\[
v = \sum_{k=1}^N \partial_k \otimes v^k \in \mathfrak{d} \otimes R \subset T(R)
\]

is a singular vector iff it satisfies the equations

\[
(c_i^j + \delta_i^j)v^k + (c_k^j + \delta_k^j)v^j = 0 \quad \text{for all } i, j, k = 1, \ldots, N.
\]

In this case, for the action \( \rho_{\text{sing}} \) of \( \text{gl} \mathfrak{d} \) on \( v \), we have (see (6.15)):

\[
\rho_{\text{sing}}(c_i^k)v = -s(\partial_i, v^k) \mod F^0 T(R).
\]
Proof. As a special case of (6.17), we have:

\[(1 \otimes \partial_i) \ast v = \sum_{k=1}^{N} (1 \otimes \partial_k) \otimes_H (1 \otimes (\partial_i + \text{ad} \partial_i)v^k) + \sum_{k=1}^{N} (1 \otimes \partial_k) \otimes_H s(\partial_i, v^k) - \sum_{k,j=1}^{N} (1 \otimes \partial_k \partial_j) \otimes_H (1 \otimes (e_i^j + \delta_i^j)v^k).\]

For \(k \leq j\), the coefficient multiplying \(1 \otimes \partial_k \partial_j\) is up to a sign equal to

\[(6.23) \quad 1 \otimes (e_i^j + \delta_i^j)v^k + 1 \otimes (e_i^k + \delta_i^k)v^j.\]

By Remark 6.1, \(v\) is a singular vector iff this coefficient vanishes for all \(j, k\). This proves (6.21). On the other hand, the coefficient multiplying \(1 \otimes \partial_k\) is equal to \(s(\partial_k, v^k)\) modulo \(F^0 \mathcal{T}(R)\). Then (6.22) follows from (6.4).

Our next result describes all singular vectors in a tensor \(W(\mathfrak{d})\)-module \(\mathcal{T}(R)\).

**Theorem 6.3.** For any irreducible finite-dimensional \((\mathfrak{d} \oplus \mathfrak{gl}(\mathfrak{d}))\)-module \(R\), we have:

\[(6.24) \quad \text{sing} \mathcal{T}(R) = F^0 \mathcal{T}(R) + \{s(\partial, u) \mid \partial \in \mathfrak{d}, u \in R_0\},\]

where \(s(\partial, u)\) is defined by (6.15) and \(R_0\) is the subspace of all \(u \in R\) satisfying the equations

\[(6.25) \quad (e_i^j + \delta_i^j)e_l^k u + (e_i^k + \delta_i^k)e_l^j u = 0, \quad i, j, k, l = 1, \ldots, N.\]

The subspace \(R_0\) is either \(\{0\}\) or the whole \(R\).

**Proof.** When \(R = \Pi \mathbb{K}\), (6.24) follows from Proposition 6.1(i), because in this case all \(s(\partial, u) = 0\). Let us assume that the \(\mathfrak{gl}(\mathfrak{d})\)-action on \(R\) is nontrivial, and denote the space in the right-hand side of (6.24) by \(S\). Notice that \(s(\partial, u)\) is a singular vector iff \(u \in R_0\), because for \(v = s(\partial, u)\) we have \(v^k = e_l^k u\) and (6.21) becomes (6.25). Hence, Lemmas 6.9 and 6.10 imply \(S \subseteq \text{sing} \mathcal{T}(R)\). From these lemmas, we also deduce that the action \(\rho_{\text{sing}}\) of \(\mathfrak{gl}(\mathfrak{d})\) on \(\text{sing} \mathcal{T}(R)\) maps \(\text{sing} \mathcal{T}(R)\) into \(S\).

Consider the finite-dimensional \(\mathfrak{gl}(\mathfrak{d})\)-module \(s(\partial, u)\). We claim that its decomposition as a direct sum of irreducibles does not contain the trivial \(\mathfrak{gl}(\mathfrak{d})\)-module. Indeed, let \(v \in \text{sing} \mathcal{T}(R)\) be such that \(\rho_{\text{sing}}(e_l^k) v \in F^0 \mathcal{T}(R)\) for all \(i, k\). We want to show that \(v \in F^0 \mathcal{T}(R)\). Without loss of generality, we can assume that \(v \in \mathfrak{d} \otimes R\). Then, by (6.22), all \(s(\partial_i, v^k) = 0\), and from (6.15), \(e_i^k v^k = 0\) for all \(i, j, k\). This implies \(v^k = 0\) for all \(k\), and hence \(v = 0\), which proves our claim.

Therefore, the \(\mathfrak{gl}(\mathfrak{d})\)-action on \(s(\partial, u)\) is surjective and \(\text{sing} \mathcal{T}(R) = S\). Next, it is clear that for \(R = \Pi \mathbb{K} U\) we have \(R_0 = \Pi \mathbb{K} U_0\), where \(U_0\) is the subspace of all \(u \in U\) satisfying (6.25). We claim that \(U_0\) is a \(\mathfrak{gl}(\mathfrak{d})\)-submodule of \(U\). Since \(U\) is an irreducible \(\mathfrak{gl}(\mathfrak{d})\)-module, this would imply that either \(U_0 = \{0\}\) or \(U_0 = U\). Now if \(u \in U_0\), then \(v = s(\partial_l, u)\) is a singular vector for all \(l\). By (6.22), all \(s(\partial_l, v^k)\) are singular vectors too. Hence, \(v^k = e_l^k u\) belongs to \(R_0\) for all \(k, l\). Therefore, \((\mathfrak{gl}(\mathfrak{d})) R_0 \subseteq R_0\), which implies \((\mathfrak{gl}(\mathfrak{d})) U_0 \subseteq U_0]\.

**Corollary 6.4.** If the \(W(\mathfrak{d})\)-module \(\mathcal{T}(R)\) is not irreducible, then equations (6.25) are satisfied for all \(u \in R\).

**Proof.** This follows from Corollary 6.3 and Theorem 6.3.

Next, we find all singular vectors in a nontrivial proper \(W(\mathfrak{d})\)-submodule \(M\) of \(\mathcal{T}(R)\). Recall the elements \(s_M(\partial, u) \in M\), constructed in Lemma 6.8.
Theorem 6.4. For any nontrivial proper $W(\mathfrak{d})$-submodule $M$ of $T(R)$, we have:

(i) sing $M = M \cap F^1 T(R) = \{s_M(\partial, u) \mid \partial \in \mathfrak{d}, u \in R\};$

(ii) sing $T(R) = F^0 T(R) \oplus \text{sing } M$ as $(\mathfrak{d} \oplus \mathfrak{g} \mathfrak{d})$-modules.

Proof. (i) Note that sing $M \subset M \cap F^1 T(R)$ by Lemma 6.9. Conversely, pick $v' \in M \cap F^1 T(R)$, and write $v' = v + 1 \otimes u$ with $v \in \mathfrak{d} \otimes R$, $u \in R$. Since $1 \otimes u \in \text{sing } T(R)$, the vector $v'$ is singular if and only if $v$ is. In the proof of Lemma 6.10 we saw that the coefficient multiplying $1 \otimes \partial_1 \partial_2$ in $(1 \otimes \partial_1) * v$ is up to a sign equal to (6.23). By Remark 6.1, $(1 \otimes \partial_1) * v'$ has the same coefficient. Now Remark 2.2(ii) implies that the elements (6.23) belong to $M$. Hence, they vanish by Lemma 6.6. Then, by Lemma 6.10, $v'$ is a singular vector, and $v' \in \text{sing } M$.

This proves the first equality in (i). The second equality follows from the first one, Lemma 6.8 and Theorem 6.3.

(ii) The sum is direct because of Lemma 6.6. The equality follows from part (i), Lemma 6.8 and Theorem 6.3. □

Corollary 6.5. Let $R$ be an irreducible finite-dimensional $(\mathfrak{d} \oplus \mathfrak{g} \mathfrak{d})$-module, and let $M, M'$ be two nontrivial proper $W(\mathfrak{d})$-submodules of $T(R)$. Then sing $M = \text{sing } M'$.

Proof. Consider the canonical projection of $(\mathfrak{d} \oplus \mathfrak{g} \mathfrak{d})$-modules

$$\pi : \text{sing } T(R) \rightarrow \text{sing } T(R)/F^0 T(R) \subset \text{gr}^1 T(R).$$

By Theorem 6.4(ii), the restriction of $\pi$ to sing $M$ is an isomorphism. On the other hand, combining (6.10) with Corollary 6.2, we obtain isomorphisms of $(\mathfrak{d} \oplus \mathfrak{g} \mathfrak{d})$-modules

$$F^0 T(R) \simeq \tilde{\Pi} \otimes \tilde{U}, \quad \text{gr}^1 T(R) \simeq \tilde{\Pi} \otimes (\mathfrak{d} \otimes \tilde{U}),$$

where

$$R = \Pi \otimes U, \quad \tilde{\Pi} = \Pi \otimes k_{\text{tr ad}}, \quad \tilde{U} = U \otimes k_{\text{tr}}.$$ 

The $\mathfrak{g} \mathfrak{d}$-module $\tilde{U}$ is irreducible. Say that $\text{Id} \in \mathfrak{g} \mathfrak{d}$ acts as the scalar $c$ on $\tilde{U}$. Then it acts as $c + 1$ on $\mathfrak{d} \otimes \tilde{U}$. It follows that sing $M$ is precisely the set of all vectors $v \in \text{sing } T(R)$ such that $\text{Id} \cdot v = (c + 1) v$. The same is true for $M'$ instead of $M$. □

6.5. Irreducible Finite $W(\mathfrak{d})$-Modules. This subsection contains our main results about irreducible finite $W(\mathfrak{d})$-modules. As before, let $\Pi$ (respectively $U$) be an irreducible finite-dimensional representation of $\mathfrak{d}$ (respectively $\mathfrak{g} \mathfrak{d}$). First, we determine which tensor $W(\mathfrak{d})$-modules are irreducible.

