In this article, we present new integral inequalities for refined $(\alpha, h − m)$-convex functions using unified integral operators (12) and (13). The established results provide the refinements of several well-known integral and fractional integral inequalities.

1. Introduction

Convex functions are important in diverse fields of mathematics, statistics, engineering, and optimization. Especially in the formation of inequalities, they play a very vital role. In the subject of mathematical analysis, inequalities provide a significant contribution in developing classical concepts and notions. For example, inequalities well known as Cauchy–Schwarz inequality, Chebyshev inequality, Minkowski inequality, Hadamard inequality, and Jensen inequality are utilized frequently in pure and applied mathematics. It is always a challenge to extend, generalize, and refine such inequalities by considering new classes of functions. In this era, researchers are working on classical inequalities concerning fractional integral and derivative operators. It can be observed that the Hadamard inequality is studied more for many kinds of fractional integral and derivative operators than any other classical inequality, see [1–7] for more details.

The aim of this paper is to study the refinements of Hadamard and other integral inequalities recently studied in [8–11]. The consequences of these inequalities also provide refinements of fractional integral inequalities connected with the integral inequalities studied in the recent past.

The article is organized as follows. In Section 2, we suggest some preliminaries. In Section 3, the bounds of unified integral operators are given using refined $(\alpha, h − m)$-convex functions. These are the refinements of bounds already obtained in the literature. In Section 4, some applications of the main results are given in the form of fractional integral inequalities and their refinements.

2. Preliminaries

In this section, we give definitions of different kinds of convex functions and integral operators which will be useful in formulating the results of this paper. Throughout the paper, all the functions are assumed to be real-valued functions until specified.

Definition 1 (see [12]). A function $\Omega$ is called convex if

$$\Omega(tx'_1 + (1 − t)y'_1) \leq t\Omega(x'_1) + (1 − t)\Omega(y'_1),$$  \hspace{1cm} (1)

holds for all $x'_1, y'_1 \in I \subseteq \mathbb{R}$ and $t \in [0, 1]$.

Definition 2 (see [1]). A function $\Omega$ is called $(s, m)$-convex if for each $x'_1, y'_1 \in [0, v] \subseteq \mathbb{R}$, we have

$$\Omega(tx'_1 + m(1 − t)y'_1) \leq t^{s'}\Omega(x'_1) + m(1 − t)^s\Omega(y'_1),$$  \hspace{1cm} (2)

where $t \in [0, 1]$ and $(s, m) \in [0, 1]^2$. 

Definition 3 (see [13]). A function $\Omega$ is called \((a, m)\)-convex if for each $x_i', y_i' \in [0, \rho] \subseteq \mathbb{R}$, we have
\[
\Omega(t x_i' + m (1 - t) y_i') \leq t^a \Omega(x_i') + m (1 - t^a) \Omega(y_i'),
\] (3)
where \((a, m) \in [0, 1]^2\) and $t \in [0, 1]$.

Definition 4 (see [4]). Let $h_\lambda: I \longrightarrow \mathbb{R}$ is a function with $h_\lambda \equiv 0$ and $(0, 1) \subseteq I$. A function $\Omega$ is said to be \((a, h - m)\)-convex, if $\Omega, h \geq 0$ and for each $x_i', y_i' \in [0, \rho] \subseteq \mathbb{R}$, we have
\[
\Omega(t x_i' + m (1 - t) y_i') \leq h(t) \Omega(x_i') + mh(1 - t) \Omega(y_i'),
\] (4)
where $m \in [0, 1]$ and $t \in (0, 1)$.

Definition 5 (see [4]). Let $h_\lambda: I \longrightarrow \mathbb{R}$ is a function with $h_\lambda \equiv 0$ and $(0, 1) \subseteq I$. A function $\Omega$ is said to be \((a, h - m)\)-convex, if $\Omega, h \geq 0$ and for each $x_i', y_i' \in [0, \rho] \subseteq \mathbb{R}$, we have
\[
\Omega(t x_i' + m (1 - t) y_i') \leq h(t^a) \Omega(x_i') + mh(1 - t^a) \Omega(y_i'),
\] (5)
where \((a, m) \in [0, 1]^2\) and $t \in (0, 1)$.

\[
\Gamma(\cdot)\text{ is the gamma function and } \Re(\kappa) > 0.
\]

Definition 6 (see [14]). Let $h_\lambda: I \longrightarrow \mathbb{R}$ be a function with $h_\lambda \equiv 0$ and $(0, 1) \subseteq I$. A function $\Omega$ is called refined \((a, h - m)\)-convex function, if $\Omega, h \geq 0$ and for each $x_i', y_i' \in [0, \rho] \subseteq \mathbb{R}$, we have
\[
\Omega(t x_i' + m (1 - t) y_i') \leq h(t^a) h(1 - t^a) \Omega(x_i') + mh(1 - t^a) \Omega(y_i'),
\] (6)
where \((a, m) \in (0, 1]^2\) and $t \in (0, 1)$.

Inequality (6) gives refinements of several types of convexities when $0 < h(t) < 1$, see [14].

The need for integral operators in the study of fractional derivatives is of immense importance. In the recent era, integral operators are being used extensively for producing new results in the literature. For references, see [2, 4–6].

Next, we give some fundamental integral operators which are used in this paper.

