1. INTRODUCTION
On the evening of November 8, 1895, Wilhelm Conrad Röntgen discovered the X-rays effect. The Nobel Prize in Physics 1901 was awarded for Röntgen. He became the father of modern radiology field. From 1920 to now, even though there was no number of people utilizing X-rays, it might be billions (1, 2). Allan M. Cormack and Godfrey N. Hounsfield jointly achieved the Nobel Prize in Physiology or Medicine 1979 with the development of computer-assisted tomography (1, 3). In 2003, Paul C. Lauterbur and Peter Mansfield jointly obtained the Nobel Prize in Physiology or Medicine 2003 with their discoveries concerning magnetic resonance imaging (1, 4). These contributions generated a vigorous development of radiology which led to the debut of many radiological societies throughout the world (1-4).

Radiological Society of North America (RSNA) was founded very early in the 1910s. It also held the first conference in 1915. Dr. Dunnick reported that RSNA currently has over 54,000 members from over 140 countries considered as one of the biggest medical societies in the world. RSNA has five scientific journals: Radiology, Radiology: Artificial Intelligent, Radiology:
Vietnamese Society of Radiology and Nuclear Medicine: Past, Current and Future

Cardiothoracic Imaging, Radiology: Imaging Cancer, and RadioGraphics (5). Meanwhile, in the European region, the European Association of Radiology (EAR) was founded in 1962 and the European Congress of Radiology (ECR) was founded in 1967 and carried out congresses every 4 years. Then, in 2005, the European Society of Radiology (ESR) was founded by merging EAR and ECR. ESR has three scientific journals: European Radiology, Insights into imaging, and European Radiology Experimental (6).

Asian-Oceanian Society of Radiology (AOSR) was founded in 1969 and formed by the participation of some radiological societies including: Australia, New Zealand, Japan, Korea, Hong Kong, Cambodia, Singapore, Malaysia, Taiwan, Thailand, Indonesia, Bangladesh, Sri Lanka, Philippines, India, Western Samoa, Fiji, and Pakistan. In 2019, the Member Societies were 26, including Vietnam Society of Radiology and Nuclear Medicine (7, 8). ASOR was affiliated with the Biomedical Imaging and Intervention Journal. Nevertheless, this journal ceased publication in 2012 (9).

In January 1980, various representatives of the ASEAN countries agreed to form the ASEAN Association of Radiologists (AAR) then renamed as ASEAN Association of Radiology based on meeting outcome of the ASEAN radiologists in Manila, Philippines. AAR society members are Brunei, Indonesia, Malaysia, Philippines, Singapore, Thailand, Cambodia, Lao, Myanmar, and Vietnam (10).

Currently, most of continents and countries have their own radiological societies which help to share and update clinical experience and scientific knowledge to make the outcome of routine work become efficacious. Although Vietnam was affected adversely due to war, it also developed fundamentally in radiological field. So as to interact better among radiological societies, we believe that the history and current condition of Vietnamese radiology should be introduced.

2. AIM

Thus, in this paper, we aimed to describe the past, current, and future of Vietnamese Society of Radiology and Nuclear medicine.

3. FINDINGS

The Evolution of the Society

During the French colonial period, the Vietnamese radiology field was not developed due to the limitation of both modalities and human resource. Dr. Hoang Su working for Hue General Hospital studied abroad in Paris for three years. In 1939, Dr. Hoang Su became the first Vietnamese radiologist receiving a master's degree in Radiology (Diplôme d'Electro Radiologie). Dr. Hoang Su was selected to become the Head of Department of Medical Physics-Mathematics-Radiology in Hanoi Medical University. In addition, he was also Head of Department of Radiology at Viet Duc Hospital and Deputy Director of Radium Institute (now known as K Hospital). At that time, there was no society of radiology in Vietnam (11, 12).

After the Geneva Accords of 1954, the radiological field in Northern Vietnam was more developed owing to the sponsored equipment from socialist countries, such as the Soviet Union, German Democratic Republic, Hungary, Cuba, Czech, and Slovakia. Many Vietnamese doctors were sent to be trained in radiology and radiation in the socialist countries, especially in the German Democratic Republic and Hungary. With the prolonged experience in radiological field and the change in the condition of war, in 1961, Dr. Hoang Su decided to establish the “Radiology and Physiotherapy Association”. Immediately, the appearance of new society attracted medical doctors, engineers, and technicians in radiology and radiation fields. Dr. Hoang Su was elected to become the first President of the Society (Figure 1) and Dr. Vu Long was selected to become General Secretary (11, 12).