Theorem 6.5. The tensor $W(\mathfrak{d})$-module $T(\Pi, U)$ is irreducible if and only if, as a $\mathfrak{g} \mathfrak{d}$-module, $U$ is not isomorphic to $\Lambda^n \mathfrak{d}^*$ for any $n \geq 1$.

Proof. Assume that $T(\Pi, U)$ is not irreducible. Then, by Corollary 6.4, equations (6.24) are satisfied for all $u \in R$. In the special case $i = j = k = l$ they give

$$(e_i^1 + 1)e_i^1 u = 0 \quad \text{for all } u \in R = \Pi \otimes U.$$ 

We claim that the $\mathfrak{g} \mathfrak{d}$-module $U$ is isomorphic to $\Omega^n := \Lambda^n \mathfrak{d}^*$ for some $n$. To prove this, first note that the matrix $\text{Id} \in \mathfrak{g} \mathfrak{d}$ acts as a scalar on $U$, and the module $U$ remains irreducible when restricted to $\mathfrak{g} \mathfrak{d}$. Then $U$ has a highest weight vector $v$, and the $\mathfrak{g} \mathfrak{d}$-module $U$ is uniquely determined by its highest weight, i.e., by the eigenvalues $\lambda_i$ of $e_i^1$ on $v$. Furthermore, all $\lambda_i - \lambda_{i+1}$ are non-negative integers (see, e.g., [Se, Chapter V]). But by (6.26), all $\lambda_i = 0$ or $-1$; hence the $N$-tuple
\((\lambda_1, \ldots, \lambda_N)\) has the form \((0, \ldots, 0, -1, \ldots, -1)\). The module \(\Omega^n\) has such a highest weight, where the number of \(-1\)'s is \(n\). Therefore, \(U \simeq \Omega^n\), and the case \(n = 0\) is excluded by Proposition 6.1(ii).

Next, recall the \(\Pi\)-twisted pseudo de Rham complex (5.15), and introduce the shorthand notation

\[
T^n := T(\Pi, \Omega^n), \quad I^n := d_\Pi(T^{n-1}) \subset T^n.
\]

Since the differential \(d_\Pi\) is a homomorphism of \(W(\mathfrak{d})\)-modules, the image \(I^n\) is a submodule of \(T^n\) for each \(n = 1, \ldots, N\). It is easy to see from Proposition 5.2 and Lemma 5.3 that \(I^n\) is nontrivial and proper. Therefore, the tensor modules \(T^n\) are not irreducible for \(n \geq 1\).

Corollary 6.6. Let \(R\) be an irreducible finite-dimensional \((\mathfrak{d} \oplus \mathfrak{gl}(\mathfrak{d}))\)-module. Then the \(W(\mathfrak{d})\)-module \(T(R)\) is irreducible if and only if \(\text{sing} T(R) = F^0 T(R)\).

Proof. In one direction, the statement is exactly Corollary 6.3. The opposite direction follows from Theorem 6.3 and the proof of Theorem 6.5.

Our next goal is to study the submodules \(I^n\) of \(T^n\) (see (6.27)).

Lemma 6.11. For \(1 \leq n \leq N\), the \(W(\mathfrak{d})\)-submodule \(I^n \subset T^n\) has the following properties:

(i) \(I^n\) is nontrivial and proper;
(ii) \(\text{sing} I^n = d_\Pi(k \otimes \Pi \otimes \Omega^{n-1})\);
(iii) \(I^n\) is generated by \(\text{sing} I^n\) as an \(H\)-module;
(iv) Any nontrivial proper submodule \(M\) of \(T^n\) contains \(I^n\);
(v) \(I^n\) is an irreducible \(W(\mathfrak{d})\)-module.

Proof. (i) is easy to see from Proposition 5.2 and Lemma 5.3.

(ii) Formula (5.17) and Lemma 6.8 imply

\[
s_{\iota_i}(\partial_i, u \otimes \alpha) = d_\Pi(1 \otimes u \otimes \iota_i \alpha), \quad u \in \Pi, \ \alpha \in \Omega^n, \ i = 1, \ldots, N.
\]

Then (ii) follows from Theorem 6.4(i) and the fact that \(\Omega^{n-1}\) is linearly spanned by all \(\iota_i \alpha\).

(iii) is obvious from (ii) and the \(H\)-linearity of \(d_\Pi\).

(iv) By Corollary 6.5, we have \(\text{sing} M = \text{sing} I^n\). Then \(M \supset H(\text{sing} M) = H(\text{sing} I^n)\), which is equal to \(I^n\) by part (iii).

(v) is obvious from (iv).

Note that, from the exactness of the complex (5.15), we have \(I^1 \simeq T^0 = T(\Pi, \Omega^0) = T(\Pi, k)\).

Lemma 6.12. For \(1 \leq n \leq N - 1\), \(I^n\) is the unique nontrivial proper \(W(\mathfrak{d})\)-submodule of \(T^n\).

Proof. If \(M\) is a nontrivial proper submodule of \(T^n\), it contains \(I^n\). The image \(d_\Pi M\) is a submodule of \(I^{n+1}\); hence, \(d_\Pi M\) is either \([0]\) or the whole \(I^{n+1}\). But the kernel of \(d_\Pi\) is equal to \(I^n\), by the exactness of the complex (5.15). We obtain that either \(M = I^n\) or \(M = T^n\).

Now we can classify all irreducible finite \(W(\mathfrak{d})\)-modules.
Theorem 6.6. Any irreducible finite $W(\mathfrak{g})$-module is isomorphic to one of the following:

(i) Tensor modules $T(\Pi, U)$, where $\Pi$ is an irreducible finite-dimensional $\mathfrak{g}$-module, and $U$ is an irreducible finite-dimensional $\mathfrak{g}\mathfrak{l}\mathfrak{d}$-module not isomorphic to $\Omega^n = \bigwedge^n \mathfrak{d}^*$ for any $1 \leq n \leq \dim \mathfrak{d}$;

(ii) Image $d_\Pi T(\Pi, \Omega^n)$, where $\Pi$ is an irreducible finite-dimensional $\mathfrak{d}$-module, and $1 \leq n \leq \dim \mathfrak{d} - 1$ (see (5.15)).

Proof. Let $V$ be an irreducible finite $W(\mathfrak{g})$-module. Then, by Theorem 6.2 and (6.9), $V$ is a quotient of some tensor module $T(R) = T(\Pi, U)$. If $U \not\cong \Omega^n$ as a $\mathfrak{g}\mathfrak{l}\mathfrak{d}$-module for any $n \geq 1$, then $T(R)$ is irreducible by Theorem 6.5, and in this case $V \cong T(R)$.

Assume that $U \cong \Omega^n$ for some $n \geq 1$; then $T(R) \cong T(\Pi, \Omega^n) = T^n$ (see (6.27)). Now if $n \leq N - 1$, $N = \dim \mathfrak{g}$, Lemma 6.12 implies that $V \cong T^n/I^n$. By the exactness of (5.15), we get $V \cong I^{n+1} = d_\Pi T(\Pi, \Omega^n)$.

Finally, it remains to consider the case when $V$ is a quotient of $T^N$. Then $V \cong T^N/M$, where $M \subseteq T^N$ due to Lemma 6.11(iv). Now Proposition 5.2 implies that $V$ is finite dimensional; hence, $W(\mathfrak{g})$ acts trivially on it by Example 2.3. So in this case $V$ cannot be irreducible. \qed

Theorem 6.7. The irreducible finite $W(\mathfrak{g})$-modules listed in Theorem 6.6 satisfy:

(i) $\text{sing} T(\Pi, U) \cong (\Pi \otimes k_{-\text{tr}}) \boxtimes (U \otimes k_{\text{tr}})$ as $(\mathfrak{d} \oplus \mathfrak{g}\mathfrak{l}(\mathfrak{d}))$-modules;

(ii) $\text{sing}(d_\Pi T(\Pi, \Omega^n)) \cong (\Pi \otimes k_{-\text{tr}}) \boxtimes (\Omega^n \otimes k_{\text{tr}})$ as $(\mathfrak{d} \oplus \mathfrak{g}\mathfrak{l}(\mathfrak{d}))$-modules.

In particular, no two of them are isomorphic to each other.

Proof. First, note that if $\beta: V \to V'$ is a homomorphism of $W(\mathfrak{g})$-modules, then its restriction to $\text{sing} V$ is a homomorphism of $(\mathfrak{d} \oplus \mathfrak{g}\mathfrak{l}(\mathfrak{d}))$-modules $\text{sing} V \to \text{sing} V'$.

In particular, if $V$ and $V'$ are isomorphic, then sing $V \cong$ sing $V'$.

(i) If $T(R) = T(\Pi, U)$ is irreducible, then by Corollary 6.6, $\text{sing} T(\Pi, U) = F^0 T(\Pi, U) = k \otimes R$. Now (i) follows from (6.6) and (6.10).