Definition 7 (see [15]). Let $\Omega \in L_1|x_i', y_i'|$ and $\Delta$ be positive and increasing function having a continuous derivative on \((x_i', y_i')(\Omega)\). The left and right fractional integrals of $\Omega$ with respect to $\Delta$ on \([x_i', y_i']\) of order $\kappa$ are given by
\[
\left.\begin{array}{l}
\Gamma(\cdot)\text{ is the gamma function and } \Re(\kappa) > 0.
\end{array}\right\}
\]

Definition 8 (see [16]). Let $\Omega \in L_1|x_i', y_i'|$ and $\Delta$ be positive and increasing function having a continuous derivative on
\[
\left.\begin{array}{l}
\Gamma(\cdot)\text{ is the gamma function and } \Re(\kappa) > 0.
\end{array}\right\}
\]

Definition 9 (see [17]). Let $\Omega \in L_1|x_i', y_i'|$ and $x \in [x_i', y_i']$, also let
\[
\left.\begin{array}{l}
\Gamma(\cdot)\text{ is the gamma function and } \Re(\kappa) > 0.
\end{array}\right\}
\]
where \( E_{\gamma,\delta,k,z}^{\gamma,\delta,k,z} (t; p) \) is the extended generalized Mittag–Leﬄer function deﬁned as

\[
E_{\gamma,\delta,k,z}^{\gamma,\delta,k,z} (t; p) = \sum_{n=0}^{\infty} \frac{(t \alpha)^n}{\Gamma(n\alpha + \delta) \alpha^\alpha} p^n \frac{1}{(\alpha n + \alpha) \alpha^\alpha}. \tag{11}
\]

Proof. For the functions \( Y/x \) and \( \Delta \), the following inequality holds:

\[
J_x^\gamma \left( E_{\gamma,\delta,k,z}^{\gamma,\delta,k,z} \Delta, Y \right) \Delta' (t) \leq J_x^\gamma \left( E_{\gamma,\delta,k,z}^{\gamma,\delta,k,z} \Delta, Y \right) \Delta' (t). \tag{17}
\]

Using reﬁned \((a, h - m)\)-convexity of \( \Omega \), one can have

\[
\Omega (t) \leq (1 - \frac{t}{x - x_i})^a \left( \frac{x - t}{x - x_i} \right)^a \Omega (x_i) + m \Omega \left( \frac{x}{m} \right). \tag{18}
\]

From (17) and (18), we have the following integral inequality:
\[ \int_{x}^{x'} \int_{x}^{x'} E^{y,\beta,\kappa}_{y',\beta',\kappa'} (x, \Delta; Y) \Delta'(t) \Omega(t) \, dt \leq \int_{x}^{x'} E^{y,\beta,\kappa}_{y',\beta',\kappa'} (x, \Delta; Y) \left( \Omega(x') + m\Omega \left( \frac{x}{m} \right) \right) \]
\[ \times \int_{x}^{x'} h \left( \frac{x - t}{x - x'} \right)^{a} h \left( 1 - \left( \frac{x - t}{x - x'} \right)^{a} \right) \Delta'(t) \, dt. \]  

(19)

Using (12) of Definition 10 on the left side of inequality (19) and making change of the variable by setting \( u = x - t/x - x' \) on the right-hand side of the above inequality, we obtain

\[ \Omega \left( \frac{t - x}{y - x} \right) (x - x') (1 - \left( \frac{t - x}{y - x} \right)^{a}) \Delta'(x - u(x - x')) du. \]

(20)

Thus, we obtain

\[ \int_{x}^{x'} \int_{x}^{x'} E^{y,\beta,\kappa}_{y',\beta',\kappa'} (x, \sigma; \rho) \]
\[ \leq \int_{x}^{x'} E^{y,\beta,\kappa}_{y',\beta',\kappa'} (x, \Delta; Y) \left( \Omega(x') + m\Omega \left( \frac{x}{m} \right) \right) (x - x') h \left( \frac{u}{h}; \Delta \right). \]

(21)

Also, for \( t \in (x, y') \) and \( x \in (x', y') \), we can write

\[ \int_{x}^{x'} E^{y,\beta,\kappa}_{y',\beta',\kappa'} (x, \Delta; Y) \Delta'(t) \leq \int_{x}^{y'} E^{y,\beta,\kappa}_{y',\beta',\kappa'} (x, \Delta; Y) \Delta'(t). \]

(22)

From (22) and (23), we have the following integral inequality:

\[ \int_{x}^{y'} h \left( \frac{t - x}{y - x} \right)^{a} h \left( 1 - \left( \frac{t - x}{y - x} \right)^{a} \right) \Delta'(t) \, dt. \]

(24)

Using (13) of Definition 10 on the left-hand side and making change of the variable by setting \( v = t - x/y' - x \) on the right-hand side of the above inequality, we obtain

\[ \Omega \left( \frac{t - x}{y' - x} \right) \Delta'(x + v(y' - x)) dv. \]

(25)
Therefore,

\[
\left( \Delta_x^\gamma \Delta_y^\delta \Delta_{\tilde{k}, \tilde{\xi}} \Omega \right) (x, \sigma; p) \\
\leq \int_x^x \left( E_{k, \tilde{\xi}}^\gamma, \Delta; Y \right) \left( \Omega (y_i') + m \Omega \left( \frac{x}{m} \right) \right) (y_i' - x) H_{x_i'}^\gamma (v^\beta; h, \Delta).
\]

\hspace{1cm} \text{(26)}

Combining (21) and (26), the required inequality (16) is obtained. Hence, the proof is completed.

Next, we give the refinement of Theorem 1.

