Understanding the correlation effects in unconventional topological materials, in which the fermion excitations take unusual dispersion, is an important topic in recent condensed matter physics. We study the influence of short-range four-fermion interactions on three-dimensional semi-Dirac semimetal with an unusual fermion dispersion, that is linear along two directions and quadratic along the third one. Based on renormalization group theory, we find all of 11 unstable fixed points including 5 quantum critical points, 5 bicritical points, and one tricritical point. The physical essences of the quantum critical points are determined by analyzing the susceptibility exponents for all of the source terms in particle-hole and particle-particle channels. We also verify phase diagrams of the system in the parameter space through numerically studying the flows of the four-fermion coupling parameters and behaviors of the susceptibility exponents. These results are helpful for us to understand the physical properties of candidate materials for three-dimensional semi-Dirac semimetal such as ZrTe$_5$.

I. INTRODUCTION

The past 15 years have witnessed that study about topological materials becomes one of the most important fields in condensed matter physics. Topological materials have wide potential implications as electronic devices due to their fascinating physical properties. In some topological materials, such as Dirac semimetal (DSM) including Cd$_3$As$_2$ and Na$_3$Bi, and Weyl semimetal (WSM) including TaAs, TaP, NbAs, and NbP, the low-energy fermion excitations are Dirac fermions or Weyl fermions which resemble the elementary particles in high energy physics. Thus, these materials provide a platform to verify some important concepts in high energy physics.

Besides Dirac and Weyl fermions, there could be unconventional fermions with unusual dispersion in topological materials. In double- (triple-) WSM, the fermion dispersion is quadratic (cubic) along two directions and linear along the third one. Semi-DSM emerges at the topological quantum critical point (QCP) between DSM and band insulator. For two dimensional (2D) semi-DSM, the dispersion of fermion excitations is linear along one direction and quadratic along another one. For three dimensional (3D) semi-DSM, the fermion dispersion is linear along two directions and quadratic along the third one as shown in Fig. 1. Higher spin fermions with multiband crossing have also attracted a lot of interest recently.

FIG. 1: Energy dispersion of fermions in 3D semi-DSM.

The correlation effects in Dirac and Weyl fermion systems are extensively studied, and are well understood relatively. The influence of many-body interaction on unconventional fermion systems also attracted much interest and is an important topic. There have been studies about influence of long-range Coulomb interaction, short-range four-fermion interaction, and quantum fluctuation of order parameter on some unconventional fermion systems. These studies revealed many novel behaviors, such as various quantum phase transitions, non-Fermi liquid behaviors, anisotropic screening effect etc. These studies also showed that the correlation effects in unconventional fermion systems depend on the fermion dispersion subtly. For 2D semi-DSM, Isobe et al. showed that long-range Coulomb interaction results in non-Fermi liquid behaviors in a wide intermediate energy range and marginal Fermi liquid behaviors in the lowest energy regime. However, for 3D semi-DSM, it was revealed that long-range Coulomb becomes irrelevant in the lowest energy regime and the system exhibits Fermi liquid behaviors.

There are still some important open questions about
the correlation effects in unconventional fermion systems. A insightful study about the influence of short-range four-fermion interactions on 2D semi-DSM was performed by Roy and Foster [54]. However, the effects of short-range four-fermion interactions in 3D semi-DSM is an urgent question, which is yet to be resoled. In this article, we provide a comprehensive study for this question through renormalization group (RG) theory.

II. MODEL

The free action for 3D semi-DSM can be written as

$$S_0 = \int \frac{d\omega}{2\pi} \frac{d^3 k}{(2\pi)^3} \vec{\Psi}(\omega, k) \gamma_0 (i\omega + \mathcal{H}(k)) \Psi(\omega, k),$$

where the Hamiltonian density $\mathcal{H}(k)$ is given by

$$\mathcal{H}(k) = \gamma_0 (i\nu k_1 + i\nu k_2 + iAk_3^2 \gamma_3),$$

with $\nu$ and $A$ being model parameters. $\Psi$ is four component spinor, and $\Psi = \Psi^\dagger \gamma_0$. The gamma matrices have the properties as following

$$\gamma^T_{\mu} = \gamma_{\mu},$$

$$\gamma^0_{0,2,5} = \gamma^0_{0,2,5}, \quad \gamma^1_{3} = -\gamma^1_{3},$$

$$\gamma^T_{0,2,5} = \gamma^0_{0,2,5}, \quad \gamma^T_{1,3} = -\gamma^1_{3}.$$  

The energy dispersion of fermions takes the form $E(k) = \pm \sqrt{\nu^2 k_1^2 + A^2 k_3^2}$ where $k_1^2 = k_2^2 + k_3^2$. Density of states (DOS) is given by $\rho(\omega) \propto \omega^{3/2}/(\nu \sqrt{A})$, which vanishes at the Fermi level.

The fermion action $S_0$ is invariant under the discrete transformations including parity ($P$), time-reversal ($T$), and charge conjugation ($C$). Under parity transformation, the fermion spinor fields satisfy

$$P\Psi_k P^{-1} = i\gamma_1 \gamma_2 \Psi_{-k},$$

$$P\Psi_k P^{-1} = -i\gamma_1 \gamma_2 \Psi_{-k}. $$

Utilizing time-reversal transformation, we have

$$T\Psi_k T^{-1} = -i\gamma_1 \gamma_5 \Psi_{-k},$$

$$T\Psi_k T^{-1} = \Psi_{-k} \gamma_5 \gamma_1.$$  

It should be notice that $TiT^{-1} = -i$. The realization of charge conjugation on spinor fields reads as

$$C\Psi_k C^{-1} = -i\gamma_0 \gamma_1 \Psi_{-k}^* = - (\Psi_{-k} i\gamma_1)^T,$$

$$C\Psi_k C^{-1} = - (i\gamma_1 \Psi_k)^T.$$  

The fermion action $S_0$ remains invariant under a continuous global $U(1)$ chiral rotation

$$\Psi_k \rightarrow e^{i\theta\gamma_5} \Psi_k,$$

$$\Psi_k \rightarrow \Psi_k e^{i\theta\gamma_5}.$$  

The fermion action $S_0$ is also symmetric under a discrete $Z_2$ chiral transformation

$$\Psi_k \rightarrow \gamma_5 \Psi_k,$$

$$\Psi_k \rightarrow -\Psi_{-k} \gamma_5.$$  

The $O(2)$ rotation about $z$ axis is generated by

$$R_z(\phi) = e^{i\phi \gamma_3},$$

where $\Gamma_{03} = \gamma_3 \otimes \sigma_3$. We notice that $\Gamma_{03}$ can be also expressed by $\Gamma_{03} = i\gamma_5 \gamma_0 \gamma_3$. Under the $O(2)$ transformation,

$$R_z(\phi) \hat{h}(k) R_z^{-1}(\phi) = \hat{h}(k'),$$

where

$$k'_1 = k_1 \cos(\phi) + k_2 \sin(\phi),$$

$$k'_2 = -k_1 \sin(\phi) + k_2 \cos(\phi),$$

$$k'_3 = k_3.$$  

Thus, $S_0$ is invariant under the $O(2)$ rotation. For $\phi = \pi/2$, $R_z(\pi/2) = e^{i\pi/4}$.

This is just the $C_4$ rotation about $z$ axis.

If the four-fermion interaction is weak, it is irrelevant in 3D semi-DSM, due to the vanishing DOS. However, if the four-fermion interaction is strong enough, the system could be driven to a new phase. As shown in the Appendix A, there are 12 kinds of four-fermion interactions. Due to the constraint by Fierz identity, five of them are linearly independent. Here, we consider the interacting Lagrangian as following

$$\mathcal{L}_{\text{int}} = g_1 (\bar{\Psi} \gamma_0 \Psi)^2 + g_2 (\bar{\Psi} \Psi^2)^2 + g_4 (\bar{\Psi} \gamma_0 \gamma_5 \Psi)^2 + g_5 (\bar{\Psi} \gamma_5 \Psi)^2 + g_{3z} (\bar{\Psi} \gamma_0 \gamma_3 \Psi)^2.$$  

In this article, we study the influence of four-fermion interactions on 3D semi-DSM through the RG method [62].

III. MEAN-FIELD RESULTS

In this section, taking the four-fermion interaction $g_2 (\bar{\Psi} \Psi)^2$ as an example, we firstly show the results of mean-field analysis.

Under the influence of short-range four-fermion interaction $g_2 (\bar{\Psi} \Psi)^2$, the expectation value

$$\Delta_2 = \langle \bar{\Psi} \Psi \rangle,$$  

is obtained.
At zero temperature, the equation becomes
\[ T_c/T = \frac{\Delta_2}{2g_2}. \]

Through
\[ \frac{\partial f}{\partial \Delta_2} = 0, \]
we get the self-consistent equation for \( \Delta_2 \) as following
\[ 1 = 2g_2 \int \frac{d^3k}{(2\pi)^3} \text{tanh} \left( \frac{E_{k,\Delta_2}}{2T} \right) \frac{1}{E_{k,\Delta_2}}. \]
At zero temperature, the equation becomes
\[ 1 = 2g_2 \int \frac{d^3k}{(2\pi)^3} \frac{1}{E_{k,\Delta_2}}. \]

Based on analytical calculation for Eq. (27), we find that \( \Delta_2 \) is given by
\[ \Delta_2 \approx c_1 \Lambda \left( \frac{g_2 - g_{2c}}{g_2} \right)^\frac{3}{2}, \]
if \( g_2 \) is close to \( g_{2c} \), where
\[ g_{2c} = \frac{3\pi^2 v^2 \sqrt{\Lambda}}{2A^2}, \]
and \( c_1 \approx 0.662596 \). Taking \( \Delta_2 = 0 \) for Eq. (26), we notice that the critical temperature \( T_c \) satisfies
\[ T_c \approx c_2 \Lambda \left( \frac{g_2 - g_{2c}}{g_2} \right)^\frac{3}{2}, \]
if \( g_2 \) is close to \( g_{2c} \), where \( c_2 = 1/(2\sqrt{2}a)^{\frac{3}{2}} \approx 0.622863 \).

Numerical results are shown in Figs. (2a)-(2d). In (2a), dependence of \( \Delta_2 \) on \( g_2 \) at zero temperature is depicted. Dependence of critical temperature \( T_c \) on \( g_2 \) is displayed in Fig. (2b). The behaviors of \( \Delta_2 \) at finite temperature are shown in Figs. (2c) and (2d).

**IV. RG RESULTS**

As shown in Appendix C we firstly calculate all of the corrections from the one-loop Feynman diagrams, by employing a momentum shell \( b^2 \Lambda < \sqrt{v^2 k_1^2 + A^2 k_2^2} < \Lambda \), where \( b = \epsilon^{-\ell} \) with \( \ell \) being the RG running parameter. Then, we consider these corrections, and perform RG transformations to restore the original form of the actions. Accordingly, we obtain the RG equations for \( g_a \), which can be written as
\[ \frac{dg_a}{d\ell} = \frac{3}{2} g_a + F_a(g_1, g_2, g_4, g_5, g_{3z}), \]
where \( a = 1, 2, 4, 5, 3z \). The concrete expressions of \( F_a \) can be found in Appendix C.

Solving the equations
\[ \frac{dg_a}{d\ell} |_{(g_1, g_2, g_4, g_5, g_{3z})=(g_1^*, g_2^*, g_4^*, g_5^*, g_{3z}^*)}=0, \]
we get 12 fixed points, including the trivial Gaussian fixed point \((g_1^*, g_2^*, g_4^*, g_5^*, g_{3z}^*)=(0, 0, 0, 0, 0)\) and 11 non-trivial fixed points
\[ \text{FP}_i : (g_1^*, g_2^*, g_4^*, g_5^*, g_{3z}^*)=(g_1^{i*}, g_2^{i*}, g_4^{i*}, g_5^{i*}, g_{3z}^{i*}), \]
with \( i = 1, 2, \ldots, 11 \).

Expanding the RG equations of \( g_a \) in the vicinity of a fixed point, we obtain
\[ \frac{d\delta g_a}{d\ell} = \sum_b M_ab \delta g_b, \]
where \( \delta g_a = g_a - g_a^* \). \( M \) is five dimension square matrix, and the matrix elements are expressions of \( g_1^*, g_2^*, g_4^*, g_5^*, g_{3z}^* \). From eigenvalues of \( M \) at a fixed point \((g_1^*, g_2^*, g_4^*, g_5^*, g_{3z}^*)\), we can get the properties of the fixed point. A negative (positive) eigenvalue is corresponding to a stable (unstable) eigendirection. There is one unstable direction for QCP, and there are two and three unstable directions for bicritical point (BCP) and tricritical point (TCP) respectively. Substituting the values of \( g_a^* \) at each fixed point into the expression of \( M \), we calculate the corresponding eigenvalues of \( M \). We find that FP1, FP2, FP3, FP4, and FP5 are QCPs, FP6, FP7, FP8, FP9, and FP10 are BCPs, and FP11 is a TCP. The detailed calculations are presented in Appendix D.

For a QCP, the correlation length exponent \( \nu \) is determined by the inverse of the corresponding positive eigenvalue of \( M \). For the five QCPs, \( \nu \) always satisfies
\[ \nu^{-1} = 1.5. \]
In order to determine the physical essences of the QCPs, we analyze the RG flows of all the fermion bilinear source terms in particle-hole and particle-particle channels. The source terms in particle-hole channels can be written as

\[ S_s = \Delta_X \int \frac{d\omega}{2\pi} \frac{d^3k}{(2\pi)^3} \bar{\Psi}(\omega, k) \Gamma_X \Psi(\omega, k). \] (36)

There are 12 choices for the matrix \( \Gamma_X \), which corresponds to 12 different order parameters in particle-hole channels. The source terms in particle-particle channels take the form

\[ S_s = \Delta_Y \int \frac{d\omega}{2\pi} \frac{d^3k}{(2\pi)^3} \bar{\Psi}(\omega, k) \Gamma_Y \Psi(\omega, k). \] (37)

There are 6 choices for the matrix \( \Gamma_Y \), which correspond to 6 different superconducting parings.

As presented in Appendix [13] we calculate the one-loop order corrections to the source terms as shown in Eqs. [50] and [57] induced by the four-fermion interactions as shown in Eq. [22]. Then, we include these corrections and perform RG transformations to restore the original forms of the source terms. Accordingly, through the RG transformations, we obtain the equations

\[ \tilde{\beta}_{X,Y} = H_{X,Y}(g_1, g_2, g_4, g_5, g_{3z}); \] (38)

where

\[ \tilde{\beta}_{X,Y} = \frac{d \ln (\Delta_{X,Y})}{dt} - 1. \] (39)

\( \tilde{\beta}_{X,Y} \) are termed as susceptibility exponents or anomalous dimensions for the fermion-bilinear source terms. \( H_{X,Y} \) are functions of \( g_a \) with \( a = 1, 2, 4, 5, 3z \). The concrete expressions of \( H_{X,Y} \) are shown in Appendix [13]. For a QCP, substituting the values of \( g_a \) at the QCP into Eq. [50], and finding the largest one among all of \( \tilde{\beta}_{X,Y} \), we can determine the physical meaning of the QCP.

For FP1, \( \tilde{\beta}_2 \) takes the largest value. It represents that this fixed point is corresponding to the QCP to a state in which the order parameter \( \Delta_2 = \langle \bar{\Psi} \Psi \rangle \) acquires finite value. The physical meaning of \( \Delta_2 \) is pseudoscalar mass. \( \Delta_5 \) breaks the continuous \( U(1) \) chiral symmetry, but preserves \( P, T, C \) symmetries. If \( \Delta_2 \) becomes finite, the fermion dispersion becomes \( E_{k,\Delta_2} = \sqrt{v^2 k_1^2 + A^2 k_3^2 + \Delta_2^2} \), which is gapped.

For FP2, \( \tilde{\beta}_5 \) is the largest one. It means that this fixed point stands for the QCP to a state in which the order parameter \( \Delta_5 = \langle \bar{\Psi} i g_5 \Psi \rangle \) becomes finite. The physical meaning of \( \Delta_5 \) corresponds to pseudoscalar mass. \( \Delta_5 \) breaks continuous \( U(1) \) chiral symmetry and \( C \) symmetry, but preserves \( P \) and \( T \) symmetries. Once \( \Delta_5 \) becomes finite, the corresponding fermion dispersion can be written as \( E_{k,\Delta_5} = \sqrt{v^2 k_1^2 + A^2 k_3^2 + \Delta_5^2} \).

For FP3, \( \tilde{\beta}_2 \) and \( \tilde{\beta}_5 \) are largest simultaneously. It indicates that the fixed point corresponds to the QCP to a phase in which both of \( \Delta_2 \) and \( \Delta_5 \) become finite. The parameter of this phase can be written as \( \langle \bar{\Psi} (\cos(\theta) + i g_5 \sin(\theta)) \Psi \rangle \). In the axionic insulating phase, the continuous \( U(1) \) chiral symmetry is broken. This phase represents an axionic insulator [33]. In this case, the fermion dispersion takes the form \( E_{k,\Delta_2,\Delta_5} = \sqrt{v^2 k_1^2 + A^2 k_3^2 + \Delta_2^2 + \Delta_5^2} \).

If the order parameters \( \Delta_2 \) and \( \Delta_5 \) are generated by four-fermion interactions, the continuous \( U(1) \) chiral symmetry is broken. There will be gapless Goldstone boson accompanied with breaking of continuous \( U(1) \) chiral symmetry. In real solid-state materials, some higher-order gradient terms such as \( \bar{\Psi} k^2 \Psi \), \( \bar{\Psi} k^4 \Psi \), etc. could appear in the action of free 3D semi-DSM. In this case, the action of free 3D semi-DSM breaks the continuous \( U(1) \) chiral symmetry, but still satisfies the discrete symmetries including \( P, T, \) and \( C \) symmetries. Correspondingly, if \( \Delta_2 \) and \( \Delta_5 \) are generated by four-fermion interactions, we notice that the discrete symmetry \( C \) is broken. Breaking of discrete symmetry will not lead gapless Goldstone mode.

