Abstract. We calculate the triple gluon, ghost-gluon and quark-gluon vertex functions at two loops in the \( \overline{\text{MS}} \) scheme in the chiral limit for an arbitrary linear covariant gauge when the external legs are all off-shell.
1 Introduction.

In recent years there has been renewed interest in understanding the vertex functions of Quantum Chromodynamics (QCD) which is the non-abelian gauge theory describing the strong nuclear force. The main techniques used to study the vertex functions are lattice gauge theory and the Dyson-Schwinger method. In general they both aim to probe the non-perturbative structure of the 3-point functions of QCD in order to gain insight into the properties of colour and quark confinement, dynamical symmetry breaking and the formation of bound states. For instance, see [1, 2, 3] for reviews of Dyson-Schwinger techniques in this area. Such knowledge of the vertex functions can also inform the construction of models which explore the hadronization of quarks into the bound states seen in nature, [1]. In this respect providing analytic perturbative information on the triple gluon, quark-gluon and ghost-gluon vertices is important. There have been several one loop perturbative studies of the 3-point functions over several decades in a selection of momentum configurations of the external fields. Several of the original key articles in this instance are [4, 5]. In the early part of the vertex function programme Ball and Chiu, [5], examined the one loop off-shell functions for the trivalent vertices in the $\overline{\text{MS}}$ scheme with the aim of accessing the singularity structure. Indeed [5] provided an insight into properties of the vertices when the gauge fields were transverse. Moreover, the basis of tensors presented in [5] with respect to which the vertices were decomposed has allowed Schwinger-Dyson studies to access certain properties of the vertices. For instance, these have produced certain ansätze for the all orders vertex functions which are used as input structures for the solution of the tower of the Schwinger-Dyson $n$-point functions. In certain cases results have emerged which match very closely with results from lattice gauge theory. One such example is the deep infrared behaviour of the gluon and Faddeev-Popov ghost propagators in the Landau gauge. For example, in recent years it has been shown that the gluon propagator freezes to a non-zero finite value at zero momentum. Both lattice and Schwinger-Dyson analyses are in accord, [6, 7, 8, 9, 10, 11, 12, 13, 14, 15].

A parallel early work was the development of renormalization schemes as alternatives to the $\overline{\text{MS}}$ scheme of [16, 17]. In [4] the momentum subtraction (MOM) schemes were constructed. These were based on the three 3-point vertices of QCD. Briefly the MOM scheme is such that the finite part of the 2- and 3-point functions are absorbed into the appropriate renormalization constant at a particular subtraction point in addition to the terms singular in the regulator. For the coupling constant renormalization this is at the point where the square of the momenta of the three external fields are all equal which is known as the symmetric point. This produces three separate MOM schemes each based on one of the 3-point vertices. More recently that one loop MOM renormalization of QCD was extended to two loops in [18]. In respect of analytic work there have been various combinations of computations subsequent to [4] in a variety of gauges, with different external momenta configurations including some external legs on-shell and at one or two loops. A representative selection of such combinations are [19, 20, 21, 22, 23, 24, 25, 26, 27]. More recently, a string inspired method has allowed all types of one loop off-shell vertex functions to be studied simultaneously, [28]. Such an approach has the potential to be extended to two loops. Another aspect that knowledge of the explicit structure of the vertex functions is required for and that is in relation to lattice matching. If one computes vertex structures on the lattice in say a certain momentum regime, one always has to ensure that in the limit back to the high energy region the numerical results match smoothly onto the known explicit perturbative results. Such matching can aid estimation of errors, for instance. Given these considerations the aim of this article is to provide the full two loop $\overline{\text{MS}}$ results for the three 3-point vertices of QCD in an arbitrary linear covariant gauge in the chiral limit where the three external fields are all off-shell. This extends the symmetric point analysis of [18] at two loops and like [4, 18]
will be for a non-exceptional momentum configuration. It will be useful, for instance, in being a potential guide along the route envisaged in [28].

That such a computation can be achieved is due to recent developments in multiloop perturbation theory. We mention the key ones briefly. The first is the provision of the Laporta algorithm, [29]. This is a mathematical construction which allows one to determine algebraic relations between Feynman integrals within a graph of a Green's function. While this is not a major observation, what has been crucial is that such relations can be systematically solved in terms of a small set of basis integrals known as masters, [29]. The second aspect is that for 3-point functions all such one and two loop masters are known for off-shell legs. The main early work in this respect was given in [30, 31], prior to the development of the Laporta algorithm. However, to obtain the complete result, several master integrals are required to an order in \( \epsilon \) beyond that given in [30, 31]. This is because of the presence of spurious poles in \( \epsilon \) which appear in the solution of the algebraic relations. Here \( \epsilon \) is the regularizing parameter of dimensional regularization which we use throughout where \( d = 4 - 2\epsilon \) is the spacetime dimension. More recently, techniques have been developed such as those given in [32, 33, 34] founded on polylogarithms and their mathematical generalizations. However, we have used a parallel set of masters constructed in a specific problem, [35], but for a less general external momentum configuration. Based on [35] we have extended the basic master integrals required to the necessary order in \( \epsilon \) for the general off-shell situation. Equipped with these two main ingredients the construction of the general off-shell two loop vertex functions is viable. In reporting our full vertex function results it is worth noting that we have endeavoured to be as general as possible. So, for instance, one can extract the behaviour of the vertex functions in, say, the Feynman gauge or for an arbitrary gauge but at a specific external momentum configuration. One benefit of such a general approach is that aside from assisting lattice matching, it allows for studies of the vertices in relation to the various ansätze Schwinger-Dyson methods used. For instance, one approximation which is sometimes used is to neglect graphs with quartic gluon vertices. As the full two loop perturbative vertex 3-point functions cannot omit such vertices due, for instance, to requiring renormalizability, the behaviour of say the triple gluon vertex function for a range of momenta can be compared with a Schwinger-Dyson analysis of the same vertex but with a particular ansatz. For example this could determine over which range of momenta such ansätze or truncation of the tower of equations the approximation is valid for. Indeed there have been recent studies in this direction in [36, 37]. For instance, in [36] improvements have been made in a Dyson-Schwinger analysis of the triple gluon vertex, in the absence of quarks. One interesting aspect was to actually try and numerically quantify the effect of omitting those two loop diagrams with quartic gluon interactions, [36]. Our perturbative results should prove useful in future similar studies of other vertices.

The article is organized as follows. The computational setup together with a description of the algorithm we use to complete the two loop analysis is given in section 2. Explicit results for the ghost-gluon, quark-gluon and triple gluon vertices are given in sections 3, 4 and 5. Concluding comments are given in section 6. Two appendices provide the tensor basis for each vertex we consider and the projection matrices as well as a summary of the one and two loop master integrals we needed.

2 Background.

We begin by describing our computational setup. The overall procedure will be similar to the symmetric point analysis of [18] but the external momentum configuration for the 3-point vertices will be different. Moreover, we will use the same renormalization constant convention
definitions as [18]. If we denote the three external momenta by \( p \), \( q \) and \( r \) then energy momentum conservation
\[
p + q + r = 0
\]
(2.1)
simply implies that two momenta are independent. We take these to be \( p \) and \( q \) and follow the notation of [30, 31] in defining new variables by
\[
x = \frac{p^2}{r^2} \quad y = \frac{q^2}{r^2} \quad r^2 = -\mu^2
\]
(2.2)
Thus all three external legs on the vertex functions will be off-shell and at distinct values unlike [4, 18]. Our final expressions will be functions of \( x \) and \( y \) and we carry out all our analysis in terms of the dimensionful scale \( \mu \). Consequently, the scalar products are given by
\[
pq = \frac{1}{2} [x + y - 1] \mu^2 \quad pr = \frac{1}{2} [1 + x - y] \mu^2 \quad qr = \frac{1}{2} [1 - x + y] \mu^2
\]
(2.3)
and are set to these values at each stage of the calculations. To extract data for the symmetric point configuration it is clear that this corresponds to \( x = y = 1 \). As we are considering vertex functions, to the two loop order we will be working to it transpires that each vertex function has a common colour group factor. At the outset it is best to factor this off and focus on the colourless amplitudes by defining, [18],
\[
\langle A^a_p(p)A^b_q(q)A^c_{-p-q}(-p-q) \rangle = f^{abc}\Sigma^{ggg}_{\mu\nu\rho}(p,q)
\]
\[
\langle \psi^i_p(p)\bar{\psi}^j_q(q)A^c_{-p-q}(-p-q) \rangle = T_{ij}\Sigma^{qqg}_{\sigma}(p,q)
\]
\[
\langle e^\sigma(p)c^\beta_{-p-q}(-p-q) \rangle = f^{abc}\Sigma^{ccg}_{\sigma}(p,q)
\]
(2.4)
where the labels \( ggg \), \( qgg \) and \( ccg \) respectively denote the triple gluon, quark-gluon and ghost-gluon vertices. In (2.4) and analogous functions later they can be regarded as being evaluated for the momentum configuration defined in (2.2) and (2.3). To proceed we have to write the colourless amplitudes in terms of Lorentz scalars. This requires choosing a set of basis tensors for each vertex. While the Ball-Chiu analysis [5] was one of the first decompositions considered, we have chosen to follow those given for the symmetric point in [18]. One reason for this is that we retain one basic tensor structure per basis element, rather than combine them at the outset. In [5] the basis choice was motivated in part by particular structures the overall vertex function should satisfy. This could slow down the computer algebraic computations. A second reason is to have a smooth way of checking that the results of [18] emerge in the symmetric point limit of the full expression. Moreover, in [18] no assumption was made to simplify the tensor basis due to the completely symmetric nature of the analysis. For instance, it was noted a postiori that the triple gluon vertex function could be written in terms of three independent tensor structures. However, for the general case one cannot make any such assumptions about the final structure of this or either of the other two vertex functions. Therefore, we will consider the most general Lorentz tensor decomposition. In other words we will use a basis built from the two independent external momenta, \( p \) and \( q \), the metric tensor, \( \eta_{\mu\nu} \), and in the case of the quark-gluon vertex we will append tensors deriving from the \( \gamma \)-algebra.