At the National Congress in 1978, the Administrative Committee fully agreed to rename the society as “Radiology–Physiotherapy–Medical Radioactivity Association”. During this time, due to illness, Dr. Hoang Su retired from the activities of Society, hence, all the members elected Dr. Dang Van An (Head of Department of Radiology at Bach Mai Hospital) as the President of the So-
Society, Vice Presidents of the Society were Dr. Dang Chu Ky (the representative member of Physiotherapy group) and Dr. Nguyen Cong Thuy (the representative member of Medical Radioactivity group). Dr. Vu Long and Dr. Hoang Duc Kiet were selected as General Secretaries (11, 12).

After 1990, members of Physiotherapy group requested to separate from the society and later joined to the Society of Rehabilitation. From 1990 to 2010, the members of society boomed owing to the availability of new equipment including X-ray, Ultrasound, Computer tomography (CT), Magnetic resonance imaging (MRI), and Digital subtraction angiography (DSA). Medical radioactivity field also thrived since the availability of new devices, such as Single-photon emission computed tomography (SPECT) and Positron emission tomography - computed tomography (PET-CT); thus, it then renamed as Nuclear medicine.

Due to the fluctuated situation, at the National conference in 1995, the committee decided to rename the society as “Vietnamese society of radiology and nuclear medicine” (VSRNM) (Figure 3). Professor Hoang Duc Kiet was elected as President of the Society (Figure 4) and Dr. Pham Minh Thong was selected as General Secretary. Vice Presidents were Associate Professor Vu Long, Associate Professor Phan Sy An, Dr. Nguyen Quy Khoang, and Associate Professor Nguyen Duy Hue (Head of Department of Radiology at Hanoi Medical University). Then, Dr. Nguyen Quy Khoang retired and Associate Professor Pham Ngoc Hoa, head of Diagnostic imaging department at Cho Ray Hospital, was additionally elected as Vice president of society. In 2008, the committee appointed additionally Associate Professor Pham Minh Thong to be Vice President cum General Secretary. In 2010, at the meeting in Hai Phong, the committee agreed to appoint more Deputy General Secretaries in three regions: Dr. Vu Dang Luu (Northern region), Associate Professor Le Trong Khoan (Middle region) and Dr. Vo Tan Duc (Southern region) (11, 12).

In 2013, all members elected Professor Pham Minh Thong as President of VSRNM (Figure 5). Vice presidents were Associate Professor Pham Ngoc Hoa and Associate Professor Nguyen Duy Hue. Professor Phan Sy An retired and Professor Mai Trong Khoa became new vice president (the representative member of Nuclear medicine group). Other new vice presidents were Associate Professor Haungh Minh Loi (the representative member of middle region) and Associate Professor Nguyen Quoc Dung (Head of Diagnostic imaging department at Huu Nghi Hospital). Dr. Bui Van Giang was selected as General Secretary (11).

In 2018, at National Congress of the Society in Hanoi, all members continued electing Professor Pham Minh Thong as President. Vice presidents were Professor Mai Trong Khoa, Associate Professor Pham Ngoc Hoa, Associate Professor Nguyen Duy Hue, Associate Professor Hoang Minh Loi, and Associate Professor Nguyen Quoc Dung. Associate Professor Bui Van Giang was additionally elected as Vice president. Associate Professor
Vu Dang Luu was selected as General Secretary. Deputy General Secretaries in three regions were Dr. Nguyen Ngoc Trang (Northern region), Associate Professor Le Trong Khoan (Middle region) and Dr. Vo Tan Duc (Southern region) (11).

Currently, VSRNM has had over 1,000 members and opened three subspeciality groups including: Vietnamese society of interventional radiology (in July 2010), Vietnam Association of Radiological Technologists (in August 2013), and Vietnamese society of Ultrasound in Medicine (in August 2016) (11).

Relationship with Other Societies

VSRNM is currently members of many main radiological societies such as: AAR, AOSR, and ESR (6, 7, 8, 10).

