SYNTHESIS OF 3-(2-(4-CHLOROPHENYLIMINO)-3-(4-CHLOROPHENYL)-2,3-DIHYDROTHIAZOL-4-YL)-2H-CHROMEN-2-ONE VIA MULTICOMPONENT APPROACH

Raj Kumar Ramagiri and Rajeswar Rao Vedula
Department of Chemistry, National Institute of Technology, Warangal, India

Abstract A simple and highly efficient one-pot, three-component synthesis of 3-(2-(4-chlorophenylimino)-3-(4-chlorophenyl)-2,3-dihydrothiazol-4-yl)-2H-chromen-2-ones has been reported by the reaction of 3-(2-bromoacetyl)-2H-chromen-2-one, primary amines, and phenyl isothiocyanates in presence of dimethylformamide as a solvent. The structures of newly synthesized compounds were confirmed by their analytical and spectral data.

Keywords Coumarin; isothiocyanate; multicomponent reaction; phenyl; primary amines; thiazol-2-imine

INTRODUCTION

In multicomponent reactions (MCRs) more than two components are assembled into the product in a one-step reaction. The advantages of MCRs are atom economy, simplicity, and time-saving features. These are useful for the synthesis of biologically active compounds such as drugs and agrochemicals, and diversity is achieved easily by varying the components.[1–3]

Coumarin (benzopyran-2-one) derivatives have found various medicinal applications as antibacterial,[4,5] antifungal,[6,7] herbicidal,[8] antitumoral,[9] cytotoxic,[10] and anti-HIV agents.[11,12] The compounds containing the coumarin motif are widely used as additives in food and cosmetic products and known as luminescent materials.[13] They also act as anticoagulants,[14] free radical scavengers,[15] antioxidant,[16] lipoxygenase,[17] and cyclooxygenase inhibitors.[18]
Heterocyclic systems having nitrogen and sulfur are very interesting because of their physicochemical properties with relevance to the design of new drugs. In particular the thiazoline ring system has attracted considerable attention because of its presence in several drug molecules with different biological activities such as antifungal,[19] anti-inflammatory,[20] anti-HIV,[21] analgesic, kinase inhibition,[22] and melanin-reducing activity.[23] These are also applied in agriculture as acricides, insecticides, and plant-growth regulators.

Our current studies are focused on the development of new routes for the synthesis of thiazol-2-imine incorporating coumarin moieties.

RESULTS AND DISCUSSION

Reaction of 3-(2-bromoacetyl)-2H-chromen-2-one 1, primary amines 2 with different phenyl isothiocyanates 3 in presences of dimethylformamide (DMF) gave thiazole-2-imine 4 in good yields (Table 1). All the synthesized compounds are new and not reported in the literature (Scheme 1).

The mechanism for the formation of these products is discussed in Scheme 2. In this procedure we have modified the known Hantzsch method for thiazole synthesis involving the reaction of phenyl isothiocyanates, primary amines, and 3-(2-bromoacetyl)-2H-chromen-2-one compounds. In the literature[24] the synthesis of 3-(4-phenyl thiazoline-2-anil)-2H-1-benzopyran-2-ones 9 by the condensation of 3-(2-bromoacetyl)-2H-chromen-2-ones 1 with symmetrical thiourea such as diphenylthiourea 8 (Scheme 3) has been reported. As the scope for the synthesis of these compounds is rather limited, we tried to develop the present one-pot multicomponent synthesis of the title compounds. This procedures may find extensive applications in the synthesis of a wide variety of substituted thiazolines. This procedure is
also novel compared to existing literature procedure. The structures of compounds 4a–i were confirmed by their infrared (IR), $^1$H NMR, and $^{13}$C NMR spectral data. The $^1$H NMR spectrum of 4a in dimethylsulfoxide (DMSO) showed thiazole proton as a singlet at 6.92 and C$_4$ proton of coumarin appeared at 8.30 δ ppm. In the $^{13}$C NMR spectrum of 4a the imino and carbonyl carbons resonate at 157.7 and 158.8 δ ppm respectively. The mass spectrum of 4a exhibited the [M + H]$^+$ peak at m/z 465. The reaction is presumed to start with interaction of primary amine with phenyl isothiocyanate to give unsymmetrical thiourea 5. Then 5 reacts with 3-(2-bromoacetyl)-2$^H$-chromen-2-one to form intermediate 6, which cyclizes to result in 7. On loss of a water molecule this gives the end product 4.