First, we define in general terms the decomposition into Lorentz scalar amplitudes. For each vertex function we set
\[
\Sigma^{ccg}_{\sigma}(p,q) = \sum_{k=1}^{2} P^{ccg}_{(k)\sigma}(p,q) \Sigma^{ccg}_{(k)}(p,q)
\]
\[
\Sigma^{qqg}_{\sigma}(p,q) = \sum_{k=1}^{6} P^{qqg}_{(k)\sigma}(p,q) \Sigma^{qqg}_{(k)}(p,q)
\]
\[ \Sigma_{\mu_\nu^\sigma}(p, q) = \sum_{k=1}^{14} P_{(k)\mu_\nu^\sigma}(p, q) \Sigma_{(k)}^{ggg}(p, q) \]  

(2.5)

where \( \Sigma_{(k)}^{i}(p, q) \) are the amplitudes and \( P_{(k)\mu_\nu^\sigma}(p, q) \) is the associated Lorentz tensor. We use the same labelling convention as [18] and \( n = 1 \) for the ghost-gluon and quark-gluon vertices and \( n = 3 \) for the triple gluon case. The explicit expressions for each situation is given in Appendix A.

To disentangle the amplitudes in order to evaluate each individually we extend the method of [18] to the general momentum point. This involves projecting the 3-point function with a specific Lorentz tensor for each label \( k \). This projection matrix \( \mathcal{M}_{kl} \) where \( i \) labels the vertex, is defined as the inverse of the symmetric matrix \( \mathcal{N}_{kl} \) whose elements are defined by the product of the \( k \)th and \( l \)th basis tensor,

\[ \mathcal{N}_{kl}^i = P_{(k)\mu_1...\mu_n}(p, q) P_{(l)\mu_1...\mu_n}(p, q) \]  

(2.6)

where there is no sum over \( i \). We have provided the projection matrix for each of the three vertices in Appendix A as their explicit forms are too involved for the main discussion due to the fact that we are in a general momentum configuration. Hence the \( k \)th amplitude of each of the three vertices is given by

\[ f^{abc}\Sigma_{(k)}^{ccg}(p, q) = \mathcal{M}_{ccg}^{kl} \left( \mathcal{M}_{ccg}^{kl} \right)^{-1}(p, q) \left\{ c^a(p)\bar{c}^b(q)A_\sigma^c(-p - q) \right\} \]  

(2.6)

\[ T_{ij}^{\gamma \tau}\Sigma_{(k)}^{ggg}(p, q) = \mathcal{M}_{ggg}^{kl} \left( \mathcal{M}_{ggg}^{kl} \right)^{-1}(p, q) \left\{ \psi^i(p)\bar{\psi}^j(q)A_\tau^c(-p - q) \right\} \]  

(2.6)

\[ f^{abc}\Sigma_{(k)}^{ggg}(p, q) = \mathcal{M}_{ggg}^{kl} \left( \mathcal{M}_{ggg}^{kl} \right)^{-1}(p, q) \left\{ \delta_\mu^a(p)\delta_\nu^b(q)A_\sigma^c(-p - q) \right\} \]  

(2.7)

For this decomposition there is an additional aspect for the quark-gluon vertex. As the external quarks carry spinor indices one has to allow for this in the projection. So a trace over these indices is also included implicitly within our construction. In addition we use the generalized \( \gamma \)-matrices of [38] denoted by \( \Gamma_{(n)}^{\mu_1...\mu_n} \) which are defined by

\[ \Gamma_{(n)}^{\mu_1...\mu_n} = \gamma^{[\mu_1}...\gamma^{\mu_n]} \]  

(2.8)

which is totally antisymmetric in its Lorentz indices and a factor of \( 1/n! \) is understood in the definition. Although one could use a different construction to accommodate the potential tensor basis element \( \gamma^\mu \gamma^\tau \) the benefit of using \( \Gamma_{(n)}^{\mu_\nu^\sigma} \) \( P_\nu q_\sigma \) is that there is a partitioning of the projection matrix.

One of the reasons for discussing the projection into Lorentz scalar amplitudes is that this is necessary for the way we perform the explicit loop computations. This is based on the Laporta algorithm, [29], which is a method to systematically construct all the relevant integration by parts relations between Feynman integrals within a specific defining topology. Such integrals are necessarily scalar for the application of the algorithm. The outcome of the procedure is to solve the set of of relations for all the integrals in the problem at hand in terms of a basis set of what is termed master integrals, [29]. Their value is determined by direct computation by non-integration by parts methods. For 3-point functions in the general momentum configuration to two loops there are 1 one loop and 4 two loop basic topologies. For the latter there is one non-planar topology and three ladder integrals which are each formal rotations of each other but different external momenta. Once one projects the vertex function to scalar integrals then one writes the numerator momentum scalar products in terms of the topology propagators. For the one loop topology this is always possible but for the 4 two loop cases one has to append an additional propagator within the Laporta context to handle an irreducible numerator scalar product. Once such rearrangements have been carried out one constructs the integration by
parts relations and solves the system in order to write each vertex amplitude in terms of the master integral basis. For our problem the application of the Laporta algorithm can only be performed with a computer package and we use the REDUCE encoding, [43], which is written in C++ and uses GiNaC, [44]. In this version a database of relations is constructed and the required integrals can be readily extracted. Such expressions are converted into the symbolic manipulation language FORM, [45]. We use this and its multi-threaded version TFORM, [46], to handle the large amounts of intermediate algebra. Indeed the whole computation for each of the three vertices was performed automatically in FORM. The Feynman graphs were generated in QGRAF, [47], and converted into FORM notation. Overall there are 2 one loop and 33 two loop graphs for each of the ghost-gluon and quark-gluon vertices. In the case of the triple gluon vertex there were 8 one loop and 106 two loop graphs to compute. With its 14 amplitudes to determine this was by far the largest of our three vertex functions.

A final part of the computation is the substitution of the master integrals. For these we have used the values as they are already recorded in various articles. For the most part they were provided in [30, 31]. However, when one uses integration by parts, such as in the Laporta approach, there is a potential that spurious poles in $\epsilon$ can appear. Hence one may require the master integrals to various finite powers in $\epsilon$ in order to extract the finite parts for the vertex functions. That is the case here and we have had to extend several of the master integrals of [30, 31] to $O(\epsilon^2)$. This extends the same observation of [35] for the interpolating configuration. It is so called since it depends on a parameter which links the fully symmetric point with the asymmetric point where one of the external momenta is zero. Though this latter point is an exceptional momentum configuration we note that (2.2) is non-exceptional and hence not subject to any infrared problems. We have devolved the technical discussion of extracting the necessary $O(\epsilon^2)$ terms of the various master integrals to Appendix B. Moreover, for completeness we also give there the explicit expressions for the functions which will appear in our final vertex amplitudes which were derived in [30, 31] in terms of the polylogarithm function. Though we note that as a check on our computational setup we have reproduced the full calculation of [35] for that interpolating momentum configuration. In [35] the Green’s function under consideration was a quark 2-point function with the quark mass operator inserted with a non-zero external momentum flowing through it.

Finally, we note that as we are performing an automatic computation we use the procedure of [48] to implement the renormalization procedure. We calculate in terms of bare parameters such as the coupling constant and the gauge parameter. Once all the diagrams have been compiled and added together the bare parameters are replaced by their renormalized counterparts with the corresponding renormalization constant as the constant of proportionality. This automatically introduces the requisite counterterms. To handle the divergences we use the $\overline{\text{MS}}$ scheme. This provides a minor check on our construction. As these renormalization constants have been established for a long time, [49, 50, 51, 52, 53, 54], we must obtain the same values for the coupling constant renormalization to two loops for example. Thus we should not have a pole in $\epsilon$ whose residue is a function of $x$ or $y$ or both momentum ratio parameters. Such poles would contradict the renormalizability of QCD. This is a non-trivial observation since one has spurious poles within the main part of the integration. So equally one should not find quartic and triple poles in $\epsilon$ with $x$ or $y$ dependent residues either. In this respect we note that this is partially as a consequence of functional relations between some of the basic functions which appear in the master integrals such as those given in (B.3). In carrying out an $\overline{\text{MS}}$ renormalization we note that we subtract at the point given by (2.2). Moreover, all the explicit finite expressions for the vertex function presented later in the article are at that point after renormalization. Therefore, the scale which appears in the running coupling constant, for instance, is the parameter $\mu$ of (2.2). In other words we use $\mu$ as the mass scale which is introduced in to ensure that
the coupling constant is dimensionless in \(d\)-dimensions. Choosing an independent scale, say \(\mu\), is straightforward to incorporate. In the context of the article this is possible to achieve as electronic versions of all these final expressions are provided in an attached data file. In addition we have also included the expressions for each of the three 3-point functions prior to any wave function, coupling constant or gauge parameter renormalization. In other words these correspond to the bare vertex functions. This will allow, for example, an interested reader to any wave function, coupling constant or gauge parameter renormalization. In other words these addition we have also included the expressions for each of the three 3-point functions as electronic versions of all these final expressions are provided in an attached data file. In \(\mu\) the channel one amplitude for the ghost-gluon vertex in the sections of the function domain. The reason for concentrating on the Landau gauge in presenting in relation to the one loop part, we will compare the amplitudes graphically for various cross-points concerning their derivation. However, to appreciate the effect of the two loop corrections the coupling constant is dimensionless in \(\epsilon\) at one loop. These terms are necessary when considering schemes which absorb finite parts into some or all of the renormalization constants. The counterterms affecting the one loop part will contribute to the finite part of the vertex function at two loops. The benefit of providing this bare data is that it also allows one to perform the automatic renormalization using the method of [48].

