### Table 1. Age-adjusted hazard ratios for mortality of marital status subgroups

| Variables     | Categories | Japan Men (N=10,684; n events=790) | Japan Women (N=11,965; n events=352) | Finland Men (N=2,524; n events=125) | Finland Women (N=9,469; n events=260) |
|---------------|------------|-----------------------------------|--------------------------------------|-------------------------------------|---------------------------------------|
|               |            | M (SD) or % HR (95% CI)           | M (SD) or % HR (95% CI)              | M (SD) or % HR (95% CI)             | M (SD) or % HR (95% CI)               |
| Marital status| Married    | 89.1 1.00                          | 71.4 1.00                            | 85.4 1.00                           | 63.5 1.00                            |
|               | Widowed    | 5.0 1.32 (0.99, 1.75)              | 21.4 1.17 (0.91, 1.50)              | 3.3 1.53 (0.67, 3.50)               | 13.1 1.48 (1.06, 2.05)               |
|               | Divorced   | 3.6 1.80 (1.34, 2.43)              | 4.9 1.35 (0.87, 2.12)               | 8.3 2.13 (1.30, 3.49)               | 16.5 0.98 (0.69, 1.40)               |
|               | Single     | 2.2 1.31 (0.84, 2.05)              | 2.3 1.58 (0.88, 2.82)               | 3.0 1.89 (0.83, 4.32)               | 6.8 1.58 (1.04, 2.40)                |

CI, confidence interval; HR, age-adjusted hazard ratio; SD, standard deviation.