**Theorem 2.** Under the assumptions of Theorem 1, if \(0 < h(t) < 1\), then the following result holds:

\[
\left( \Delta_x^\gamma \Delta_y^\delta \Delta_{\tilde{k}, \tilde{\xi}} \Omega \right) (x, \sigma; p) + \left( \Delta_x^\gamma \Delta_y^\delta \Delta_{\tilde{k}, \tilde{\xi}} \Omega \right) (x, \sigma; p) \\
\leq \int_x^x \left( E_{k, \tilde{\xi}}^\gamma, \Delta; Y \right) \left( \Omega (x_i') + m \Omega \left( \frac{x}{m} \right) \right) (x - x_i') H_{x_i'}^\gamma (u^\alpha; h, \Delta) \\
+ \int_x^x \left( E_{k, \tilde{\xi}}^\gamma, \Delta; Y \right) \left( \Omega (y_i') + m \Omega \left( \frac{x}{m} \right) \right) (y_i' - x) H_{x_i'}^\gamma (v^\beta; h, \Delta) \\
\leq \int_x^x \left( E_{k, \tilde{\xi}}^\gamma, \Delta; Y \right) \left( x - x_i' \right) \left( \Omega (x_i') H_{x_i'}^\gamma (u^\alpha; h, \Delta) + m \Omega \left( \frac{x}{m} \right) H_{x_i'}^\gamma (1 - u^\alpha; h, \Delta) \right) \\
+ \int_x^x \left( E_{k, \tilde{\xi}}^\gamma, \Delta; Y \right) \left( y_i' - x \right) \left( \Omega (y_i') H_{x_i'}^\gamma (v^\beta; h, \Delta) + m \Omega \left( \frac{x}{m} \right) H_{x_i'}^\gamma (1 - v^\beta; h, \Delta) \right).
\]

**Proof.** From (18) and (23), one can see that, for \(0 < h(t) < 1\),

\[
\Omega (t) \leq h \left( \left( \frac{x - t}{x - x_i'} \right)^a \right) h \left( 1 - \left( \frac{x - t}{x - x_i'} \right)^a \right) \left( \Omega (x_i') + m \Omega \left( \frac{x}{m} \right) \right) \\
\leq h \left( \left( \frac{x - t}{x - x_i'} \right)^a \right) \Omega (x_i') + mh \left( 1 - \left( \frac{x - t}{x - x_i'} \right)^a \right) \Omega \left( \frac{x}{m} \right),
\]

\hspace{1cm} \text{(28)}

\[
\Omega (t) \leq h \left( \left( \frac{t - x}{y_i' - x} \right)^a \right) h \left( 1 - \left( \frac{t - x}{y_i' - x} \right)^a \right) \Omega (y_i') + m \Omega \left( \frac{x}{m} \right) \\
\leq h \left( \left( \frac{t - x}{y_i' - x} \right)^a \right) \Omega (y_i') + mh \left( 1 - \left( \frac{t - x}{y_i' - x} \right)^a \right) \Omega \left( \frac{x}{m} \right).
\]

Hence, by following the proof of Theorem 1, one can obtain (27). Hence, the proof is completed.

**Corollary 1.** Under the assumptions of Theorem 1, (16) gives the following result:
(\Delta \mathbb{F}_{\gamma, \delta, k, \eta} \Omega) (x, \sigma; p) + (\Delta \mathbb{F}_{\gamma, \delta, k, \eta} \Omega) (x, \sigma; p) \\
\leq \int_{x}^{h} (\mathbb{E}_{k, \beta, \xi} \Delta; Y) (x - x') (\Omega (x') + m \Omega \left(\frac{x}{m}\right)) H^h_x (u^\sigma; h, \Delta) \\
+ \int_{x}^{h} (\mathbb{E}_{k, \beta, \xi} \Delta; Y) (y' - x) (\Omega (y') + m \Omega \left(\frac{x}{m}\right)) H^h_{x'} (v^\sigma; h, \Delta). \quad (29)
Lemma 1. Let $\Omega : [0,\infty) \rightarrow \mathbb{R}$ be a refined $(a, h - m)$-convex function. If $\Omega(x) = \Omega(x' + y'_i - x/m)$, $x \in [x'_i, y'_i]$, and $m \in (0, 1)$, then the following inequality holds:

$$\Omega\left(\frac{x'_i + y'_i}{2}\right) \leq h\left(\frac{1}{2^a}\right)h\left(\frac{2^a - 1}{2^m}\right)(m + 1)\Omega(x). \quad (31)$$

Proof. Since $\Omega$ is refined $(a, h - m)$-convex, then following inequality holds:

$$\Omega\left(\frac{x'_i + y'_i}{2}\right) \leq h\left(\frac{1}{2^a}\right)h\left(\frac{2^a - 1}{2^m}\right)\left[\left(\frac{x - x'_i}{y'_i - x'_i}\right) + m\Omega\left(\frac{x - x'_i}{y'_i - x'_i}\right)\right]$$

$$\leq h\left(\frac{1}{2^a}\right)h\left(\frac{2^a - 1}{2^m}\right)\left(\Omega(x) + m\Omega\left(\frac{x'_i + y'_i}{2}\right)\right). \quad (32)$$

Using $\Omega(x) = \Omega(x'_i + y'_i - x/m)$ in the above inequality, we obtain (31). This completes the proof.

Remark 2.