(ii) By Lemma 6.11(ii), we have: $\text{sing}(d_\Pi T(\Pi, \Omega^n)) = d_\Pi(F^0 T(\Pi, \Omega^n))$. But $F^0 T(\Pi, \Omega^n) \cong (\Pi \otimes k_{-\text{tr}}) \boxtimes (\Omega^n \otimes k_{\text{tr}})$ is an irreducible $(\mathfrak{d} \oplus \mathfrak{g}\mathfrak{l}(\mathfrak{d}))$-module. Therefore, $d_\Pi$ is an isomorphism from $F^0 T(\Pi, \Omega^n)$ onto $\text{sing}(d_\Pi T(\Pi, \Omega^n))$. \qed

Remark 6.3. Let $R$ and $R'$ be two non-isomorphic irreducible finite-dimensional $(\mathfrak{d} \oplus \mathfrak{g}\mathfrak{l}(\mathfrak{d}))$-modules. Using Theorem 6.4(ii) and the same argument as in the proof of Theorem 6.7, one can show that the only nonzero homomorphisms of $W(\mathfrak{d})$-modules $T(R) \to T(R')$ are, up to a constant factor, the differentials $d_\Pi$.  

7. Classification of Irreducible Finite $S(\mathfrak{d}, \chi)$-Modules

In this section we adapt the classification results of Section 6 to the case of the Lie pseudoalgebra $S(\mathfrak{d}, \chi)$. Our main result is Theorem 7.6.

7.1. Singular Vectors. Recall that the annihilation algebra $S$ of $S(\mathfrak{d}, \chi)$ possesses a decreasing filtration $\{S_p\}_{p\geq-1}$ by subspaces of finite codimension, as given by (3.20). This filtration is compatible with that of $\mathcal{W}$ given by (3.8), (3.11), in the sense made clear by Lemma 3.6 and Proposition 3.5. In particular, we know that $\mathcal{S} \subset \mathcal{W} \cong W_X$ is a graded Lie algebra isomorphic to $S_X$, the grading being given by the eigenspace decomposition with respect to the adjoint action of the element $\hat{e} \in \mathcal{W}$ described in Definition 3.3. We denote the $i$-eigenspace by $S_i$; hence, $S_p = \prod_{i\geq p} S_i$. Note that we can do the same with the extended annihilation
algebra $\tilde{S}$, as $\hat{\partial}$ commutes with $\tilde{\mathfrak{g}}$. We denote the corresponding eigenspaces by $\tilde{\mathfrak{g}}_i$; then $\tilde{\mathfrak{g}} \subset \tilde{\mathfrak{g}}_0$ and $\tilde{\mathfrak{g}}_1 = \mathfrak{g}_i$ for $i \neq 0$.

In analogy with the case of $W(\mathfrak{g})$, for an $S$-module $V$, we denote by $\ker_p V$ the space of all elements $v \in V$ that are killed by $S_p$. We denote by $\ker V$ the space $\ker_{-1} V$ killed by $S = S_{-1}$. Then the module $V$ is conformal iff $V = \bigcup_p \ker_p V$. Any $S(\mathfrak{g}, \chi)$-module has a natural structure of a conformal module over the extended annihilation algebra $\tilde{S} = \mathfrak{g} \ltimes S$ (see Proposition 2.1). The normalizer of $S_p$ in $\tilde{S}$ was computed in Section 3.5. It is independent of $p \geq 0$, and is denoted by $N_S$.

Note that $N_S = \prod_{p > 0} \tilde{\mathfrak{g}}_i$ and $\tilde{\mathfrak{g}} = \tilde{\mathfrak{g}}_{-1} \oplus N_S$ as a vector space.

Each $\ker_p V$ is a module over the finite-dimensional quotient $N_S/S_p$; moreover, the Lie algebra $N_S/S_1 = \tilde{\mathfrak{g}} \oplus (S_0/S_1)$ is isomorphic to the direct sum $\mathfrak{g} \oplus \mathfrak{sl} \mathfrak{d}$.

**Definition 7.1.** A singular vector in an $S(\mathfrak{g}, \chi)$-module $V$ is an element $v \in V$ such that $S_1 \cdot v = 0$. The space of singular vectors $\ker_1 V$ is also denoted by $\text{sing} V$.

**Theorem 7.1.** For any nontrivial finite $S(\mathfrak{g}, \chi)$-module $V$, we have $\text{sing} V \neq \{0\}$, and the space $\text{sing} V/\ker V$ is finite dimensional.

**Proof.** The proof is the same as that of Theorem 6.1, making use of Proposition 3.9 instead of Proposition 3.4.

Recall that $S(\mathfrak{g}, \chi)$ is generated over $H$ by the elements $s_{ab}$ defined in (3.5). It will be convenient to introduce the notation

\[(7.1) \quad \hat{\partial} = \partial + \chi(\partial), \quad \partial \in \mathfrak{g},\]

and

\[(7.2) \quad s_{ij} \equiv s_{\partial_i \partial_j} = \partial_i \partial_j - \partial_j \partial_i - 1 \otimes [\partial_i, \partial_j],\]

where, as before, $\{\partial_i\}$ is a fixed basis of $\mathfrak{g}$.

**Remark 7.1.** By (3.20) and Proposition 2.1, a vector $v \in V$ is singular if and only if

\[s_{ij} \cdot v \in (F^2 H \otimes k) \otimes_H V, \quad i, j = 1, \ldots, N,\]

or, equivalently,

\[s_{ij} \cdot v \in (k \otimes F^2 H) \otimes_H V, \quad i, j = 1, \ldots, N.\]

### 7.2. Tensor Modules for $S(\mathfrak{g}, \chi)$

Let $R$ be a finite-dimensional $(\mathfrak{g} \oplus \mathfrak{sl} \mathfrak{d})$-module, with an action denoted by $\hat{\rho}_R$. Then the isomorphism $N_S/S_1 \simeq \mathfrak{g} \oplus \mathfrak{sl} \mathfrak{d}$ can be employed to make $R$ an $N_S$-module with a trivial action of $S_1$. For example, the action of the subalgebra $\tilde{\mathfrak{g}} \subset N_S$ is given by:

\[(7.3) \quad \hat{\partial} \cdot u = \hat{\rho}_R(\partial)u, \quad \partial \in \mathfrak{g}, \ u \in R.\]

Consider the induced $\tilde{S}$-module $V = \text{Ind}_{N_S}^{\tilde{S}} R$. Since as a vector space $\tilde{S} = \mathfrak{g} \oplus N_S$ (see Proposition 3.8), as an $H$-module $V$ is isomorphic to the free module $H \otimes R$.

**Definition 7.2.** The $S(\mathfrak{g}, \chi)$-module $\text{Ind}_{N_S}^{\tilde{S}} R$ constructed above will be denoted by $V_\chi(R)$, and will be called a tensor module for the Lie pseudoalgebra $S(\mathfrak{g}, \chi)$. If $R$ is an irreducible $(\mathfrak{g} \oplus \mathfrak{sl} \mathfrak{d})$-module isomorphic to $H \otimes U$, then we will also write $V_\chi(R) = V_{\chi}(H \otimes U)$.

The name tensor module is justified by the fact that, as we will show in Theorem 7.3 below, the $S(\mathfrak{g}, \chi)$-module $V_\chi(R)$ is the restriction to $S(\mathfrak{g}, \chi) \subset W(\mathfrak{g})$ of a tensor module for $W(\mathfrak{g})$ (see also Remark 6.2).
Theorem 7.2. Let $V$ be an $S(\mathfrak{d}, \chi)$-module, and let $R$ be a $(\mathfrak{d} \oplus \mathfrak{s}(\mathfrak{d}))$-submodule of $\text{sing} V$. Then $HR$ is an $S(\mathfrak{d}, \chi)$-submodule of $V$, and there is a natural surjective homomorphism $V(\chi)(R) \rightarrow HR$. In particular, every irreducible finite $S(\mathfrak{d}, \chi)$-module is a quotient of a tensor module.

Proof. Since $\tilde{S} = \mathfrak{d} \oplus \mathcal{N}_S$ as a vector space, and $R \subset \text{sing} V$, it follows that $HR$ is preserved by the action of $\tilde{S}$. Then by Proposition 2.1, $HR$ is an $S(\mathfrak{d}, \chi)$-submodule of $V$. The existence of a natural surjective homomorphism $V(\chi)(R) \rightarrow HR$ follows from the definition of $V(\chi)(R)$. Finally, if $V$ is irreducible and finite, then by Theorem 7.1, $\text{sing} V \neq \{0\}$, and we have $H(\text{sing} V) = V$. □

Lemma 7.1. The unique injection $\iota : S(\mathfrak{d}, \chi) \rightarrow W(\mathfrak{d})$ induces an injective Lie algebra homomorphism $\iota_* : N_S/S_1 \rightarrow \mathcal{N}_W/W_1$. The homomorphism $\iota_*$ satisfies $\iota_*(\tilde{\mathfrak{d}}) \subset \tilde{\mathfrak{d}} \oplus \mathfrak{k}\text{Id}$. More precisely (see (3.29)),

$$\iota_*(\tilde{\mathfrak{d}}) = \tilde{\mathfrak{d}} + \frac{1}{N} (\text{tr}\text{ad} - \chi)(\tilde{\mathfrak{d}}) \text{Id}, \quad \tilde{\mathfrak{d}} \in \mathfrak{d}. \quad (7.4)$$

Furthermore, $\iota_*$ embeds $\mathcal{N}_S/S_1 \simeq \mathfrak{s}(\mathfrak{d})$ as the Lie subalgebra $\mathfrak{s}(\mathfrak{d}) \subset \mathfrak{sl}(\mathfrak{d}) \simeq \mathcal{N}_W/W_1$.