**CONCLUSIONS**

This article reports an efficient, one-pot, three-component method for the synthesis of 3-(2-(4-chlorophenylimino)-3-(4-chlorophenyl)-2,3-dihydrothiazol-4-yl)-2$^H$-chromen-2-ones from the reaction of 3-(2-bromoacetyl)-2$^H$-chromen-2-ones in good yields. The experimental conditions are simple and inexpensive and have easy workup and clean reaction profiles. This multicomponent approach may be useful in the synthesis of derivatives of medicinal importance.

**EXPERIMENTAL**

All the reagents and solvents were pure, purchased from commercial sources, and used without further purification unless otherwise stated. 3-(2-Bromo-acetyl)-2$^H$-chromen-2-ones were prepared by the literature procedure[25] Melting points were determined in open capillaries with a Cintex melting-point apparatus (Mumbai, India) and were uncorrected. CHN analysis was carried out by Carlo Erba EA 1108 automatic elemental analyzer. The purity of the compounds was checked by thin-layer

**Table 1.** Synthesis of compounds 4 and their corresponding yields

| Product 4 | R$^1$ | R$^2$ | R$^3$ | R$^4$ | R$^5$ | Yield (%) |
|-----------|-------|-------|-------|-------|-------|-----------|

chromatography (TLC) plates (E. Merck, Mumbai, India). IR spectra were recorded on a thermo Nicolet Nexus 670 Q8 instrument (KBr pellets). 1H NMR spectra were recorded on a Bruker WM-400 spectrometer in δ ppm using tetramethylsilane (TMS) as the standard. Mass spectra (EI-MS) were determined on a Perkin-Elmer spectrometer (SCIEX API-2000, ESI) at 12.5 eV.

General Procedure for 4

A mixture of 3-(2-bromoacetyl)-2H-chromen-2-one 1 (1 mmol), primary amine 2 (1 mmol), and phenyl isothiocyanate 3 (1 mmol) were taken in DMF (10 ml) and refluxed for 1 h. After completion of the reaction, the resulting mixture was cooled, filtered, and recrystallized from ethanol.

3-(2-(4-Chlorophenylimino)-3-(4-chlorophenyl)-2,3-dihydrothiazol-4-yl)-2H-chromen-2-one (4a)

A mixture of 3-(2-bromoacetyl)-2H-chromen-2-one (1 mmol), 4-chloro aniline (1 mmol), and 4-chlorophenyl isothiocyanate (1 mmol) were taken in DMF (10 ml) and refluxed for 1 h. After completion of the reaction, the resulting mixture was cooled, filtered, and recrystallized from ethanol. Color: white solid, mp: 298–300 °C, yield: 69%; IR (KBr) cm⁻¹: 1718 (lactone C=O), 1636 (C=N), 1599 (C=C); 1H NMR (400 MHZ, DMSO-δ6): δ 6.92 (1H, s, =CH), 7.11 (2H, d, J=8 Hz, ArH), 7.36–7.49 (8H, m, ArH), 7.64–7.68 (1H, m, ArH), 7.77 (1H, d, J=8 Hz, ArH), 8.30 (1H, s, C-4 of coumarin) ppm, 13C NMR (DMSO-δ6): δ 101.6, 116.2,118.3, 118.6, 122.8, 124.9, 126.8, 128.7, 129, 129.4 130.2, 132.2, 132.8, 133.6, 135.9, 145, 149.9, 153.3, 157.7, 158.8 ppm; ESI-MS: m/z (%); 465 [M+H]⁺. Anal. calcd for C₂₄H₁₄Cl₂N₂O₂S: C, 61.94; H, 3.03; N, 6.02. Found: C, 61.90; H, 3.12; N, 6.12.