3 Ghost-gluon vertex.

In this section we discuss the amplitudes for the ghost-gluon vertex. As the full gauge dependent result is large we present the Landau gauge expression for one amplitude after renormalizing in the \(\overline{\text{MS}}\) scheme. This is to illustrate the complexity of the final expressions and to discuss several points concerning their derivation. However, to appreciate the effect of the two loop corrections in relation to the one loop part, we will compare the amplitudes graphically for various cross-sections of the function domain. The reason for concentrating on the Landau gauge in presenting results is that it is the one of intense lattice and Schwinger-Dyson interest in recent years. Thus the channel one amplitude for the ghost-gluon vertex in the \(\overline{\text{MS}}\) scheme is

\[
\Sigma_{\text{ccg, } a=0}^{\overline{\text{MS}}}(p, q) = -1 + \left[ -\frac{9}{4} \Phi_1(x, y)y^2 \Delta_G^{-1} - \frac{15}{16} \Phi_1(x, y)y - \frac{3}{4} \Phi_1(x, y)xy \Delta_G^{-1} - \frac{1}{2} - \frac{1}{4} y \\
- \frac{1}{4} \ln(x)y \Delta_G^{-1} - \frac{1}{4} \ln(x)x \Delta_G^{-1} - \frac{1}{8} \ln(x)y - \frac{1}{8} \ln(x)x + \frac{1}{16} \Phi_1(x, y)x \\
+ \frac{1}{8} \ln(y) + \frac{1}{8} \ln(y)y + \frac{1}{8} \ln(y)x + \frac{1}{8} \Phi_1(x, y) + \frac{1}{4} x + \frac{1}{4} \ln(x) \\
+ \frac{1}{4} \ln(x) \Delta_G^{-1} + \frac{5}{4} \Phi_1(x, y)y \Delta_G^{-1} + \frac{3}{2} \ln(y) \Delta_G^{-1} - \ln(y)y^2 \Delta_G^{-1} \\
- \ln(y)xy \Delta_G^{-1} - \Phi_1(x, y)xy^2 \Delta_G^{-1} + \Phi_1(x, y)y^3 \Delta_G^{-1} \\
+ 2 \ln(x)xy \Delta_G^{-1}] C_{\text{gg}} a \\
+ \left[ -\frac{149}{18} \ln(x)xy \Delta_G^{-1} - \frac{59}{12} \ln(y)y \Delta_G^{-1} - \frac{163}{36} \Phi_1(x, y)y \Delta_G^{-1} \\
- \frac{149}{36} \Phi_1(x, y)y^3 \Delta_G^{-1} - \frac{19}{12} \ln(y) \Phi_1(x, y)y^2 \Delta_G^{-1} - \frac{3}{2} \ln(x) \Phi_1(x, y)y^2 \Delta_G^{-1} \\
- \frac{47}{36} \ln(x) - \frac{25}{24} \Phi_1(x, y) - \frac{11}{12} \ln^2(y) y^2 \Delta_G^{-1} - \frac{11}{12} \ln(y) \Phi_1(x, y)xy \Delta_G^{-1} \\
- \frac{19}{24} \ln(x) \Phi_1(x, y)y - \frac{2}{3} \ln(x) \Phi_1(x, y)xy \Delta_G^{-1} - \frac{2}{3} \ln^2(y) xy \Delta_G^{-1} \\
- \frac{11}{18} \ln(y) - \frac{1}{2} \ln(x) \Phi_1(x, y)xy \Delta_G^{-1} - \frac{1}{2} \ln(y) \Phi_1(x, y)xy \Delta_G^{-1} \\
- \frac{11}{24} \ln(y) \Phi_1(x, y)y - \frac{7}{18} \ln(x) \Delta_G^{-1} - \frac{11}{36} x - \frac{1}{4} \ln^2(x) y^2 \Delta_G^{-1} \\
- \frac{1}{4} \ln(x) \ln(y)y^2 \Delta_G^{-1} - \frac{5}{24} \ln(x) \Phi_1(x, y)x - \frac{1}{6} \ln^2(x) y \\
\right]
\]
\[-\frac{1}{6} \ln(x) \ln(y) y^3 \Delta^{-1}_G - \frac{1}{6} \ln(x) \ln(y) x \Delta^{-1}_G - \frac{1}{6} \Omega_2 \left( y, \frac{1}{x} \right) x \]
\[-\frac{1}{6} \Omega_2 \left( \frac{x}{y^2}, \frac{1}{y^2} \right) x - \frac{1}{6} \Phi_1(x, y) y^2 - \frac{1}{12} \ln^2(x) x \Delta^{-1}_G \]
\[-\frac{1}{12} \ln^2(x) x y^2 \Delta^{-1}_G - \frac{1}{12} \ln(x) \ln(y) x - \frac{1}{12} \ln(x) \Phi_1(x, y) \Delta_G \]
\[-\frac{1}{12} \ln^2(y) y \ln(x) \ln(y) y - \frac{1}{12} \ln^2(y) x y^2 \Delta^{-1}_G - \frac{1}{36} \ln(y) y - \frac{1}{36} \ln(y) x - \frac{1}{36} \ln(x) y \]
\[+ \frac{1}{36} \ln(x) x + \frac{1}{24} \ln(y) \Phi_1(x, y) x + \frac{1}{12} \ln^2(x) \Delta^{-1}_G + \frac{1}{12} \ln^2(x) y \Delta^{-1}_G \]
\[+ \frac{1}{12} \ln^2(x) x y^3 \Delta^{-1}_G + \frac{1}{12} \ln^2(y) y + \frac{1}{12} \ln^2(y) x y^3 \Delta^{-1}_G + \frac{1}{12} \ln^2(y) x \]
\[+ \frac{1}{12} \ln(y) \Phi_1(x, y) \Delta_G + \frac{1}{12} \Phi_1(x, y) \Delta_G + \frac{1}{8} \ln(y) \Phi_1(x, y) \]
\[+ \frac{1}{6} \ln(x) \ln(y) \Delta^{-1}_G + \frac{1}{6} \ln(x) \ln(y) x y \Delta^{-1}_G + \frac{1}{6} \Omega_2 \left( y, \frac{1}{x} \right) \]
\[\frac{1}{6} \Omega_2 \left( \frac{x}{y^2}, \frac{1}{y^2} \right) y + \frac{1}{6} \Omega_2 \left( \frac{x}{y^2}, \frac{1}{y^2} \right) \]
\[+ \frac{1}{6} \Phi_1(x, y) x y \]
\[+ \frac{1}{4} \ln^2(x) + \frac{1}{4} \ln(x) \ln(y) y + \frac{7}{24} \ln(x) \Phi_1(x, y) + \frac{11}{36} y + \frac{3}{8} \ln(x) \ln(y) \]
\[+ \frac{7}{18} \ln(x) y \Delta^{-1}_G + \frac{7}{18} \ln(x) x \Delta^{-1}_G + \frac{41}{72} \Phi_1(x, y) x + \frac{7}{12} \ln(x) \ln(y) y \Delta^{-1}_G \]
\[+ \frac{2}{3} \ln(x) \Phi_1(x, y) y \Delta^{-1}_G + \frac{3}{4} \ln(x) \ln(y) x y \Delta^{-1}_G + \frac{3}{4} \ln(y) \Phi_1(x, y) y \Delta^{-1}_G \]
\[+ \frac{5}{6} \ln(x) \Phi_1(x, y) y \Delta^{-1}_G + \frac{5}{6} \ln(y) \Phi_1(x, y) x \Delta^{-1}_G + \frac{31}{36} + \frac{4}{3} \ln^2(x) x y \Delta^{-1}_G \]
\[+ \frac{83}{24} \Phi_1(x, y) y + \frac{15}{4} \Phi_1(x, y) x y \Delta^{-1}_G + \frac{149}{36} \ln(y) y \Delta^{-1}_G \]
\[+ \frac{149}{36} \ln(y) x y \Delta^{-1}_G + \frac{149}{36} \Phi_1(x, y) x y \Delta^{-1}_G + \frac{26}{3} \Phi_1(x, y) y \Delta^{-1}_G \]
\[+ \ln^2(y) x \Delta^{-1}_G \right] C_A T_F N_f a^2 \]
\[+ \left[ -\frac{1159}{48} \Phi_1(x, y) y^2 \Delta^{-1}_G - \frac{4315}{384} \Phi_1(x, y) y - \frac{3203}{288} \ln(y) y \Delta^{-1}_G \right. \]
\[\left. - \frac{3203}{288} \ln(y) x y \Delta^{-1}_G - \frac{3203}{288} \Phi_1(x, y) x y \Delta^{-1}_G - \frac{295}{32} \Phi_1(x, y) x y \Delta^{-1}_G \right. \]
\[\left. - \frac{1351}{384} \ln^2(x) x y \Delta^{-1}_G - \frac{901}{288} - \frac{377}{192} \ln(x) \Phi_1(x, y) y \Delta^{-1}_G - \frac{137}{72} \ln(x) y \Delta^{-1}_G \right. \]