Proof. By Proposition 3.5, the induced Lie algebra homomorphism $\iota : S \rightarrow W$ is injective and satisfies $\iota(S_1) \subset W_1$. Hence, $\iota_*$ is injective. The rest of the lemma follows from (3.29) and Corollary 3.4. □

Lemma 7.1 shows that $\mathcal{N}_W/W_1 = \iota_*(N_S/S_1) \oplus \mathfrak{k}\text{Id}$. Hence, every $N_S/S_1$-module can be extended to an $\mathcal{N}_W/W_1$-module by imposing the element $\text{Id}$ to act as multiplication by a scalar $c \in \mathfrak{k}$. These are the only possible extensions if the action of $N_S/S_1$ is irreducible.

Theorem 7.3. Every tensor module for $S(\mathfrak{d}, \chi)$ can be obtained as the restriction of a tensor module for $W(\mathfrak{d})$. More precisely, for every $c \in \mathfrak{k}$, $V(\chi)(R) = V(\chi)(\Pi, U)$ is isomorphic to the restriction of $\mathcal{V}(\Pi \otimes \mathfrak{k}_{c(\chi - \text{tr}\text{ad})}/N, U, c)$.

Proof. Note that, as an $H$-module, $V = \mathcal{V}(\Pi \otimes \mathfrak{k}_{c(\chi - \text{tr}\text{ad})}/N, U, c)$ can be identified with $H \otimes R$. Moreover, since $R \subset \text{sing} V$, we have $W_1 \cdot R = \{0\}$. Then $R$ becomes an $N_S/S_1$-module via the embedding $\iota_*$ from Lemma 7.1.

We identify each of the Lie algebras $\tilde{\mathfrak{d}}$ and $\mathfrak{d}$ with $\mathfrak{d}$. It follows from (7.4) that if $\tilde{\mathfrak{d}}$ acts on $\Pi \otimes \mathfrak{k}_{c(\chi - \text{tr}\text{ad})}/N$ and $\text{Id}$ acts as $c$, then $\mathfrak{d}$ acts on $\Pi$. Similarly, $\mathfrak{s}(\mathfrak{d})$ acts on $U$, so the action of $\tilde{\mathfrak{d}} \oplus \mathfrak{s}(\mathfrak{d}) \simeq N_S/S_1$ on $R$ is isomorphic to $\Pi \otimes \mathfrak{U}$.

Then, by the definition of $V(\chi)(R)$, there is a natural surjective homomorphism of $S(\mathfrak{d}, \chi)$-modules

$$\pi : V(\chi)(R) = V(\chi)(\Pi, U) \rightarrow HR = V.$$

The homomorphism $\pi$ takes an element $u \in R \subset V(\chi)(R)$ to the element $u \in R \subset V$. But $V$ is free as an $H$-module; hence, $\pi$ is injective and $V(\chi) \simeq V$. □

We will denote the restriction of $\mathcal{T}(\Pi, U)$ to $S(\mathfrak{d}, \chi)$ by $\mathcal{T}_\chi(\Pi, U)$, and similarly for $\mathcal{T}(\Pi, U, c)$ (cf. Definition 4.4). Note that by (6.10), we have

$$\mathcal{T}(\Pi \otimes \mathfrak{k}_{c+\chi(\chi - \text{tr}\text{ad})}/N, U, c) = V(\Pi \otimes \mathfrak{k}_{(N+c)(\chi - \text{tr}\text{ad})}/N, U, N + c). \quad (7.5)$$

Then Theorem 7.3 implies

$$V(\chi)(\Pi, U) \simeq \mathcal{T}_\chi(\Pi \otimes \mathfrak{k}_{c+\chi(\chi - \text{tr}\text{ad})}/N, U, c), \quad c \in \mathfrak{k}. \quad (7.6)$$

Observe that $\chi = \text{tr}\text{ad}$ is the only case for which the restriction of $\mathcal{T}(\Pi, U, c)$ to $S(\mathfrak{d}, \chi)$ is independent of $c$. 

Example 7.1. Note that $\mathcal{T}(\Pi, \Omega^n) = \mathcal{T}(\Pi, \Omega^n, -n)$, because the element $\text{Id} \in \mathfrak{gl} \mathfrak{d}$ acts on $\Omega^n = \Lambda^n \mathfrak{d}^*$ as $-n$. Then it follows from (7.6) that

$$T_n(\Pi, \Omega^n) \simeq V_n(\Pi \otimes k_{-\chi+n(\chi-\text{tr} \mathfrak{ad})/N}, \Omega^n).$$

In particular, we have

$$V_n(\Pi, k) \simeq T_n(\Pi \otimes k_{\chi}, \Omega^0) \simeq T_n(\Pi \otimes k_{\text{tr} \mathfrak{ad}}, \Omega^N).$$

One can use (7.6) for $c = 0$ to write an explicit expression for the action of $S(\mathfrak{d}, \chi)$ on its tensor module $V_n(\Pi, U)$. First, we note that if we identify $T(\Pi \otimes k_{\chi}, U, 0)$ with $H \otimes R$, then $\partial \in \mathfrak{d}$ acts on $R$ as $\partial$ (see (7.1)). Then we use (7.2) and (6.14) to compute $s_{ij} \ast (1 \otimes u)$ for $u \in R$. The full expression is too cumbersome to write here. Because of (7.2), it is a sum of three terms. The third term is just a direct application of (6.14) for $[\partial_i, \partial_j]$. The second term is obtained from the first one by switching the roles of $i$ and $j$. Finally, using $H$-bilinearity, (6.14), and (6.15), we find that the first term is equal to:

$$(\partial_i \otimes \partial_j) \ast (1 \otimes u) = (\partial_i \otimes 1) \otimes_H (1 \otimes (\partial_j + \text{ad} \partial_j)u)$$

$$+ (\partial_i \otimes 1) \otimes_H s(\partial_j, u) - \sum_{k=1}^{N} (\partial_i \otimes \partial_k) \otimes_H (1 \otimes (e^k_j + \delta^k_j)u).$$

Recall that $\Delta(\partial) = \partial \otimes 1 + 1 \otimes \partial$ for $\partial \in \mathfrak{d}$. This implies $\Delta(\partial) = \partial \otimes 1 + 1 \otimes \partial$ and

$$(\partial \otimes g) \otimes_H (h \otimes u) = (1 \otimes g) \otimes_H (\partial h \otimes u) - (1 \otimes g \partial) \otimes_H (h \otimes u),$$

$$\partial \in \mathfrak{d}, g, h \in H, \ u \in R.$$  

Applying (7.10), we rewrite (7.9) as follows:

$$(\partial_i \otimes \partial_j) \ast (1 \otimes u) = (1 \otimes 1) \otimes_H (\partial_i \otimes (\partial_j + \text{ad} \partial_j)u)$$

$$- (1 \otimes \partial_i) \otimes_H (1 \otimes (\partial_j + \text{ad} \partial_j)u) + (1 \otimes 1) \otimes_H \partial_i s(\partial_j, u)$$

$$- (1 \otimes \partial_i) \otimes_H s(\partial_j, u) - \sum_{k=1}^{N} (1 \otimes \partial_k) \otimes_H (\partial_i \otimes (e^k_j + \delta^k_j)u)$$

$$+ \sum_{k=1}^{N} (1 \otimes \partial_k \partial_i) \otimes_H (1 \otimes (e^k_j + \delta^k_j)u).$$

When the action of $\mathfrak{gl} \mathfrak{d}$ on $R$ is trivial, things can be rearranged in a more elegant form as follows:

$$s_{ij} \ast (1 \otimes u) = (1 \otimes 1) \otimes_H (\partial_i \otimes \partial_j u - \partial_j \otimes \partial_i u - 1 \otimes [\partial_i, \partial_j]u)$$

$$+ (1 \otimes \partial_i) \otimes_H (\partial_j \otimes u - 1 \otimes \partial_j u)$$

$$- (1 \otimes \partial_j) \otimes_H (\partial_i \otimes u - 1 \otimes \partial_i u).$$

Even though the expression (7.11) is not very inspiring, it will turn out to be useful. We state as a lemma the properties that we are going to need later. Before that let us introduce the notation (see (6.15)):

$$a_{ij}(u) = \partial_i s(\partial_j, u) - \partial_j s(\partial_i, u) = \sum_{k=1}^{N} (\partial_i \partial_k \otimes e^k_j u - \partial_j \partial_k \otimes e^k_i u).$$

Note that $a_{ii}(u) = 0.$
Lemma 7.2. Consider the tensor $S(\mathfrak{d}, \chi)$-module $\mathcal{V}_\chi(R)$. Then the action of the elements $s_{ij} \in S(\mathfrak{d}, \chi)$, defined in (7.2), on an element $1 \otimes u \in R \otimes R \subset \mathcal{V}_\chi(R)$ has the form

\[
s_{ij} \ast (1 \otimes u) = (1 \otimes 1) \otimes_H A_{ij}(u) + \sum_{k=1}^{N} (1 \otimes \partial_k) \otimes_H A_{ij}^k(u),
\]

where

\[
A_{ij}^k(u) \in k \otimes (k + \mathfrak{s}\mathfrak{l}\mathfrak{d})u, \\
A_{ij}^l(u) \in \mathfrak{d} \otimes (k + \mathfrak{s}\mathfrak{l}\mathfrak{d})u + k \otimes (k + \mathfrak{d} + \mathfrak{s}\mathfrak{l}\mathfrak{d})u,
\]

and

\[
A_{ij}(u) = a_{ij}(u) + \partial_i \otimes \partial_j u - \partial_j \otimes \partial_i u + \mathfrak{d} \otimes (k + \mathfrak{s}\mathfrak{l}\mathfrak{d})u + k \otimes (k + \mathfrak{d} + \mathfrak{s}\mathfrak{l}\mathfrak{d})u.
\]

7.3. Filtration of Tensor Modules. In analogy with tensor modules for $W(\mathfrak{d})$, one can define an increasing filtration $F^p \mathcal{V}_\chi(R)$ of $\mathcal{V}_\chi(R) = H \otimes R$ by

\[
F^p \mathcal{V}_\chi(R) = F^p H \otimes R, \quad p \geq -1.
\]

Note that $F^{-1} \mathcal{V}_\chi(R) = \{0\}$ and $F^0 \mathcal{V}_\chi(R) = k \otimes R$. The associated graded space of $\mathcal{V}_\chi(R)$ is

\[
gr \mathcal{V}_\chi(R) = \bigoplus_{p \geq -1} gr^p \mathcal{V}_\chi(R), \quad gr^p \mathcal{V}_\chi(R) = F^p \mathcal{V}_\chi(R) / F^{p-1} \mathcal{V}_\chi(R).
\]

The proof of the following lemma is completely similar to that of Lemma 6.3, so we omit it.