(i) For $h(t) = t$ and $m = \alpha = 1$, (31) coincides with Lemma 1 in [9]

$$\frac{1}{h(1/2^a)(2^a - 1/2^a)(m + 1)}\Omega\left(\frac{x'_i + y'_i}{2}\right)$$

$$\times\left[\left(\frac{x - x'_i}{y'_i - x'_i}\right)\left(\frac{x'_i}{m}\right) + m\Omega\left(\frac{x'_i}{m}\right)\right]$$

$$\leq \left(\frac{x - x'_i}{y'_i - x'_i}\right)\left(\Omega(x) + m\Omega\left(\frac{x'_i}{m}\right)\right) + \Omega\left(\frac{x'_i}{m}\right)H_{\alpha, \Delta}^v\left(v^\alpha, \alpha, \Delta\right)$$

$$+ H_{\alpha, \Delta}^v\left(-v^\alpha, \alpha, \Delta\right)\left(\Omega(y'_i) + m\Omega\left(\frac{x'_i}{m}\right)\right). \quad (33)$$

Proof. For the kernel defined in (14) and function $\Delta$, the following inequality holds:

$$\int_{x'_i}^{y'_i} \left[\left(\frac{x - x'_i}{y'_i - x'_i}\right)\left(\Omega(x) + m\Omega\left(\frac{x'_i}{m}\right)\right)\right] dx \leq \int_{x'_i}^{y'_i} \left[\left(\frac{x - x'_i}{y'_i - x'_i}\right)\Omega(y'_i) + m\Omega\left(\frac{x'_i}{m}\right)\right] dx. \quad (34)$$

Using refined $(a, h - m)$-convexity of $\Omega$, we have

$$\int_{x'_i}^{y'_i} \left[\left(\frac{x - x'_i}{y'_i - x'_i}\right)\Omega(x)\Delta'(x)dx \leq \int_{x'_i}^{y'_i} \left(\frac{x - x'_i}{y'_i - x'_i}\right)dx \int_{x'_i}^{y'_i} \left(\Omega(y'_i) + m\Omega\left(\frac{x'_i}{m}\right)\right) \Delta'(x)dx. \quad (36)$$

From (34) and (35), we have the following integral inequality:

$$\Omega(x) \leq h\left(\frac{x - x'_i}{y'_i - x'_i}\right)^a h\left(1 - \left(\frac{x - x'_i}{y'_i - x'_i}\right)^a\right)\left(\Omega(y'_i) + m\Omega\left(\frac{x'_i}{m}\right)\right). \quad (35)$$

From (34) and (35), we have the following integral inequality:
Using (13) of Definition 10 on the right-hand side and making change of the variable by setting $v = x - x'_1/y'_1 - x'_1$ on the right-hand side of the above inequality, we obtain

$$\left(\Delta^\frac{\gamma y}{\delta k}, \Omega\right)(x', \sigma; p)$$

$$\leq \int_{x'_1}^{y'_1} \left( E_{\delta k} \cdot \Delta; \gamma \right) \Omega(y'_1) + m\Omega \left(\frac{x'_1}{m}\right) H^{y'_1}(\varphi; h, \Delta).$$

(37)

$$\int_{x'_1}^{y'_1} \left( E_{\delta k} \cdot \Delta; \gamma \right) \Delta'(x) \Omega(x)dx \leq \int_{x'_1}^{y'_1} \left( E_{\delta k} \cdot \Delta; \gamma \right) \Omega(y'_1) + m\Omega \left(\frac{x'_1}{m}\right)$$

$$\times \int_{x'_1}^{y'_1} h \left( \left( \frac{x - x'_1}{y'_1 - x'_1} \right)^a \right) h \left( 1 - \left( \frac{x - x'_1}{y'_1 - x'_1} \right)^a \right) \Delta'(x)dx.$$

(39)

Using (12) of Definition 10 on the left-hand side and making change of the variable on the right-hand side of the above inequality, we obtain

$$\left(\Delta^\frac{\gamma y}{\delta k}, \Omega\right)(y'_1, \sigma; p)$$

$$\leq \int_{x'_1}^{y'_1} \left( E_{\delta k} \cdot \Delta; \gamma \right) \Omega(y'_1) + m\Omega \left(\frac{x'_1}{m}\right) H^{y'_1}(\varphi; h, \Delta).$$

(40)

Now, using Lemma 1, we can write

$$\frac{1}{h(1/2^m)h(2^m - 1/2^m)} \Omega \left(\frac{x'_1 + y'_1}{2}\right) \Omega(\Delta^\frac{\gamma y}{\delta k}, \Omega)(x')dx$$

$$\leq \left(\Delta^\frac{\gamma y}{\delta k}, \Omega\right)(x', \sigma; p).$$

(42)

Again, using Lemma 1, we can write

$$\Omega \left(\frac{x'_1 + y'_1}{2}\right) \int_{x'_1}^{y'_1} \left( E_{\delta k} \cdot \Delta; \gamma \right) \Delta'(x) \Omega(x)dx$$

$$\leq h \left(\frac{1}{2^m}\right)h \left(\frac{2^m - 1}{2^m}\right) (m + 1) \int_{x'_1}^{y'_1} \left( E_{\delta k} \cdot \Delta; \gamma \right) \Delta'(x) \Omega(x)dx,$$

(43)

$$\frac{1}{h(1/2^m)h(2^m - 1/2^m)} \Omega \left(\frac{x'_1 + y'_1}{2}\right) \Omega(\Delta^\frac{\gamma y}{\delta k}, \Omega)(y'_1, \sigma; p)$$

$$\leq \left(\Delta^\frac{\gamma y}{\delta k}, \Omega\right)(y'_1, \sigma; p).$$

(44)
Inequality (33) will be obtained by using (37), (40), (42), and (44).