\[\left. - \frac{137}{72} \ln(x) x \Delta^{-1}_G - \frac{237}{128} \ln^2(y) y \Delta^{-1}_G - \frac{57}{32} \zeta(3) y^2 \Delta^{-1}_G - \frac{455}{288} \right. \]
\[\left. \frac{277}{192} \ln(x) \Phi_1(x, y) y \Delta^{-1}_G - \frac{45}{32} \ln(y) \Phi_1(x, y) y \Delta^{-1}_G \right. \]
\[\left. - \frac{511}{384} \ln(y) \Phi_1(x, y) y \Delta^{-1}_G - \frac{223}{192} \Phi_1(x, y) x y - \frac{73}{64} \ln^2(x) \right. \]
\[\left. - \frac{55}{64} \Phi_2 \left( \frac{1}{y}, \frac{x}{y} \right) y \Delta^{-1}_G - \frac{155}{192} \ln(x) \ln(y) y \Delta^{-1}_G - \frac{51}{64} \Phi_2 \left( \frac{y}{x}, \frac{1}{x} \right) y \Delta^{-1}_G \right. \]
\[\left. - \frac{11}{16} \Phi_2 \left( \frac{y}{x}, \frac{1}{y} \right) y \Delta^{-1}_G - \frac{41}{64} \Phi_2 \left( \frac{1}{y}, \frac{1}{y} \right) x y \Delta^{-1}_G - \frac{41}{64} \Phi_2 \left( \frac{1}{y}, \frac{1}{y} \right) x y \Delta^{-1}_G \right. \]
\[\left. - \frac{61}{96} \ln^2(x) y \Delta^{-1}_G - \frac{19}{32} \Phi_2 \left( \frac{y}{x}, \frac{1}{x} \right) y^3 \Delta^{-1}_G - \frac{149}{256} \Phi_2 \left( \frac{1}{y}, \frac{1}{y} \right) y \Delta^{-1}_G \right. \]
\[-\frac{149}{256} \Omega_2(y, x) y \Delta_G^{-1} - \frac{223}{384} \cdot \Phi_1(x, y) \Delta_G - \frac{9}{16} \zeta(3) x y^2 \Delta_G^{-1} \]
\[-\frac{25}{48} \ln(x) \ln(y) \Delta_G^{-1} - \frac{33}{64} \zeta(3) y - \frac{117}{256} \Omega_2 \left( \frac{1}{x}, \frac{1}{y} \right) - \frac{117}{256} \Omega_2(y, x) \]
\[-\frac{85}{192} \ln(x) \Phi_1(x, y) = -\frac{27}{64} \Phi_2(x, y) y \Delta_G^{-1} - \frac{289}{768} \ln(y) \Phi_1(x, y) x \]
\[-\frac{115}{384} \ln^2(y) x - \frac{17}{64} \Phi_2 \left( \frac{y}{x}, \frac{1}{x} \right) x \Delta_G^{-1} - \frac{33}{128} \Omega_2 \left( y, \frac{1}{x} \right) x y \Delta_G^{-1} \]
\[-\frac{33}{128} \Omega_2 \left( \frac{x}{y}, \frac{1}{y} \right) y x y \Delta_G^{-1} - \frac{59}{256} \Omega_2 \left( \frac{y}{x}, \frac{1}{x} \right) x y \Delta_G^{-1} \]
\[-\frac{55}{256} \Omega_2 \left( \frac{x}{y}, \frac{1}{y} \right) \Delta_G^{-1} - \frac{55}{256} \Omega_2(x, y) \Delta_G^{-1} - \frac{61}{288} \ln(x) x \]
\[-\frac{157}{768} \Omega_2 \left( \frac{y}{x}, \frac{1}{x} \right) - \frac{157}{768} \Omega_2 \left( \frac{x}{y}, \frac{1}{y} \right) - \frac{13}{64} \Phi_2(x, y) y^3 \Delta_G^{-1} \]
\[-\frac{51}{256} \Omega_2 \left( \frac{x}{y}, \frac{1}{y} \right) x \Delta_G^{-1} - \frac{51}{256} \Omega_2(y, x) x \Delta_G^{-1} - \frac{73}{384} \ln^2(y) \]
\[-\frac{205}{1152} \Phi_1(x, y) = -\frac{17}{96} \ln^2(y) y - \frac{9}{64} \ln(x) \ln(y) x y \Delta_G^{-1} - \frac{9}{64} \Phi_2(x, y) \]
\[-\frac{33}{256} \ln(y) \Phi_1(x, y) = -\frac{31}{128} \Omega_2 \left( \frac{y}{x}, \frac{1}{x} \right) y \Delta_G^{-1} - \frac{31}{256} \Omega_2 \left( \frac{x}{y}, \frac{1}{y} \right) y \Delta_G^{-1} \]
\[-\frac{17}{144} \ln(x) y - \frac{19}{192} \Omega_2 \left( \frac{y}{x}, \frac{1}{x} \right) x y \Delta_G^{-1} - \frac{19}{192} \Omega_2 \left( \frac{x}{y}, \frac{1}{y} \right) x y \Delta_G^{-1} \]
\[-\frac{37}{384} \ln(y) \Phi_1(x, y) = \frac{3}{32} \Phi_2(x, y) y \Delta_G^{-1} - \frac{1}{128} \ln(x) \ln(y) y \]
\[-\frac{29}{384} \ln^2(x) x \Delta_G^{-1} - \frac{7}{96} \ln(x) \ln(y) y^3 \Delta_G^{-1} - \frac{7}{128} \ln(y) \Phi_1(x, y) x y \]
\[-\frac{1}{16} \Phi_2 \left( \frac{y}{x}, \frac{1}{x} \right) \frac{1}{x} \Delta_G^{-1} - \frac{1}{16} \Phi_2 \left( \frac{x}{y}, \frac{1}{y} \right) x \Delta_G^{-1} - \frac{3}{64} \zeta(3) x \]
\[-\frac{3}{64} \Omega_2 \left( \frac{y}{x}, \frac{1}{x} \right) y^2 \Delta_G^{-1} - \frac{3}{64} \Omega_2 \left( \frac{x}{y}, \frac{1}{y} \right) x \Delta_G^{-1} - \frac{3}{64} \Omega_2(x, y) y \Delta_G^{-1} \]
\[-\frac{3}{64} \Omega_2(x, y) x - \frac{3}{64} \Omega_2(y, x) x \Delta_G^{-1} - \frac{7}{192} \ln^2(x) x y \Delta_G^{-1} \]
\[-\frac{7}{192} \ln^2(y) x y \Delta_G^{-1} - \frac{3}{128} \ln(x) \Phi_1(x, y) x y + \frac{1}{32} \Phi_2 \left( \frac{y}{x}, \frac{1}{x} \right) \]
\[+ \frac{7}{192} \ln^2(x) x y^2 \Delta_G^{-1} + \frac{7}{192} \ln^2(y) y^3 \Delta_G^{-1} + \frac{3}{64} \ln(x) \Phi_1(x, y) x y \]
\[-\frac{3}{64} \ln(y) \Phi_1(x, y) y^2 + \frac{3}{64} \Omega_2 \left( \frac{y}{x}, \frac{1}{x} \right) x y^2 \Delta_G^{-1} + \frac{3}{64} \Omega_2 \left( \frac{1}{y}, \frac{1}{y} \right) y \]
\[-\frac{3}{64} \Omega_2 \left( \frac{1}{y}, \frac{1}{y} \right) x + \frac{3}{64} \Omega_2 \left( \frac{x}{y}, \frac{1}{y} \right) x y^2 \Delta_G^{-1} + \frac{3}{64} \Omega_2(y, x) y \]
\[-\frac{3}{64} \Omega_2(y, x) x + \frac{3}{64} \Phi_2(x, y) x y + \frac{19}{384} \ln(x) \Phi_1(x, y) \Delta_G \]
\[-\frac{7}{96} \ln(x) \ln(y) x y \Delta_G^{-1} + \frac{29}{384} \ln^2(x) x \Delta_G^{-1} + \frac{3}{32} \zeta(3) x y \Delta_G^{-1} \]
\[-\frac{3}{32} \Phi_2 \left( \frac{y}{x}, \frac{1}{x} \right) x y \Delta_G^{-1} + \frac{3}{32} \Phi_2(x, y) y^2 + \frac{3}{32} \Phi_2(x, y) x y \Delta_G^{-1} \]
\[-\frac{27}{256} \Omega_2 \left( \frac{1}{y}, \frac{1}{y} \right) + \frac{27}{256} \Omega_2(y, x) + \frac{7}{64} \ln(x) \ln(y) + \frac{7}{64} \Phi_2(x, y) x \]
This channel corresponds to the Feynman rule of the original vertex itself. Here \( \zeta(z) \) is the Riemann zeta function, \( C_A, C_F \) and \( T_F \) are the usual colour group Casimirs, \( N_f \) is the number of massless flavours, \( a = g^2/(16\pi^2) \) and \( g \) is the coupling constant. We have introduced the Gram determinant \( \Delta_G \) which depends on \( x \) and \( y \) and is given by