The Executive Committee of VSRNM has sent a number of members to participate in Groupe des Radiologistes Enseignants d’Expression Française (GREF), of which Associate Professor Vu Long is Vice President and Professor Hoang Duc Kiet is a member of the Executive Committee of GREF. Annually, the French professor came to Vietnam to teach and select young Vietnamese radiologist for a 1-year scholarship in France. From 1994 to 2009, there were 119 radiologists achieved scholarship. In addition, Professor Pham Minh Thong, Associate professor Hoang Minh Loi, and Associate professor Pham Ngoc Hoa currently join AAR, AOSR, Asian society of Cardiovascular imaging (ASCI), and Asian society of abdominal radiology (ASAR) as executive committee members (7, 10, 13, 14).

VSRNM has organized annually scientific conferences in Hanoi, Ho Chi Minh City and some other cities such as Hai Phong, Hue, Da Nang, Da Lat, Vung Tau, and Nha Trang. Each meeting has abundant scientific reports and educational exhibitions from both domestic members and foreign experts. VSRNM organized two French-Vietnamese Diagnostic Imaging Conferences in conjunction with annual congresses by 1999 and 2003, in which many French professors presented scientific and review reports to update knowledge for domestic members. In addition, in September 2008, VSRNM cooperated with AAR to hold 14th Asean association of radiology conference in Hanoi (12). In 2011, VSRNM organized the Third France-Vietnamese Conference in Hue. In 2019, VSRNM coordinated with ASAR to hold lecture course at Hanoi (13). In 2020, at Da Nang city, The society will conjoin with ASCI to hold the 14th conference (14).

Educations and Publications

In terms of education, there are two types of training course. One type is managed by Ministry of Health, which focuses more on clinical practice. First, oriented specialists are trained with ultrasonography and X-ray within 9 months. Nonetheless, from 2019 it was contemporarily discontinued. Specialists at level 1 are trained for 2 years after finishing oriented education course. By 2022, it will become specialist program. Training of specialists at level 2 (2 years) is reserved for specialist level 1 or master of degree. This type will be completed by a thesis. By 2022, it will become expert program. Another type is managed by Ministry of Education and Training. There are also two levels of course (Master course in 2 years and then Doctor of Philosophy in 3 years). To graduate, both Master degree and PhD candidates have to complete their own thesis. Currently, only Hanoi Medical University, Hue University of Medicine and Pharmacy, and Research Institute of 108 Military Central Hospital have Doctor of Philosophy in Radiology and Nuclear medicine program. Most of Medical universities have many learning courses such as: Master degree, Specialist level I, and Specialist level II in Radiology. In Vietnam, some medical universities also have residency program in radiology for medical student to be able to learn immediately after graduating from university. Hanoi Medical University early started residency training course in radiology from 1978. By 2010, there were 43 residency doctors graduating under this program. By 2006, University of Medicine and Pharmacy at Ho Chi Minh city and Hue University of Medicine and Pharmacy launched this training program. Later, in 2018, Pham Ngoc Thach University of Medicine initiated this program (11, 12).

Prior to 2009, there were only three colleges in Hai Duong, Da Nang, and Ho Chi Minh City offering radiological technologist program. Thus, radiology and nuclear medicine field critically lack radiological technicians. Fortunately, today, many medical universities offer this course; therefore, the insufficiency of radiological technologists has been partially resolved (11, 12).

Nuclear medicine physicians are independently educated and also complied with these levels as described above. Presently, there are only two training centers for this specialty including Military Medical University and Hanoi Medical Uni-
versity (11, 12). In terms of publication, after estab-
lishing Society in 1961, the committee decided to
publish four issues per year on Vietnamese ra-
diology journal in 1962 and 1963. Then, the journal
published two issues per year up to 1984. Due to
the limited condition in printing publication,
prior to 1990, journal could not publish figures in
content. Since 2010, VSRNM has published con-
secutively the Vietnamese journal of Radiology
with four issues per year. In 2019, executive staff
of journal decided to publish one special English
issue and three Vietnamese issues per year (11, 12).