Lemma 7.3. The action of $\tilde{S}$ on $\mathcal{V}_\chi(R)$ satisfies:

(i) $\mathfrak{d} \cdot F^p \mathcal{V}_\chi(R) \subset F^{p+1} \mathcal{V}_\chi(R)$,
(ii) $\mathcal{N}_S \cdot F^p \mathcal{V}_\chi(R) \subset F^p \mathcal{V}_\chi(R)$,
(iii) $\mathcal{S}_1 \cdot F^p \mathcal{V}_\chi(R) \subset F^{p-1} \mathcal{V}_\chi(R)$.

Lemma 7.3 implies that each $gr^p \mathcal{V}_\chi(R)$ is a module over the Lie algebra $\mathcal{N}_S / \mathcal{S}_1 \simeq \mathfrak{d} \oplus \mathfrak{s} \mathfrak{l} \mathfrak{d}$. This module is described in the next lemma.

Lemma 7.4. We have

\[
gr^p \mathcal{V}_\chi(\Pi, U) \simeq (\Pi \otimes k_{p(\text{tr ad} - \chi) / N}) \otimes (S^p \mathfrak{d} \otimes U)
\]

as $(\mathfrak{d} \oplus \mathfrak{s} \mathfrak{l} \mathfrak{d})$-modules.

Proof. Let us extend the $\mathfrak{s} \mathfrak{l} \mathfrak{d}$-action on $U$ to an action of $\mathfrak{gl} \mathfrak{d}$ by letting $\text{Id}$ act as $0$. Then, by Theorem 7.3, $\mathcal{V}_\chi(\Pi, U)$ is the restriction to $S(\mathfrak{d}, \chi)$ of the tensor $W(\mathfrak{d})$-module $\mathcal{V}(\Pi, U, 0)$. Moreover, the filtration (7.15) coincides with the one defined in Section 6.2. The structure of a $(\mathfrak{d} \oplus \mathfrak{gl} \mathfrak{d})$-module on $gr^p \mathcal{V}(\Pi, U, 0)$ is described in Corollary 6.2. Note that this describes the action of $\mathfrak{d}$. Using (7.4), we find that $\mathfrak{d}$ acts as $\Pi \otimes k_{p(\text{tr ad} - \chi) / N}$, because $\text{Id}$ acts as $p$ on $S^p \mathfrak{d} \otimes U$. \hfill $\Box$
The grading of $\tilde{S}$ can be used to endow $\mathcal{V}_\chi(R)$ with a graded module structure as follows. Recall that $\mathcal{V}_\chi(R) = \text{Ind}^\mathfrak{S}/N_{\mathfrak{S}} R$ and $\mathfrak{S} = \mathfrak{s}_{-1} \oplus N_{\mathfrak{S}}$ as a vector space. Therefore, as a vector space, $\mathcal{V}_\chi(R) = U(\mathfrak{s}_{-1}) \otimes R$. However, the Lie algebra $\mathfrak{s}_{-1}$ is commutative, because the degree $-1$ part in $S_N$ is commutative and because the isomorphism $\mathfrak{S} \simeq S_N$ is compatible with the grading (see Corollary 3.3). Then $U(\mathfrak{s}_{-1})$ is the symmetric algebra generated by $\mathfrak{s}_{-1}$, and we grade $\mathcal{V}_\chi(R)$ by letting $\mathfrak{s}_{-1}$ have degree $-1$ and $R$ have degree 0.

By definition, the above grading of $\mathcal{V}_\chi(R)$ is compatible with the grading of $\tilde{S}$. It is also compatible with the filtration (7.15).

### 7.4. Submodules of Tensor Modules

In what follows, $\mathcal{V}_\chi(R)$ will be a tensor module for $S(\mathfrak{d}, \chi)$. We will assume that $R = \Pi \boxtimes U$, where $\Pi$ (respectively $U$) is an irreducible finite-dimensional representation of $\mathfrak{d}$ (respectively $\mathfrak{s}(\mathfrak{d})$).

Recall that every element $v \in \mathcal{V}_\chi(R)$ can be expressed uniquely as a finite sum

$$v = \sum_{I \in \mathbb{P}^n} \partial(I) \otimes v_I, \quad v_I \in R.$$  

(7.17)

As in Section 6.3, nonzero elements $v_I$ are called coefficients of $v$, and we denote by $\text{coeff } M$ the subspace of $R$ linearly spanned by coefficients of elements $v \in M$.

**Lemma 7.5.** For any nontrivial proper $S(\mathfrak{d}, \chi)$-submodule $M \subset \mathcal{V}_\chi(R)$, we have $M \cap F^0 \mathcal{V}_\chi(R) = \{0\}$.

**Proof.** The action of $\mathfrak{d} \oplus \mathfrak{s}(\mathfrak{d})$ preserves both $k \otimes R$ (by the definition of $\mathcal{V}_\chi(R)$) and $M$ (because it is an $S(\mathfrak{d}, \chi)$-submodule). Thus, their intersection $M \cap F^0 \mathcal{V}_\chi(R)$ is a $(\mathfrak{d} \oplus \mathfrak{s}(\mathfrak{d}))$-submodule of $R$. Irreducibility of $R$ implies that this intersection is trivial. $\square$

**Lemma 7.6.** For any nontrivial proper $S(\mathfrak{d}, \chi)$-submodule $M \subset \mathcal{V}_\chi(R)$, we have $\text{coeff } M = R$.

**Proof.** Take an element $v \in M$ and write it in the form (7.17). For $i \neq j$, we compute $s_{ij} \ast v$ using $H$-bilinearity and Lemma 7.2. Denote by $m$ the coefficient of $1 \otimes \partial(I)$ in the expression for $s_{ij} \ast v$; then, by Remark 2.2(ii), $m \in M$. By Lemma 7.2, we have

$$m = a_{ij}(v_I) \mod F^1 H \otimes R.$$  

Note that $e^i_k v_I$ for $k \neq i$, $e^i_i v_I$ for $k \neq j$, and $(e^j_j - e^i_i)v_I$ are coefficients of $a_{ij}(v_I)$ (see (7.13)). Hence, they are coefficients of $m$, and we conclude that $(\mathfrak{d} \oplus \mathfrak{s}(\mathfrak{d}))v_I \subset \text{coeff } M$.

In order to show that $\partial \cdot v_I \subset \text{coeff } M$, we look at the degree one part of the above element $m$. Again by Lemma 7.2, it is equal to

$$\partial_i \otimes \partial_j v_I - \partial_j \otimes \partial_i v_I + \partial \otimes (k + \mathfrak{s}(\mathfrak{d}))(\text{coeff } M).$$  

Hence, the action of $\partial$ preserves coeff $M$. Then coeff $M$ is a $(\mathfrak{d} \oplus \mathfrak{s}(\mathfrak{d}))$-submodule of $R$, which is irreducible. This shows that coeff $M = R$, as it cannot be $\{0\}$. $\square$

**Lemma 7.7.** Let $M$ be a nontrivial proper $S(\mathfrak{d}, \chi)$-submodule of $\mathcal{V}(R)$. Then for every $i \neq j$ and $u \in R$, there exists an element $m \in M \cap F^2 \mathcal{V}_\chi(R)$ such that

$$m = a_{ij}(u) \mod F^1 \mathcal{V}_\chi(R),$$  

where $a_{ij}(u)$ is given by (7.13).
Lemma 7.6. As \( M = R \), it is enough to prove the statement when \( u \) is a coefficient \( v_1 \) of some element \( v \in M \). Then \( m \) is the element considered in the proof of Lemma 7.6.

Our next result describes which tensor \( S(\mathfrak{g}, \chi) \)-modules are irreducible.

**Theorem 7.4.** Let \( \Pi \) (respectively \( U \)) be an irreducible finite-dimensional module over \( \mathfrak{g} \) (respectively \( \mathfrak{sl}(2) \)). Then the \( S(\mathfrak{g}, \chi) \)-module \( V_\chi(\Pi, U) \) is irreducible if and only if \( U \) is not isomorphic to \( \Omega^n = \bigwedge^n \mathfrak{g}^* \) for any \( n \geq 0 \).