For FP4, \( \tilde{\beta}_{7z} \) takes the largest value. It signifies that this fixed point is corresponding to the QCP to a state in which the order parameter \( \Delta_{7z} = \langle \bar{\Psi} i g_7 \gamma_3 \Psi \rangle \) becomes finite. \( \Delta_{7z} \) stands for axial magnetization along \( z \) axis. \( \Delta_{7z} \) breaks \( T \) symmetry, but preserves \( P, C \), and \( U(1) \) chiral symmetries. If \( \Delta_{7z} > 0 \), the original fermion dispersion becomes two dispersions \( E_{k,\Delta_2} \) which

\begin{table}[h]
\begin{tabular}{|c|c|c|c|c|c|}
\hline
FPC & FP2 & FP3 & FP4 & FP5 \\
\hline
Order parameter & \( \Delta_2 \) & \( \Delta_5 \) & \( \Delta_2/\Delta_5 \) & \( \Delta_{7z} \) & \( \Delta_{8z} \) \\
\hline
\end{tabular}
\end{table}

FIG. 3: (a)-(e): Flows of \( g_1, g_2, g_4, g_5, \) and \( g_{3z} \), with different initial conditions. \( g_{1,0} = 0, g_{4,0} = 0, g_{5,0} = 0, \) and \( g_{3z,0} = 0 \), are taken.

\[ \text{TABLE I: There are 5 QCPs among the 11 non-trivial unstable fixed points. The corresponding order parameters for the five QCPs are shown in the second rows.} \]
can be written as \( E_{k_{\pm}} = \sqrt{v^2 k_+^2 + (A k_0^2 \pm \Delta \gamma z)^2} \). It is easy to find that one dispersion \( E_{k_{\pm}} \) is gapped, but another dispersion \( E_{k_{\mp}} \) is gapless at two points \( k_{\pm} = (0, 0, \sqrt{\Delta / A}) \) and \( k_{\mp} = (0, 0, -\sqrt{\Delta / A}) \). At these two gapless points, the fermions dispersion takes the form \( E_{k_{\pm}} = \sqrt{v^2 K_+^2 + v_0^2 K_0^2} \), with \( v_z = 2\sqrt{A \Delta} \gamma z \) and \( k_{\pm} \) being the momentum relative to the point \( k_{\pm} \) or \( k_{\mp} \). It is obvious that this fermion dispersion is linear within \( xy \) plane and also linear along \( z \) axis.

For FPF, \( \bar{\beta}_5 \) is the largest one. It suggests that this fixed point represents the QCP to a state with finite order parameter \( \Delta_{az} = (\bar{\Psi} i \gamma_5 \Psi) \). \( \Delta_{az} \) does not break the symmetries of the free semi-DSM. The physical meaning of \( \Delta_{az} \) is current along \( z \) axis. If \( \Delta_{az} > 0 \), the fermion dispersion becomes \( E_{k_{\pm}} = \sqrt{v^2 k_+^2 + (A k_0^2 + \Delta_{az})^2} \), which is gapped.

For convenience, we summarize the corresponding order parameters for the five QCPs in Table III.

For general given initial conditions that is decided by \( (g_{1, 0}, g_{2, 0}, g_{4, 0}, g_{5, 0}, g_{3, 0}) \), we determine the corresponding phase through the flows of four-fermion coupling parameters \( g_a \) and flows of susceptibility exponents \( \bar{\beta}_{X, Y} \). We show the flows of \( g_{1, 0}, g_{2, 0}, g_{4, 0}, g_{5, 0}, \) and \( g_{3, 0} \) under several initial conditions in Fig. 3. If \( g_a \) with \( a = 1, 2, 4, 5, 3z \) approach to zero, it represents that the system is still in SM phase. If \( g_a \) flow to infinity at a finite running parameter \( \xi_0 \), the system becomes unstable to a new phase.

In order to determine the physical essence of the new phase, we calculate the flows of the susceptibility exponents \( \bar{\beta}_{X, Y} \) and compare them. For three general initial conditions, the flows of \( \bar{\beta}_{X, Y} \) and the ratio between them are presented in Figs. (a)-(f). Here we only show the susceptibility exponents that approach to positive infinity in Figs. (a), (c), and (e) respectively. For the initial condition corresponding to Figs. (a) and (b), we find that \( \bar{\beta}_2 \) flows to positive infinity most quickly. It means that scalar mass \( \Delta_2 \) is generated in the new phase. For the initial condition corresponding to Figs. (c) and (d), \( \bar{\beta}_5 \) flows to positive infinity with the largest speed. It indicates that pseudoscalar mass \( \Delta_5 \) becomes finite in the new phase. For the initial condition corresponding to Figs. (e) and (f), we notice that \( \bar{\beta}_2 \) and \( \bar{\beta}_5 \) approach to positive infinity most quickly and \( \bar{\beta}_5 / \bar{\beta}_2 \to 1 \). It represents that the system becomes to a new phase that \( \Delta_2 \) and \( \Delta_5 \) acquire finite values simultaneously. Namely, the system becomes to axionic insulating phase.

The phase diagrams on the planes composed by initial values of two four-fermion coupling parameters are shown in Fig. 3. Different phases are marked by different colors. In Figs. (a)-(j), we show all the 10 phase diagrams on the planes composed by initial values of two coupling parameters chosen from the five linearly independent coupling parameters. The initial values of rest of three coupling parameters are taken as zero. Taken Fig. (a) composed by \( g_{2, 0} \) and \( g_{5, 0} \) as an example, we can notice that there are five phases, SM, insulator with scalar mass \( \Delta_2 \), insulator characterized by pseudoscalar mass \( \Delta_5 \), axionic insulating phase, and a phase with current along \( z \) axis \( \Delta_{az} \). In Fig. (k), we present the phase diagram composed by \( g_{5, 0} \) and \( g_{3, 0} \). In this phase diagram, \( g_{1, 0}, g_{2, 0}, g_{4, 0} \) are taken as proper values so that the phase with axial magnetization along \( z \) axis \( \Delta_{az} \) appears in the phase diagram.

The behaviors in the vicinity of a QCP is generally consistent with these indicated by Sur and Roy. In 3D semi-DSM, the Yukawa coupling between quantum fluctuation of order parameter and fermion excitations becomes irrelevant in the low energy regime. Thus, the fermions should take Fermi liquid behaviors in the vicinity of a QCP between SM phase and a symmetry breaking phase in 3D semi-DSM. Concretely, the residue of fermions \( Z_f \) approaches to a finite constant value in the lowest energy limit, and the Landau damping rate of fermions \( \Gamma(\omega) \) satisfies

\[
\lim_{\omega \to 0} \frac{\Gamma(\omega)}{\omega} \to 0.
\]

(40)

Additionally, under the influence of quantum fluctuation of order parameter, the observable quantities DOS \( \rho \), specific heat \( C_v \), compressibility \( \kappa \), optical conductivities within the \( xy \) plane and along \( z \) axis \( \sigma_{\perp \perp} \) and \( \sigma_{zz} \) should respectively still take the behaviors

\[
\rho(\omega) \sim \omega^{3/2}, \quad C_v(T) \sim T^{5/2}, \quad \kappa(T) \sim T^{3/2}, \quad \sigma_{\perp \perp}(\omega) \sim \omega^{1/2}, \quad \sigma_{zz}(\omega) \sim \omega^{3/2},
\]

(41)

which are qualitatively same as the ones for free fermions.
FIG. 5: Phase diagrams on the planes of two initial values of four-fermion coupling strength. (a) $g_{2,0}$ and $g_{5,0}$; (b) $g_{2,0}$ and $g_{1,0}$; (c) $g_{2,0}$ and $g_{4,0}$; (d) $g_{2,0}$ and $g_{3,0}$; (e) $g_{5,0}$ and $g_{1,0}$; (f) $g_{5,0}$ and $g_{4,0}$; (g) $g_{5,0}$ and $g_{2,0}$; (h) $g_{1,0}$ and $g_{4,0}$; (i) $g_{1,0}$ and $g_{3,0}$; (j) $g_{4,0}$ and $g_{3,0}$; (k) $g_{5,0}$ and $g_{3,0}$ In (a)-(j), the initial values of rest four-fermion coupling parameters are taken as zero. For example, $g_{1,0} = 0$, $g_{4,0} = 0$ and $g_{3,0} = 0$ are taken in (a). In (k), $g_{1,0} = -2.3$, $g_{2,0} = 0$, and $g_{4,0} = -0.61$ are taken.

V. INTERPLAY WITH COULOMB INTERACTION

In 3D semi-DSM, the long-range Coulomb interaction becomes irrelevant in the low energy regime [37, 38]. Considering the interplay of short-range four-fermion interactions and long-range Coulomb interaction, we find that the flow of Coulomb interaction is not changed and still becomes irrelevant in the low energy regime. Whereas, the flows of four-fermion interactions are modified by Coulomb interaction. It is shown that Coulomb interaction tends to enhance the instabilities in particle-hole channels. For the case that all the initial values of four-fermion coupling strength vanish, if the Coulomb interaction is strong enough, the four-fermion interactions are generated and become divergent finally driven by the Coulomb interaction. We notice that the system is driven into axionic insulating phase in this case. The detailed derivation and numerical results are shown in Appendix F.

VI. SUMMARY

To conclude, we perform comprehensive studies about the influence of four-fermion interactions on 3D semi-DSM through RG theory. We find 11 unstable fixed points and show that five of them are QCPs, five are BCPs, and the rest one is a TCP. The physical essence of the QCPs are determined by analyzing the scalings of fermion bilinear source terms. The phase diagrams for general initial conditions are also presented through detailed numerical calculations of flows of four-fermion couplings and susceptibility exponents.

According to the theoretical study by Yang and Nagaosa [14], 3D semi-DSM state can be realized at the topological QCP between 3D DSM and band insulator. Through magneto-optics and magneto-transport, Yuan et al. observed the evidence of 3D semi-DSM phase in ZrTe$_5$ [63]. The subsequent study about magnetotransport properties of ZrTe$_5$ under hydrostatic pressure also supports the existence of 3D semi-DSM phase [64]. Recent measurements of optical spectroscopy in ZrTe$_5$ are also consistent with 3D semi-DSM phase [65, 66]. 3D semi-DSM state was also realized in pressured Cd$_3$As$_2$ [67]. Recently, Monhanta et al. showed that nonmagnetic tetragonal perovskite oxides with $I_4/mcm$ symmetry, e.g., SrNbO$_3$, CaNbO$_3$, and SrMoO$_3$, host 3D semi-Dirac fermions which are protected by a nonsymmorphic symmetry [68]. The present RG calculation results are helpful for understanding the physical properties of these candidate materials for 3D semi-DSM.

ACKNOWLEDGEMENTS

J.R.W. is grateful to Prof. G.-Z. Liu for the valuable discussions. We acknowledge the support from the Na-
four-fermion interactions (\(\bar{\Psi}\gamma^\alpha\bar{\Psi}\gamma^\beta\bar{\Psi}\gamma^\gamma\bar{\Psi}\)) reduce the number of four-fermion interactions by these symmetries. Therefore, we don’t consider the four-fermion interactions (\(\bar{\Psi}\gamma^\alpha\bar{\Psi}\gamma^\beta\bar{\Psi}\gamma^\gamma\bar{\Psi}\)) that are not allowed by the symmetries. For local interaction, we have \(F X = 0\), Thus,

\[
\begin{align*}
\left[\bar{\Psi}(x)M\Psi(x)\right] \left[\bar{\Psi}(x)N\Psi(x)\right] &= -\frac{1}{16} \text{Tr} [M\Gamma_a N\Gamma_b] [\bar{\Psi}(x)\Gamma_a \Psi(x)] \\
&\quad \times [\bar{\Psi}(y)\Gamma_b \Psi(x)] .
\end{align*}
\]

(\(A3\))

Repeat of indexes \(a\) and \(b\) in Eqs. \((A3)\) and \((A4)\) represents summation. Substituting each four-fermion coupling in Eq. \((A1)\) into Eq. \((A4)\), we could get eight equations, which can be compactly expressed by

\[
FX = 0 ,
\]

where

\[
X = \begin{pmatrix}
(\bar{\Psi}\gamma_0\Psi)^2 \\
(\bar{\Psi}\Psi)^2 \\
\sum_{j=1}^{3} (\bar{\Psi}\gamma_{j3}\Psi)^2 \\
\sum_{j=1}^{3} (\bar{\Psi}\gamma_{j2}\Psi)^2 \\
\sum_{j=1}^{3} (\bar{\Psi}\gamma_{j1}\Psi)^2
\end{pmatrix} ,
\]

\[
F = \begin{pmatrix}
5 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\
1 & 5 & -1 & -1 & -1 & 1 & 1 & 1 \\
3 & -3 & 3 & -3 & 3 & 1 & -1 & 1 \\
1 & -1 & 1 & -1 & 5 & -1 & 1 & 1 \\
1 & -1 & 1 & -1 & 5 & -1 & 1 & 1 \\
3 & 3 & 1 & -3 & -3 & 3 & 1 & -1 \\
3 & 3 & -1 & 3 & 3 & -1 & 3 & -1 \\
3 & -3 & 1 & 3 & -3 & 1 & 1 & -1
\end{pmatrix} .
\]

It is easy to verify that rank of \(F\) is 4, namely

\[
\text{Rank}(F) = 4 .
\]

Then, the number of linearly independent couplings is

\[
8 - \text{Rank}(F) = 4 .
\]

For convenience, we take the four couplings \((\bar{\Psi}\gamma_0\Psi)^2, (\bar{\Psi}\Psi)^2, (\bar{\Psi}\gamma_{j3}\Psi)^2, (\bar{\Psi}\gamma_{j2}\Psi)^2\) \((A10)\) as linearly independent couplings. The other couplings

\[
\begin{align*}
\sum_{j=1}^{3} (\bar{\Psi}\gamma_{j3}\Psi)^2 , & \sum_{j=1}^{3} (\bar{\Psi}\gamma_{j2}\Psi)^2 , \\
\sum_{j=1}^{3} (\bar{\Psi}\gamma_{j1}\Psi)^2 , & \sum_{j=1}^{3} (\bar{\Psi}\gamma_{j0}\Psi)^2 
\end{align*}
\]
can be expressed by the four independent couplings shown in Eq. (A10). In order to obtain the concrete expressions for other couplings, we define

\[
\tilde{X} = \begin{pmatrix}
\sum_{j=1}^{3} (\bar{\Psi} \gamma_0 \gamma_j \Psi)^2 \\
\sum_{\langle k \rangle} (\bar{\Psi} i \gamma_k \gamma_j \Psi)^2 \\
\sum_{j=1}^{3} (\bar{\Psi} i \gamma_j \gamma_0 \Psi)^2 \\
(\bar{\Psi} \gamma_0 \Psi)^2 \\
(\bar{\Psi} \gamma_5 \Psi)^2 \\
(\bar{\Psi} i \gamma_5 \Psi)^2
\end{pmatrix}.
\]

(A12)

It is easy to find that

\[
\tilde{F} \tilde{X} = 0,
\]

(A13)

where

\[
\tilde{F} = \begin{pmatrix}
1 & 1 & 1 & 1 & 5 & 1 & 1 & 1 \\
-1 & 1 & 1 & -1 & 1 & 5 & -1 & -1 \\
3 & 1 & -1 & 1 & 3 & -3 & -3 & 3 \\
-1 & -1 & 1 & 1 & 1 & -1 & 5 & -1 \\
1 & -1 & 1 & -1 & 1 & -1 & -1 & 5 \\
1 & 3 & -1 & 1 & 3 & 3 & -3 & -3 \\
-1 & -1 & 3 & -1 & 3 & 3 & 3 & 3 \\
1 & 1 & -1 & 3 & 3 & -3 & 3 & -3
\end{pmatrix}.
\]

(A14)

Performing a series of similarity transformations for \(\tilde{F}\),

\[
\tilde{F} \rightarrow \tilde{F}',
\]

(A15)

2. Fierz identity for 3D semi-DSM

For 3D semi-DSM, the interacting Lagrangian density is described by

\[
\mathcal{L}_{\text{int}} = g_1 (\bar{\Psi} \gamma_0 \Psi)^2 + g_2 (\bar{\Psi} \Psi)^2 + g_{3\perp} \sum_{j=1}^{2} (\bar{\Psi} \gamma_0 \gamma_j \Psi)^2 + g_{3z} (\bar{\Psi} \gamma_0 \gamma_3 \Psi)^2 + g_4 (\bar{\Psi} \gamma_0 \gamma_5 \Psi)^2 + g_5 (\bar{\Psi} i \gamma_5 \Psi)^2
\]

\[
+ g_{6\perp} \sum_{\langle k \rangle} (\bar{\Psi} i \gamma_k \gamma_j \Psi)^2 + g_{6z} (\bar{\Psi} i \gamma_1 \gamma_2 \Psi)^2 + g_{7\perp} \sum_{j=1}^{2} (\bar{\Psi} i \gamma_j \gamma_5 \Psi)^2 + g_{7z} (\bar{\Psi} i \gamma_5 \gamma_3 \Psi)^2
\]

\[
+ g_{8\perp} \sum_{j=1}^{2} (\bar{\Psi} i \gamma_j \Psi)^2 + g_{8z} (\bar{\Psi} i \gamma_3 \Psi)^2,
\]

(A22)

where

\[
\sum_{\langle k \rangle} (\bar{\Psi} i \gamma_k \Psi)^2 = \left( (\bar{\Psi} i \gamma_2 \gamma_3 \Psi)^2 + (\bar{\Psi} i \gamma_3 \gamma_1 \Psi)^2 \right).
\]

(A23)

As shown in Eq. (A11), there are 8 four-fermion couplings for 3D DSM. However, we consider 12 kinds of four-fermion couplings as shown in Eq. (A22) for 3D semi-DSM, due to the anisotropy of the fermion dispersion.
After careful derivation, as shown in Table II we obtain the properties of each fermion biliner under the parity ($P$), time-reversal ($T$), charge conjugation ($C$), and $Z_2$ chiral, $U(1)$ chiral, and $O(2)$ rotation transformations. We reduce 136 possible four-fermion interactions ($\Psi M \Psi)(\bar{\Psi} N \Psi)$ by imposing discrete transformations including $P$, $T$, $C$, and $Z_2$ chiral symmetries. It is easy to find that both of $(\Psi M \Psi)$ and $(\bar{\Psi} N \Psi)$ should be either even or odd under $P$, $T$, $C$, and $Z_2$ transformations, such that the four-fermion interaction is invariant under all these four individual discrete symmetries. We can find that there are no two identical rows under these four symmetry transformations in Table II Therefore, there exists no interaction term $(\bar{\Psi} M \Psi)(\Psi N \Psi)$ with $M \neq N$ that mixes any two different fermion bilinears.