The following theorem is the refinement of Theorem 3. □

**Theorem 4.** Under the assumptions of Theorem 3, if $0 < h(t) < 1$, then the following refinement holds:

\[
\frac{1}{h(1/2^n)h(2^n - 1/2^n)(m + 1)}\left(\frac{x'_i + y'_i}{2}\right)
\]

\[\times\left(\left(\Delta^{\gamma_{y,\delta,k,i}}\right)(x'_i, \sigma; p) + \left(\Delta^{\gamma_{y,\delta,k,i}}\right)(y'_i, \sigma; p)\right)
\]

\[\leq \frac{1}{h(1/2^n) + mh(2^n - 1/2^n)}\left(\frac{x'_i + y'_i}{2}\right)
\]

\[\times\left(\left(\Delta^{\gamma_{y,\delta,k,i}}\right)(x'_i, \sigma; p) + \left(\Delta^{\gamma_{y,\delta,k,i}}\right)(y'_i, \sigma; p)\right)
\]

\[\leq \left(\frac{1}{\gamma_{y,\delta,k,i}}\right)(\gamma_{y,\delta,k,i}; \Delta; Y) + \left(\frac{1}{\gamma_{y,\delta,k,i}}\right)(\gamma_{y,\delta,k,i}; \Delta; Y)
\]

\[\times \left(\Omega(y'_i)H^y_{\gamma_{y,\delta,k,i}}(v^a; h, \Delta) + m\Omega\left(\frac{x'_i}{m}\right)H^y_{\gamma_{y,\delta,k,i}}(1 - v^a; h, \Delta)\right).
\]

**Proof.** From (35), one can see that, for $0 < h(t) < 1$,

\[
\Omega(x) \leq h\left(\left(\frac{x - x'_i}{y'_i - x'_i}\right)^a\right)h\left(1 - \left(\frac{x - x'_i}{y'_i - x'_i}\right)^a\right)\left(\Omega(y'_i) + m\Omega\left(\frac{x'_i}{m}\right)\right)
\]

\[\leq h\left(\left(\frac{x - x'_i}{y'_i - x'_i}\right)^a\right)\left(\Omega(y'_i) + mh\left(1 - \left(\frac{x - x'_i}{y'_i - x'_i}\right)^a\right)\right)\Omega\left(\frac{x'_i}{m}\right).
\]

Hence, by following the proof of Theorem 3, one can obtain (45). This completes the proof. □

**Corollary 3.** Under the assumptions of Theorem 3, (33) gives the following result:

\[
\frac{1}{h(1/2^n)h(2^n - 1/2^n)(m + 1)}\left(\frac{x'_i + y'_i}{2}\right)
\]

\[\times\left(\left(\Delta^{\gamma_{y,\delta,k,i}}\right)(x'_i, \sigma; p) + \left(\Delta^{\gamma_{y,\delta,k,i}}\right)(y'_i, \sigma; p)\right)
\]

\[\leq 2\left(\frac{y'_i - x'_i}{\gamma_{y,\delta,k,i}}\right)(\gamma_{y,\delta,k,i}; \Delta; Y) + \left(\frac{1}{\gamma_{y,\delta,k,i}}\right)(\gamma_{y,\delta,k,i}; \Delta; Y)
\]

\[\times \left(\Omega(y'_i)H^y_{\gamma_{y,\delta,k,i}}(v^a; h, \Delta) + m\Omega\left(\frac{x'_i}{m}\right)H^y_{\gamma_{y,\delta,k,i}}(1 - v^a; h, \Delta)\right).
\]
Now, we give the refinement of Theorem 6 in [9] in the following corollary.

**Corollary** 4. The following inequality for refined \((h - m)\)-convex function holds:

\[
\frac{1}{h^2} \left( \frac{1}{(2/1)} + m \right) \left( \frac{x'_1 + y'_1}{2} \right) \left( \left( \Delta E_{Y, k, \alpha, x^1} \right) \left( x'_1, \sigma; p, \Delta \right) + \left( \Delta E_{Y, k, \alpha, y^1} \right) \left( y'_1, \sigma; p, \Delta \right) \right) 
\]

\[
\leq \frac{1}{h} \left( \frac{1}{(2/(2/1))} + m \right) \left( \frac{x'_1 + y'_1}{2} \right) \left( \left( \Delta E_{Y, k, \alpha, x^1} \right) \left( x'_1, \sigma; p, \Delta \right) + \left( \Delta E_{Y, k, \alpha, y^1} \right) \left( y'_1, \sigma; p, \Delta \right) \right) 
\]

\[
\leq \left( \Delta E_{Y, k, \alpha, x^1} \right) \left( x'_1, \sigma; p, \Delta \right) + \left( \Delta E_{Y, k, \alpha, y^1} \right) \left( y'_1, \sigma; p, \Delta \right) 
\]

\[
\leq 2 \left( \Omega \left( y'_1 \right) + m \Omega \left( \frac{x'_1}{m} \right) \right) \left( \Delta \left( y'_1 \right) - \Delta \left( x'_1 \right) \right) \| h \|_\infty^2 
\]

\[
\leq 2 \left( \Omega \left( y'_1 \right) + m \Omega \left( \frac{x'_1}{m} \right) \right) \left( \Delta \left( y'_1 \right) - \Delta \left( x'_1 \right) \right) \| h \|_\infty^2. 
\]

**Proof.** For \( h \in L_\infty \) and \( \alpha = 1 \) in (45), one can obtain (48).

**Remark 3**

(i) For \( h(t) = t \) and \( m = 1 = \alpha \), inequality (33) coincides with Theorem 5 in [19]

(ii) For \( h(t) = t \) and \( m = 1 = \alpha \), inequality (47) coincides with Corollary 2 in [19]