**Proof.** Recall from Theorem 6.5 that the tensor \( W(\mathfrak{g}) \)-module \( T(\Pi, \Omega^n) \) is not irreducible for \( n \geq 1 \). Then its restriction \( T_0(\Pi, \Omega^n) \) is not irreducible either. It follows from (7.8) and Proposition 5.2 that \( V_\chi(\Pi, \Omega^n) \) is not irreducible as well.

Conversely, assume that \( V_\chi(\Pi, U) \) is not irreducible, and let \( M \) be a nontrivial proper submodule. Apply \( s_{ij} \) on an element \( m \in M \) satisfying the conditions of Lemma 7.7 (for the same \( i, j \)). Then for \( i < j \) the coefficient multiplying \( 1 \otimes \partial_i \partial_j \) in the expression for \( s_{ij} \ast m \) is equal to (see Lemma 7.2):

\[
1 \otimes ((e_i^1 - e_j^1)^2 - (e_i^1 e_j^1 + e_j^1 e_i^1))u.
\]

By Remark 2.2(ii), this is an element of \( M \). Lemma 7.5 implies that this element vanishes for all \( u \in R = \Pi \otimes U \).

Note that \( h = e_i^1 - e_j^1 \), \( e = e_i^1 \), and \( f = e_i^1 \) are standard generators of a subalgebra of \( \mathfrak{sl}(2) \) isomorphic to \( \mathfrak{sl}(2) \). We know that \( h^2 - (e f + f e) \) acts trivially on \( R \). The element \( h^2 \) is a linear combination of \( h^2 - (e f + f e) \) and of the Casimir element; hence, it acts on any irreducible \( \mathfrak{sl}(2) \)-submodule \( W \subset U \) as a scalar. This means that \( \dim W = 0 \) or \( 1 \); hence, for \( i < j \) the eigenvalues of \( e_i^1 - e_j^1 \) on weight vectors can only be 0 or 1.

Recall that every irreducible \( \mathfrak{sl}(2) \)-module \( U \) has a highest weight vector, and \( U \) is uniquely determined by its highest weight (see, e.g., [Se, Chapter VII]). Let us denote by \( \lambda_{ij} \) the eigenvalue of \( e_i^1 - e_j^1 \) on the highest weight vector of \( U \). Then \( \lambda_{ij} + \lambda_{jk} = \lambda_{ik} \) but all \( \lambda_{ij} = 0 \) or 1. This implies that \( \lambda_{i,i+1} = \delta_{i,n} \) for some \( n \); in other words, \( U \) is the \( n \)-th fundamental representation, which is isomorphic to \( \Omega^{N-n} \). \( \square \)

**Corollary 7.1.** Let \( V \) be a finite \( S(\mathfrak{g}, \chi) \)-module, and let \( R \subset \text{sing} V \) be an irreducible \( (\mathfrak{g} \oplus \mathfrak{sl}(2)) \)-submodule. Assume that \( R \simeq \Pi \otimes U \) with \( U \not\simeq \Omega^n \) for any \( n \). Then as an \( H \)-module, \( H R \simeq H \otimes R \).

**Proof.** By the definition of \( V_\chi(R) \), there is a natural surjective homomorphism of \( S(\mathfrak{g}, \chi) \)-modules \( V_\chi(R) \to H R \subset V \). However, by Theorem 7.4, the tensor module \( V_\chi(R) \) is irreducible. Therefore, \( H R \simeq V_\chi(R) = H \otimes R \) is free as an \( H \)-module. \( \square \)

### 7.5 Computation of Singular Vectors

In this section, we will compute singular vectors for all tensor \( S(\mathfrak{g}, \chi) \)-modules of the form \( V_\chi(\Pi, \Omega^n) \), where \( \Pi \) is an irreducible finite-dimensional representation of \( \mathfrak{g} \) and \( \Omega^n = \bigwedge^n \mathfrak{g}^* \). This will be used in Section 7.6 for the classification of all irreducible quotients of tensor modules.

**Proposition 7.1.** For \( V = V_\chi(\Pi, \Omega^n) \), we have \( F^0 V \subset \text{sing} V \subset F^1 V \). Furthermore, if \( V = V_\chi(\Pi, k) \), then \( \text{sing} V \subset F^1 V \).
Proof. Let us consider first the case \( n = 0 \), i.e., \( V = V_\chi(\Pi, k) \). Let \( v \in V \) be a singular vector written in the form \((7.17)\). Then using \((7.12)\) and \(H\)-bilinearity, we get:

\[
\begin{align*}
  s_{ij} \ast v &= \sum_i (1 \otimes \partial^{(j)}_i) \otimes (\partial_i \otimes \partial_j v_I - \partial_j \otimes \partial_i v_I - 1 \otimes [\partial_i, \partial_j] v_I) \\
  &= \sum_i (1 \otimes \partial^{(j)}_i) \otimes (\partial_j v_I - 1 \otimes \partial_i v_I) \\
  &= - \sum_i (1 \otimes \partial^{(j)}_i) \otimes (\partial_i v_I - 1 \otimes \partial_j v_I).
\end{align*}
\]

Assume that \( v \notin F^1 V \), and choose \( I \) so that \( |I| \) is maximal among those for which \( v_I \neq 0 \). Then, by Remark 7.1, the element multiplying \( 1 \otimes \partial^{(j)}_i \) in the above expression must vanish. Hence, \( v_I = 0 \), which is a contradiction.

Now let us assume that \( n \neq 0, N \), i.e., \( \Omega^n \neq k \). We proceed as above: consider a singular vector \( v = \sum \partial^{(j)}_i \otimes v_I \) and use \((7.14)\) to compute \( s_{ij} \ast v \). Then the coefficient of \( 1 \otimes \partial^{(j)}_i \) is equal to \( a_{ij}(v_I) \mod F^1 V \). If \( |I| > 2 \) and \( v_I \neq 0 \), this contradicts Remark 7.1.

Recall that the tensor \( S(\theta, \chi)\)-module \( V = V_\chi(\Pi) \) has a filtration \( \{F^p V\} \), given by \((7.15)\). If \( v \in V \) is a nonzero singular vector, we can find a unique \( p \geq 0 \) such that \( v \in F^p V \setminus F^{p-1} V \). Note that, by Lemma 7.3, both \( F^p V \) and \( gr^p V \) are \( (\theta \oplus \mathfrak{s}(\mathfrak{d}))\)-modules, and the natural projection \( \pi^p : F^p V \rightarrow gr^p V \) is a homomorphism. Therefore, the restriction

\[
\pi^p : \text{sing} V \cap F^p V \rightarrow gr^p V
\]

is a homomorphism of \( (\theta \oplus \mathfrak{s}(\mathfrak{d}))\)-modules. Since \( \pi^p(v) \neq 0 \), we obtain that the \( \mathfrak{s}(\mathfrak{d})\)-modules \( \text{sing} V \) and \( gr^p V \) contain an isomorphic irreducible summand. We will utilize these remarks, together with the next lemma, to study singular vectors.

Lemma 7.8. Let \( V = V_\chi(\Pi, U) \), and let \( U' \) be an irreducible \( \mathfrak{s}(\mathfrak{d})\)-submodule of \( gr^p V \). Assume that \( U' \neq \Omega^m \) for any \( m \), and that \( \dim U' > \dim U \). Then the submodule \( \pi^p(\text{sing} V \cap F^p V) \subseteq gr^p V \) does not intersect \( U' \).

Proof. Let

\[
R = \Pi \boxtimes U, \quad R' = (\Pi \otimes k_{\text{tr} \mathfrak{ad} - \chi}/N) \boxtimes U'.
\]

By Lemma 7.4, \( R' \) is an irreducible \( (\theta \oplus \mathfrak{s}(\mathfrak{d}))\)-submodule of \( gr^p V \). If we assume that \( \pi^p(\text{sing} V \cap F^p V) \) intersects \( U' \), then \( \text{sing} V \cap F^p V \) contains a \( (\theta \oplus \mathfrak{s}(\mathfrak{d}))\)-submodule isomorphic to \( R' \). Now Corollary 7.1 implies that \( HR' \subseteq V \) is free as an \( H\)-module. But

\[
\dim R' = (\dim \Pi)(\dim U') > (\dim \Pi)(\dim U) = \dim R.
\]

Therefore, the \( H\)-submodule \( HR' \subseteq V \) has a larger rank than \( V = H \otimes R \), which is impossible.

Lemma 7.8 is a powerful tool for studying singular vectors, when combined with the explicit knowledge of the \( \mathfrak{s}(\mathfrak{d})\)-modules \( gr^p V \). It follows from Lemma 7.4 that \( gr^p V \) is a completely reducible \( \mathfrak{s}(\mathfrak{d})\)-module, all of whose irreducible \( \mathfrak{s}(\mathfrak{d})\)-components are contained in \( S^p \theta \otimes \mathfrak{d} \). In addition, since \( \text{sing} V \subset F^2 V \) by Proposition 7.1, we can restrict our attention to the cases \( p = 1 \) or \( 2 \). Our next result shows a typical application of these ideas.