Substituting each four-fermion coupling in Eq. (A22) into Eq. (A4), we could get 12 equations, which can be compactly expressed by

$$FX = 0,$$

where

$$X = \begin{pmatrix}
(\Psi \gamma_0 \Psi)^2 \\
(\bar{\Psi} \Psi)^2 \\
\sum_{j=1}^{2} (\Psi \gamma_0 \gamma_j \Psi)^2 \\
(\Psi \gamma_0 \gamma_3 \Psi)^2 \\
(\bar{\Psi} \gamma_0 \gamma_3 \Psi)^2 \\
(\bar{\Psi} i \gamma_2 \Psi)^2 \\
\sum_{j=1}^{2} (\bar{\Psi} i \gamma_5 \gamma_j \Psi)^2 \\
(\bar{\Psi} i \gamma_5 \gamma_3 \Psi)^2 \\
(\bar{\Psi} i \gamma_7 \Psi)^2 \\
(\bar{\Psi} i \gamma_3 \Psi)^2
\end{pmatrix},$$

(A25)
and

\[
F = \begin{pmatrix}
5 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\
1 & 5 & -1 & -1 & -1 & -1 & 1 & 1 & 1 & 1 & -1 \\
1 & -1 & 2 & -1 & -1 & 1 & 0 & 1 & 0 & -1 & 0 \\
1 & -1 & -1 & 5 & -1 & 1 & 1 & -1 & 1 & 1 & -1 \\
1 & -1 & -1 & -1 & 5 & -1 & -1 & -1 & 1 & 1 & 1 \\
1 & -1 & 1 & 1 & -1 & 1 & -1 & -1 & 1 & 1 & -1 \\
1 & 1 & 0 & 1 & -1 & 2 & -1 & 0 & -1 & 0 & 1 \\
1 & 1 & 1 & -1 & -1 & -1 & 5 & -1 & 1 & 1 & -1 \\
1 & 1 & 0 & -1 & 1 & 1 & 0 & -1 & 2 & 1 & 0 \\
1 & 1 & -1 & 1 & 1 & -1 & 1 & -1 & 5 & -1 & 1 \\
1 & -1 & 1 & -1 & 1 & -1 & 1 & -1 & 1 & -1 & 5
\end{pmatrix}.
\]

(A26)

It is easy to find that

\[
\text{Rank}(F) = 7.
\]

(A27)

Then the number of linearly independent couplings is

\[
12 - \text{Rank}(F) = 5.
\]

(A28)

For convenience, we take the five couplings

\[
(\bar{\Psi}\gamma_0\Psi)^2, \quad (\bar{\Psi}\Psi)^2, \quad (\bar{\Psi}\gamma_0\gamma_5\Psi)^2, \quad (\bar{\Psi}i\gamma_2\Psi)^2, \quad (\bar{\Psi}\gamma_0\gamma_3\Psi)^2,
\]

(A29)

as linearly independent couplings. The other couplings

\[
\sum_{j=1}^{2} (\bar{\Psi}\gamma_j\Psi)^2, \quad \sum_{<\langle k\rangle>} (\bar{\Psi}i\gamma_j\gamma_k\Psi)^2, \quad (\bar{\Psi}i\gamma_1\gamma_2\Psi)^2, \quad \sum_{j=1}^{2} (\bar{\Psi}i\gamma_5\gamma_j\Psi)^2, \quad (\bar{\Psi}i\gamma_5\gamma_3\Psi)^2,
\]

(A30)

can be expressed by the five independent couplings shown in Eq. (A29). In order to obtain the concrete expressions for other couplings, we define

\[
\tilde{X} = \begin{pmatrix}
\sum_{j=1}^{2} (\bar{\Psi}\gamma_j\Psi)^2 \\
\sum_{<\langle k\rangle>} (\bar{\Psi}i\gamma_j\gamma_k\Psi)^2 \\
(\bar{\Psi}i\gamma_1\gamma_2\Psi)^2 \\
\sum_{j=1}^{2} (\bar{\Psi}i\gamma_5\gamma_j\Psi)^2 \\
(\bar{\Psi}i\gamma_{5}\Psi)^2 \\
\sum_{j=1}^{2} (\bar{\Psi}\gamma_j\Psi)^2 \\
(\bar{\Psi}\gamma_0\Psi)^2 \\
(\bar{\Psi}\Psi)^2 \\
(\bar{\Psi}\gamma_0\gamma_2\Psi)^2 \\
(\bar{\Psi}\gamma_0\gamma_3\Psi)^2 \\
(\bar{\Psi}\gamma_0\gamma_5\Psi)^2 \\
(\bar{\Psi}i\gamma_5\Psi)^2 \\
(\bar{\Psi}i\gamma_0\gamma_3\Psi)^2
\end{pmatrix}.
\]

(A31)

It is easy to get that

\[
\bar{F}\tilde{X} = 0.
\]

(A32)
where

\[ F = \begin{pmatrix}
1 & 1 & 1 & 1 & 1 & 5 & 1 & 1 & 1 & 1 \\
-1 & 1 & 1 & 1 & 1 & -1 & -1 & 5 & -1 & -1 \\
2 & 0 & 1 & 0 & -1 & 0 & 1 & -1 & -1 & 1 \\
-1 & 1 & -1 & -1 & 1 & 1 & -1 & 1 & 1 & 5 \\
-1 & -1 & -1 & 1 & 1 & 1 & 1 & -1 & 5 & -1 \\
1 & -1 & -1 & 1 & 1 & -1 & -1 & -1 & 5 & 1 \\
0 & 2 & -1 & 0 & -1 & 0 & 1 & 1 & -1 & 1 \\
1 & -1 & 5 & -1 & 1 & 1 & -1 & 1 & -1 & -1 \\
0 & 0 & -1 & 2 & -1 & 0 & -1 & 1 & 1 & 1 \\
-1 & -1 & 1 & -1 & 5 & -1 & 1 & 1 & 1 & 1 \\
0 & 0 & 1 & 0 & -1 & 2 & -1 & -1 & 1 & -1
\end{pmatrix}. \tag{A33}

Carrying out a series of similarity transformations for \( F \),

\[ F \rightarrow F', \tag{A34} \]

we arrive

\[ F'X = 0, \tag{A35} \]

where

\[ F' = \begin{pmatrix}
1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & -1 & -1 & 2 & 1 \\
0 & 1 & 0 & 0 & 0 & 0 & 1 & 1 & -1 & 0 & 1 \\
0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & -1 & -1 \\
0 & 0 & 0 & 1 & 0 & 0 & 1 & 1 & 1 & 0 & -1 \\
0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 1 \\
0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 1 & 0 & 1 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0
\end{pmatrix}. \tag{A36} \]

Eq. (A35) can be also written as

\[ \sum_{j=1}^{2} (\bar{\psi}\gamma_{0}\gamma_{j}\psi)^{2} = -(\bar{\psi}\gamma_{0}\psi)^{2} + (\bar{\psi}\psi)^{2} + (\bar{\psi}\gamma_{0}\gamma_{5}\psi)^{2} - 2(\bar{\psi}\gamma_{5}\psi)^{2} - (\bar{\psi}\gamma_{0}\gamma_{3}\psi)^{2}, \tag{A37} \]

\[ \sum_{\langle l<k \rangle} (\bar{\psi}\gamma_{1}\gamma_{k}\psi)^{2} = -(\bar{\psi}\gamma_{0}\psi)^{2} - (\bar{\psi}\psi)^{2} + (\bar{\psi}\gamma_{0}\gamma_{5}\psi)^{2} - (\bar{\psi}\gamma_{0}\gamma_{3}\psi)^{2}, \tag{A38} \]

\[ (\bar{\psi}\gamma_{1}\gamma_{2}\psi)^{2} = -(\bar{\psi}\psi)^{2} + (\bar{\psi}\gamma_{5}\psi)^{2} + (\bar{\psi}\gamma_{0}\gamma_{3}\psi)^{2}, \tag{A39} \]

\[ \sum_{j=1}^{2} (\bar{\psi}\gamma_{5}\gamma_{j}\psi)^{2} = -(\bar{\psi}\gamma_{0}\psi)^{2} - (\bar{\psi}\psi)^{2} - (\bar{\psi}\gamma_{0}\gamma_{5}\psi)^{2} + (\bar{\psi}\gamma_{0}\gamma_{3}\psi)^{2}, \tag{A40} \]

\[ (\bar{\psi}\gamma_{5}\gamma_{3}\psi)^{2} = -(\bar{\psi}\gamma_{0}\psi)^{2} - (\bar{\psi}\gamma_{5}\psi)^{2} - (\bar{\psi}\gamma_{0}\gamma_{3}\psi)^{2}, \tag{A41} \]

\[ \sum_{j=1}^{2} (\bar{\psi}\gamma_{5}\psi)^{2} = -(\bar{\psi}\gamma_{0}\psi)^{2} + (\bar{\psi}\psi)^{2} - (\bar{\psi}\gamma_{0}\gamma_{5}\psi)^{2} - (\bar{\psi}\gamma_{0}\gamma_{3}\psi)^{2}, \tag{A42} \]

\[ (\bar{\psi}\gamma_{5}\psi)^{2} = -(\bar{\psi}\gamma_{0}\gamma_{5}\psi)^{2} + (\bar{\psi}\gamma_{5}\psi)^{2} + (\bar{\psi}\gamma_{0}\gamma_{3}\psi)^{2}. \tag{A43} \]

**Appendix B: Mean-field analysis**

Here taking the short-range four-fermion interaction \( g_{2} (\bar{\psi}\psi)^{2} \) as an example, we give the details of the derivation and calculation for the mean-field analysis. Analysis
1. Derivation of the self-consistent equation

Under the influence of short-range four-fermion interaction $g_2 \left( \bar{\Psi} \Psi \right)^2$, the expectation value

$$\Delta_2 = \langle \bar{\Psi} \Psi \rangle,$$

(B1)

could become finite. Considering the order parameter $\Delta_2$, the fermion propagator can be written as

$$G(i\omega, k, \Delta_2) = \left[ i\omega\gamma_0 + iV(k_1\gamma_1 + k_2\gamma_2) + iAK_3^2\gamma_3 + \Delta_2 \right]^{-1}. \quad (B2)$$

For finite temperature, we employ the propagator in Matsubara formalism as following

$$G(i\omega_n, k, \Delta_2) = \left[ i\omega_n\gamma_0 + iV(k_1\gamma_1 + k_2\gamma_2) + iAK_3^2\gamma_3 + \Delta_2 \right]^{-1}, \quad (B3)$$

where $\omega_n = (2n+1)\pi T$ with $n$ being integers and $T$ the temperature.

The partition functions is given by

$$Z = \int \mathcal{D}\bar{\Psi} \mathcal{D}\Psi e^{S},$$

$$= \prod_{\omega_n} \prod_k \left[ \int \mathcal{D}\bar{\Psi} \mathcal{D}\Psi e^{\bar{\Psi}G^{-1}(i\omega_n, k, \Delta_2)\Psi} \right] \times e^{-\int d\tau \int d^3k \frac{\Delta_2^2}{2g_2}}, \quad (B4)$$

where $\beta = \frac{1}{T}$. Using the functional integral formula

$$\int \mathcal{D}\bar{\eta} \mathcal{D}\eta e^{\bar{\eta}K\eta} = \det K, \quad (B5)$$

we get

$$Z = \prod_{\omega_n} \prod_k \beta^4 \det \left[ G^{-1}(i\omega_n, k, \Delta_2) \right] \times e^{-\int d\tau \int d^3k \frac{\Delta_2^2}{2g_2}}, \quad (B6)$$

which leads to

$$\ln Z = \sum_{\omega_n} \sum_k \ln \left\{ \beta^4 \det \left[ G^{-1}(i\omega_n, k, \Delta_2) \right] \right\}$$

$$- \int d\tau \int d^3k \frac{\Delta_2^2}{2g_2}. \quad (B7)$$

It is easy to obtain

$$\det \left[ G^{-1}(i\omega_n, k, \Delta_2) \right] = \left( \omega_n^2 + E_{k,\Delta_2}^2 \right)^2, \quad (B8)$$

where

$$E_{k,\Delta_2} = \sqrt{\omega_n^2 + AK_3^4 + \Delta_2^2}. \quad (B9)$$

Thus, we arrive

$$\ln Z = \sum_{\omega_n} \sum_k \ln \left[ \beta^4 \left( \omega_n^2 + E_{k,\Delta_2}^2 \right)^2 \right]$$

$$- \int d\tau \int d^3k \frac{\Delta_2^2}{2g_2}. \quad (B10)$$

Carrying out the summarization of frequency, we get

$$\ln Z = 4 \sum_k \ln \left[ 2 \cosh \left( \frac{E_{k,\Delta_2}}{2T} \right) \right] - \beta V \frac{\Delta_2^2}{2g_2} \quad (B11)$$

where $V$ is volume of sample.

The free energy density $f$ and free energy $F$ are defined as

$$f = \frac{F}{V} = -\frac{1}{\beta} \ln Z \quad (B12)$$

Taking the continuous limit by using the replacement

$$\frac{1}{\beta} \sum_k \to \int \frac{d^3k}{(2\pi)^3}, \quad (B13)$$

we obtain

$$f = -4T \int \frac{d^3k}{(2\pi)^3} \ln \left[ 2 \cosh \left( \frac{E_{k,\Delta_2}}{2T} \right) \right] + \frac{\Delta_2^2}{2g_2} \quad (B14)$$

The self-consistent equation for $\Delta_2$ is determined by

$$\frac{\partial f}{\partial \Delta_2} = 0. \quad (B15)$$

Concretely, the self-consistent equation is given by

$$1 = 2g_2 \int \frac{d^3k}{(2\pi)^3} \tanh \left( \frac{E_{k,\Delta_2}}{2T} \right) \frac{1}{E_{k,\Delta_2}}. \quad (B16)$$

At zero temperature, the equation becomes

$$1 = 2g_2 \int \frac{d^3k}{(2\pi)^3} \frac{1}{E_{k,\Delta_2}}. \quad (B17)$$

2. Solving the self-consistent equation

a. Zero temperature

At zero temperature, the self-consistent equation can be written as

$$1 = 2g_2 \int \frac{d^3k}{(2\pi)^3} \frac{1}{\sqrt{\omega_n^2 + AK_3^4 + \Delta_2^2}} \quad (B18)$$
We employing the transformations

\[ E = \sqrt{v^2 q_{\perp}^2 + A^2 q_3^4}, \quad \delta = \frac{A g_2^2}{v q_{\perp}}, \]  

(B19)

which are equivalent to

\[ q_{\perp} = \frac{E}{v \sqrt{1 + \delta^2}}, \quad |q_3| = \frac{\sqrt{\delta v E}}{\sqrt{A (1 + \delta^2)^\frac{3}{2}}}. \]  

(B20)

The integration measures satisfy the relation

\[ dq_{\perp} d|q_3| = \frac{\sqrt{E}}{2 v \sqrt{\Lambda} \sqrt{\delta (1 + \delta^2)^\frac{3}{2}}} dE d\delta. \]  

(B21)

Utilizing the transformations Eqs. (B19)–(B21), we obtain

\[ 1 = \frac{g_2}{2 \pi^2 v^2 \sqrt{A}} \int_0^\Lambda dE \frac{E^\frac{3}{2}}{E^2 + \Delta_2^2} \int_0^\infty d\delta \frac{1}{\sqrt{\delta (1 + \delta^2)^\frac{3}{2}}} \]

\[ = \frac{g_2 \Lambda^\frac{3}{2}}{2 \pi^2 v^2 \sqrt{A}} \int_0^\Lambda dE \frac{E^\frac{3}{2}}{E^2 + \Delta_2^2}. \]  

(B22)

It can be further written as

\[ 1 = \frac{g_2 \Lambda^\frac{3}{2}}{2 \pi^2 v^2 \sqrt{A}} \left[ \int_0^1 dx \left( \frac{x^\frac{3}{2}}{\sqrt{x^2 + (\Delta_2^2)^\frac{3}{2}}} - x^\frac{3}{2} \right) \right. \]

\[ + \frac{2}{3} \left. \right]. \]  

(B23)

Taking \( \Delta_2 = 0 \), we can get the critical coupling strength \( g_{2c} \), which satisfies

\[ g_{2c} = \frac{3 \pi^2 v^2 \sqrt{A}}{2 \Lambda^\frac{3}{2}}. \]  

(B24)

In the limit \( \Delta_2 \ll \Lambda \), we have

\[ 1 \approx \frac{2 g_2 \Lambda^\frac{3}{2}}{3 \pi^2 v^2 \sqrt{A}} \left[ 1 - \frac{\Gamma \left( \frac{1}{2} \right) \Gamma \left( \frac{5}{4} \right)}{\sqrt{\pi}} \left( \frac{\Delta_2}{\Lambda} \right)^{\frac{3}{2}} \right] \]

\[ = \frac{g_2}{g_{2c}} \left[ 1 - \frac{\Gamma \left( \frac{1}{2} \right) \Gamma \left( \frac{5}{4} \right)}{\sqrt{\pi}} \left( \frac{\Delta_2}{\Lambda} \right)^{\frac{3}{2}} \right]. \]  

(B25)

Thus, \( \Delta_2 \) is given by

\[ \Delta_2 \approx c_1 \Lambda \left( \frac{g_2 - g_{2c}}{g_2^4} \right)^{\frac{3}{2}}, \]  

(B26)

where

\[ c_1 = \left( \frac{\sqrt{\pi}}{\Gamma \left( \frac{1}{2} \right) \Gamma \left( \frac{5}{4} \right)} \right)^{\frac{3}{2}} \approx 0.662596. \]  

(B27)

At finite temperature, the self-consistent equation can be written as

\[ \frac{1}{g_2} = \frac{1}{\pi^2} \int dk_{\perp} d|k_3| k_{\perp} \frac{1}{\sqrt{v^2 k_{\perp}^2 + A^2 k_3^4 + \Delta_2^2}} \times \tanh \left( \frac{\sqrt{v^2 k_{\perp}^2 + A^2 k_3^4 + \Delta_2^2}}{2T} \right). \]  

(B28)

Employing the transformations Eqs. (B19)–(B21) and carrying out the integration of \( \delta \), we obtain

\[ \frac{1}{g_2} = \frac{1}{\pi^2 v^2 \sqrt{A}} \int_0^\Lambda dE \frac{E^\frac{3}{2}}{E^2 + \Delta_2^2} \times \tanh \left( \frac{\sqrt{E^2 + \Delta_2^2}}{2T} \right). \]  

(B29)

\( T_c \) is determined by

\[ \frac{1}{g_2} = \frac{1}{\pi^2 v^2 \sqrt{A}} \int_0^\Lambda dE \sqrt{E} \tan \left( \frac{E}{2T_c} \right) \]

\[ = \frac{2 \sqrt{2} \pi^2}{\pi^2 v^2 \sqrt{A}} \left[ \frac{2}{3} \left( \frac{\Lambda}{2T_c} \right)^\frac{3}{2} \tan \left( \frac{\Lambda}{2T_c} \right) \right. \]

\[ - \frac{2}{3} \left. \right] \int_0^\Lambda dx \left( \frac{3}{2} \right) \frac{1}{\cosh^2(x)}. \]  

(B30)

If \( T_c \ll \Lambda \), the equation can be approximated by

\[ \frac{1}{g_2} \approx \frac{2 \sqrt{2} \pi^2}{\pi^2 v^2 \sqrt{A}} \left[ \frac{2}{3} \left( \frac{\Lambda}{2T_c} \right)^\frac{3}{2} - \frac{2}{3} \int_0^\infty dx x^\frac{3}{2} \frac{1}{\cosh^2(x)} \right] \]

\[ = \frac{1}{g_{2c}} - 2 \sqrt{2} a \frac{T_c}{g_{2c} \Lambda}, \]  

(B31)

where

\[ a = \int_0^\infty dx x^\frac{3}{2} \frac{1}{\cosh^2(x)} \approx 0.719227. \]  

