Figure S1 Expression of FGF21 in human serum and experimental PH. (A) WB was used to detect the protein levels of FGF21 in liver tissue homogenates of adult C57BL/6 mice under normoxia, hypoxia, and hypoxia + FGF21. (B) ELISA was used to detect the serum FGF21 expression level of adult C57BL/6 mice under normoxia, hypoxia, and hypoxia + FGF21. (C) ELISA was used to detect the serum FGF21 expression level of healthy individuals (HCs, n = 21) and HAPH patients (HAPH, n = 9). *p < 0.05, **p < 0.01.