Proposition 7.2. If \( V = V_\chi(\Pi, \Omega^n) \), \( n \neq 1 \), then \( \text{sing} V \subset F^1 V \).
Proof. Recall that \( \text{sing} \, V \subset F^2 \, V \) by Proposition 7.1. We want to show that 
\( \pi^2(\text{sing} \, V) = \{0\} \) (see (7.18)). We know from Lemma 7.4 that 
\[
\text{gr}^2 \, V \simeq (\Pi \otimes k_{(\text{tr} \, \text{ad} - \chi)/N}) \boxtimes (S^2 \, \mathfrak{d} \otimes \Omega^m).
\]
Thus, any irreducible \( \mathfrak{sl} \, \mathfrak{d} \)-submodule \( U'' \subset \text{gr}^2 \, V \) is contained in \( S^2 \, \mathfrak{d} \otimes \Omega^m \). One can check (see Lemma 7.9(iii) below) that all such \( U'' \) satisfy \( \dim \, U'' > \dim \, \Omega^m \) and 
\[
U'' \not\lesssim \Omega^m
\]
for any \( m \). Hence, we can apply Lemma 7.8 to conclude that \( \pi^2(\text{sing} \, V) \cap U' = \{0\} \). Therefore, \( \text{sing} \, V \subset F^1 \, V \).

Note that the above proof does not hold in the case \( n = 1 \), as one of the irreducible \( \mathfrak{sl} \, \mathfrak{d} \)-summands in \( S^2 \, \mathfrak{d} \otimes \Omega^1 \) is isomorphic to \( \mathfrak{d} \simeq \Omega^{N-1} \). To get a complete description of all singular vectors, we need a detailed study of the \( \mathfrak{sl} \, \mathfrak{d} \)-modules \( S^2 \, \mathfrak{d} \otimes \Omega^1 \) and \( \mathfrak{d} \otimes \Omega^m \).

Lemma 7.9. (i) For \( 1 \leq n \leq N - 1 \), we have a direct sum of \( \mathfrak{sl} \, \mathfrak{d} \)-modules: \( \mathfrak{d} \otimes \Omega^m = \Omega^{m-1} \oplus U'' \), where \( U'' \) is irreducible, \( \dim \, U'' > \dim \, \Omega^m \) and \( U'' \not\lesssim \Omega^m \) for any \( m \).

(ii) We have a direct sum of \( \mathfrak{sl} \, \mathfrak{d} \)-modules: \( S^2 \, \mathfrak{d} \otimes \Omega^1 = \mathfrak{d} \oplus U'' \), where \( U'' \) is irreducible, \( \dim \, U'' > \dim \, \Omega^1 = N \) and \( U'' \not\lesssim \Omega^m \) for any \( m \).

(iii) For \( 2 \leq n \leq N - 1 \), every irreducible \( \mathfrak{sl} \, \mathfrak{d} \)-submodule \( U'' \subset S^2 \, \mathfrak{d} \otimes \Omega^m \) satisfies \( \dim \, U'' > \dim \, \Omega^m \) and \( U'' \not\lesssim \Omega^m \) for any \( m \).

Proof. We will use Table 5 from the Reference Chapter of [OV]. Following [OV], we will denote by \( R(\Lambda) \) the irreducible representation of \( \mathfrak{sl} \, \mathfrak{d} \simeq \mathfrak{sl}_N \) with highest weight \( \Lambda \). We will denote by \( \pi_n \) the \( n \)-th fundamental weight of \( \mathfrak{sl}_N \), and we will set \( \pi_0 = \pi_N = 0 \). Note that \( R(\pi_1) = \mathfrak{d} \) is the vector representation of \( \mathfrak{sl} \, \mathfrak{d} \), and \( R(0) = k \) is the trivial one. Then we have \( S^2 \, \mathfrak{d} \simeq R(2\pi_1) \) and 
\[
\Omega^m = \Lambda^n \mathfrak{d}^* \simeq (\Lambda^n \mathfrak{d}^*)^* \simeq \Lambda^{N-n} \mathfrak{d} \simeq R(\pi_{N-n}).
\]

Using [OV], we find:
\[
R(\pi_1) \otimes R(\pi_p) \simeq R(\pi_1 + \pi_p) \oplus R(\pi_{p+1}),
\]
\[
R(2\pi_1) \otimes R(\pi_p) \simeq R(2\pi_1 + \pi_p) \oplus R(\pi_1 + \pi_{p+1}),
\]
and 
\[
\dim \, R(\pi_p) = \binom{N}{p},
\]
\[
\dim \, R(\pi_1 + \pi_p) = \frac{p}{p+1} \binom{N+1}{p} \binom{N}{p},
\]
\[
\dim \, R(2\pi_1 + \pi_p) = \frac{p}{p+2} \binom{N+2}{p+1} \binom{N}{p}.
\]

From here, it is easy to finish the proof.

Let us introduce some notation. For a \( \mathfrak{d} \)-module \( \Pi \), we set
\[
\Pi_n = \Pi \otimes k_{-n(\chi \mapsto \text{tr} \, \text{ad} - \chi)/N}, \quad \Pi' = \Pi \otimes k_{\text{tr} \, \text{ad} - \chi}.
\]
Then we can restate (7.7) as
\[
\mathcal{T}_\chi(\Pi, \Omega^n) \simeq \mathcal{V}_\chi(\Pi_n, \Omega^n),
\]
while by (7.8) we have an isomorphism of \( S(\mathfrak{d}, \chi) \)-modules
\[
\psi: \mathcal{T}_\chi(\Pi', \Omega^n) \simeq \mathcal{T}_\chi(\Pi, \Omega^n).
\]
Also, recall the $\leftarrow$-twisted pseudo de Rham complex of $W(\mathfrak{g})$-modules \((\ref{eq:twisted-pseudo-de-Rham})\). When we restrict these modules to $S(\mathfrak{g}, \chi)$, we obtain a complex of $S(\mathfrak{g}, \chi)$-modules

\[
0 \rightarrow \mathcal{T}_X(\Pi, \Omega^0) \xrightarrow{d_n} \mathcal{T}_X(\Pi, \Omega^1) \xrightarrow{d_n} \cdots \xrightarrow{d_n} \mathcal{T}_X(\Pi, \Omega^N).
\]

Note that the isomorphism $\psi$ is compatible with the filtrations (i.e., it maps each $F^p$ to $F^p$), while $d_{\Pi}$ has degree 1 (i.e., it maps each $F^p$ to $F^{p+1}$).

**Theorem 7.5.** Let $\Pi$ be an irreducible finite-dimensional $\mathfrak{g}$-module. Then we have the following equalities and isomorphisms of $(\mathfrak{g} \oplus \mathfrak{sl} \mathfrak{g})$-modules:

\begin{align*}
(i) \quad & \text{sing} \mathcal{T}_X(\Pi, \Omega^n) = F^0 \mathcal{T}_X(\Pi, \Omega^n) + d_{\Pi} F^0 \mathcal{T}_X(\Pi, \Omega^{n-1}) \\
& \simeq (\Pi_n \otimes \Omega^n) \oplus (\Pi_{n-1} \otimes \Omega^{n-1}), \quad 2 \leq n \leq N, \\
(ii) \quad & \text{sing} \mathcal{T}_X(\Pi, \Omega^1) = F^0 \mathcal{T}(\Pi, \Omega^1) + d_{\Pi} F^0 \mathcal{T}_X(\Pi, \Omega^0) + d_{\Pi} \psi d_{\Pi} F^0 \mathcal{T}_X(\Pi', \Omega^{N-1}) \\
& \simeq (\Pi_1 \otimes \Omega^1) \oplus (\Pi_0 \otimes \Omega^0) \oplus (\Pi_{-1} \otimes \Omega^{N-1}),
\end{align*}

where we use the notation from \((\ref{eq:notations})\)-(\(\ref{eq:notations}2\)).

**Proof.** Let $V = \mathcal{T}_X(\Pi, \Omega^n)$. Then by \((\ref{eq:twisted-pseudo-de-Rham}2)\), $V \simeq V_X(\Pi_n, \Omega^n)$, and by Lemma 7.4, we have an isomorphism of $(\mathfrak{g} \oplus \mathfrak{sl} \mathfrak{g})$-modules

\[
\text{gr}^p V \simeq \Pi_{n-p} \otimes (S^p \mathfrak{g} \otimes \Omega^n).
\]

In particular, $F^0 V = \text{gr}^0 V \simeq \Pi_n \otimes \Omega^n$. Note that the latter is an irreducible $(\mathfrak{g} \oplus \mathfrak{sl} \mathfrak{g})$-module. This implies the isomorphisms in (i) and (ii) above, because $d_{\Pi}$ and $\psi$ are homomorphisms and because $(\Pi')_{N-1} \simeq \Pi_{-1}$ (see \((\ref{eq:notations}19)\)).

Recall that $F^0 V \subset \text{sing} V \subset F^2 V$, and $\text{sing} V \subset F^1 V$ for $n \neq 1$ (see Propositions 7.1 and 7.2). Since $d_{\Pi}$ and $\psi$ are homomorphisms of $S(\mathfrak{g}, \chi)$-modules, they map singular vectors to singular vectors. Then it is clear that the right-hand sides of (i) and (ii) are contained in $\text{sing} V$.

Next, we describe the image of $\text{sing} V \cap F^1 V$ in $\text{gr}^1 V$ under the natural projection \((\ref{eq:projections})\). On one hand, we have

\[
\pi^1(\text{sing} V \cap F^1 V) \supset \pi^1(d_{\Pi} F^0 \mathcal{T}_X(\Pi, \Omega^{n-1})) \simeq \Pi_{n-1} \otimes \Omega^{n-1}.
\]

On the other hand, every irreducible $\mathfrak{sl} \mathfrak{g}$-submodule of $\text{gr}^1 V$ is contained in $\mathfrak{g} \otimes \Omega^n$. By Lemma 7.9(i), we have a direct sum of $\mathfrak{sl} \mathfrak{g}$-modules: $\mathfrak{g} \otimes \Omega^n = \Omega^{n-1} \oplus U'$, where $U'$ is irreducible, $\dim U' > \dim \Omega^n$ and $U' \neq \Omega^m$ for any $m$. Now, by Lemma 7.8, the image $\pi^1(\text{sing} V \cap F^1 V)$ does not intersect $\Pi_{n-1} \otimes U'$. Therefore, the above inclusion is an equality. In particular, we get statement (i).