(B32)

Then \( T_c \) satisfies

\[ T_c \approx c_2 \Lambda \left( \frac{g_2 - g_{2c}}{g_2^4} \right)^{\frac{3}{2}}. \]  

(B33)

where \( c_2 = 1/(2 \sqrt{2} a) \approx 0.622863. \)

3. Dispersion of fermions with finite order parameter

Mean-field analysis for other four-fermion couplings can be performed through similar procedures as subsections [B1] and [B2]. For convenience, we show the fermion

### Table III: Energy dispersions of fermion excitations considering different order parameters.

| Order Parameter | Expectation Value | Energy Dispersion |
|-----------------|------------------|-------------------|
| $\Delta_1$     | $\langle \Psi_{70} \rangle$ | $E_{k,\Delta_1}^+ = \sqrt{v^2k_1^2 + A^2k_3^2 + \Delta_1}$ |
| $\Delta_2$     | $\langle \Psi \rangle$ | $E_{k,\Delta_2} = \sqrt{v^2k_1^2 + A^2k_3^2 + \Delta_2}$ |
| $\Delta_{1,1}$ | $\sum_{j=1,2} \langle \bar{\Psi}_{70} \gamma_j \rangle \Psi$ | $E_{k,\Delta_{1,1}}^+ = \sqrt{\frac{1}{2}v^2(k_1 + k_2)^2 + 2\Delta_{3,1} + \frac{1}{2}v^2(k_2 - k_1)^2 + 2A^2k_3^2}$ |
| $\Delta_3$     | $\langle \Psi_{70} \rangle \Psi$ | $E_{k,\Delta_3}^+ = \sqrt{(vk_1 \pm \Delta_3)^2 + A^2k_3^2}$ |
| $\Delta_4$     | $\langle \Psi_{70} \gamma_3 \rangle \Psi$ | $E_{k,\Delta_4}^+ = \sqrt{v^2k_1^2 + A^2k_3^2 + \Delta_4}$ |
| $\Delta_5$     | $\langle \bar{\Psi}_{70} \gamma_5 \rangle \Psi$ | $E_{k,\Delta_5} = \sqrt{v^2k_1^2 + A^2k_3^2 + \Delta_5}$ |
| $\Delta_{6,1}$ | $\langle \bar{\Psi}(i\gamma_{73} + i\gamma_{7}) \Psi \rangle$ | $E_{k,\Delta_{6,1}}^+ = \sqrt{\frac{1}{2}v^2(k_1 + k_2)^2 + 2\Delta_{6,1} + \frac{1}{2}v^2(k_2 - k_1)^2 + 2A^2k_3^2}$ |
| $\Delta_{6,2}$ | $\langle \bar{\Psi}i_{71} \gamma_2 \Psi \rangle$ | $E_{k,\Delta_{6,2}}^+ = \sqrt{(vk_1 \pm \Delta_{6,2})^2 + A^2k_3^2}$ |
| $\Delta_{6,1}$ | $\sum_{j=1,2} \langle \bar{\Psi}i_{70} \gamma_j \rangle \Psi$ | $E_{k,\Delta_{6,1}}^+ = \frac{1}{2}(k_1 - k_2)^2 + A^2k_3^2 + \frac{1}{2}(k_1 + k_2 \pm 2\Delta_{7,1})^2$ |
| $\Delta_{7,2}$ | $\langle \bar{\Psi}i_{70} \gamma_3 \Psi \rangle$ | $E_{k,\Delta_{7,2}}^+ = \sqrt{v^2k_1^2 + (Ak_3^2 \pm \Delta_{7,2})^2}$ |
| $\Delta_{6,1}$ | $\sum_{j=1,2} \langle \bar{\Psi}_i \gamma_j \rangle \Psi$ | $E_{k,\Delta_{6,1}}^+ = \sqrt{(vk_1 + \Delta_{6,1})^2 + (vk_2 + \Delta_{6,1})^2 + A^2k_3^2}$ |
| $\Delta_{6,2}$ | $\langle \bar{\Psi}i_{71} \gamma_2 \Psi \rangle$ | $E_{k,\Delta_{6,2}} = \sqrt{v^2k_1^2 + (Ak_3^2 + \Delta_{6,2})^2}$ |

Dispersions with various finite order parameters in Table III. If $\Delta_1 > 0$, the original fermion dispersion $E_k = \sqrt{v^2k_1^2 + A^2k_3^2}$ becomes two dispersions $E_{k,\Delta_1}^+$ and $E_{k,\Delta_1}^-$, $E_{k,\Delta_1}^+$ is gapped. Whereas, $E_{k,\Delta_1}^-$ is gapless when $\sqrt{v^2k_1^2 + A^2k_3^2} = \Delta_1$. It indicates that the gapless nodal point becomes gapless on a surface. If $\Delta_2 > 0$, the fermion dispersion becomes to $E_{k,\Delta_2}$ which is gapped. If $\Delta_{1,1} > 0$, there are two fermion dispersions $E_{k,\Delta_{1,1}}^+$ and $E_{k,\Delta_{1,1}}^-$. We find that $E_{k,\Delta_{1,1}}^+$ is gapped, but $E_{k,\Delta_{1,1}}^-$ is gapless along a nodal line which is determined by

$$1 + \frac{1}{2}v^2(k_2 - k_1)^2 + 2A^2k_3^2 = \Delta_{3,1}. \quad (B35)$$

If $\Delta_3 > 0$, one dispersion $E_{k,\Delta_3}^+$ is gapped, but another dispersion $E_{k,\Delta_3}^-$ is gapless along a nodal line which is decided by $vk_1 = \Delta_3$ and $k_3 = 0$. If $\Delta_4 > 0$, the dispersion $E_{k,\Delta_4}^+$ is gapped, whereas $E_{k,\Delta_4}^-$ is gapless on the surface which satisfies $\sqrt{v^2k_1^2 + A^2k_3^2} = \Delta_4$. If $\Delta_5 > 0$, the corresponding fermion dispersion $E_{k,\Delta_5}$ is gapped. If $\Delta_{6,1} > 0$, the dispersion $E_{k,\Delta_{6,1}}^+$ is gapped, but the dispersion $E_{k,\Delta_{6,1}}^-$ is gapless along a nodal line which satisfies

$$1 + \frac{1}{2}v^2(k_2 - k_1)^2 + 2A^2k_3^2 = \Delta_{6,1}. \quad (B37)$$

If $\Delta_{6,2} > 0$, we can find that one dispersion $E_{k,\Delta_{6,2}}^+$ is gapped, but another dispersion $E_{k,\Delta_{6,2}}^-$ is gapless along a nodal line which is determined by $vk_1 = \Delta_{6,2}$ and $k_3 = 0$. If $\Delta_{7,2} > 0$, there are two fermions dispersions $E_{k,\Delta_{7,2}}^+$ and $E_{k,\Delta_{7,2}}^-$. It is easy to verify that $E_{k,\Delta_{7,2}}^+$ is gapless at the point $(-\Delta_{7,2}, -\Delta_{7,2}, 0)$ and $E_{k,\Delta_{7,2}}^-$ is gapless at $(\Delta_{7,2}, \Delta_{7,2}, 0)$. At these two gapless points, the fermion dispersions are still linear within xy plane and quadratic along the z axis. If $\Delta_{7,2} > 0$, we can find that one dispersion $E_{k,\Delta_{7,2}}^+$ is gapped, but another dispersion $E_{k,\Delta_{7,2}}^-$ is gapless at two points

$$k_a = (0, 0, \frac{\Delta_{7,2}}{A}), \quad k_b = (0, 0, -\frac{\Delta_{7,2}}{A}). \quad (B38)$$

At these two gapless points, the fermion dispersion can be written as

$$E_{k,\Delta_{7,2}} = \sqrt{v^2k_1^2 + v^2K_z^2}, \quad (B39)$$

with $v_z = 2\sqrt{A\Delta_{7,2}}$ and $K$ being the momentum relative to the point $k_a$ or $k_b$. It is clear that this fermion dispersion is linear within xy plane and also linear along z axis. If $\Delta_{8,1} > 0$, the fermions dispersion $E_{k,\Delta_{8,1}}$ is gapless at the point $(-\Delta_{8,1}/v, -\Delta_{8,1}/v, 0)$. If $\Delta_{8,2} > 0$, the fermion dispersion $E_{k,\Delta_{8,2}} > 0$ is gapped.

### Appendix C: Derivation of the RG equations for the strength of four-fermion couplings

#### 1. Self-energy of the fermions

The fermion propagator reads as

$$G_0(\omega, k) = -\frac{i\omega\gamma_0 + iv(k_1\gamma_1 + k_2\gamma_2) + iAk_3^2\gamma_3}{\omega^2 + E_k^2}. \quad (C1)$$
where \( E_k = \sqrt{\mathbf{k}^2 + a^2 k_3^2} \) with \( k_3^2 = k_1^2 + k_2^2 \). The self-energy of fermions resulting from Fig. 6(a) takes the form

\[
\Sigma_1 = \sum_a g_a \int_\infty^{-\infty} \frac{d\omega}{2\pi} \int' \frac{d^3k}{(2\pi)^3} \Gamma_a G_0(\omega, \mathbf{k}) \Gamma_a, \tag{C2}
\]

where

\[
\sum'_a = \sum_{a=1,2,4,5,3z}.
\tag{C3}
\]

\( \int' \) represents a momentum shell which will be properly taken. Figure 6(b) induces the self-energy of fermions as following

\[
\Sigma_2 = \sum_a g_a \int_\infty^{-\infty} \frac{d\omega}{2\pi} \int' \frac{d^3k}{(2\pi)^3} \text{Tr} [G_0(\omega, \mathbf{k}) \Gamma_a]. \tag{C4}
\]

Substituting Eq. (C1) into Eqs. (C2) and (C4), we obtain

\[
\Sigma_1 = 0, \tag{C5}
\]
\[
\Sigma_2 = 0. \tag{C6}
\]

It should be noticed that a generated constant term in \( \Sigma_1 \) has been discarded. The generated constant term in self-energy is also discarded in the study about long-range Coulomb interaction in 3D semi-DSM [38]. According to Eqs. (C5) and (C6), the fermion propagator is not renormalized by the four-fermion interactions to one-loop order.

For the five independent four-fermion interactions shown in Eq. (22), there is not a constant term in \( \Sigma_2 \), and \( \Sigma_2 \) always equals to zero. If we consider the four-fermion interaction \( \langle \bar{\Psi} \gamma_3 \Psi \rangle^2 \), we can find that there is a constant term in \( \Sigma_2 \). This constant term is actually a correction for the chemical potential \( \mu \). This constant term could modify the chemical potential \( \mu \) from zero to finite and thus drives the Fermi level away from the node. In this case, we assume that the system parameters (for examples, gate voltage, pressure etc.) are fine-tuned in such a way that effective chemical potential is zero. This way we can study the influence of interactions on 3D semi-DSM with zero chemical potential.

2. One-loop corrections for the four-fermion couplings

Fig. 7(a) leads to the correction

\[
V_a^{(1)} = -2 g_a^2 \langle \bar{\Psi} \Gamma_a \Psi \rangle^2 \int_\infty^{-\infty} \frac{d\omega}{2\pi} \int' \frac{d^3k}{(2\pi)^3} \text{Tr} [\Gamma_a \times G_0(\omega, \mathbf{k}) \Gamma_a G_0(\omega, \mathbf{k})]. \tag{C7}
\]

Fig. 7(b) results in the correction

\[
V_a^{(2)} = \sum_b V_{ab}^{(2)}, \tag{C8}
\]

where

\[
V_{ab}^{(2)} = 4 g_a g_b \langle \bar{\Psi} \Gamma_a \Psi \rangle \int_\infty^{-\infty} \frac{d\omega}{2\pi} \int' \frac{d^3k}{(2\pi)^3} (\bar{\Psi} \Gamma_b \times G_0(\omega, \mathbf{k}) \Gamma_a G_0(\omega, \mathbf{k}) \Gamma_b \bar{\Psi}). \tag{C9}
\]

The Figs. 7(c) and 7(d) induce the correction

\[
V^{(3)+(4)} = \sum_a \sum_{a \leq b} V_{ab}^{(3)+(4)}, \tag{C10}
\]

where

\[
V_{ab}^{(3)+(4)} = 4 g_a g_b \int_\infty^{-\infty} \frac{d\omega}{2\pi} \int' \frac{d^3k}{(2\pi)^3} \times (\bar{\Psi} \Gamma_a G_0(\omega, \mathbf{k}) \Gamma_b \bar{\Psi}) \{ [\Gamma_b G_0(\omega, \mathbf{k}) \Gamma_a + \Gamma_a G_0(-\omega, -\mathbf{k}) \Gamma_b] \bar{\Psi}. \tag{C11}
\]

Substituting Eq. (C1) into Eq. (C7), we obtain

\[
V_a^{(1)} = \delta g_a^{(1)} \langle \bar{\Psi} \Gamma_a \Psi \rangle^2, \tag{C12}
\]
where

\[ \delta g_1^{(1)} = 0, \quad (C13) \]
\[ \delta g_2^{(1)} = g_2^2 \frac{2 \Lambda^2}{\pi^2 v^2} \ell, \quad (C14) \]
\[ \delta g_4^{(1)} = 0, \quad (C15) \]
\[ \delta g_5^{(1)} = g_5^2 \frac{2 \Lambda^2}{\pi^2 v^2} \ell, \quad (C16) \]
\[ \delta g_{3z}^{(1)} = g_{3z}^2 \frac{2 \Lambda^2}{5 \pi^2 v^2} \ell. \quad (C17) \]

Substituting Eq. (C11) into Eqs. (C8) and (C9), we find that the contribution from Fig. 7(b) can be written as

\[ V_2^{(2)} = \delta g_2^{(2)} \left( \bar{\Psi}_a \Psi \right)^2, \quad (C18) \]

where

\[ \delta g_1^{(2)} = 0, \quad (C19) \]
\[ \delta g_2^{(2)} = \left( -g_2 g_1 - g_2^2 + g_2 g_4 + g_2 g_5 + g_2 g_{3z} \right) \times \frac{\Lambda^2}{\pi^2 v^2} \sqrt{A} \ell, \quad (C20) \]
\[ \delta g_4^{(2)} = 0, \quad (C21) \]
\[ \delta g_5^{(2)} = \left( -g_5 g_1 + g_5 g_2 + g_5 g_4 - g_5 g_5 - g_5 g_{3z} \right) \times \frac{\Lambda^2}{\pi^2 v^2} \sqrt{A} \ell, \quad (C22) \]
\[ \delta g_{3z}^{(2)} = \left( -g_{3z} g_1 + g_{3z} g_2 + g_{3z} g_4 - g_{3z} g_{3z} - g_{3z} \right) \times \frac{\Lambda^2}{5 \pi^2 v^2} \sqrt{A} \ell. \quad (C23) \]

Substituting Eq. (C11) into Eq. (C11), the contribution from Figs. 7(c) and 7(d) can be written as

\[ V_1^{(3)+(4)} = 0, \quad (C32) \]
\[ V_{2,4}^{(3)+(4)} = -g_2 g_4 \frac{\Lambda^2}{\pi^2 v^2} \sqrt{A} \left( \bar{\Psi} i \gamma_5 \Psi \right)^2 \]
\[ + g_2 g_4 \frac{\Lambda^2}{5 \pi^2 v^2} \sqrt{A} \left( \bar{\Psi} i \gamma_1 \gamma_2 \Psi \right)^2, \quad (C33) \]
\[ V_{2,5}^{(3)+(4)} = -g_2 g_5 \frac{\Lambda^2}{\pi^2 v^2} \sqrt{A} \left( \bar{\Psi} i \gamma_5 \Psi \right)^2 \]
\[ + g_2 g_5 \sum_{j=1}^{2} \frac{2 \Lambda^2}{5 \pi^2 v^2} \sqrt{A} \left( \bar{\Psi} i \gamma_j \gamma_j \Psi \right)^2, \quad (C34) \]
\[ V_{2,3z}^{(3)+(4)} = -g_2 g_{3z} \frac{\Lambda^2}{\pi^2 v^2} \sqrt{A} \left( \bar{\Psi} i \gamma_3 \Psi \right)^2, \quad (C35) \]
\[ V_{4,5}^{(3)+(4)} = -g_4 g_5 \frac{\Lambda^2}{\pi^2 v^2} \sqrt{A} \left( \bar{\Psi} i \gamma_5 \Psi \right)^2 \]
\[ + g_4 g_5 \sum_{j=1}^{2} \frac{2 \Lambda^2}{5 \pi^2 v^2} \sqrt{A} \left( \bar{\Psi} i \gamma_j \Psi \right)^2, \quad (C36) \]
\[ V_{4,3z}^{(3)+(4)} = -g_4 g_{3z} \frac{\Lambda^2}{\pi^2 v^2} \sqrt{A} \left( \bar{\Psi} i \gamma_3 \Psi \right)^2 \]
\[ + g_4 g_{3z} \sum_{j=1}^{2} \frac{2 \Lambda^2}{5 \pi^2 v^2} \sqrt{A} \left( \bar{\Psi} i \gamma_j \Psi \right)^2, \quad (C37) \]
\[ V_{5,3z}^{(3)+(4)} = g_5 g_{3z} \sum_{j=1}^{2} \frac{2 \Lambda^2}{5 \pi^2 v^2} \sqrt{A} \left( \bar{\Psi} i \gamma_j \Psi \right)^2 \]
\[ + g_5 g_{3z} \frac{\Lambda^2}{5 \pi^2 v^2} \sqrt{A} \left( \bar{\Psi} i \gamma_5 \Psi \right)^2. \quad (C38) \]