By using \( 0 < h(t) < 1 \) and making different choices of functions \( h \) and \( \Delta \) and the parameters in (33), one can get the

\[
\left( \Delta E_{Y, k, \alpha, x^1} \right) \left( x, \sigma; p, \Delta \right) + \left( \Delta E_{Y, k, \alpha, y^1} \right) \left( y, \sigma; p, \Delta \right) 
\]

\[
\leq \int \left( E_{Y, k, \alpha, x^1} \right) \left( \Delta \left( x'_1 \right) \right) \left| \Omega' \left( x'_1 \right) \right| + m \left| \Omega' \left( \frac{x'_1}{m} \right) \right| \left( u^e, h, \Delta \right) 
\]

\[
= \int \left( E_{Y, k, \alpha, y^1} \right) \left( \Delta \left( y'_1 \right) \right) \left| \Omega' \left( y'_1 \right) \right| + m \left| \Omega' \left( \frac{x'_1}{m} \right) \right| \left( v^e, h, \Delta \right), 
\]

where

\[
\left( \Delta E_{Y, k, \alpha, x^1} \right) \left( x, \sigma; p, \Delta \right) = \int \left( E_{Y, k, \alpha, x^1} \right) \left( \Delta \left( t \right) \Omega' \left( t \right) \right) dt, 
\]

\[
\left( \Delta E_{Y, k, \alpha, y^1} \right) \left( x, \sigma; p, \Delta \right) = \int \left( E_{Y, k, \alpha, y^1} \right) \left( \Delta \left( t \right) \Omega' \left( t \right) \right) dt. 
\]

**Proof.** Using refined \((\alpha, h - m)\)-convexity of \( |\Omega'| \) over \( [x'_1, y'_1] \) implies
\begin{equation}
\left| \Omega'(t) \right| \leq h\left( \left( \frac{x-t}{x-x_1} \right)^{a} \right) h\left( 1 - \left( \frac{x-t}{x-x_1} \right)^{a} \right) \left( |\Omega'(x)| + m |\Omega'\left( \frac{x}{m} \right) | \right). \tag{51}
\end{equation}

Absolute value property implies the following relation:

\begin{equation}
- h\left( \left( \frac{x-t}{x-x_1} \right)^{a} \right) h\left( 1 - \left( \frac{x-t}{x-x_1} \right)^{a} \right) \left( |\Omega'(x)| + m |\Omega'\left( \frac{x}{m} \right) | \right) \leq \Omega'(t)
\end{equation}

\begin{equation}
\leq h\left( \left( \frac{x-t}{x-x_1} \right)^{a} \right) h\left( 1 - \left( \frac{x-t}{x-x_1} \right)^{a} \right) \left( |\Omega'(x)| + m |\Omega'\left( \frac{x}{m} \right) | \right). \tag{52}
\end{equation}

From (17) and the second inequality of (52), we have the following inequality:

\begin{equation}
\int_{x_1}^{x} f_x^{\beta} \left( E_{y,\delta,\kappa}^{\gamma,\delta,\kappa}, \Delta; Y \right) \Delta'(t) \Omega'(t) dt \leq \int_{x_1}^{x} h\left( \left( \frac{x-t}{x-x_1} \right)^{a} \right) h\left( 1 - \left( \frac{x-t}{x-x_1} \right)^{a} \right) \Delta'(t) dt,
\end{equation}

which leads to the following fractional integral inequality:

\begin{equation}
\left( \int_{x_1}^{x} f_x^{\beta} \left( E_{y,\delta,\kappa}^{\gamma,\delta,\kappa}, \Delta; Y \right) dt \right) \left( \frac{x-x_1}{\Delta} \right) \left( |\Omega'(x)| + m |\Omega'\left( \frac{x}{m} \right) | \right) \geq \int_{x_1}^{x} h\left( \left( \frac{x-t}{x-x_1} \right)^{a} \right) h\left( 1 - \left( \frac{x-t}{x-x_1} \right)^{a} \right) \Delta'(t) dt.
\end{equation}

Also, inequality (17) and the first inequality of (52) give the following fractional integral inequality:

\begin{equation}
\left( \int_{x_1}^{x} f_x^{\beta} \left( E_{y,\delta,\kappa}^{\gamma,\delta,\kappa}, \Delta; Y \right) dt \right) \left( \frac{x-x_1}{\Delta} \right) \left( |\Omega'(x)| + m |\Omega'\left( \frac{x}{m} \right) | \right) \geq \int_{x_1}^{x} h\left( \left( \frac{x-t}{x-x_1} \right)^{a} \right) h\left( 1 - \left( \frac{x-t}{x-x_1} \right)^{a} \right) \Delta'(t) dt.
\end{equation}

Again, using refined \((\alpha, h-m)\)-convexity of \(|\Omega'|\) over \([x_1', y_1']\), we can write

\begin{equation}
\left| \Omega'(t) \right| \leq h\left( \left( \frac{t-x}{y_1'-x} \right)^{a} \right) h\left( 1 - \left( \frac{t-x}{y_1'-x} \right)^{a} \right) \left( m |\Omega'\left( \frac{x}{m} \right) | + |\Omega'(y_1')| \right).
\end{equation}

and
\begin{equation}
\begin{aligned}
&h\left(\left(\frac{t-x}{y'_j-x}\right)^a\right)\left(1-\left(\frac{t-x}{y'_j-x}\right)^a\right)\left(m\left|\Omega\left(\frac{x}{m}\right)\right|+\left|\Omega'(y'_j)\right|\right) \leq \Omega'(t) \\
&\leq h\left(\left(\frac{t-x}{y'_j-x}\right)^a\right)\left(1-\left(\frac{t-x}{y'_j-x}\right)^a\right)\left(m\left|\Omega\left(\frac{x}{m}\right)\right|+\left|\Omega'(y'_j)\right|\right).
\end{aligned}
\end{equation}