\[
\Delta_G(x, y) = x^2 - 2xy + y^2 - 2x - 2y + 1. \tag{3.2}
\]
This arises from the determinant of the matrix which produces the projection matrix. In the above expression we have endeavoured to simplify the tedious algebra as far as possible using FORM. However, due to the presence of \( \Delta_G^{-1} \) it was not always possible to do so in a symmetric way for cases where the expression has say an \( x \) and \( y \) interchange symmetry. This is the reason for the absence of any obvious underlying symmetries. However, as a check on our all the amplitudes we have computed we have taken the limit to the full symmetric point and compared with the results of [18]. We found exact agreement for all \( \alpha \). In order to assist others with this check we note the limits of the various functions as \( x \to 1 \) and \( y \to 1 \) in the notation of [55].

We have

\[
\Phi_1(1,1) = \frac{2}{3} \psi' \left( \frac{1}{3} \right) - \frac{4\pi^2}{9}, \quad \Psi_1(1,1) = \frac{\pi}{4\sqrt{3}} \ln^2(3) - 12s_3 \left( \frac{\pi}{6} \right) + \frac{35\pi^3}{108\sqrt{3}}
\]

\[
\Phi_2(1,1) = \frac{1}{36} \psi'' \left( \frac{1}{3} \right) - \frac{2\pi^4}{27},
\]

\[
\Omega_2(1,1) = \frac{8\pi^2}{3} + 4\zeta(3) - 24s_2 \left( \frac{\pi}{6} \right) + 48s_2 \left( \frac{\pi}{2} \right) + 40s_3 \left( \frac{\pi}{6} \right) - 32s_3 \left( \frac{\pi}{2} \right)
\]

\[
- 4\psi' \left( \frac{1}{3} \right) + \frac{29\pi^3}{162\sqrt{3}} + \frac{2\pi}{\sqrt{3}} \ln(3) - \frac{\pi}{6\sqrt{3}} \ln^2(3)
\]

\[
\chi_1(1,1) = \frac{\pi^4}{27} - \frac{\pi^2}{18} \psi' \left( \frac{1}{3} \right) - \mathcal{H}_{31}^{(2)}, \quad \chi_3(1,1) = \frac{\pi^4}{27} - \frac{\pi^2}{18} \psi' \left( \frac{1}{3} \right) + \mathcal{H}_{43}^{(2)}
\]

\[
\chi_2(1,1) = 12s_2 \left( \frac{\pi}{6} \right) - 24s_2 \left( \frac{\pi}{2} \right) - 8s_3 \left( \frac{\pi}{6} \right) + 16s_3 \left( \frac{\pi}{2} \right) - \frac{4\pi^2}{3} - 4\zeta(3)
\]

\[
+ 2\psi' \left( \frac{1}{3} \right) - \frac{67\pi^3}{162\sqrt{3}} - \frac{\pi}{\sqrt{3}} \ln(3) - \frac{\pi}{6\sqrt{3}} \ln^2(3)
\]

where \( \psi(z) \) is the derivative of the logarithm of the Euler Gamma function,

\[
s_n(z) = \frac{1}{\sqrt{3}} \ln \left[ \text{Li}_n \left( \frac{e^{iz}}{\sqrt{3}} \right) \right]
\]

and \( \text{Li}_n(z) \) is the polylogarithm function. Also \( \mathcal{H}_{31}^{(2)} \) and \( \mathcal{H}_{43}^{(2)} \) are two harmonic polylogarithms, [55], but in a symmetric point computation they always appear in the combination

\[
\Sigma = \mathcal{H}_{31}^{(2)} + \mathcal{H}_{43}^{(2)}.
\]

Although \( \Psi_1(x,y) \) does not appear in our final expressions we have included its symmetric point value for any intermediate checks. In addition we have provided the values for the intermediate functions, \( \chi_i(x,y) \) for \( i = 1, 2 \) and 3, which appear in the derivation of the master integrals at \( O(\epsilon^2) \) and discussed in Appendix B. In performing this symmetric limit check it should be noted that in [18] the master integrals used for that computation were based on those given in [55]. There it was assumed that two expressions were distinct. However, it transpires that \( \Sigma \) is not independent and is related to another combination of numbers in a master integral. Specifically,

\[
\Sigma = \frac{1}{36} \psi'' \left( \frac{1}{3} \right) - \frac{2\pi^4}{27}.
\]

Though the final expressions and numerical values for the results of [18] are still valid since [3.6] only simplifies the results. We have also checked all our general expressions against another computation, [56], of each of the three vertices. That independent calculation was for the

\*We are particularly indebted to Dr M. Gorbahn on this point.
momentum configuration used in [35] and in this instance is a non-trivial check. The reason for this is that to compare with [35] the definition of the overall mass scale $\tilde{\mu}$ used there, [56], is different from the scale $\mu$ used here. Therefore, to effect the comparison we have to allow for the effect of extra logarithms deriving from the ratio $(\tilde{\mu}^2/\mu^2)^\varepsilon$ which multiplies each loop integral. Once this is included we find precise agreement. Indeed as part of this process we used the bare expressions provided in the attached data file for the verification. Hence, that non-trivial check ensures that those expressions are correct and hence can be used to deduce the general vertex functions when $r^2$ is not tied to $\mu^2$.

Figure 1: Various sections of the Landau gauge channel 1 ghost-gluon vertex amplitude for $\alpha_s = 0.125$.

To appreciate the effect the two loop corrections have we have provided graphs of the amplitudes for both channels in Figures 1 and 2. In these we use the reduced notation

$$H_k(x, y) = \sum_{(k)}^\text{cyc}(p, q)$$

where $x$ and $y$ are the variables defined in (2.2), and plot the shape of the functions along various lines on the $(x, y)$-plane. Though we will use $x$ as the plotting variable in the argument of sections. Also our graphs will all be in the Landau gauge and for a particular value of the coupling constant which is $\alpha_s = 0.125$ where $\alpha_s = g^2/(4\pi)$. For channel 1 it is clear that the two loop corrections are not significantly different for a reasonably large range of the variables. Though, of course, this is for a specific choice of coupling constant and a much larger value
would lead to the two loop contributions dominating. One interesting aspect of the two loop correction is that for such a large expression, (3.1), there is not a significant deviation from the one loop result for this channel. A similar feature emerges for other channels and vertices. For instance, for channel 2 the two loop correction appears to have a smaller deviation from the one loop part in comparison. For two of the graphs in Figure 2 there appear to be gaps around 4 and 6. These arise from singularities due to the Gram determinant as is apparent in (3.1). For the ghost-gluon vertex this is a simple pole. However, as is evident in the full expressions given in the data file, for the other vertices the singularity is more severe being a double pole for the quark-gluon vertex and a triple pole for the triple gluon vertex.

Figure 2: Various sections of the Landau gauge channel 2 ghost-gluon vertex for $\alpha_s = 0.125$.

4 Quark-gluon vertex.

We continue the presentation of the results by focusing on the quark-gluon vertex in this section. Again we have checked that the correct symmetric point $\overline{\text{MS}}$ expressions emerge in comparison with [18] for arbitrary $\alpha$ as well as performing the other checks discussed for the ghost-gluon vertex. Similarly to the previous case we focus on graphical illustrations. For the figures relating to the quark-gluon vertex amplitudes our syntax is

$$Q_k(x, y) = \Sigma_{qg}^{qg}(p, q).$$  (4.1)
In Figure 3 we show the same section of all six amplitudes for this vertex in order to compare. Clearly, the two loop corrections for this specific value of the coupling constant are effectively negligible. The same is true for other sections as is clear in Figure 4 and this indicates the more severe nature of the singularity.

5 Triple gluon vertex.

Finally, we discuss the situation with the triple gluon vertex in the Landau gauge. Of the three cases the results for this vertex are the most involved due in part to the number of graphs and the large number of amplitudes. For the latter it is instructive to focus on a representative sample and then comment on the remainder. First we note that we have again verified that in the limit to the symmetric point the previous expressions given in [18] are obtained for all $\alpha$ as well as checking against [56] for all amplitudes and for all $\alpha$. Unlike the other two vertices the integration by parts routine produces denominator factors of $(1-x)$, $(1-y)$ and $(x-y)$ as part of the intermediate algebra. Such singularities could be problematic in the limit to the symmetric point but it is reassuring to note that they cancelled when the full set of diagrams was summed prior to renormalization. This provided another useful check. The notation used for our graphs here is

$$G_k(x,y) = \Sigma_{\gamma}^{gg}(p,q).$$

(5.1)

In Figure 5 we have plotted the section along $y = x$ for the six amplitudes which derive from the triple gluon vertex Feynman rule itself as these are of more interest. Hence there is a degree of symmetry in the graphs. This is apparent in the pairings $(1,4)$, $(2,6)$ and $(3,5)$ recalling that the leg with Lorentz index $\sigma$, (2.4), has momentum $r$ flowing through it and is a graphical illustration of a consistency check. By way of variation we have given an alternative section in Figure 6 where the singularity is more evident. Of course for this section there is no analogous symmetry compared to the $(x,x)$ section. However, aside from this the two loop corrections do not differ significantly from the one loop situation for the particular value of $\alpha_s$ chosen. Indeed for the remaining channels the situation is similar to the other vertices for the non-Feynman rule amplitudes in that the two loop corrections are not significant. Moreover, in complete parallel with the graphs of Figure 2 they are numerically small.

6 Discussion.

We conclude with brief remarks. First, we have provided the full two loop off-shell vertex functions for the 3-point vertices in QCD for a linear covariant gauge fixing in the chiral limit. Given that recent lattice studies of these vertex functions are primarily to examine their behaviour in the low momentum regime, more precise knowledge of how the functions behave for various external momentum configurations should prove useful for matching to high energy behaviour and improve error analysis. As there is parallel interest in studying these functions using Schwinger-Dyson methods, the assumptions that are used for various vertex ansätze can be explored in more detail beyond the original and seminal work of [5]. Indeed from the graphical representations presented here it appears that the two loop corrections do not significantly deviate from the one loop behaviour for a wide range of momenta scales at the particular value of the coupling constant considered. On the one hand this is expected from perturbation theory but one has also the potential now to explore at what values this breaks down. Further the channels corresponding to the Feynman rule of the vertex represent the dominant contribution. Though it is worth stressing that this is an observation based on a two loop analysis, which
Figure 3: Section \((x, x)\) of the Landau gauge channels of the quark-gluon vertex for \(\alpha_s = 0.125\).
Figure 4: Section $(1, x)$ of the Landau gauge channels of the quark-gluon vertex for $\alpha_s = 0.125$. 
Figure 5: Section \((x,x)\) of various Landau gauge channels of the triple gluon vertex for \(\alpha_s = 0.125\).
Figure 6: Section $(2x, x)$ of various Landau gauge channels of the triple gluon vertex for $\alpha_s = 0.125$. 
should probably persist to higher orders, but it could be a justification for a vertex ansatz for Schwinger-Dyson analyses for this structure. However, it is not possible in our computation to isolate the quartic gluon vertex contribution and see what effect it has on the two loop corrections. Moreover, there is now scope to explore various definitions of effective strong coupling constants, and refine their running, which are based on the structure of 2- and 3-point functions and studied in, for example, [6] [7] [8] [9] [10] [11] [12] [13] [14] [15] [16]. Given that our computations concentrated on the vertices in the chiral limit one natural extension would be to include massive quarks. Indeed that analysis has already been carried out at one loop for the quark-gluon and triple gluon vertices in [21] [25]. (The ghost-gluon vertex has no quark contributions at one loop.) However, to extend those analyses to two loops in the completely off-shell situation would require knowledge of the necessary basic two loop massive master integrals. Currently these are not known in analytic form even for the symmetric point. In the interim the best that could be expected is to express the vertex functions as expansions in powers of the quark mass. Methods such as those developed in [57] [58] for 2-point functions could be adapted to tackle such a problem. However, that is beyond the scope of the current article.