Using the relations shown in Eqs. (A37)–(A43), we further get

\[ V_{1,1}^{(3)+(4)} = g_6^2 \frac{\Lambda^2}{5 \pi^2 v^2} \sqrt{A} \left[ - \left( \bar{\Psi} \gamma_0 \gamma_5 \Psi \right)^2 + \left( \bar{\Psi} i \gamma_5 \Psi \right)^2 \right], \quad (C39) \]
\[ V_{2,1}^{(3)+(4)} = g_2^2 \frac{\Lambda^2}{5 \pi^2 v^2} \sqrt{A} \left[ - \left( \bar{\Psi} \gamma_0 \gamma_5 \Psi \right)^2 + \left( \bar{\Psi} i \gamma_5 \Psi \right)^2 \right], \quad (C40) \]
\[ V_{4,4}^{(3)+(4)} = g_2^2 \frac{\Lambda^2}{5 \pi^2 v^2} \sqrt{A} \left[ - \left( \bar{\Psi} \gamma_0 \gamma_5 \Psi \right)^2 + \left( \bar{\Psi} i \gamma_5 \Psi \right)^2 \right], \quad (C41) \]
\[ V_{5,5}^{(3)+(4)} = g_5^2 \frac{\Lambda^2}{5 \pi^2 v^2} \sqrt{A} \left[ - \left( \bar{\Psi} \gamma_0 \gamma_5 \Psi \right)^2 + \left( \bar{\Psi} i \gamma_5 \Psi \right)^2 \right], \quad (C42) \]

\[ V_{3,3z}^{(3)+(4)} = g_3^2 \frac{\Lambda^2}{5 \pi^2 v^2} \sqrt{A} \left[ - \left( \bar{\Psi} \gamma_0 \gamma_5 \Psi \right)^2 + \left( \bar{\Psi} i \gamma_5 \Psi \right)^2 \right]. \]
\begin{align}
V_{1,2}^{3+(4)} &= \frac{2\Lambda}{5\pi^2 v^2 \sqrt{A}} \ell \left[ - \left( \Psi_0 \right)^2 + \left( \bar{\Psi} \right)^2 \\
&+ \left( \bar{\Psi}_0 \gamma_5 \Psi \right)^2 - 2 \left( \bar{\Psi}_0 i \gamma_5 \Psi \right)^2 - \left( \bar{\Psi}_0 \gamma_5 \Psi \right)^2 \right], \\
\delta g_1^{3+(4)} &= \left(-g_1 g_2 - \frac{1}{2} g_1 g_4 - g_1 g_5 - g_2 g_5 - g_4 g_3\right) - g_5 g_3 \frac{2\Lambda}{5\pi^2 v^2 \sqrt{A}} \ell,
\end{align}

where
\begin{align}
\delta g_1^{3+(4)} &= \left(-g_1 g_2 - \frac{1}{2} g_1 g_4 - g_1 g_5 - g_2 g_5 - g_4 g_3\right) - g_5 g_3 \frac{2\Lambda}{5\pi^2 v^2 \sqrt{A}} \ell,
\end{align}

and
\begin{align}
\delta g_2^{3+(4)} &= \left(g_1 g_2 - g_1 g_5 - \frac{1}{2} g_2 g_4 - g_2 g_5 - \frac{5}{2} g_4 g_3\right) + \frac{7}{2} g_4 g_3 + g_5 g_3 \frac{2\Lambda}{5\pi^2 v^2 \sqrt{A}} \ell,
\end{align}

and
\begin{align}
\delta g_3^{3+(4)} &= \left(-\frac{1}{2} g_1 g_2 - \frac{1}{2} g_1 g_4 - \frac{1}{2} g_2 g_4 - \frac{1}{2} g_2 g_5 - \frac{1}{2} g_3 - 2 g_1 g_2\right) - \frac{1}{2} g_1 g_4 - 2 g_2 g_4 - \frac{5}{2} g_2 g_5 + 4 g_4 g_3) \\
&\times \frac{2\Lambda}{5\pi^2 v^2 \sqrt{A}} \ell,
\end{align}

As shown above, the one-loop corrections are proportional to $\Lambda^\frac{\bar{z}}{2}$. This characteristic actually is easy to see from the expressions of the one-loop corrections to four-fermion interactions. From Eqs. (C7) to (C11), we can find that the one-loop corrections should be proportional to
\begin{align}
\frac{\Lambda^\frac{\bar{z}}{2} + \frac{1}{2} v^2}{\Lambda} = \Lambda^\frac{\bar{z}}{2},
\end{align}

where $z_1 = 1$ and $z_3 = 2$. The numerator $\Lambda^\frac{\bar{z}}{2} + \frac{1}{2} v^2 = \Lambda^\frac{\bar{z}}{2}$ comes from the integral measure $\int \ell d^4 k$. The denominator $\Lambda$ results from the expression of integrand after the integration of energy $\omega$ is carried out.

From the above results, we obtain
\begin{align}
\delta g_a &= \delta g_a^{(1)} + \delta g_a^{(2)} + \delta g_a^{(3)+4},
\end{align}

Concretely,
\begin{align}
\delta g_1 &= \left(-g_1 g_2 - \frac{1}{2} g_1 g_4 - g_1 g_5 - g_2 g_5 - g_4 g_3\right),
\end{align}
\[-g_5g_3\frac{2\Lambda^4}{5\pi^4v^2A}, \quad (C62)\]
\[\delta g_2 = \left( \frac{5}{2}g_2 - \frac{3}{2}g_1g_2 - g_1g_5 + 2g_2g_4 + \frac{3}{2}g_2g_5 
+ \frac{5}{2}g_2g_3 - \frac{5}{2}g_4g_5 + \frac{7}{2}g_4g_3 + g_5g_3 \right) \times \frac{2\Lambda^4}{5\pi^4v^2A}, \quad (C63)\]
\[\delta g_4 = \left( \frac{1}{2}g_1 - \frac{1}{2}g_1^2 - \frac{1}{2}g_1^2 - \frac{1}{2}g_1^2 - \frac{1}{2}g_1^2 + \frac{1}{2}g_1^2 + g_1g_2 
+ g_1g_5 - \frac{7}{2}g_2g_5 + \frac{5}{2}g_2g_3 + g_4g_3 - \frac{1}{2}g_5g_3 \right) \times \frac{2\Lambda^4}{5\pi^4v^2A}, \quad (C64)\]
\[\delta g_5 = \left( \frac{1}{2}g_1^2 + \frac{1}{2}g_1^2 + \frac{1}{2}g_1^2 + \frac{1}{2}g_1^2 - \frac{1}{2}g_1^2 - \frac{1}{2}g_1^2 - 2g_1g_2 
- \frac{1}{2}g_1g_4 - \frac{1}{2}g_1g_5 - 2g_2g_4 + \frac{5}{2}g_2g_5 - \frac{5}{2}g_2g_3 
+ \frac{5}{2}g_4g_5 - 4g_4g_3 + \frac{5}{2}g_5g_3 \right) \times \frac{2\Lambda^4}{5\pi^4v^2A}, \quad (C65)\]
\[\delta g_{12} = \left( \frac{1}{2}g_1^2 + \frac{1}{2}g_1^2 + \frac{1}{2}g_1^2 + \frac{1}{2}g_1^2 - \frac{1}{2}g_1^2 - \frac{1}{2}g_1^2 - 2g_1g_4 
- \frac{1}{2}g_1g_4 - \frac{1}{2}g_1g_5 + \frac{1}{2}g_2g_4 + g_2g_5 - 2g_2g_3 
+ \frac{1}{2}g_4g_5 - 3g_4g_3 + \frac{3}{2}g_5g_3 \right) \times \frac{2\Lambda^4}{5\pi^4v^2A}, \quad (C66)\]

3. Scaling transformations

The free action of fermions is
\[S_\Psi = \int \frac{d\omega}{2\pi} d^3k \Psi(\omega, k) (i\omega\gamma_0 + ivk_1\gamma_1 + ivk_2\gamma_2 + iA k^2_3 \gamma_3) \Psi(\omega, k). \quad (C67)\]
The fermion self-energy induced by four-fermion interactions to one-loop order vanishes. Thus, the form of action \(S_\Psi\) is not changed. Employing the transformations
\[\omega = \omega' e^{-\ell}, \quad (C68)\]
\[k_1 = k'_1 e^{-\ell}, \quad (C69)\]
\[k_2 = k'_2 e^{-\ell}, \quad (C70)\]
\[k_3 = k'_3 e^{-\ell}, \quad (C71)\]
\[v = v', \quad (C72)\]
\[A = A', \quad (C73)\]
\[\Psi = \Psi' e^{2\ell}, \quad (C74)\]
the action becomes
\[S_{\Psi'} = \int \frac{d\omega'}{2\pi} d^3k' \Psi'(\omega', k') (i\omega'\gamma_0 + iv'k'_1\gamma_1 + iv'k'_2\gamma_2 
+ iA k'^2_3 \gamma_3) \Psi'(\omega', k'), \quad (C75)\]
which has the same form as the original action.

The original action of four-fermion interactions takes the form
\[S_{\varphi^4} = \sum_{a=1,2,4,5,3} g_a \int \frac{d\omega_1}{2\pi} \frac{d^3k_1}{(2\pi)^3} \frac{d\omega_2}{2\pi} \frac{d^3k_2}{(2\pi)^3} \frac{d\omega_3}{2\pi} \frac{d^3k_3}{(2\pi)^3} \times \tilde{\Psi}(\omega_1, k_1) \Gamma_a \Psi(\omega_2, k_2) \tilde{\Psi}(\omega_3, k_3) \Gamma_a \times \Psi(\omega_4 - \omega_2 + \omega_3, k_1 - k_2 + k_3). \quad (C76)\]

Including the one-loop order correction, the action becomes
\[S_{\varphi'^4} = \sum_{a=1,2,4,5,3} (g_a + \delta g_a) \int \frac{d\omega_1}{2\pi} \frac{d^3k_1}{(2\pi)^3} \frac{d\omega_2}{2\pi} \frac{d^3k_2}{(2\pi)^3} \times \frac{d\omega_3}{2\pi} \frac{d^3k_3}{(2\pi)^3} \tilde{\Psi}(\omega_1, k_1) \Gamma_a \Psi(\omega_2, k_2) \tilde{\Psi}(\omega_3, k_3) \Gamma_a \times \Psi(\omega_4 - \omega_2 + \omega_3, k_1 - k_2 + k_3). \quad (C77)\]

Utilizing the transformations Eqs. (C63)-(C71) and (C74), we get
\[S_{\varphi'^4} = \sum_{a=1,2,4,5,3} (g_a + \delta g_a) e^{-\frac{2}{\ell}} \int \frac{d\omega'_1}{2\pi} \frac{d^3k'_1}{(2\pi)^3} \frac{d\omega'_2}{2\pi} \frac{d^3k'_2}{(2\pi)^3} \times \frac{d\omega'_3}{2\pi} \frac{d^3k'_3}{(2\pi)^3} \tilde{\Psi}'(\omega'_1, k'_1) \Gamma_a \Psi'(\omega'_2, k'_2) \tilde{\Psi}'(\omega'_3, k'_3) \Gamma_a \times \Psi'(\omega'_4 - \omega'_2 + \omega'_3, k'_1 - k'_2 + k'_3). \quad (C78)\]

Let
\[g'_a = (g_a + \delta g_a) e^{-\frac{2}{\ell}} \approx g_a - \frac{3}{2}g_a \ell + \delta g_a, \quad (C79)\]
we obtain
\[S_{\varphi'^4} = \sum_{a=1,2,4,5,3} g'_a \int \frac{d\omega'_1}{2\pi} \frac{d^3k'_1}{(2\pi)^3} \frac{d\omega'_2}{2\pi} \frac{d^3k'_2}{(2\pi)^3} \frac{d\omega'_3}{2\pi} \frac{d^3k'_3}{(2\pi)^3} \times \tilde{\Psi}'(\omega'_1, k'_1) \Gamma_a \Psi'(\omega'_2, k'_2) \tilde{\Psi}'(\omega'_3, k'_3) \Gamma_a \times \Psi'(\omega'_4 - \omega'_2 + \omega'_3, k'_1 - k'_2 + k'_3), \quad (C80)\]
which recovers the original form of the action.

From Eq. (C79), we get the RG equation for \(g_a\) as following
\[\frac{dg_a}{d\ell} = -\frac{3}{2}g_1 - \frac{2}{5}g_1 \left( g_2 + \frac{1}{2}g_4 + g_5 \right) - \frac{2}{5}g_5g_3 + g_5g_3, \quad (C81)\]
Substituting Eqs. (C62)-(C66) into Eq. (C81), we find
\[\frac{dg_1}{d\ell} = -\frac{3}{2}g_1 - \frac{2}{5}g_1 \left( g_2 + \frac{1}{2}g_4 + g_5 \right) - \frac{2}{5}g_5g_3 + g_5g_3, \quad (C82)\]
\[\frac{dg_2}{d\ell} = -\frac{3}{2}g_2 + g_2 + g_2 \left( \frac{3}{5}g_1 + \frac{4}{5}g_4 + \frac{3}{5}g_5 + g_3 \right) \left( \frac{2}{5}g_5g_3 + g_5g_3 \right), \quad (C83)\]
\[
\frac{dg_4}{d\ell} = -\frac{3}{2}g_1 - \frac{1}{5}g_1^2 - \frac{1}{5}(g_1^2 + g_2 + g_3 + g_3^2) + \frac{2}{5}g_4g_3z + \frac{2}{5}g_1(g_2 + g_5) + g_2\left(-\frac{7}{5}g_5 + g_3z\right) + \frac{1}{5}g_5g_3z, \tag{C84}
\]
\[
\frac{dg_5}{d\ell} = -\frac{3}{2}g_2 + \frac{6}{5}g_2^2 + \frac{1}{5}(g_1^2 + g_2 + g_3 + g_3^2) + g_5(-g_1 + g_2 + g_4 - g_3z) - \frac{2}{5}g_1\left(2g_2 + \frac{1}{2}g_4\right) - g_2\left(\frac{4}{5}g_4 + g_3z\right) - \frac{8}{5}g_4g_3z, \tag{C85}
\]
\[
\frac{dg_{g_3z}}{d\ell} = -\frac{3}{2}g_3z + \frac{2}{5}g_3z^2 + \frac{1}{5}(g_1^2 + g_2 + g_3 + g_3^2) + \frac{2}{5}g_1\left(g_2 + 2g_4 + 3g_4 + \frac{3}{2}g_5\right) - \frac{2}{5}g_1\left(g_2 + \frac{1}{2}g_4 + g_5\right) + \frac{2}{5}g_2\left(\frac{1}{2}g_4 + g_5\right) + \frac{1}{5}g_4g_5. \tag{C86}
\]

The redefinition \[
\frac{\Lambda^2 g_q}{\pi^2 v^2 \sqrt{A}} \to g_a,
\]
has been employed.

**Appendix D: Susceptibility of source terms**

We consider the Lagrangian for the source terms as following

\[
L_s = \Delta_1 \bar{\Psi}\gamma_0 \Psi + \Delta_2 \bar{\Psi}\Psi + \Delta_{3\perp} \sum_{j=1}^{2} \bar{\Psi}\gamma_0 \gamma_j \Psi + \Delta_{3z} \bar{\Psi}\gamma_0 \gamma_5 \Psi + \Delta_5 \bar{\Psi}\gamma_5 \Psi + \Delta_{61} \sum_{\langle \langle k \rangle \rangle} \left(\bar{\Psi}i\gamma_k \Psi\right) + \Delta_{62} \bar{\Psi}i\gamma_1 \gamma_2 \Psi + \Delta_{71} \sum_{j=1}^{2} \bar{\Psi}i\gamma_5 \gamma_j \Psi + \Delta_{72} \bar{\Psi}i\gamma_5 \gamma_3 \Psi + \Delta_{81} \sum_{j=1}^{2} \bar{\Psi}i\gamma_j \Psi + \Delta_{82} \bar{\Psi}i\gamma_3 \Psi + \Delta_S \tilde{\Psi}i\gamma_0 \gamma_2 \Psi + \Delta_{\alpha \perp} \tilde{\Psi}i\gamma_0 \gamma_2 \Psi^* + \Delta_{\alpha 1} \bar{\Psi}i\gamma_3 \Psi^* + \Delta_{\alpha 2} \bar{\Psi}i\gamma_0 \gamma_5 \Psi^* + \Delta_{\alpha 3} \bar{\Psi}i\gamma_1 \Psi^* + \Delta_{\alpha 6} \bar{\Psi}i\gamma_0 \gamma_2 \gamma_3 \Psi^*. \tag{D1}
\]

1. **One-loop order corrections for source terms in particle-hole channels**

   There are two one-loop Feynman diagrams lead to the corrections for source terms in particle-hole channels.

   ![Feynman diagrams](image)

   FIG. 8: (a) and (b): One-loop Feynman diagrams for the corrections to the source terms in particle-hole channels. (c): One-loop Feynman diagram for the corrections to the source terms in particle-particle channels.

   The one-loop correction for the source term \(\Delta_X\) from Fig. 8(a) is given by

   \[
   W_{\Delta_X}^{(1)} = -2\Delta_X g_X \left(\bar{\Psi} \Gamma_X \Psi\right) \sum_{a=1,2,4,5,3z} g_a \int_{-\infty}^{+\infty} \frac{d\omega}{2\pi} \int_{-\infty}^{+\infty} \frac{d^3k}{(2\pi)^3} \text{Tr} \left[\Gamma_X \bar{G}_0(i\omega, k) \Gamma_a \times G_0(i\omega, k)\right]. \tag{D2}
   \]

   The one-loop correction for the source term \(\Delta_X\) resulting from Fig. 8(b) can be written as

   \[
   W_{\Delta_X}^{(2)} = 2\Delta_X \sum_{a=1,2,4,5,3z} g_a \int_{-\infty}^{+\infty} \frac{d\omega}{2\pi} \int_{-\infty}^{+\infty} \frac{d^3k}{(2\pi)^3} \left(\bar{\Psi} \Gamma_a G_0(i\omega, k) \Gamma_X \bar{G}_0(i\omega, k) \Gamma_4 \Psi\right). \tag{D3}
   \]

   Substituting Eq. (C1) into Eq. (D2), we find

   \[
   W_{\Delta_1}^{(1)} = 0, \tag{D4}
   \]

   \[
   W_{\Delta_2}^{(1)} = \Delta_2 g_2 \frac{2\Lambda^2}{\pi^2 v^2 \sqrt{A}} \ell \left(\bar{\Psi} \Psi\right), \tag{D5}
   \]

   \[
   W_{\Delta_3}^{(1)} = 0, \tag{D6}
   \]

   \[
   W_{\Delta_{4z}}^{(1)} = \Delta_{4z} g_3z \frac{2\Lambda^2}{5\pi^2 v^2 \sqrt{A}} \ell \left(\bar{\Psi} \gamma_5 \gamma_3 \Psi\right), \tag{D7}
   \]

   \[
   W_{\Delta_4}^{(1)} = 0, \tag{D8}
   \]

   \[
   W_{\Delta_5}^{(1)} = \Delta_5 g_5 \frac{2\Lambda^2}{\pi^2 v^2 \sqrt{A}} \ell \left(\bar{\Psi} \gamma_5 \Psi\right), \tag{D9}
   \]

   \[
   W_{\Delta_{6z}}^{(1)} = 0, \tag{D10}
   \]

   \[
   W_{\Delta_{6z}}^{(1)} = 0, \tag{D11}
   \]

   \[
   W_{\Delta_{6z}}^{(1)} = 0, \tag{D12}
   \]

   \[
   W_{\Delta_{6z}}^{(1)} = 0, \tag{D13}
   \]

   \[
   W_{\Delta_{6z}}^{(1)} = 0, \tag{D14}
   \]

   \[
   W_{\Delta_{6z}}^{(1)} = 0. \tag{D15}
   \]