4. DISCUSSION

Vietnam, an ASEAN country with an area of
331,699 km² and a population of 95.5 million in
2018, is currently classified as developing country
with low-middle income. In 2009, the number of
physicians was about 6.25 per 10,000 people. The
number of hospital beds was 25 per 10,000 people
meanwhile the numbers of public hospital beds
was 19 per 10,000 people. Health care expenditure
per capita was about 27 USD per year (12). Prior to
1975, when the country was split into two re-
gions: Northern region and Southern region, ac-
tivities of the Vietnam Radiology Society were lo-
calized only in Northern region. Since 1975, activ-
ities of Society have been extended to the whole
country. During 5-decades development, the So-
ciety changed its name four times: Radiology
and Physiotherapy Association (1961), Radiolo-
y–Physiotherapy–Medical Radioactivity Associ-
ation (1978), Radiology and Nuclear Medicine So-
ciety (1995), and Vietnamese society of Radiology
and Nuclear medicine (1999) (11, 12).

Vietnamese radiology was truly formed after
the end of the war against French invasion in
1954. Nonetheless, it was not well developing due
to the war against the United states of America
until 1975. From 1954 to 1974, only big hospitals
in big cities, including Saigon, Hue, and Hanoi
owned few X-ray modalities for diagnostic pur-
poses; even though, in 1972, computed tomog-
raphy became more and more popular throughout
the world. In 1991, the first computed tomography
scanner was installed in Viet-Xo Hospital, Hanoi,
in which in 1997, the first magnetic resonance im-
aging system was also launched. In 1971, Nuclear
medicine field was just started at Cho Ray hos-
pital (Saigon) and Bach Mai hospital (Hanoi). After
1975, together with the development of commu-
nity healthcare, Vietnamese radiology flourished
efficaciously (11, 12).

In 2009, Hoang Duc Kiet reported that almost all
district hospitals possessed X-ray and ultrasound
modalities. About 80% of the hospitals in province
and cities owned 174 CT systems, 51 MRI systems,
and 21 DSA systems. Regarding nuclear medicine
modalities, 25 provincial hospitals and all cen-
tral hospitals had SPECT and four PET–CT systems
throughout Vietnam. Furthermore, there were
many learning programs for both radiologists
and technologists to update and practice, which
reduce the insufficiency of human resource of ra-
diology and nuclear medicine fields in Vietnam
by 1960s. Thus, from 1961 to 2009, there was a
big improvement from both available modalities
and human resource in this field. Therefore, with
these reasons, the appearance of Vietnamese so-
ciety of Radiology in 1961 became very reasonable
to cope with the development of radiology field in
the world (6, 8, 10, 12).

Eventhough, there are an effective development
of Vietnamese radiological field, Vietnamese ra-
diological society still faced some problematic
conditions. Firstly, the availability of CT and MRI
modalities throughout Vietnam is relatively lim-
ited; therefore, the human resource working ef-
fectively with CT and MRI is still lacking. Sec-
ondly, the male diagnostic and interventional
radiologists were more predominant than the
female; thus it results in the gender disparity
among the Vietnamese radiological society. The
advanced Vietnamese radiologists worked mainly
in big cities like Hochiminh, Danang, and Hanoi;
therefore, there is a significant different in human
resource level among the Vietnamese provinces.
Thirdly, the Vietnamese interventional radiolo-
gists are severely deficient despite the acute ne-
cessity of interventional radiology field.

From now to 2024, the Society aims to improve
the national level of radiology and nuclear medi-
cine with six main tasks: (1) Performing Conti-
uous Medical Education Program for radiologists
and technologists of every region; (2) Unifying the
recommendative protocol and course throughout
the medical universities, clinical centers, and
subspecialities societies in many regions; (3) Co-
ordinating with regional radiological associa-
tions such as AAR and AOSR and experts from de-
veloped countries such as Korea, Japan, France,
USA... to update knowledge and to share clinical
experience; (4) Holding the annual conference in
conjuction with another specific meeting of ASAR,
Vietnamese Society of Radiology and Nuclear Medicine: Past, Current and Future

5. CONCLUSION

With the appearance of Vietnamese society of radiology and nuclear medicine, many doctors and technicians are close together. In terms of domestic activities of the Society, such as training, education, meeting, and conference, many radiologists and technologists can share knowledge and update information related to this field. In terms of international activities of the Society, many international conferences in conjunction with annual conference were and will be hold, which opens an effective chance for Vietnamese radiology to intergrate into actively global radiological field.