Acknowledgements. The author thanks J.M. Bell and Dr M. Gorbahn for valuable discussions.

A Tensor basis.

In this appendix we provide the explicit tensor bases and the projection matrices for each vertex. As the latter are invariably quite involved, especially for the triple gluon vertex, we have compacted the expressions. We give the tensor bases for each of the vertex functions first with that for the ghost-gluon vertex being the two vectors

$$ P^{ccg}_{(1)\sigma}(p,q) = p_\sigma , \quad P^{ccg}_{(2)\sigma}(p,q) = q_\sigma . \quad (A.1) $$

For the quark-gluon vertex we have

$$ P^{qgg}_{(1)\sigma}(p,q) = \gamma_\sigma , \quad P^{qgg}_{(2)\sigma}(p,q) = \frac{p_\sigma q}{\mu^2} , \quad P^{qgg}_{(3)\sigma}(p,q) = \frac{q_\sigma q}{\mu^2} , $$

$$ P^{qgg}_{(4)\sigma}(p,q) = \frac{q_\sigma p}{\mu^2} , \quad P^{qgg}_{(5)\sigma}(p,q) = \frac{q_\sigma q}{\mu^2} , \quad P^{qgg}_{(6)\sigma}(p,q) = \frac{1}{\mu^2} \Gamma_{(3)\sigma pq} \quad (A.2) $$

using the generalized $\gamma$-matrices. We use the convention that when a vector is contracted with a Lorentz index on a $\gamma$-matrix, including $\Gamma^{\mu_1 \ldots \mu_n}_{(n)}$, then the vector appears in the corresponding location in the $\gamma$-matrix string. Finally, there are fourteen independent tensors for the triple gluon vertex which are

$$ P^{ggg}_{(1)\mu\nu\sigma}(p,q) = \eta_{\mu\nu} p_\sigma , \quad P^{ggg}_{(2)\mu\nu\sigma}(p,q) = \eta_{\nu\sigma} p_\mu , \quad P^{ggg}_{(3)\mu\nu\sigma}(p,q) = \eta_{\mu\sigma} p_\nu , $$

$$ P^{ggg}_{(4)\mu\nu\sigma}(p,q) = \eta_{\mu\nu} q_\sigma , \quad P^{ggg}_{(5)\mu\nu\sigma}(p,q) = \eta_{\nu\sigma} q_\mu , \quad P^{ggg}_{(6)\mu\nu\sigma}(p,q) = \eta_{\mu\sigma} q_\nu , $$

$$ P^{ggg}_{(7)\mu\nu\sigma}(p,q) = \frac{1}{\mu^2} q_\mu p_\nu p_\sigma , \quad P^{ggg}_{(8)\mu\nu\sigma}(p,q) = \frac{1}{\mu^2} p_\mu p_\nu q_\sigma , \quad P^{ggg}_{(9)\mu\nu\sigma}(p,q) = \frac{1}{\mu^2} p_\mu q_\nu q_\sigma , $$

$$ P^{ggg}_{(10)\mu\nu\sigma}(p,q) = \frac{1}{\mu^2} p_\mu p_\nu q_\sigma , \quad P^{ggg}_{(11)\mu\nu\sigma}(p,q) = \frac{1}{\mu^2} p_\mu q_\nu q_\sigma , \quad P^{ggg}_{(12)\mu\nu\sigma}(p,q) = \frac{1}{\mu^2} q_\mu p_\nu q_\sigma , \quad P^{ggg}_{(13)\mu\nu\sigma}(p,q) = \frac{1}{\mu^2} q_\mu q_\nu q_\sigma . \quad (A.3) $$

In each of the three cases we have chosen $\mu$ as the common dimension scale for simplicity and use the convention that all elements in a specific vertex basis have the same dimension.
Similarly defining for the ghost-gluon case we have

\[
\mathcal{M}^{\text{cg}} = \frac{1}{\Delta_G} \begin{pmatrix}
4y & -2(1-x-y) \\
-2(1-x-y) & 4x
\end{pmatrix}.
\] (A.4)

To save space for the remaining cases we have chosen to define the matrices by listing the individual elements since each projection matrix is symmetric. For the quark-gluon vertex we define the intermediate matrix \( Q \) by

\[
\mathcal{M}^{\text{qg}} = \frac{1}{4(d-2)\Delta_G^2} Q
\] (A.5)

so that the common factor is removed from the presentation of the elements. Thus we have

\[
\begin{align*}
Q_{11} &= \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right]^2 , \quad Q_{12} = -4 \left[ (y-1)^2 + x^2 - 2(y+1)x \right] y \\
Q_{13} &= -2 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1) \\
Q_{14} &= -2 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1) \\
Q_{15} &= -4 \left[ (y-1)^2 + x^2 - 2(y+1)x \right] x , \quad Q_{16} = 0 , \quad Q_{22} = 16(d-1)y^2 \\
Q_{23} &= 8(y-1+x)(d-1)y , \quad Q_{24} = 8(y-1+x)(d-1)y \\
Q_{25} &= -4 \left[ 2 \left( x - 2 \right) x + (y - 1)^2 \right] - (x + y - 1)^2 d^2 \quad , \quad Q_{26} = 0 \\
Q_{33} &= 4 \left[ (y-1)^2 + x^2 + 4dx - 2(3y+1)x \right] , \quad Q_{34} = 4(d-1)(x+y-1)^2 \\
Q_{35} &= 8(y-1+x)(d-1)x , \quad Q_{36} = 0 , \quad Q_{44} = 4 \left[ (y-1)^2 + x^2 + 4dx - 2(3y+1)x \right] \\
Q_{45} &= 8(y-1+x)(d-1)x , \quad Q_{46} = 0 , \quad Q_{55} = 16(d-1)x^2 , \quad Q_{56} = 0 \\
Q_{66} &= 4 \left[ (y-1)^2 + x^2 - 2(y+1)x \right].
\end{align*}
\] (A.6)

Similarly defining

\[
\mathcal{M}^{\text{gg}} = \frac{1}{(d-2)\Delta_G^2} G
\] (A.7)

for the triple gluon vertex case the elements of the intermediate matrix \( G \) are