   Substituting Eq. (C1) into Eq. (D3), we obtain

   \[
   W_{\Delta_1}^{(2)} = 0, \tag{D16}
   \]
The parameters \( \delta \) \( W_{\Delta_2}(2) = \frac{1}{2} \Delta_2 (g_1 - g_2 + g_4 + g_5 + g_{3z}) \)
\( \times \frac{\Lambda^2}{\pi^2 v^2 \sqrt{A}} \ell (\bar{\Psi} \gamma_5 \Psi) \), \( (D17) \)
\( W_{\Delta_{3\perp}}(2) = \Delta_{3\perp} (-g_1 + g_2 + g_4 - g_5 + g_{3z}) \)
\( \times \frac{\Lambda^2}{5 \pi^2 v^2 \sqrt{A}} \ell \left( \frac{1}{2} \sum_{j=1}^{2} (\bar{\Psi} \gamma_j \gamma_5 \Psi) \right) \), \( (D18) \)
\( W_{\Delta_{3z}}(2) = \Delta_{3z} (-g_1 + g_2 + g_4 - g_5 + g_{3z}) \)
\( \times \frac{\Lambda^2}{10 \pi^2 v^2 \sqrt{A}} \ell (\bar{\Psi} \gamma_5 \gamma_3 \Psi) \), \( (D19) \)
\( W_{\Delta_4}(2) = 0 \), \( (D20) \)
\( W_{\Delta_5}(2) = \Delta_5 (-g_1 + g_2 + g_4 - g_5 + g_{3z}) \)
\( \times \frac{\Lambda^2}{2 \pi^2 v^2 \sqrt{A}} \ell (\bar{\Psi} \gamma_5 \Psi) \), \( (D21) \)
\( W_{\Delta_{6\perp}}(2) = \Delta_{6\perp} (-g_1 - g_2 + g_4 + g_5 - g_{3z}) \)
\( \times \frac{\Lambda^2}{5 \pi^2 v^2 \sqrt{A}} \ell \left( \frac{1}{2} \sum_{j=1}^{2} (\bar{\Psi} \gamma_j \gamma_5 \Psi) \right) \), \( (D22) \)
\( W_{\Delta_{6z}}(2) = \Delta_{6z} (-g_1 - g_2 + g_4 + g_5 - g_{3z}) \)
\( \times \frac{\Lambda^2}{10 \pi^2 v^2 \sqrt{A}} \ell (\bar{\Psi} \gamma_5 \gamma_3 \Psi) \), \( (D23) \)
\( W_{\Delta_{7\perp}}(2) = \Delta_{7\perp} (-g_1 - g_2 - g_4 - g_5 + g_{3z}) \)
\( \times \frac{3 \Lambda^2}{10 \pi^2 v^2 \sqrt{A}} \ell \left( \frac{1}{2} \sum_{j=1}^{2} (\bar{\Psi} \gamma_j \gamma_5 \Psi) \right) \), \( (D24) \)
\( W_{\Delta_{7z}}(2) = \Delta_{7z} (g_1 + g_2 + g_4 + g_5 + g_{3z}) \)
\( \times \frac{2 \Lambda^2}{5 \pi^2 v^2 \sqrt{A}} \ell (\bar{\Psi} \gamma_5 \gamma_3 \Psi) \), \( (D25) \)
\( W_{\Delta_{8\perp}}(2) = \Delta_{8\perp} (-g_1 - g_2 - g_4 + g_5 - g_{3z}) \)
\( \times \frac{3 \Lambda^2}{10 \pi^2 v^2 \sqrt{A}} \ell \left( \frac{1}{2} \sum_{j=1}^{2} (\bar{\Psi} \gamma_j \gamma_5 \Psi) \right) \), \( (D26) \)
\( W_{\Delta_{8z}}(2) = \Delta_{8z} (-g_1 - g_2 - g_4 + g_5 + g_{3z}) \)
\( \times \frac{2 \Lambda^2}{5 \pi^2 v^2 \sqrt{A}} \ell (\bar{\Psi} \gamma_5 \gamma_3 \Psi) \). \( (D27) \)

From \( W_{\Delta_X} = W_{\Delta_X}^{(1)} + W_{\Delta_X}^{(2)} \), \( (D28) \)
we arrive
\( W_{\Delta_X} = \delta \Delta_X (\bar{\Psi} \Gamma_X \Psi) \). \( (D29) \)

The parameters \( \delta \Delta_X \) are given by
\( \delta \Delta_1 = 0 \), \( (D30) \)
\( \delta \Delta_2 = \Delta_2 (-g_1 + 3 g_2 + g_4 + g_5 + g_{3z}) \)

2. One-loop order corrections for source terms in particle-particle channels

In particle-particle channels, to one-loop order, there is one Feynman diagram as shown in Fig.\( \text{S(c)} \) resulting in the corrections to source terms. The correction can be expressed as
\( W_{\Delta_Y} = 2 \Delta_Y \sum_{a=1,2,4,5,3} \int_0^{+\infty} \int_0^{+\infty} d\omega \int d^3k \int d^3k' \left( \bar{\Psi} \Gamma_T^T (\bar{\Psi} \Gamma_T \Psi) \right) \times G_0^T (i\omega, k) \Gamma_Y G_0 (-i\omega, -k) \Gamma_a \Psi^* \). \( (D42) \)

where \( T \) represents transposition. Substituting Eq. \( (C1) \) into Eq. \( (D42) \), we get
\( W_{\Delta_Y} = \delta \Delta_Y \left( \bar{\Psi} \Gamma_Y \Psi^* \right) \). \( (D43) \)
where
\[
\begin{align*}
\delta \Delta_S &= \Delta_S (g_1 - g_2 + g_4 - g_5 - g_{3z}) \\
&\quad \times \frac{2\Lambda^2}{5\pi^2 v^2} \ell, \\
\delta \Delta_{op} &= \Delta_{op} (g_1 - g_2 + g_4 - g_5 + g_{3z}) \\
&\quad \times \frac{2\Lambda^2}{5\pi^2 v^2} \ell, \\
\delta \Delta_{V,1} &= \Delta_{V,1} (g_1 + g_2 - g_4 + g_5 + g_{3z}) \\
&\quad \times \frac{\Lambda^2}{5\pi^2 v^2} \ell, \\
\delta \Delta_{V,2} &= \Delta_{V,2} (g_1 + g_2 - g_4 + g_5 + g_{3z}) \\
&\quad \times \frac{\Lambda^2}{5\pi^2 v^2} \ell, \\
\delta \Delta_{V,3} &= \Delta_{V,3} (g_1 + g_2 - g_4 + g_5 - g_{3z}) \\
&\quad \times \frac{\Lambda^2}{2\pi^2 v^2} \ell, \\
\delta \Delta_{V,0} &= \Delta_{V,0} (g_1 - g_2 - g_4 - g_5 + g_{3z}) \\
&\quad \times \frac{\Lambda^2}{2\pi^2 v^2} \ell.
\end{align*}
\]

3. Derivation of the RG equations for source terms

In particle-hole channels, the bare action for the source terms is
\[
S_s = \Delta_X \int \frac{d\omega}{2\pi} \frac{d^3k}{(2\pi)^3} \Psi(\omega, k) \Gamma_X \Psi(\omega, k).
\]

Considering the one-loop order corrections, we obtain
\[
S_s = (\Delta_X + \delta \Delta_X) \int \frac{d\omega}{2\pi} \frac{d^3k}{(2\pi)^3} \tilde{\Psi}(\omega, k) \Gamma_X \Psi(\omega, k).
\]

Using the transformations Eqs. (C68), (C71) and (C74), we can get
\[
S_s = (\Delta_X + \delta \Delta_X) e^\ell \int \frac{d\omega'}{2\pi} \frac{d^3k'}{(2\pi)^3} \tilde{\Psi}'(\omega', k') \Gamma_X \Psi'(\omega', k').
\]

Let
\[
\Delta' = \Delta_X + \Delta_X \ell + \delta \Delta_X,
\]
the action can be further written as
\[
S_s = \Delta' \int \frac{d\omega'}{2\pi} \frac{d^3k'}{(2\pi)^3} \tilde{\Psi}'(\omega', k') \Gamma_X \Psi'(\omega', k').
\]

which recovers the form of the original action. We can easily find that the RG equation for \( \Delta_X \) is
\[
\frac{d\Delta_X}{d\ell} = \Delta_X + \frac{d\delta \Delta_X}{d\ell}.
\]

Performing similar rescaling transformations, we can get the RG equation for source terms in particle-particle channels
\[
\frac{d\Delta_Y}{d\ell} = \Delta_Y + \frac{d\delta \Delta_Y}{d\ell}.
\]

Substituting Eqs. (D30)–(D44) into Eq. (D55), and substituting Eqs. (D44)–(D49) into Eq. (D56), we get the RG equations
\[
\begin{align*}
\beta_1 &= 0, \\
\beta_2 &= \frac{1}{5} (-g_1 + 3g_2 + g_4 + g_5 + g_{3z}), \\
\beta_{3\perp} &= \frac{1}{5} (-g_1 - g_2 + g_4 - g_5 + g_{3z}), \\
\beta_3 &= \frac{1}{10} (-g_1 + g_2 + g_4 - g_5), \\
\beta_4 &= 0, \\
\beta_5 &= \frac{1}{2} (-g_1 + g_2 + g_4 + 3g_5 - g_{3z}), \\
\beta_{6\perp} &= \frac{1}{5} (-g_1 - g_2 + g_4 + g_5 - g_{3z}), \\
\beta_6 &= \frac{1}{10} (-g_1 - g_2 + g_4 + g_5 + g_{3z}), \\
\beta_{7\perp} &= \frac{3}{10} (-g_1 - g_2 - g_4 - g_5 + g_{3z}), \\
\beta_7 &= \frac{2}{5} (-g_1 - g_2 - g_4 - g_5 - g_{3z}), \\
\beta_{8\perp} &= \frac{3}{10} (-g_1 + g_2 - g_4 - g_5 - g_{3z}), \\
\beta_8 &= \frac{2}{5} (-g_1 + g_2 - g_4 + g_5 + g_{3z}), \\
\beta_S &= \frac{2}{5} (g_1 - g_2 + g_4 + g_5 + g_{3z}), \\
\beta_{op} &= \frac{2}{5} (g_1 + g_2 - g_4 - g_5 + g_{3z}), \\
\beta_{V,1} &= \frac{1}{5} (g_1 + g_2 - g_4 + g_5 + g_{3z}), \\
\beta_{V,2} &= \frac{1}{5} (g_1 + g_2 - g_4 + g_5 + g_{3z}), \\
\beta_{V,3} &= \frac{1}{2} (g_1 + g_2 - g_4 + g_5 - g_{3z}), \\
\beta_{V,0} &= \frac{1}{20} (g_1 - g_2 - g_4 - g_5 + g_{3z}),
\end{align*}
\]

where
\[
\beta_{X,Y} = \frac{d\ln(\Delta_X Y)}{d\ell} - 1.
\]

For convenience, we show the physical meaning of different order parameters and corresponding fermion bilinears in Table IV.
TABLE IV: Physical meaning of different order parameters and the corresponding fermion bilinears.

| Order Parameter | Fermion Bilinear | Physical meaning |
|-----------------|------------------|------------------|
| \(\Delta_1\)    | \(\gamma_0\gamma_3\) | chemical potential |
| \(\Delta_2\)    | \(\gamma_4\) | scalar mass |
| \(\Delta_{sL}\) | \(\sum_{j=1,2} \gamma_4 \gamma_j\) | spin-orbit coupling within xy plane |
| \(\Delta_{sL}\) | \(\gamma_0\gamma_3\) | spin-orbit coupling along z axis |
| \(\Delta_{iL}\) | \(\gamma_0\gamma_3\) | axial chemical potential |
| \(\Delta_{sL}\) | \(\gamma_0\gamma_3\) | pseudoscalar mass |
| \(\Delta_{sL}\) | \(\gamma_0\gamma_3\) | magnetization within xy plane |
| \(\Delta_{sL}\) | \(\gamma_0\gamma_3\) | magnetization along z axis |
| \(\Delta_{sL}\) | \(\gamma_0\gamma_3\) | axial magnetization within xy plane |
| \(\Delta_{sL}\) | \(\gamma_0\gamma_3\) | axial magnetization along z axis |
| \(\Delta_{sL}\) | \(\gamma_0\gamma_3\) | current within xy plane |
| \(\Delta_{sL}\) | \(\gamma_0\gamma_3\) | current along z axis |

| \(\Delta_{sL}\) | \(\gamma_0\gamma_3\) | vector pairing along y axis |
| \(\Delta_{sL}\) | \(\gamma_0\gamma_3\) | vector pairing along z axis |
| \(\Delta_{sL}\) | \(\gamma_0\gamma_3\) | temporal vector paring |

Appendix E: Numerical Results

1. Fixed points and their properties

Solving the RG equations for \(g_a\) as shown in Eqs. (C82)-(C86), we obtained the real roots as following

\[
\begin{align*}
\text{FP0} : \quad & (g_1, g_2, g_3, g_4, g_5, g_6) = (0, 0, 0, 0, 0) \\
\text{FP1} : \quad & (g_1, g_2, g_3, g_4, g_5, g_6) = (0.152019, 1.25444, 0.459247, -0.561711, 0.0551435), \\
\text{FP2} : \quad & (g_1, g_2, g_3, g_4, g_5, g_6) = (0.140905, -0.585585, 0.418385, 1.34686, 0.06996), \\
\text{FP3} : \quad & (g_1, g_2, g_3, g_4, g_5, g_6) = (-0.100015, 0.575751, -0.61003, 0.775675, 0.199924), \\
\text{FP4} : \quad & (g_1, g_2, g_3, g_4, g_5, g_6) = (-2.33263, 0, -0.610178, -1.72246, -1.72246), \\
\text{FP5} : \quad & (g_1, g_2, g_3, g_4, g_5, g_6) = (0.126936, -0.463077, -0.854005, 0.769245, 1.23232), \\
\text{FP6} : \quad & (g_1, g_2, g_3, g_4, g_5, g_6) = (0.0860014, 1.37623, 0.236822, -0.304132, 0.0941005), \\
\text{FP7} : \quad & (g_1, g_2, g_3, g_4, g_5, g_6) = (0.103947, -0.465334, 0.29293, 1.43995, 0.0944817), \\
\text{FP8} : \quad & (g_1, g_2, g_3, g_4, g_5, g_6) = (-3.33745, -1.22097, -1.28072, -1.32395, -0.102973), \\
\text{FP9} : \quad & (g_1, g_2, g_3, g_4, g_5, g_6) = (-2.68181, 1.06255, -1.97657, -1.35604, -2.41859), \\
\text{FP10} : \quad & (g_1, g_2, g_3, g_4, g_5, g_6) = (0, 0, -1.25, 1.25, 1.25), \\
\text{FP11} : \quad & (g_1, g_2, g_3, g_4, g_5, g_6) = (-5.16737, 0, -4.38982, -0.777544, -0.777544),
\end{align*}
\]  

FP0 is the trivial Gaussian fixed point. FP1-FP11 are non-trivial fixed points. Expanding the RG equations (C82)-(C86) in the vicinity of a fixed point \((g_1, g_2, g_3, g_4, g_5, g_6)\), we find that

\[
\frac{dG}{d\ell} = MG, 
\]  

(E13)
where

\[ G = \begin{pmatrix} \delta g_1 \\ \delta g_2 \\ \delta g_4 \\ \delta g_{32} \end{pmatrix}, \tag{E14} \]

with \( \delta g_a = g_a - g_a^* \). The matrix \( M \) is given by

\[
M = \begin{pmatrix}
M_{11} & M_{12} & M_{13} & M_{14} & M_{15} \\
M_{21} & M_{22} & M_{23} & M_{24} & M_{25} \\
M_{31} & M_{32} & M_{33} & M_{34} & M_{35} \\
M_{41} & M_{42} & M_{43} & M_{44} & M_{45} \\
M_{51} & M_{52} & M_{53} & M_{54} & M_{55}
\end{pmatrix}, \tag{E15} \]

where

\[
M_{11} = -\left( \frac{3}{5} + \frac{2}{5} g_2^* + \frac{1}{5} g_4^* + \frac{2}{5} g_5^* \right), \tag{E16} \]

\[
M_{12} = -\frac{2}{5} (g_1^* + g_5^*), \tag{E17} \]

\[
M_{13} = -\left( \frac{1}{5} g_1^* + \frac{2}{5} g_3^* \right), \tag{E18} \]

\[
M_{14} = -\frac{2}{5} (g_1^* + g_2^* + g_3^*), \tag{E19} \]

\[
M_{15} = -\frac{2}{5} (g_1^* + g_5^*), \tag{E20} \]

\[
M_{21} = -\frac{3}{5} g_2^* - \frac{2}{5} g_4^*, \tag{E21} \]

\[
M_{22} = -\frac{3}{5} g_2^* - \frac{3}{5} g_1^* + \frac{4}{5} g_4^* + \frac{3}{5} g_5^* + g_3^*, \tag{E22} \]

\[
M_{23} = \frac{4}{5} g_2^* - g_5^* + \frac{7}{5} g_3^*, \tag{E23} \]

\[
M_{24} = \frac{3}{5} g_2^* - \frac{2}{5} g_1^* - g_4^* + \frac{2}{5} g_3^*, \tag{E24} \]

\[
M_{25} = g_2^* + \frac{7}{5} g_4^* + \frac{2}{5} g_5^*, \tag{E25} \]

\[
M_{31} = -\frac{2}{5} g_1^* + \frac{2}{5} g_4^* + \frac{2}{5} g_5^*, \tag{E26} \]

\[
M_{32} = -\frac{2}{5} g_2^* + \frac{2}{5} g_1^* - \frac{7}{5} g_5^* + g_3^*, \tag{E27} \]

\[
M_{33} = -\frac{3}{2} - \frac{5}{2} g_4^* + \frac{2}{5} g_5^*, \tag{E28} \]

\[
M_{34} = \frac{2}{5} g_5^* + \frac{2}{5} g_1^* - \frac{7}{5} g_2^* - \frac{1}{5} g_3^*, \tag{E29} \]

\[
M_{35} = -\frac{2}{5} g_3^* + \frac{2}{5} g_4^* + \frac{2}{5} g_5^*, \tag{E30} \]

\[
M_{41} = \frac{2}{5} g_1^* - g_5^* - \frac{4}{5} g_2^* - \frac{1}{5} g_4^*, \tag{E31} \]

\[
M_{42} = \frac{2}{5} g_2^* + g_5^* - \frac{4}{5} g_1^* - \frac{4}{5} g_4^* - g_3^*, \tag{E32} \]

\[
M_{43} = \frac{2}{5} g_4^* + g_5^* - \frac{1}{5} g_1^* - \frac{4}{5} g_2^* - \frac{8}{5} g_3^*, \tag{E33} \]

\[
M_{44} = -\frac{3}{2} + \frac{12}{5} g_5^* - g_1^* + g_2^* + g_4^* - g_3^*, \tag{E34} \]

\[
M_{45} = \frac{2}{5} g_3^* - g_5^* - g_2^* - \frac{8}{5} g_4^*. \tag{E35} \]

From eigenvalues of \( M \) at a fixed point \( (g_1^*, g_2^*, g_3^*, g_5^*) \), we can get the properties of the fixed point. A negative (positive) eigenvalue is corresponding to a stable (unstable) eigendirection. For quantum critical point (QCP), bicritical point (BCP), and tricritical point (TCP), there is/are one, two, and three unstable direction(s) respectively. For a QCP, the correlation length exponent is determined by the inverse of the corresponding positive eigenvalue.