To finish the proof of (ii), we note that

\[
\pi^2(\text{sing} V) \supset \pi^2(d_{\Pi} \psi d_{\Pi'} F^0 \mathcal{T}_X(\Pi', \Omega^{N-1})) \simeq \Pi_{-1} \otimes \Omega^{N-1}.
\]

By the same argument as above, this is an equality, because of Lemma 7.9(ii). \qed

**Remark 7.2.** It follows from Theorem 7.5 and the isomorphism \((\ref{eq:isomorphism})\) that

\[
\text{sing} \mathcal{T}_X(\Pi, \Omega^0) = F^0 \mathcal{T}_X(\Pi, \Omega^0) + \psi d_{\Pi'} F^0 \mathcal{T}_X(\Pi', \Omega^{N-1}) \\
\simeq (\Pi_0 \otimes \Omega^0) \oplus (\Pi_{-1} \otimes \Omega^{N-1}).
\]
7.6. Irreducible Finite $S(\mathfrak{d}, \chi)$-Modules. We can now complete the classification of irreducible finite $S(\mathfrak{d}, \chi)$-modules. Our first result describes all submodules of the tensor $S(\mathfrak{d}, \chi)$-module $\mathcal{T}_\chi(\Pi, \Omega^n)$.

**Lemma 7.10.** Let $\Pi$ be an irreducible finite-dimensional $\mathfrak{d}$-module, let $T^n = \mathcal{T}_\chi(\Pi, \Omega^n)$, and let $M \subset T^n$ be a nontrivial proper $S(\mathfrak{d}, \chi)$-submodule. Then:

(i) $\text{sing} M = d_\Pi F^0 T^{n-1}$, if $2 \leq n \leq N$;
(ii) $M \subset d_\Pi T^{N-1}$, if $n = N$;
(iii) $M = d_\Pi T^{n-1}$, if $2 \leq n \leq N - 1$;
(iv) $d_\Pi T^{n-1}$ is irreducible for $2 \leq n \leq N$.

**Proof.** Let $2 \leq n \leq N$, and let $M \subset T^n$ be a nontrivial proper $S(\mathfrak{d}, \chi)$-submodule. Then $\text{sing} M \subset \text{sing} T^n$ is a $(\mathfrak{d} \oplus \mathfrak{s} \mathfrak{d})$-submodule, and $M \cap F^0 T^n = \{0\}$ by Lemma 7.5. Now Theorem 7.5(i) and an argument similar to the one used in the proof of Corollary 6.5 imply part (i). Then

$$M \subset H(\text{sing} M) = d_\Pi (H(F^0 T^{n-1})) = d_\Pi T^{n-1}.$$ 

The rest of the proof of (iii) is the same as that of Lemma 6.12, while (iv) follows from (ii) and (iii).

**Remark 7.3.** Recall that the $W(\mathfrak{d})$-module $T(\Pi, \Omega^1)$ has a unique nontrivial proper $W(\mathfrak{d})$-submodule, namely $d_\Pi T(\Pi, \Omega^0)$ (see Lemma 6.12). However, the restriction $T(\Pi, \Omega^1)$ to $S(\mathfrak{d}, \chi)$ has two nontrivial proper $S(\mathfrak{d}, \chi)$-submodules:

$$d_\Pi \psi_1 d_\Pi T(\Pi', \Omega^{N-1}) \subset d_\Pi T(\Pi, \Omega^0)$$

(cf. Theorem 7.5(ii)). Because of (7.21) and the exactness of (7.22), these two $S(\mathfrak{d}, \chi)$-modules are isomorphic to the following ones:

$$\psi_1 T(\Pi', \Omega^{N-1}) \subset T(\Pi, \Omega^N).$$

Now we can state the main result of this section.

**Theorem 7.6.** Any irreducible finite $S(\mathfrak{d}, \chi)$-module is isomorphic to one of the following:

(i) Tensor modules $T_\chi(\Pi, U, 0)$, where $\Pi$ is an irreducible finite-dimensional $\mathfrak{d}$-module, and $U$ is an irreducible finite-dimensional $\mathfrak{s} \mathfrak{d}$-module not isomorphic to $\Omega^n = \Lambda^n \mathfrak{d}^*$ for any $0 \leq n \leq \dim \mathfrak{d}$;
(ii) Images $d_\Pi T_\chi(\Pi, \Omega^n)$, where $\Pi$ is an irreducible finite-dimensional $\mathfrak{d}$-module, and $1 \leq n \leq \dim \mathfrak{d} - 1$ (see (7.22)).

**Proof.** The proof is similar to that of Theorem 6.6. Let $V$ be an irreducible finite $S(\mathfrak{d}, \chi)$-module. Then, by Theorem 7.2 and (7.6), $V \simeq T/M$, where $T = T_\chi(\Pi, U)$ is a tensor module and $M \subset T$ is an $S(\mathfrak{d}, \chi)$-submodule.

If $U \not\simeq \Omega^n$ as an $\mathfrak{s} \mathfrak{d}$-module for any $n \geq 0$, then $T$ is irreducible by Theorem 7.4 and (7.6). In this case, $V \simeq T_\chi(\Pi, U)$.

Assume that $U \simeq \Omega^n$ for some $n \geq 0$; then $T \simeq T_\chi(\Pi, \Omega^n) = T^n$ is not irreducible. Because of (7.8), we can assume without loss of generality that $1 \leq n \leq N = \dim \mathfrak{d}$. Now if $2 \leq n \leq N - 1$, Lemma 7.10(iii) implies that $M = d_\Pi T^{n-1}$. By the exactness of (7.22), we get $V \simeq T^n/d_\Pi T^{n-1} \simeq d_\Pi T^n$.

Next, consider the case when $V$ is a quotient of $T^N$. Then, by Lemma 7.10(ii), we have $M \supset d_\Pi T^{N-1}$. Now Proposition 5.2 implies that $V$ is finite dimensional; hence, $S(\mathfrak{d}, \chi)$ acts trivially on it by Example 2.3, and $V$ is not irreducible.
Finally, it remains to consider the case when $V$ is a quotient of $T^1$. Note that $d_\Pi M$ is a proper $S(\mathfrak{d}, \chi)$-submodule of $T^2$; hence, by Lemma 7.10(iii), it must be either trivial or equal to $d_\Pi T^1$. First, if $d_\Pi M = \{0\}$, then $M \subset d_\Pi T^0$ and we have a surjective homomorphism $T^1/M \rightarrow T^1/d_\Pi T^0$. But $T^1/M \cong V$ is irreducible; therefore, $V \cong T^1/d_\Pi T^0 \cong d_\Pi T^1$. Second, if $d_\Pi M = d_\Pi T^1$, then $M + d_\Pi T^0 = T^1$ and we have isomorphisms $V \cong T^1/M \cong (d_\Pi T^0)/(d_\Pi T^0 \cap M)$. Since the map $d_\Pi : T^0 \rightarrow T^1$ is injective, we get that $V \cong T^0/K$ for some $S(\mathfrak{d}, \chi)$-submodule $K$ of $T^0$. This case was already considered above, because of (7.8).

Finally, for each irreducible finite $S(\mathfrak{d}, \chi)$-module $V$, we will describe the space $\text{sing} V$ of singular vectors of $V$.

**Lemma 7.11.** Let $R$ be an irreducible finite-dimensional $(\mathfrak{d} \oplus \mathfrak{sl})$-module. Then $V = \mathcal{V}_\chi(R)$ is an irreducible $S(\mathfrak{d}, \chi)$-module if and only if $\text{sing} V = F^0 V$.

**Proof.** It is clear from Lemma 7.5 that $V$ is irreducible when $\text{sing} V = F^0 V$. Conversely, assume that $V$ is irreducible. Consider the grading of $V = U(\mathfrak{sl}_1) \otimes R$ constructed at the end of Section 7.3. All homogeneous components of a singular vector are still singular, so we have to show that the only homogeneous singular vectors in $V$ are of degree zero. If $v \in \text{sing} V$ is a singular vector of negative degree, then the $\mathcal{S}$-submodule generated by $v$ is contained in the negatively graded part of $V$, which contradicts the irreducibility of $V$. Therefore, $\text{sing} V = R = F^0 V$. \hfill \square

**Theorem 7.7.** The irreducible finite $S(\mathfrak{d}, \chi)$-modules listed in Theorem 7.6 satisfy (see (7.19)):

(i) $\text{sing} T^2(\Pi, U, 0) \cong \Pi_0 \otimes U$ as $(\mathfrak{d} \oplus \mathfrak{sl})$-modules;

(ii) $\text{sing} (d_\Pi^2 T^2(\Pi, \Omega^n)) \cong \Pi_0 \otimes \Omega^n$ as $(\mathfrak{d} \oplus \mathfrak{sl})$-modules.

In particular, no two of them are isomorphic to each other.

**Proof.** The proof is similar to that of Theorem 6.7, and it uses (7.20), Theorem 7.5(i), and Lemmas 7.10(i) and 7.11. \hfill \square