From (22) and the second inequality of (57), the following fractional integral inequality is obtained:

\begin{equation}
\left(\Delta^\nu\mathbb{F}_{\alpha,\beta,\xi,\gamma}^{t,y,\delta,k_j} \Omega * \Delta\right)(x, \sigma; p)
\end{equation}

\begin{equation}
\leq J_x^y\left(E_{\alpha,\beta,\xi,\gamma}^{t,y,\delta,k_j} \Delta; Y\right) \left(y'_j - x\right) \left(m\left|\Omega'(y'_j)\right|\right) H_{\gamma y}^x(v^a; h, \Delta),
\end{equation}

and (22) and the first inequality of (57) give the following fractional integral inequality:

\begin{equation}
\left(\Delta^\nu\mathbb{F}_{\alpha,\beta,\xi,\gamma}^{t,y,\delta,k_j} \Omega * \Delta\right)(x, \sigma; p)
\end{equation}

\begin{equation}
\geq - J_x^y\left(E_{\alpha,\beta,\xi,\gamma}^{t,y,\delta,k_j} \Delta; Y\right) \left(y'_j - x\right) \left(m\left|\Omega'(y'_j)\right|\right) H_{\gamma y}^x(v^a; h, \Delta).
\end{equation}

Inequality (49) will be obtained by using (54), (55), (58), and (59). Hence, the proof is completed.

Next, we give refinement of Theorem 5 in the following theorem.

\begin{equation}
\left(\Delta^\nu\mathbb{F}_{\alpha,\beta,\xi,\gamma}^{t,y,\delta,k_j} \Omega * \Delta\right)(x, \sigma; p)
\end{equation}

\begin{equation}
\leq J_x^y\left(E_{\alpha,\beta,\xi,\gamma}^{t,y,\delta,k_j} \Delta; Y\right) \left(y'_j - x\right) \left(m\left|\Omega'(y'_j)\right|\right) H_{\gamma y}^x(v^a; h, \Delta)
\\
+ J_{x_1}^y\left(E_{\alpha,\beta,\xi,\gamma}^{t,y,\delta,k_j} \Delta; Y\right) \left(y'_j - x\right) \left(m\left|\Omega'(y'_j)\right|\right) H_{\gamma y}^x(v^a; h, \Delta)
\\
\leq J_x^y\left(E_{\alpha,\beta,\xi,\gamma}^{t,y,\delta,k_j} \Delta; Y\right) \left(y'_j - x\right) \left(m\left|\Omega'(y'_j)\right|\right) H_{\gamma y}^x(v^a; h, \Delta)
\\
+m\left|\Omega\left(\frac{x}{m}\right)\right| H_{\gamma y}^x(1 - v^a; h, \Delta)
\\
x \left(m\left|\Omega'(y'_j)\right|\right) H_{\gamma y}^x(v^a; h, \Delta) + m\left|\Omega\left(\frac{x}{m}\right)\right| H_{\gamma y}^x(1 - v^a; h, \Delta).
\end{equation}

\textbf{Theorem 6.} Under the assumptions of Theorem 5, if \(0 < h(t) < 1\), then the following refinement holds:

\textit{Proof.} From (51), one can see that, for \(0 < h(t) < 1\),
\[ |\Omega'(t)| \leq h\left( \left( \frac{x-t}{x-x_i} \right)^a \right) h\left( 1 - \left( \frac{x-t}{x-x_i} \right)^a \right) \left( |\Omega'(x_i)| + m |\Omega'(\frac{x}{m})| \right) \]

\[ \leq h\left( \left( \frac{x-t}{x-x_i} \right)^a \right) |\Omega'(x_i)| + mh\left( 1 - \left( \frac{x-t}{x-x_i} \right)^a \right) |\Omega'(\frac{x}{m})|. \]  

(61)

Hence, by following the proof of Theorem 5, one can obtain (60). This completes the proof. □

**Remark 4**

(i) For \( h(t) = t \) and \( m = 1 = \alpha \), inequality (49) coincides with Theorem 6 in [19]

(ii) For \( h(t) = t \) and \( m = 1 = \alpha \), inequality (62) coincides with Corollary 3 in [19]

By using \( 0 < h(t) < 1 \) and making different choices of functions \( h \) and \( \Delta \) and the parameters in (49), one can get the refinements of many well-known inequalities for different classes of convex functions which are mentioned in Remark 6 of [9].

**Corollary 5.** Under the assumptions of Theorem 5, (49) gives the following result:

\[ \left\{ \left( \Delta F^{Y,\gamma,\delta,k,x} \Omega * \Delta \right)(x, \sigma; p) + \left( \Delta F^{Y,\gamma,\delta,k,x} \Omega * \Delta \right)(x, \sigma; p) \right\} \]

\[ \leq f_x^Y(E^{\gamma,\delta,k,x}, \Delta; \gamma)(x - x_i) \left( |\Omega'(x_i)| + m |\Omega'(\frac{x}{m})| \right) + m |\Omega'(\frac{x}{m})| \]

(62)

**Corollary 6.** The following inequality for refined \((h - m)\)-convex function holds:

\[ \left\{ \left( \Delta F^{Y,\gamma,\delta,k,x} \Omega * \Delta \right)(x, \sigma; p) + \left( \Delta F^{Y,\gamma,\delta,k,x} \Omega * \Delta \right)(x, \sigma; p) \right\} \]

\[ \leq f_x^Y(E^{\gamma,\delta,k,x}, \Delta; \gamma)(x - x_i) \left( |\Omega'(x_i)| + m |\Omega'(\frac{x}{m})| \right) + m |\Omega'(\frac{x}{m})| \]

(63)

**Proof.** For \( h \in L_\infty [0,1] \) and \( \alpha = 1 \) in (60), we obtain (63). □

4. Inequalities for Fractional Integral Operators

In this section, we present the bounds of some of the fractional integral operators which will be deduced from the results of Section 3.