Substituting the values of \( g_a^* \) at each fixed point into the expression \( M \), we calculate the corresponding eigenvalues of \( M \). The eigenvalues for the fixed points are shown in Table V. For FP0, the eigenvalues of \( M \) are always negative, thus FP0 is a stable fixed point. We can find that there is one positive eigenvalue for FP1, FP2, FP3, FP4, and FP5, and there are two positive eigenvalues for FP6, FP7, FP8, FP9, and FP10, and three positive eigenvalues for FP11. Thus, FP1, FP2, FP3, FP4, and FP5 are QCPs, FP6, FP7, FP8, FP9, and FP10 are BCPs, and FP11 is a TCP.

It is easy to find that the correlation length exponent at the QCPs FP1, FP2, FP3, FP4 and FP5 all satisfy

\[ \nu^{-1} = 1.5. \tag{E41} \]

Substituting the values of \( g_a^* \) with \( i = 1, 2, 4, 5, 3z \) into Eqs. D571-D74, we can get values of \( \beta_{XY} \) for different \( \Delta_{XY} \), which are shown in Table VI. For a QCP, the largest value of \( \beta_{XY} \) is marked by the bold style. It represents that the fixed point is a QCP to the new state in which \( \Delta_{XY} \) acquires finite value. FP1, FP2, FP4, and FP5 are corresponding to QCPs to a state in which \( \Delta_2 \), \( \Delta_3 \), \( \Delta_7 \), and \( \Delta_{5z} \) acquire finite value respectively. For FP3, it stands for a QCP to a state in which both \( \Delta_2 \) and \( \Delta_5 \) become finite generally. This state represents an axionic insulator whose order parameter can be written as \( \langle \psi(\cos(\theta) + i\gamma_5\sin(\theta)) \rangle \). \( \beta_{XY} \).

**Appendix F: Interplay of four-fermion interaction and long-range Coulomb interaction**

The Coulomb interaction between fermions can be described by the coupling between fermion field \( \Psi \) and boson field \( \phi \) as the following action

\[
S_{\phi\psi} = i\lambda \int \frac{d\omega_1}{2\pi} \frac{d^3k_1}{(2\pi)^3} \frac{d\omega_2}{2\pi} \frac{d^3k_2}{(2\pi)^3} \bar{\Psi}(\omega_1, k_1)\gamma_0 \Psi(\omega_2, k_2) \times \phi(\omega_1 - \omega_2, k_1 - k_2), \tag{F1} \]

\[
M_{51} = \frac{2}{5} g_1^* - \frac{1}{5} g_3^* - \frac{2}{5} g_2^* - \frac{1}{5} g_4^* - \frac{2}{5} g_5^*, \tag{E36} \]

\[
M_{52} = \frac{2}{5} g_2^* - \frac{4}{5} g_3^* - \frac{2}{5} g_4^* + \frac{1}{5} g_5^* + \frac{2}{5} g_5^*, \tag{E37} \]

\[
M_{53} = \frac{2}{5} g_4^* - \frac{6}{5} g_3^* - \frac{1}{5} g_5^* + \frac{1}{5} g_4^* + \frac{1}{5} g_5^*, \tag{E38} \]

\[
M_{54} = \frac{2}{5} g_5^* - \frac{3}{5} g_3^* - \frac{2}{5} g_4^* - \frac{2}{5} g_4^* + \frac{1}{5} g_5^* , \tag{E39} \]

\[
M_{55} = -\frac{3}{2} + \frac{4}{5} g_3^* - \frac{1}{5} g_5^* - \frac{4}{5} g_2^* - \frac{6}{5} g_4^* - \frac{3}{5} g_5^*. \tag{E40} \]

where $\lambda = \frac{e}{\varepsilon}$ with $e$ the elementary charge and $\varepsilon$ the dielectric constant. The free action of $\phi$ is given by

$$S_0^\phi = \int \frac{d\omega}{2\pi} \frac{d^3 k}{(2\pi)^3} \left( \frac{1}{\sqrt{\eta}} k^2 + \sqrt{\eta} k^2 \right) \phi(\omega, k).$$

1. Interaction Corrections related to Coulomb interaction

a. Fermion self-energy induced by Coulomb interaction

As the shown in Fig. 9(a), the fermion self-energy induced by long-range Coulomb interaction is given by

$$\Sigma_C(i\omega, k) = -\lambda^2 \int_{-\infty}^{+\infty} \frac{d\Omega}{2\pi} \int_{-\infty}^\infty \frac{d^3 q}{(2\pi)^3} \gamma_0 G_0(i\Omega, q) \gamma_0 \times D_0(i\omega - i\Omega, k - q),$$

where

$$D_0(i\Omega, q) = \frac{\sqrt{\eta}}{q^2 + \eta q^2}.$$
where

\[ \Sigma_{C,\perp} = \frac{\lambda^2 \sqrt{\eta}}{4\pi^2} \int d^\prime q_\perp d|q|_3 q_\perp \frac{q_\perp^2}{\sqrt{v^2 q_\perp^2 + A^2 q_3^2}} \]
\[ \times \frac{1}{(q_\perp^2 + \eta q_3^2)^3}, \]  

\( \text{(F6)} \)

\[ \Sigma_{C,3} = \frac{\lambda^2 \eta^2}{4\pi^2} \int d^\prime q_\perp d|q|_3 q_\perp \frac{q_\perp^2 (-q_\perp^2 + 3\eta q_3^2)}{\sqrt{v^2 q_\perp^2 + A^2 q_3^2}} \]
\[ \times \frac{1}{(q_\perp^2 + \eta q_3^2)^3}. \]  

\( \text{(F7)} \)

A constant term that does not depend on energy and momenta has been discarded.

Utilizing the transformations Eqs. [B19]–[B21] and carrying out the integrations of E and \( \delta \) within the ranges \( b \Lambda < E < \Lambda \) and \( 0 < \delta < +\infty \), we get

\[ \Sigma_{C,\perp} \approx C_1 \ell, \quad \Sigma_{C,3} = C_2 \ell, \]  

\( \text{(F8)} \)

where

\[ C_1 = \frac{\lambda^2 \zeta^2}{8\pi^2 v} \int_0^{+\infty} d\delta \frac{1}{\sqrt{\delta (1 + \delta^2)}^3} \]
\[ \times \frac{1}{(\zeta + \delta (1 + \delta^2)^{3/2}).} \]  

\( \text{(F9)} \)

\[ C_2 = \frac{\lambda^2 \zeta^2}{8\pi^2 v} \int_0^{+\infty} d\delta \sqrt{\delta (1 + \delta^2)^{3/2}} \]
\[ \times \frac{(-\zeta + 3\delta (1 + \delta^2)^{3/2})}{(\zeta + \delta (1 + \delta^2)^{3/2})}. \]  

\( \text{(F10)} \)

with \( \zeta = \frac{4A}{v \sqrt{\eta}}. \)

b. Boson self-energy

As depicted in Fig. [I]b), the boson self-energy is given by

\[ \Pi(i\Omega, \mathbf{q}) = -\lambda^2 \int \frac{d\omega}{2\pi} \int d^3k \frac{1}{(2\pi)^3} \text{Tr} \left[ \gamma_0 G_0(i\omega, \mathbf{k}) \gamma_0 \right. \]
\[ \times G_0(i\omega + i\delta, \mathbf{k} + \mathbf{q}) \left. \right] . \]  

\( \text{(F11)} \)

Substituting Eq. [C1] into Eq. [F11] and expanding to quadratic order of \( \Omega \) and \( q_3 \), we arrive

\[ \Pi(i\Omega, \mathbf{q}) = \lambda^2 v_\perp^2 q_\perp^2 \frac{1}{8\pi^2} \frac{1}{(2\pi)^3} \int dk_\perp d|k|_3 k_\perp \left( \frac{2}{E_k^3} - \frac{v^2 k_3^2}{E_k^5} \right) \]
\[ + \lambda^2 v_\perp^2 A^2 \eta^2 \frac{1}{\pi^2} \frac{1}{(2\pi)^3} \int dk_\perp d|k|_3 k_\perp k_3^2 \frac{1}{E_k^3}. \]  

\( \text{(F12)} \)

Employing the transformations Eqs. [B19]–[B21] and performing the integrations of \( E \) and \( \delta \), \( \Pi \) can be expressed as

\[ \Pi(i\Omega, \mathbf{q}) = C_1 q_\perp^2 \ell + C_2 q_3^2 \ell, \]  

\( \text{(F13)} \)

where

\[ C_1 = \frac{3\lambda^2}{16\pi^2 \sqrt{A v}} \],  

\( \text{(F14)} \)

\[ C_2 = \frac{4\lambda^2 \sqrt{A^2 \Lambda^2}}{36\pi v^2}. \]  

\( \text{(F15)} \)

c. Corrections to fermion-boson coupling

As displayed in Fig. [II]a), the correction to fermion-boson coupling induced by Coulomb interaction takes the form

\[ V_C^{(1)} = -i\lambda^3 \int d\Omega \int d^3q \quad \frac{d^3q}{(2\pi)^3} \gamma_0 G_0(i\Omega, \mathbf{q}) \gamma_0 G_0(i\Omega, \mathbf{q}) \gamma_0 \]
\[ \times D_0(i\Omega, \mathbf{q}). \]  

\( \text{(F16)} \)

Substituting Eqs. [C1] and [F14] into Eq. [F16], we find

\[ V_C^{(1)} = -i\lambda^3 \gamma_0 \int d\Omega \int d^3q \quad \frac{d^3q}{(2\pi)^3} \int_{-\infty}^{+\infty} d\Omega \quad \frac{-\Omega^2 + E_q^2}{2\pi (\Omega^2 + E_q^2)^2} \]
\[ \times \frac{\sqrt{\eta}}{q_\perp^2 + \eta q_3^2}. \]  

\( \text{(F17)} \)

which means

\[ \delta \lambda^{(1)} = 0. \]  

\( \text{(F18)} \)

As presented in Fig. [II]b), the correction to fermion-boson coupling generated by four-fermion interactions can be written as

\[ V_C^{(2)} = i\lambda^3 \sum_{a=1,2,4,5,32} g_a^2 \left( \int d\Omega \int d^3q \frac{d^3q}{(2\pi)^3} \right) \Gamma_a G_0(i\Omega, \mathbf{q}) \gamma_0 \]
\[ \times G_0(i\Omega, \mathbf{q}) \Gamma_a. \]  

\( \text{(F19)} \)

Substituting Eq. [C1] into Eq. [F19], one can obtain

\[ V_C^{(2)} = i\lambda^3 \sum_{a=1,2,4,5,32} g_a^2 \left( \int d^3q \frac{d^3q}{(2\pi)^3} \int_{-\infty}^{+\infty} d\Omega \frac{\Gamma_a}{2\pi (\Omega^2 + E_q^2)^2} \right) \Gamma_a = 0. \]  

\( \text{(F20)} \)

Thus, \( \delta \lambda^{(2)} \) is given by

\[ \delta \lambda^{(2)} = 0. \]  

\( \text{(F21)} \)

The total correction to fermion-boson coupling is

\[ \delta \lambda = \delta \lambda^{(1)} + \delta \lambda^{(2)} = 0. \]  

\( \text{(F22)} \)
The correction from Fig. (a) is
\[ V_a^{(5)} = 2\lambda^2 g_a (\bar{\Psi}\Gamma_a \Psi)^2 \int \frac{d\omega}{2\pi} \frac{d^3 k}{(2\pi)^3} \text{Tr} [\gamma_0 G_0(i\omega, k)\Gamma_a \times G_0(i\omega + i\Omega, k + q)] D_0(i\Omega, q). \] (F23)

Fig. (b) leads to the correction
\[ V_a^{(6)} = -4\lambda^2 g_a \int \frac{d\Omega}{2\pi} \frac{d^3 q}{(2\pi)^3} (\bar{\Psi}\Gamma_a G_0(i\Omega, q)\Gamma_a \times G_0(i\Omega, q)\gamma_0 \Psi) D_0(i\Omega, q). \] (F24)

The correction from Figs. (c) and (d) takes the form
\[ V_a^{(7)+ (8)} = -4\lambda^2 g_a \int \frac{d\Omega}{2\pi} \frac{d^3 q}{(2\pi)^3} (\bar{\Psi}\Gamma_a G_0(i\Omega, q)\gamma_0 \Psi) + \Gamma_a G_0(-i\Omega, -q)\gamma_0 \Psi \} D_0(i\Omega, q). \] (F25)

Figs. (e) and (f) generate the correction
\[ V_a^{(9)+ (10)} = 4\lambda^4 \int \frac{d\Omega}{2\pi} \frac{d^3 q}{(2\pi)^3} (\bar{\Psi}\Gamma_a G_0(i\Omega, q)\gamma_0 \Psi) \times D_0(i\Omega, q) \{ \bar{\Psi} \gamma_0 G_0(i\Omega, q) \gamma_0 + \gamma_0 G_0(-i\Omega, -q) \} \Psi D_0(i\Omega, q). \] (F26)

Substituting Eqs. (C1) and (F4) into Eq. (F23), we arrive
\[ V_a^{(6)} = \delta g_a^{(6)} (\bar{\Psi}\Gamma_a \Psi)^2, \] (F33)

where
\[ \delta g_1^{(6)} = 0, \] (F34)
\[ \delta g_2^{(6)} = g_2 C_4 \ell, \] (F35)
\[ \delta g_3^{(6)} = 0, \] (F36)
\[ \delta g_5^{(6)} = g_5 C_4 \ell, \] (F37)
\[ \delta g_{3z}^{(6)} = -g_3 C_4 \ell, \] (F38)

with
\[ C_3 = \frac{\lambda^2 \sqrt{\zeta}}{2\pi^2 v} \int_0^{+\infty} d\delta \frac{1}{\sqrt{\zeta (1 + \delta^2)^2} \zeta + \delta (1 + \delta^2)^2}, \] (F39)
\[ C_4 = \frac{\lambda^2 \sqrt{\zeta}}{2\pi^2 v} \int_0^{+\infty} d\delta \frac{1}{(1 + \delta^2)^2 \zeta + \delta (1 + \delta^2)^2}, \] (F40)

Substituting Eqs. (C1) and (F4) into Eq. (F25), we can be written as
\[ V_1^{(7)+ (8)} = - (\bar{\Psi}i\gamma_3 \Psi)^2 g_1 C_4 \ell, \] (F41)
\[ V_2^{(7)+ (8)} = \sum_{j=1}^{2} (\bar{\Psi}_{j} \gamma_3 \Psi_{j})^2 g_2 C_5 \ell, \] (F42)
\[ V_4^{(7)+ (8)} = - (\bar{\Psi}i\gamma_5 \gamma_3 \Psi)^2 g_4 C_4 \ell, \] (F43)
\[ V_5^{(7)+ (8)} = - \sum_{<ik> \neq<ik>} (\bar{\Psi}_{j} \gamma_5 \Psi_{j})^2 g_5 C_{5} \ell, \] (F44)
\[ V_{3z}^{(7)+ (8)} = 0, \] (F45)

where
\[ C_5 = \frac{\lambda^2 \sqrt{\zeta}}{4\pi^2 v} \int_0^{+\infty} d\delta \frac{1}{\sqrt{\zeta (1 + \delta^2)^2} \zeta + \delta (1 + \delta^2)^2}, \] (F46)
Through the relations Eqs. (A37), (A38), (A41), and (A43), we obtain

\[ V_{1}^{(7)+(8)} = \left[ (\bar{\Psi}\gamma_{0}\gamma_{5}\Psi)^{2} - (\bar{\Psi}i\gamma_{5}\Psi)^{2} - (\bar{\Psi}\gamma_{0}\gamma_{3}\Psi)^{2} \right] \times g_{1}C_{4}\ell, \quad (F47) \]

\[ V_{2}^{(7)+(8)} = \left[ -(\bar{\Psi}\gamma_{0}\Psi)^{2} + (\bar{\Psi}\Psi)^{2} + (\bar{\Psi}\gamma_{0}\gamma_{5}\Psi)^{2} \right. \]
\[ \left. -2(\bar{\Psi}i\gamma_{5}\Psi)^{2} - (\bar{\Psi}\gamma_{0}\gamma_{3}\Psi)^{2} \right] \times g_{2}C_{5}\ell, \quad (F48) \]

\[ V_{4}^{(7)+(8)} = \left[ (\bar{\Psi}\gamma_{0}\Psi)^{2} + (\bar{\Psi}i\gamma_{5}\Psi)^{2} + (\bar{\Psi}\gamma_{0}\gamma_{3}\Psi)^{2} \right] \times g_{4}C_{4}\ell, \quad (F49) \]

\[ V_{5}^{(7)+(8)} = \left[ (\bar{\Psi}\gamma_{0}\Psi)^{2} + (\bar{\Psi}\Psi)^{2} - (\bar{\Psi}\gamma_{0}\gamma_{3}\Psi)^{2} \right] \times g_{5}C_{5}\ell. \quad (F50) \]

Thus, the total correction from Figs. (c) and (d) can be expressed as

\[ V^{(7)+(8)} = \sum_{a=1,2,3} V_{a}^{(7)+(8)} = \sum_{a=1,2,3} \delta g_{a}^{(7)+(8)} \left( \bar{\Psi}\Gamma_{a}\Psi \right)^{2}, \quad (F51) \]

where

\[ \delta g_{1}^{(7)+(8)} = (-g_{2}C_{5} + g_{2}C_{4} + g_{5}C_{5})\ell, \quad (F52) \]

\[ \delta g_{2}^{(7)+(8)} = (g_{2}C_{5} + g_{5}C_{5})\ell, \quad (F53) \]

\[ \delta g_{4}^{(7)+(8)} = (g_{1}C_{4} + g_{5}C_{5})\ell, \quad (F54) \]

\[ \delta g_{5}^{(7)+(8)} = (-g_{1}C_{4} - 2g_{2}C_{5} + g_{4}C_{4})\ell, \quad (F55) \]

\[ \delta g_{3z}^{(7)+(8)} = (g_{1}C_{4} - 2g_{2}C_{5} + g_{4}C_{4} + g_{5}C_{5})\ell. \quad (F56) \]