\[
\begin{align*}
G_{11} &= 4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right]^2 y , \quad G_{12} = 0 , \quad G_{13} = 0 \\
G_{14} &= 2 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right]^2 (x + y - 1) , \quad G_{15} = 0 , \quad G_{16} = 0 \\
G_{17} &= -16 \left[ (y-1)^2 + x^2 - 2(y+1)x \right] y^2 \\
G_{18} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)y \\
G_{19} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)y \\
G_{10} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)y \\
G_{11} &= -4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)^2 \\
G_{12} &= -4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)^2 \\
G_{13} &= -16 \left[ (y-1)^2 + x^2 - 2(y+1)x \right] xy \\
G_{14} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)x
\end{align*}
\]
\begin{align*}
G_{22} &= 4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right]^2 y, \quad G_{23} = 0, \quad G_{24} = 0 \\
G_{25} &= 2 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right]^2 (x + y - 1), \quad G_{26} = 0 \\
G_{27} &= -16 \left[ (y - 1)^2 + x^2 - 2(y + 1)x \right] y^2 \\
G_{28} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)y \\
G_{29} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)y \\
G_{30} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)y \\
G_{31} &= -4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)^2 \\
G_{32} &= -16 \left[ (y - 1)^2 + x^2 - 2(y + 1)x \right] xy \\
G_{33} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)y \\
G_{34} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)y \\
G_{35} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)y \\
G_{36} &= -4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)^2 \\
G_{37} &= -16 \left[ (y - 1)^2 + x^2 - 2(y + 1)x \right] xy \\
G_{38} &= -4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)^2 \\
G_{39} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)x \\
G_{40} &= 4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right]^2 x, \quad G_{45} = 0, \quad G_{46} = 0 \\
G_{47} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)y \\
G_{48} &= -16 \left[ (y - 1)^2 + x^2 - 2(y + 1)x \right] xy \\
G_{49} &= -4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)^2 \\
G_{50} &= -4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)^2 \\
G_{51} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)x \\
G_{52} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)x \\
G_{53} &= -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)x \\
G_{54} &= -16 \left[ (y - 1)^2 + x^2 - 2(y + 1)x \right] x^2 \\
G_{55} &= 4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right]^2 x, \quad G_{56} = 0
\end{align*}
\[ G_{57} = -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)y \]
\[ G_{58} = -4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)^2 \]
\[ G_{59} = -4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)^2 \]
\[ G_{60} = -16 \left[ (y - 1)^2 + x^2 - 2(y + 1)x \right] xy \]
\[ G_{61} = -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)x \]
\[ G_{62} = -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)x \]
\[ G_{63} = -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)x \]
\[ G_{64} = -16 \left[ (y - 1)^2 + x^2 - 2(y + 1)x \right] x^2 \]
\[ G_{65} = 4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right]^2 x \]
\[ G_{66} = -8 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)y \]
\[ G_{67} = -4 \left[ x^2 - 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1)^2 \]
\[ G_{68} = -16 \left[ (y - 1)^2 + x^2 - 2(y + 1)x \right] xy \]
\[ G_{69} = 64(d + 1)y^3 , \quad G_{70} = 32(y - 1 + x)(d + 1)y^2 , \quad G_{71} = 32(y - 1 + x)(d + 1)y^2 \]
\[ G_{72} = 32(y - 1 + x)(d + 1)y^2 , \quad G_{73} = 16 \left[ (x + y - 1)^2 d + 4xy \right] y \]
\[ G_{74} = 16 \left[ (x + y - 1)^2 d + 4xy \right] y , \quad G_{75} = 16 \left[ (x + y - 1)^2 d + 4xy \right] y \]
\[ G_{76} = -8 \left[ 2(x^2 - 4xy - 2x + y^2 - 2y + 1) - (x + y - 1)^2 d \right] (x + y - 1) \]
\[ G_{77} = 32 \left[ (x - 2)x + (y - 1)^2 + 2dxy \right] y , \quad G_{78} = 16(d + 1)(x + y - 1)^2 y \]
\[ G_{79} = 16(d + 1)(x + y - 1)^2 y \]
\[ G_{80} = 8 \left[ 4dxy + x^2 + 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1) \]
\[ G_{81} = 8 \left[ 4dxy + x^2 + 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1) \]
\[ G_{82} = 8 \left[ dx^2 + 2dxy - 2dx + dy^2 - 2dy + d + 4xy \right] (x + y - 1) \]
\[ G_{83} = 16 \left[ (x + y - 1)^2 d + 4xy \right] x \]
\[ G_{84} = 32 \left[ (x - 2)x + (y - 1)^2 + 2dxy \right] y , \quad G_{85} = 16(d + 1)(x + y - 1)^2 y \]
\[ G_{86} = 8 \left[ 4dxy + x^2 + 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1) \]
\[ G_{87} = 8 \left[ dx^2 + 2dxy - 2dx + dy^2 - 2dy + d + 4xy \right] (x + y - 1) \]
\[ G_{88} = 8 \left[ 4dxy + x^2 + 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1) \]
\[ G_{914} = 16 \left[ (x + y - 1)^2 d + 4xy \right] x, \quad G_{1010} = 32 \left[ (x - 2)x + (y - 1)^2 + 2dxy \right] y \]
\[ G_{1010} = 8 \left[ d^2 x^2 + 2dxy - 2dx + dy^2 - 2dy + d + 4xy \right] (x + y - 1) \]
\[ G_{1010} = 8 \left[ 4dxy + x^2 + 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1) \]
\[ G_{1010} = 8 \left[ 4dxy + x^2 + 2xy - 2x + y^2 - 2y + 1 \right] (x + y - 1) \]
\[ G_{1112} = 16(d + 1)(x + y - 1)^2 x, \quad G_{1113} = 16(d + 1)(x + y - 1)^2 x \]
\[ G_{1114} = 32(y - 1 + x)(d + 1)x^2, \quad G_{1212} = 32 \left[ (x - 2 + 2dy)x + (y - 1)^2 \right] x \]
\[ G_{1213} = 16(d + 1)(x + y - 1)^2 x, \quad G_{1214} = 32(y - 1 + x)(d + 1)x^2 \]
\[ G_{1313} = 32 \left[ (x - 2 + 2dy)x + (y - 1)^2 \right] x, \quad G_{1314} = 32(y - 1 + x)(d + 1)x^2 \]
\[ G_{1414} = 64(d + 1)x^3 \] (A.8)

which is much more involved. We have checked that the projection matrices of the completely symmetric case, [18], emerge in the limit of \( x \to 1 \) and \( y \to 1 \).

B Master integrals.

In this appendix we define the various master integrals which emerge from the application of the Laporta algorithm to the vertex functions. Several of these are already known, [30, 31, 59], to the order in \( \epsilon \) which is required and for arbitrary external momentum squared. For instance, the two loop non-planar graph with unit propagators can be written in terms of two one loop integrals. Therefore, we concentrate on those master integrals whose \( \epsilon \) expansion is required to an order beyond that considered in [30, 31] and for the most general momentum configuration. In [35] several of these master integrals were recorded but for a less general case. Though we have used a similar method to establish sufficient terms of the \( \epsilon \) expansion in order to write the full expressions for our vertex functions in terms of known functions. First, we define the basic one loop vertex function \( I(\alpha, \beta, \gamma) \) by

\[ I(\alpha, \beta, \gamma) = \int_k \frac{1}{(k^2)^\alpha ((k - p)^2)^\beta (k + q)^2)^\gamma} \] (B.1)

where \( \int_k = d^dk/(2\pi)^d \). When any two of \( \{ \alpha, \beta, \gamma \} \) are zero or negative then the integral vanishes. If only one of the powers is zero or negative then one has the basic bubble integral. The master integrals related to the latter are \( I(1, 1, 0) \), \( I(1, 0, 1) \) and \( I(0, 1, 1) \). We have highlighted all three as their \( \epsilon \) expansions are different due to the appearance of \( \ln(x) \) for example in the first case. In the other non-bubble cases the Laporta algorithm produces \( I(1, 1, 1) \) as the one loop master integral. In this case we have, [30, 31, 59],

\[ I(1, 1, 1) = - \frac{1}{\mu^2} \left[ \Phi_1(x, y) + \Psi_1(x, y) \epsilon + \left[ \frac{\zeta(2)}{2} \Phi_1(x, y) + \chi_1(x, y) \right] \epsilon^2 + \mathcal{O}(\epsilon^3) \right]. \] (B.2)

The first two terms of (B.2) correspond to the same terms of [30, 31]. We use a modified notation, though, where we label via subscript without parentheses. Also when comparing to [30, 31, 59] we note that our convention defining the order of the powers on the left side of (B.1) is different. At \( \mathcal{O}(\epsilon^2) \) we have introduced the intermediate function \( \chi_1(x, y) \) which will be discussed later in the context of two loop masters. Given that \( I(1, 1, 1) \) has a large degree of symmetry one can
construct various relations between the functions which are used within our computations. We have

\[
\Phi_1 \left( \frac{y}{x} \right) = x \Phi_1 (x, y) , \quad \Phi_1 \left( \frac{1}{y} \right) = y \Phi_1 (x, y)
\]

\[
\Psi_1 \left( \frac{y}{x} \right) = x \left( \Psi_1 (x, y) + \ln(x) \Phi_1 (x, y) \right) , \quad \Psi_1 \left( \frac{1}{y} \right) = y \left( \Psi_1 (x, y) + \ln(y) \Phi_1 (x, y) \right)
\]

\[
\chi_1 \left( \frac{y}{x} \right) = x \left[ \chi_1 (x, y) + \ln(x) \Psi_1 (x, y) + \frac{1}{2} \ln^2(x) \Phi_1 (x, y) \right]
\]

\[
\chi_1 \left( \frac{1}{y} \right) = y \left[ \chi_1 (x, y) + \ln(y) \Psi_1 (x, y) + \frac{1}{2} \ln^2(y) \Phi_1 (x, y) \right]
\]

which can be deduced by rotating the original integral \( I(1, 1, 1) \).

At two loops aside from the 5-propagator master integrals of \([30, 31]\) which are already known to the order we require, and the basic two loop 2-point sunset graph, it is the 4-propagator master integrals which require extra attention. There are two types of these and they are related to \([B.1]\) when one line has a bubble subgraph. For completeness we record each rotation of the two types. First, we have

\[
I \left( 3 - \frac{d}{2} , 1 , 1 \right) = \left[ \Phi_1 (x, y) + \left[ \Psi_1 (x, y) - \frac{1}{2} \ln(x) \Phi_1 (x, y) - \frac{1}{2} \ln(y) \Phi_1 (x, y) \right] \epsilon \right]
\]

\[
+ \left[ \frac{\zeta(2) \Phi_1 (x, y) + \chi_3 (x, y)}{2} \right] \frac{1}{\mu^2} + O(\epsilon^3)
\]

\[
I \left( 1 , 3 - \frac{d}{2} , 1 \right) = \left[ \Phi_1 \left( \frac{1}{y} \right) \right]
\]

\[
+ \left[ - \frac{1}{2} \ln(x) \Phi_1 \left( \frac{1}{y} , \frac{x}{y} \right) - \ln(y) \Phi_1 \left( \frac{1}{y} , \frac{x}{y} \right) + \Psi_1 \left( \frac{1}{y} , \frac{x}{y} \right) \right] \epsilon
\]

\[
+ \left[ \ln(x) \ln(y) \Phi_1 \left( \frac{1}{y} , \frac{x}{y} \right) - 2 \ln(x) \Psi_1 \left( \frac{1}{y} , \frac{x}{y} \right) + \frac{\zeta(2)}{2} \Phi_1 \left( \frac{1}{y} , \frac{x}{y} \right) \right]
\]

\[
+ \chi_3 \left( \frac{1}{y} , \frac{x}{y} \right) \epsilon^2 + O(\epsilon^3)
\]

\[
I \left( 1 , 1 , 3 - \frac{d}{2} \right) = \left[ \Phi_1 \left( \frac{1}{y} , \frac{x}{y} \right) \right]
\]

\[
+ \left[ - \ln(x) \Phi_1 \left( \frac{1}{y} , \frac{x}{y} \right) - \frac{1}{2} \ln(y) \Phi_1 \left( \frac{1}{y} , \frac{x}{y} \right) + \Psi_1 \left( \frac{1}{y} , \frac{x}{y} \right) \right] \epsilon
\]

\[
+ \left[ \ln(x) \ln(y) \Phi_1 \left( \frac{1}{y} , \frac{x}{y} \right) - 2 \ln(x) \Psi_1 \left( \frac{1}{y} , \frac{x}{y} \right) + \frac{\zeta(2)}{2} \Phi_1 \left( \frac{1}{y} , \frac{x}{y} \right) \right]
\]

\[
+ \chi_3 \left( \frac{1}{y} , \frac{x}{y} \right) \epsilon^2 + O(\epsilon^3) \left( \frac{1}{x \mu^2} \right)
\]