**Proposition 1.** Under the assumptions of Theorem 1, the following result holds:
Proposition 2. Under the assumptions of Theorem 1, the following inequality holds:

\[ \Gamma (\beta) \left( \left( \frac{\beta}{\Delta x_i}, \Omega \right) (x) + \left( \frac{\beta}{\Delta y}, \Omega \right) (y) \right) \]

\[ \leq \Delta (x - \Delta(x_i))^{\beta-1} \left( \Omega(x_i) + \mu \Omega \left( \frac{x}{m} \right) \right) (x - x_i) H_{\Delta x_i}^\beta (u^n; h, \Delta) \]

\[ + (\Delta(y_i - \Delta(x)))^{\beta-1} \left( \Omega(y_i) + \mu \Omega \left( \frac{x}{m} \right) \right) (y_i - x) H_{\Delta y_i}^\beta (v^n; h, \Delta). \]

(64)

Proof. For \( Y(t) = t^\beta; \beta > 0 \), and \( p = \sigma = 0 \) in the proof of Theorem 1, we obtain (64).

Corollary 7. For \( Y(t) = \Gamma (\beta) \mu_t^{\omega/k} \Gamma_k (\beta) \) with \( \beta > k \) and \( p = \sigma = 0 \), (12) and (13) reduce to the fractional integral operators (8) and (9), which satisfy the following upper bound:

\[ \left[ \Gamma (\beta) \left( \left( \frac{\beta}{\Delta x_i}, \Omega \right) (x) + \left( \frac{\beta}{\Delta y}, \Omega \right) (y) \right) \right] \]

\[ \leq \Delta (x - \Delta(x_i))^{\beta-1} \left( \Omega(x_i) + \mu \Omega \left( \frac{x}{m} \right) \right) (x - x_i) H_{\Delta x_i}^\beta (u^n; h, \Delta) \]

\[ + (\Delta(y_i - \Delta(x)))^{\beta-1} \left( \Omega(y_i) + \mu \Omega \left( \frac{x}{m} \right) \right) (y_i - x) H_{\Delta y_i}^\beta (v^n; h, \Delta). \]

(65)

Remark 5. For \( 0 < h(t) < 1 \), (66) gives refinement of Corollary 8 in [9].

Corollary 8. Using \( Y(t) = t^\beta \) and \( \Delta \) as identity function for \( \beta \geq 1 \) along with \( p = \sigma = 0 \), (12) and (13) give fractional integral operators \( \frac{\beta}{\Delta x_i}, \Omega(x) \) and \( \frac{\beta}{\Delta y}, \Omega(x) \) defined in [15], which satisfy the following upper bound:

\[ \Gamma (\beta) \left( \left( \frac{\beta}{\Delta x_i}, \Omega \right) (x) + \left( \frac{\beta}{\Delta y}, \Omega \right) (y) \right) \]

\[ \leq (x - x_i)^{\beta-1} \left( \Omega(x_i) + \mu \Omega \left( \frac{x}{m} \right) \right) (x - x_i) H_{\Delta x_i}^\beta (u^n; h, \Delta) \]

\[ + (y_i - x)^{\beta-1} \left( \Omega(y_i) + \mu \Omega \left( \frac{x}{m} \right) \right) (y_i - x) H_{\Delta y_i}^\beta (v^n; h, \Delta). \]

(67)

Corollary 9. Using \( Y(t) = \Gamma (\beta) \mu_t^{\omega/k} \Gamma_k (\beta) \) and \( \Delta \) as identity function along with \( p = \sigma = 0 \), (12) and (13) reduce to the fractional integral operators \( \frac{\beta}{\Delta x_i}, \Omega(x) \) and \( \frac{\beta}{\Delta y}, \Omega(x) \) given in [21], which satisfy the following upper bound:

\[ \left[ \Gamma (\beta) \left( \left( \frac{\beta}{\Delta x_i}, \Omega \right) (x) + \left( \frac{\beta}{\Delta y}, \Omega \right) (y) \right) \right] \]

\[ \leq \frac{1}{k \Gamma_k (\beta)} \left[ (x - x_i)^{\beta-1} \left( \Omega(x_i) + \mu \Omega \left( \frac{x}{m} \right) \right) \right. \]

\[ \times \left. \int_0^1 h(u^n) h(1 - u^n) du + (y_i - x)^{\beta-1} \left( \Omega(y_i) + \mu \Omega \left( \frac{x}{m} \right) \right) \right] \]

\[ \times \int_0^1 h(v^n) h(1 - v^n) dv. \]

(68)

Remark 6. For \( 0 < h(t) < 1 \), (68) gives refinement of Corollary 10 in [9].
Corollary 10. For $k = 1$ in Corollary 9, the following upper bound for Riemann–Liouville fractional integral is satisfied:

$$
\left( \frac{\Gamma(k)}{\Gamma(k-\beta)} \right) \left( \frac{\Gamma(k-\gamma)}{\Gamma(k-\beta-\gamma)} \right) \left( \frac{\Gamma(k-\alpha)}{\Gamma(k-\beta-\alpha)} \right)
$$

Remark 7. For $0 < h(t) < 1$, (69) gives refinement of Corollary 11 in [9].

Similar bounds can be obtained for Theorems 3 and 5, which we leave for the reader.

5. Conclusions

This article is about the bounds of unified integral operators via refined $(\alpha, h-m$)-convexity. The obtained results are the refinements of some already published results. Moreover, some deducible fractional integral operators and their related bounds are also given.