Substituting Eqs. (C1) and (C4) into Eq. (F26), one can get

\[ V^{(9)+(10)} = (\bar{\Psi}i\gamma_{3}\Psi)^{2} \frac{\pi^{2}v^{2}A_{2}^{\frac{2}{3}}}{\Lambda_{2}^{\frac{2}{3}}} C_{6}\ell, \quad (F57) \]

where

\[ C_{6} = \frac{\lambda^{3}\zeta}{2\pi^{2}v^{2}} \int_{0}^{+\infty} \frac{1}{(1 + \delta^{2})^{rac{3}{2}}} \left[ \zeta + \delta (1 + \delta^{2})^{rac{1}{2}} \right]^{2}. \quad (F58) \]

Using Eq. (A43), we can get

\[ V_{3z}^{(9)+(10)} = \left[ - (\bar{\Psi}\gamma_{0}\gamma_{5}\Psi)^{2} + (\bar{\Psi}i\gamma_{5}\Psi)^{2} \right. \]
\[ \left. + (\bar{\Psi}\gamma_{0}\gamma_{3}\Psi)^{2} \right] \frac{\pi^{2}v^{2}A_{2}^{\frac{2}{3}}}{\Lambda_{2}^{\frac{2}{3}}} C_{6}\ell. \quad (F59) \]

It indicates that

\[ \delta g_{1}^{(9)+(10)} = 0, \quad (F60) \]
\[ \delta g_{2}^{(9)+(10)} = 0, \quad (F61) \]
\[ \delta g_{4}^{(9)+(10)} = -\frac{\pi^{2}v^{2}A_{2}^{\frac{2}{3}}}{\Lambda_{2}^{\frac{2}{3}}} C_{6}\ell, \quad (F62) \]
\[ \delta g_{5}^{(9)+(10)} = \frac{\pi^{2}v^{2}A_{2}^{\frac{2}{3}}}{\Lambda_{2}^{\frac{2}{3}}} C_{6}\ell, \quad (F63) \]
\[ \delta g_{3z}^{(9)+(10)} = \frac{\pi^{2}v^{2}A_{2}^{\frac{2}{3}}}{\Lambda_{2}^{\frac{2}{3}}} C_{6}\ell. \quad (F64) \]

2. RG equations

Considering the correction of interactions, the action of fermions becomes

\[ S_{\Psi} = \int \frac{d\omega}{2\pi} \frac{d^{3}k}{(2\pi)^{3}} \bar{\Psi}(\omega, k) \left( i\omega\gamma_{0} + ik_{1}\gamma_{1} + ik_{2}\gamma_{2} \right. \]
\[ \left. + iAk_{3}\gamma_{3} - \Sigma_{C}(i\omega, k) \right) \Psi(\omega, k) \approx \int \frac{d\omega}{2\pi} \frac{d^{3}k}{(2\pi)^{3}} \bar{\Psi}(\omega, k) \left( i\omega\gamma_{0} + ik_{1}\gamma_{1} + ik_{2}\gamma_{2} \right. \]
\[ \left. \times e^{C_{1}\ell} + iAk_{3}\gamma_{3}e^{C_{2}\ell} \right) \Psi(\omega, k). \quad (F65) \]

Employing the transformations Eqs. (C68)-(C71), and

\[ v = v' e^{-C_{1}\ell}, \quad (F66) \]
\[ A = A' e^{-C_{2}\ell}, \quad (F67) \]

the action becomes

\[ S_{\Psi'} = \int \frac{d\omega'}{2\pi} \frac{d^{3}k'}{(2\pi)^{3}} \bar{\Psi}'(\omega', k') \left( i\omega'\gamma_{0} + ik_{1}'\gamma_{1} + ik_{2}'\gamma_{2} \right. \]
\[ \left. + iA'k_{3}'\gamma_{3} \right) \Psi'(\omega', k'), \quad (F68) \]

which recovers the original form of the fermion action.

Including the correction of boson self-energy, the action of \( \phi \) can be written as

\[ S_{\phi} = \int \frac{d\omega}{2\pi} \frac{d^{3}k}{(2\pi)^{3}} \phi(\omega, k) \left( \frac{1}{\sqrt{\eta}}k_{1}^{2} + \sqrt{\eta}k_{z}^{2} + \Pi(k) \right) \times \phi(\omega, k) \approx \int \frac{d\omega}{2\pi} \frac{d^{3}k}{(2\pi)^{3}} \phi(\omega, k) \left( \frac{1}{\sqrt{\eta}}k_{1}^{2} + \sqrt{\eta}k_{z}^{2}e^{C_{1}\ell} \right. \]
\[ \left. + \sqrt{\eta}k_{z}^{2}e^{C_{2}\ell} \right) \phi(\omega, k). \quad (F69) \]

Utilizing the transformations Eqs. (C68)-(C71), and

\[ \phi = \phi' \left( \frac{1}{\sqrt{\eta}} + \sqrt{\eta}e^{C_{1}\ell} \right) e^{C_{2}\ell}, \quad (F70) \]
\[ \eta = \eta' e^{-1 + \sqrt{\eta}e^{C_{1}\ell} - \frac{C_{1}\ell}{2}}. \quad (F71) \]
the action can be expressed as
\[
S_{\phi'} = \int \frac{d\omega'}{2\pi} \frac{d^3k'}{(2\pi)^3} \phi'(\omega', k') \left( \frac{1}{\sqrt{\eta}} k'^2 + \sqrt{\eta} k'^2 \right) \times \phi'(\omega', k'),
\]
which has the same form as the original action of boson.

Including the correction of one-loop Feynman diagrams, the action of fermion-boson couplings can be written as
\[
S_{\psi\phi} = i(\lambda + \delta\lambda) \int \frac{d\omega_1}{2\pi} \frac{d^3k_1}{(2\pi)^3} \frac{d\omega_2}{2\pi} \frac{d^3k_2}{(2\pi)^3} \Psi(\omega_1, k_1)\gamma_0 \\
\times \Psi(\omega_2, k_2)\phi(\omega_1 - \omega_2, k_1 - k_2)
= i\lambda \int \frac{d\omega_1}{2\pi} \frac{d^3k_1}{(2\pi)^3} \frac{d\omega_2}{2\pi} \frac{d^3k_2}{(2\pi)^3} \Psi(\omega_1, k_1)\gamma_0 \Psi(\omega_2, k_2) \\
\times \phi(\omega_1 - \omega_2, k_1 - k_2),
\]
(73)

since \(\delta\lambda = 0\). Employing the transformations Eqs. (C68), (C71), (C74), (F70), and
\[
\lambda = \lambda' \exp \left( \frac{\sqrt{\gamma} \epsilon}{\epsilon} \right),
\]
(74)

the action becomes
\[
S_{\psi'\phi'} = i\lambda' \int \frac{d\omega'_1}{2\pi} \frac{d^3k'_1}{(2\pi)^3} \frac{d\omega'_2}{2\pi} \frac{d^3k'_2}{(2\pi)^3} \Psi(\omega'_1, k'_1)\gamma_0 \\
\times \Psi(\omega'_2, k'_2)\phi'(\omega'_1 - \omega'_2, k'_1 - k'_2),
\]
(75)

which recovers the original form of the action of fermion-boson coupling.

Including the corrections of one-loop Feynman diagrams, the action of four-fermion interaction becomes
\[
S_{\psi^4} = \sum_{a=1,2,4,5,3z} (g_a + \delta g_a) \int \frac{d\omega_1}{2\pi} \frac{d^3k_1}{(2\pi)^3} \frac{d\omega_2}{2\pi} \frac{d^3k_2}{(2\pi)^3} \\
\times \frac{d\omega_3}{2\pi} \frac{d^3k_3}{(2\pi)^3} \Psi(\omega_1, k_1)\Gamma_a \Psi(\omega_2, k_2)\Psi(\omega_3, k_3)\Gamma_a \\
\times \Psi(\omega_1 - \omega_2 + \omega_3, k_1 - k_2 + k_3),
\]
(76)

Using the transformations Eqs. (C68), (C71), (C74), and
\[
g_a' = (g_a + \delta g_a) e^{-\frac{\sqrt{\gamma} \epsilon}{\epsilon}} \approx g_a - \frac{3}{2} g_a' \epsilon + \delta g_a,
\]
(77)

we get
\[
S_{\psi'^4} = \sum_{a=1,2,4,5,3z} g_a' \int \frac{d\omega'_1}{2\pi} \frac{d^3k'_1}{(2\pi)^3} \frac{d\omega'_2}{2\pi} \frac{d^3k'_2}{(2\pi)^3} \frac{d\omega'_3}{2\pi} \frac{d^3k'_3}{(2\pi)^3} \\
\times \Psi'(\omega'_1, k'_1)\Gamma_a \Psi'(\omega'_2, k'_2)\Psi'(\omega'_3, k'_3)\Gamma_a \\
\times \Psi'(\omega'_1 - \omega'_2 + \omega'_3, k'_1 - k'_2 + k'_3),
\]
(78)

which recovers the original form of the action.

From the transformations as shown in Eqs. (F66), (F67), (F71), (F74), (F77), we can get the RG equations
\[
\frac{dv}{dt} = C_1 v,
\]
(79)
\[
\frac{dA}{dt} = C_2 A,
\]
(80)
\[
\frac{dn}{dt} = (1 - \beta + \gamma) n,
\]
(81)
\[
\frac{dg}{dt} = \frac{\beta + \gamma}{4} g,
\]
(82)
\[
\frac{dA}{dt} = \left( -\frac{1}{2} + \frac{1}{2} C_2 - C_1 + \frac{1}{2} \beta - \frac{1}{2} \gamma \right) A,
\]
(83)
\[
\frac{da}{dt} = \left( -C_1 - \frac{1}{2} \beta + \frac{1}{2} \gamma \right) a,
\]
(84)
\[
\frac{db}{dt} = \left( \frac{1}{2} - \frac{1}{2} C_2 - \gamma \right) \beta,
\]
(85)
\[
\frac{d\gamma}{dt} = \left( -\frac{1}{2} + \frac{1}{2} C_2 - 2C_1 - \gamma \right) \gamma,
\]
(86)
\[
\frac{dg_1}{dt} = -\frac{3}{2} g_1 - \frac{2}{5} g_1 \left( g_2 + \frac{1}{2} g_4 + g_5 \right) - \frac{5}{4} (g2g5 + g4g3z + g5g3z) - 2g_1 (\beta + \gamma) + \left( -2g_1 C_1 \right.
\]
\[
\left. -\frac{1}{2} g_1 C_2 - g_2 C_5 + g_2 C_4 + g_5 C_5 \right),
\]
(87)
\[
\frac{dg_2}{dt} = -\frac{3}{2} g_2 + \frac{2}{5} g_2 \left( -\frac{3}{5} g_1 + \frac{4}{5} g_4 + \frac{3}{5} g_5 + g_3z \right)
\]
\[
+ \frac{2}{5} g_1 g_5 + g_4 \left( -g_5 + \frac{7}{5} g_3z \right) + \frac{2}{5} g_5 g_3z
\]
\[
+ \left( -2g_2 C_1 - \frac{1}{2} g_2 C_2 + g_2 C_3 + g_4 C_5 \right.
\]
\[
\left. + g_5 C_5 \right),
\]
(88)
\[
\frac{dg_4}{dt} = -\frac{3}{2} g_4 - \frac{1}{5} g_4^2 - \frac{1}{5} (g_1^2 + g_2^2 + g_3^2)
\]
\[
+ \frac{2}{5} g_5 g_3z + \frac{2}{5} g_1 (g_2 + g_5) + g_2 \left( -\frac{7}{5} g_5 + g_3z \right)
\]
\[
- \frac{1}{5} g_5 g_3z + \left( g_1 C_4 + g_2 C_5 - 2g_4 C_1 - \frac{1}{2} g_4 C_2 \right.
\]
\[
\left. - g_5 C_5 \right) - \frac{7}{2} C_6,
\]
(89)
\[
\frac{dg_5}{dt} = -\frac{3}{2} g_5 + \frac{6}{5} g_5^2 + \frac{1}{5} (g_1^2 + g_2^2 + g_4^2 + g_3^2)
\]
\[
+ g_5 (g_1 + g_2 + g_4 - g_3z) - \frac{2}{5} g_1 \left( 2g_2 + \frac{1}{2} g_4 \right)
\]
\[
- g_2 \left( \frac{4}{5} g_4 + g_3z \right) - \frac{8}{5} g_4 g_3z - \left( -g_1 C_4 - 2g_2 C_5 \right.
\]
\[
+ g_4 C_2 + g_5 C_5 - \frac{1}{2} g_5 C_2 + g_5 C_3 \right) + \frac{2}{5} C_6, (F90)
\]
\[
\frac{dg_3z}{dt} = -\frac{3}{2} g_3z + \frac{2}{5} g_3z^2 + \frac{1}{5} (g_1^2 + g_2^2 + g_4^2 + g_5^2)
\]
(90)
In particle-hole channels, the one-loop correction for the source term $\Delta$ can be written as

\[
\Delta = \frac{1}{2} \left( \frac{g_1 + 2g_2 + 3g_4 + 3 \frac{3}{2} g_5}{2} \right) - \frac{2}{5} \left( \frac{g_2 + 1}{2} g_4 + g_5 \right) + \frac{2}{5} g_2 \left( \frac{1}{2} g_4 + g_5 \right) + \frac{1}{5} g_4 g_5 + \left( -g_1 C_4 - g_2 C_5 + g_4 C_4 + g_5 C_5 \right)
\]

\[
-2g_{3z} C_1 \left( \frac{1}{2} g_{3z} C_2 - g_{3z} C_4 \right) + \frac{2}{5} C_6,
\]

where

\[
\alpha = \frac{\lambda^2}{4\pi v},
\]

\[
\bar{A} = \frac{\sqrt{A\sqrt{A}}}{v\sqrt{C}},
\]

\[
\beta = \sqrt{\eta C} = \frac{3}{5\pi} A,
\]

\[
\gamma = \frac{C_2}{\sqrt{C}} = \frac{16}{21\pi} \alpha \bar{A},
\]

and redefinition

\[
\Delta \frac{2}{\pi^2 r^2} g_a \rightarrow g_a
\]

has been employed.

FIG. 12: One-loop Feynman diagrams for the corrections to the source terms in particle-hole channels induced by long-range Coulomb interaction.

### 3. Source terms

The one loop correction for the source term $\Delta_X$ in particle-hole channels induced by long-range Coulomb interaction as shown in Fig. 12(a) can be written as

\[
W^{(3)}_{\Delta_X} = 2\Delta_X \lambda^2 \left( \Psi \Gamma_X \Psi \right) \int_{-\infty}^{+\infty} d\omega \int \frac{d^3 k}{(2\pi)^3} \times \text{Tr} \left[ \Gamma_X G_0(i\omega + i\Omega, k + q) \gamma_0 G_0(i\omega, k) \right] \times D_0(i\Omega, q).
\]

In particle-hole channels, the one-loop correction for the source term $\Delta_X$ from Fig. 12(b) is given by

\[
W^{(4)}_{\Delta_X} = -2\Delta_X \lambda^2 \int_{-\infty}^{+\infty} \frac{d\Omega}{2\pi} \int \frac{d^3 q}{(2\pi)^3} \left( \Psi \gamma_0 G_0(i\Omega, q) \Gamma_X \times G_0(i\Omega, q) \gamma_0 \Psi \right) D_0(i\Omega, q).
\]

It should be noticed that long-range Coulomb interaction does not induce correction for the source terms in particle-particle channels.

Calculating the corrections for source terms in particle-hole channels induced by long-range Coulomb interaction through Eqs. (F97) and (F98), and re-deriving the RG equations for $\Delta_X$, we finally obtain

\[
\bar{\beta}_{\Delta_1} = -2 (\beta + \gamma),
\]

\[
\bar{\beta}_{\Delta_2} = \frac{1}{2} (-g_1 + 3g_2 + g_4 + g_5 + g_{3z})
\]

\[
\quad + \frac{1}{2} C_3.
\]
FIG. 15: Flows of $g_1$, $g_2$, $g_4$, $g_5$, and $g_{4s}$ are shown in (a)-(e). (f) and (g): Flows of $\tilde{\alpha}_{X,Y}$ which approach to positive infinity and ratios between $\tilde{\alpha}_{X,Y}$. In (a)-(g) $g_{1,0} = 0$, $g_{2,0} = 0$, $g_{4,0} = 0$, $g_{5,0} = 0$, $g_{4s,0} = 0$, and $\tilde{\beta}_0 = 0.1$ are taken. $\alpha_0 = 10$ is taken in (f) and (g).

\[ \tilde{\beta}_{4z} = \frac{1}{5} (-g_1 + g_2 + g_4 + g_5 + g_{3z}) + \frac{1}{2} C_5, \quad \text{(F101)} \]

\[ \tilde{\beta}_{3z} = \frac{1}{10} (-g_1 + g_2 + g_4 - g_5 + 3g_{3z}) + \frac{1}{2} C_4, \quad \text{(F102)} \]

\[ \tilde{\beta}_{4s} = 0, \quad \text{(F103)} \]

\[ \tilde{\beta}_{5s} = \frac{1}{2} (-g_1 + g_2 + g_4 + 3g_5 - g_{3z}) + \frac{1}{2} C_3, \quad \text{(F104)} \]

\[ \tilde{\beta}_{4z} = \frac{1}{5} (-g_1 - g_2 + g_4 + g_5 - g_{3z}) + \frac{1}{2} C_5 \ell, \quad \text{(F105)} \]

\[ \tilde{\beta}_{3z} = \frac{1}{10} (-g_1 - g_2 + g_4 + g_5 + g_{3z}) + \frac{1}{2} \ell, \quad \text{(F106)} \]

\[ \tilde{\beta}_{4s} = \frac{2}{5} (-g_1 - g_2 - g_4 + g_5 - g_{3z}) + C_5, \quad \text{(F107)} \]

where $\beta$ and $\gamma$ are given by Eqs. (F94), (F95), and (F96), respectively. The RG equations for source terms in particle-particle channels are still given by Eqs. (D69), (D70).

4. Numerical Results

The flows of $\alpha$, $\beta$, $v$, and $A$ are shown in Figs. (a)-(d) respectively. We can find that $\alpha$ approaches to zero quickly in the lowest energy limit. It represents that long-range Coulomb interaction becomes irrelevant in the lowest energy regime. As shown in Fig. (b), $\beta \to \frac{1}{2}$, which indicates the anisotropic screening of Coulomb interaction. According to Figs. (c) and (d), $v$ and $A$ approach to constant values in the lowest energy limit. Thus, the fermion dispersion is not changed qualitatively by long-range Coulomb interaction.

According to Fig. (c), the four-fermion interactions become divergent more quickly with increasing of initial value of Coulomb strength. This result reveals that the long-range Coulomb interaction can enhance the instabilities in particle-hole channels although it becomes irrelevant in the low energy regime. As shown in Figs. (a)-(c), if the initial value of the Coulomb strength is large enough, we can find that even if the initial values of the four-fermion interactions all vanish, the four-fermion interactions can be generated and become divergent finally at a finite energy scale. According to Figs. (f) and (g), axionic insulating phase is generated if the initial value of Coulomb interaction is strong enough.