and

\[
I \left( 2 - \frac{d}{2} , 1 , 1 \right) = \frac{1}{2 \epsilon} + \frac{3}{2} - \ln(x)
\]

\[
\left[ - \frac{1}{2} \Phi_1 \left( \frac{y}{x} , \frac{1}{x} \right) \frac{y}{x} - \frac{1}{2} \Phi_1 \left( \frac{y}{x} , \frac{1}{x} \right) \frac{1}{x} - \frac{\pi^2}{24} + \frac{1}{2} \ln^2(x) + \frac{1}{2} \ln(x) \ln(y) \right]
\]

\[
+ \frac{1}{2} \Phi_1 \left( \frac{y}{x} , \frac{1}{x} \right) + \frac{9}{2} - 3 \ln(x) \epsilon
\]

\[
\left[ - \frac{3}{2} \Phi_1 \left( \frac{y}{x} , \frac{1}{x} \right) \frac{y}{x} - \frac{3}{2} \Phi_1 \left( \frac{y}{x} , \frac{1}{x} \right) \frac{1}{x} - \frac{\zeta(3)}{6} - \frac{\pi^2}{8} + \frac{\pi^2}{12} \ln(x) \right]
\]
known functions. We have non-planar graph of which related the result to the known function \( \Omega \) but for a less general momentum configuration. This was based on the irreducible two loop we were able to determine it in terms of known functions by extending the method given in 35, was introduced. To assist the interested reader we record the relation for

\[
I \left( 1, 2 - \frac{d}{2}, 1 \right) = \frac{1}{2e} + \frac{3}{2} - \ln(y)
\]

\[
+ \left[ -\frac{1}{2} \Phi_1 \left( \frac{1}{y}, \frac{x}{y} \right) + \frac{3}{2} \Phi_1 \left( \frac{1}{y}, \frac{x}{y} \right) \frac{1}{2} - \frac{\pi^2}{24} + \frac{1}{2} \ln(x) \ln(y) + \frac{1}{2} \ln^2(y)
\]

\[
+ \frac{9}{2} - 3 \ln(y) \right] \epsilon
\]

\[
+ \left[ -\frac{3}{2} \Phi_1 \left( \frac{1}{y}, \frac{x}{y} \right) - \frac{3}{2} \Phi_1 \left( \frac{1}{y}, \frac{x}{y} \right) \frac{1}{2} - \zeta(3) \frac{1}{6} - \frac{\pi^2}{8} + \frac{\pi^2}{12} \ln(x)
\]

\[
+ \frac{9}{2} - 3 \ln(x) \right] \epsilon
\]

\[
+ \left[ -\frac{3}{2} \Phi_1 \left( \frac{1}{y}, \frac{x}{y} \right) + \frac{3}{2} \Phi_1 \left( \frac{1}{y}, \frac{x}{y} \right) \frac{1}{2} - \zeta(3) \frac{1}{6} - \frac{\pi^2}{8} + \frac{\pi^2}{12} \ln(x)
\]

\[
+ \frac{9}{2} - 3 \ln(x) \right] \epsilon
\]

\[
+ \chi_2(x, y) \]

\[
\chi_2(x, y) = 2 \left[ -8\zeta(3) + \frac{\pi^2}{6} \ln(x) - \frac{2}{3} \ln^3(x) - \ln(x) \Phi_1(x, y) + y \ln(x) \Phi_1(x, y)
\]

\[
+ x \ln(x) \Phi_1(x, y) + \frac{\pi^2}{6} \ln(y) - \frac{2}{3} \ln^3(y) - \ln(y) \Phi_1(x, y) + y \ln(y) \Phi_1(x, y)
\]

\[
+ \ln(x) \Phi_1 \left( \frac{1}{y}, \frac{1}{x} \right) \frac{1}{x} \epsilon^2 + O(\epsilon^3)
\]

In each set we have included a new intermediate function, \( \chi_2(x, y) \) and \( \chi_3(x, y) \). For the former we were able to determine it in terms of known functions by extending the method given in 35 but for a less general momentum configuration. This was based on the irreducible two loop non-planar graph of 31 which related the result to the known function \( \Omega_2(x, y) \). By using the Laporta algorithm on the same irreducible graph we were able to relate the intermediate function \( \chi_2(x, y) \) to \( \Omega_2(x, y) \). In 35 another similar intermediate function, \( \Xi^{(1)}(x, y) \), in the notation of 35, was introduced. To assist the interested reader we record the relation for \( \chi_2(x, y) \) in terms of this and the more general relation to that given in 35 which determines \( \chi_2(x, y) \) in terms of known functions. We have

\[
\chi_2(x, y) = 2 \left[ -8\zeta(3) + \frac{\pi^2}{6} \ln(x) - \frac{2}{3} \ln^3(x) - \ln(x) \Phi_1(x, y) + y \ln(x) \Phi_1(x, y)
\]

\[
+ x \ln(x) \Phi_1(x, y) + \frac{\pi^2}{6} \ln(y) - \frac{2}{3} \ln^3(y) - \ln(y) \Phi_1(x, y) + y \ln(y) \Phi_1(x, y)
\]
and exploiting various properties of $I$ determine this in terms of known functions from [30, 31]. Briefly the method involves considering they always appear in one combination which is their difference. In this case we managed to other intermediate functions $\chi$, $\Phi$, and $\Omega$. This reduces to the expression given in [35] for that specific momentum configuration. For our general case here the difference in the corresponding functions could be determined.

Finally, for completeness we record the explicit forms of each of the functions which appear in the final vertex functions and were derived in [30, 31]. Using the same notation as [30, 31], at one loop we have

$$
\Phi_1(x, y) = \frac{1}{\lambda} \left[ 2\text{Li}_2(-\rho x) + 2\text{Li}_2(-\rho y) + \ln \left( \frac{y}{x} \right) \ln \left( \frac{1 + \rho y}{1 + \rho x} \right) + \ln(\rho x) \ln(\rho y) + \frac{\pi^2}{3} \right].
$$

The functions $\lambda(x, y)$ and $\rho(x, y)$ are defined by, [30, 31],

$$
\lambda(x, y) = \sqrt{\Delta G}, \quad \rho(x, y) = \frac{2}{1 - x - y + \lambda(x, y)}.
$$

where the former equation connects notation. At two loops the two main functions are, [30, 31],

$$
\Phi_2(x, y) = \frac{1}{\lambda} \left[ 6\text{Li}_4(-\rho x) + 6\text{Li}_4(-\rho y) + 3 \ln \left( \frac{y}{x} \right) [\text{Li}_3(-\rho x) - \text{Li}_3(-\rho y)] 
+ \frac{1}{2} \ln^2 \left( \frac{y}{x} \right) [\text{Li}_2(-\rho x) + \text{Li}_2(-\rho y)] + \frac{1}{4} \ln^2(\rho x) \ln^2(\rho y) 
+ \frac{\pi^2}{2} \ln(\rho x) \ln(\rho y) + \frac{\pi^2}{12} \ln^2 \left( \frac{y}{x} \right) + \frac{7\pi^4}{60} \right],
$$

and

$$
\Omega_2(x, y) = 6\text{Li}_3(-\rho x) + 6\text{Li}_3(-\rho y) + 3 \ln \left( \frac{y}{x} \right) [\text{Li}_2(-\rho x) - \text{Li}_2(-\rho y)]
$$
The other function which appears in the above master integrals, $\Psi_1(x, y)$, is not present in the final vertex functions. We reproduce it here, \[ \text{[30] 31}, \]

\[
\Psi_1(x, y) = -\frac{1}{\lambda} \left[ 4 \text{Li}_3 \left( \frac{-\rho x (1 + \rho y)}{1 - \rho^2 xy} \right) + 4 \text{Li}_3 \left( \frac{-\rho y (1 + \rho x)}{1 - \rho^2 xy} \right) - 4 \text{Li}_3 \left( \frac{-xy \rho^2}{1 - \rho^2 xy} \right) \right. \\
+ 2 \text{Li}_3 \left( \frac{x \rho (1 + \rho y)}{1 + \rho x} \right) + 2 \text{Li}_3 \left( \frac{y \rho (1 + \rho x)}{1 + \rho y} \right) - 2 \text{Li}_3 (\rho^2 xy) - 2 \zeta(3) \\
- 2 \ln(y) \text{Li}_2 \left( \frac{x \rho (1 + \rho y)}{1 + \rho x} \right) - 2 \ln(x) \text{Li}_2 \left( \frac{y \rho (1 + \rho x)}{1 + \rho y} \right) - \frac{2}{3} \ln^3 (1 - \rho^2 xy) \\
+ \frac{2}{3} \ln^2 (1 + \rho x) + \frac{2}{3} \ln^2 (1 + \rho y) + 2 \ln(\rho) \ln^2 (1 - \rho^2 xy) \\
- 2 \ln(1 - \rho^2 xy) \left[ \ln(\rho x) \ln(\rho y) + \ln \left( \frac{y}{x} \right) \ln \left( \frac{(1 + \rho y)}{(1 + \rho x)} \right) \right. \\
+ 2 \ln(1 + \rho x) \ln(1 + \rho y) + \frac{\pi^2}{3} \left] \\
+ \frac{1}{2} \ln \left( xy \rho^2 \right) \left[ \ln(\rho x) \ln(\rho y) + \ln \left( \frac{y}{x} \right) \ln \left( \frac{(1 + \rho y)}{(1 + \rho x)} \right) - \ln^2 \left( \frac{(1 + \rho x)}{(1 + \rho y)} \right) \right. \\
+ \frac{2 \pi^2}{3} \right] . \tag{B.13}
\]

This has a considerably more involved structure compared to $\Phi_1(x, y)$, $\Phi_2(x, y)$ and $\Omega_2(x, y)$.
