SUPPORT PROBLEM FOR THE INTERMEDIATE JACOBIANS OF $l$-ADIC REPRESENTATIONS

G. Banaszak, W. Gajda, P. Krasoń

Abstract. We consider the support problem of Erdős in the context of $l$-adic representations of the absolute Galois group of a number field. Main applications of the results of the paper concern Galois cohomology of the Tate module of abelian varieties with real and complex multiplications, the algebraic $K$-theory groups of number fields and the integral homology of the general linear group of rings of integers. We answer the question of Corrales-Rodríguez and Schoof concerning the support problem for higher dimensional abelian varieties.

1. Introduction.

The support problem for $\mathbb{G}_m$ was first stated by Pál Erdős who in 1988 raised the following question:

let $\text{Supp}(m)$ denote the set of prime divisors of the integer $m$. Let $x$ and $y$ be two natural numbers. Are the following two statements equivalent?

1. $\text{Supp}(x^n - 1) = \text{Supp}(y^n - 1)$ for every $n \in \mathbb{N}$,

2. $x = y$.

This question, along with its extension to all number fields, and also its analogue for elliptic curves, were solved by Corrales-Rodríguez and Schoof in the paper [C-RS]. Other related support problems can be found in [Ba] and [S]. In the present paper we investigate the support problem in the context of $l$-adic representations

$$\rho_l: G_F \to GL(T_l).$$

The precise description of the class of representations which are considered is rather technical. It is given by Assumptions I, II in sections 2 and 3, respectively. This class of representations contains powers of the cyclotomic character, Tate modules of abelian varieties of nondegenerate CM type, and also Tate modules of some abelian varieties with real multiplications (cf. Examples 3.3-3.7).
Consider the reduction map
\[ r_v : H^1_{f,S_l}(G_F; T_l) \to H^1(g_v; T_l), \]
for all \( v \not\in S_l \), which is defined on the subgroup \( H^1_{f,S_l}(G_F; T_l) \) of the Galois cohomology group \( H^1(G_F; T_l) \) (see Definition 2.2). \( S_l \) denotes here a finite set of primes which contains primes over \( l \) in \( F \). Let \( B(F) \) be a finitely generated abelian group such that for every \( l \) there is an injective homomorphism
\[ \psi_{F,l} : B(F) \otimes \mathbb{Z}_l \to H^1_{f,S_l}(G_F; T_l). \]
Let \( P \) and \( Q \) be two nontorsion elements of \( B(F) \). Put \( \hat{P} = \psi_{F,l}(P \otimes 1) \) and \( \hat{Q} = \psi_{F,l}(Q \otimes 1) \). Our main point of interest is the following support problem.

**Support Problem.**

Let \( \mathcal{P}^* \) be an infinite set of prime numbers. Assume that for every \( l \in \mathcal{P}^* \) the following condition holds in the group \( H^1(g_v; T_l) \):

for every integer \( m \) and for almost every \( v \not\in S_l \)
\[ m r_v(\hat{P}) = 0 \quad \text{implies} \quad m r_v(\hat{Q}) = 0. \]

How are the elements \( P \) and \( Q \) related in the group \( B(F) \) ?

**Main results.**

Let \( \mathcal{P}^* \) be the infinite set of prime numbers which we define precisely in section 4 of the paper. We prove the following theorem.

**Theorem A**. [Th. 5.1]

Assume that for every \( l \in \mathcal{P}^* \), for every integer \( m \) and for almost every \( v \not\in S_l \) the following condition holds in the group \( H^1(g_v; T_l) \):

\[ m r_v(\hat{P}) = 0 \quad \text{implies} \quad m r_v(\hat{Q}) = 0. \]

Then there exist \( a \in \mathbb{Z} - \{0\} \) and \( f \in \mathcal{O}_E - \{0\} \) such that \( aP + fQ = 0 \) in \( B(F) \). Here \( \mathcal{O}_E \) denotes the ring of integers of the number field \( E \) associated with the representation \( \rho_l \) (see Definition 3.2).

In order to prove Theorem A we investigate representations with special properties formulated in Assumption I and Assumption II. We introduce the notion of the Mordell-Weil \( \mathcal{O}_E \)-module for such representations. Proof of Theorem A is based on a careful study of reduction maps in Galois cohomology associated with the given \( l \)-adic representation satisfying Assumptions I and II. We managed to extend the method of [C-RS] to the context of such \( l \)-adic representations. The main point in the proof is to control the relation between arithmetical properties of the images of \( l \)-adic representations and reduction maps. Key theorems on the image of the representations are proved in the separate work cf. Theorem A and Theorem B of [BGK1]. In section 6 of the paper we derive the following corollaries of Theorem A.
Theorem B. [Cor. 6.4]
Let $P, Q$ be two nontorsion elements of the algebraic $K$-theory group $K_{2n+1}(F)$, where $n$ is an even, positive integer. Assume that for almost every prime $v$ of $\mathcal{O}_F$ and every integer $m$ the following condition holds in the group $K_{2n+1}(k_v)$:

$$mr_v(P) = 0 \quad \text{implies} \quad mr_v(Q) = 0,$$

where in this case, $r_v$ is the map induced on the Quillen $K$-group by the reduction at $v$. Then the elements $P$ and $Q$ of $K_{2n+1}(F)$ are linearly dependent over $\mathbb{Z}$.

Note that Theorem B has already been proven by a different method in [BGK].

Theorem A has the following corollary concerning the class of abelian varieties mentioned in the beginning of this Introduction.

Theorem C. [Cor. 6.11]
Let $A$ be an abelian variety of dimension $g \geq 1$, defined over the number field $F$ and such that $A$ satisfies one of the following conditions:

1. $A$ has the nondegenerate CM type with $\text{End}_F(A) \otimes \mathbb{Q}$ equal to a CM field $E$ such that $E^H \subset F$ (cf. example 3.5)
2. $A$ is simple, principally polarised with real multiplication by a totally real field $E = \text{End}_F(A) \otimes \mathbb{Q}$ such that $E^H \subset F$ and the field $F$ is sufficiently large. We also assume that $\text{dim} A = he$, where $e = [E : \mathbb{Q}]$ and $h$ is odd (cf. example 3.6) or $A$ is simple, principally polarised such that $\text{End}_F(A) = \mathbb{Z}$ and $\text{dim} A$ is equal to 2 or 6 (cf. example 3.7 (b)).

Let $P, Q$ be two nontorsion elements of the group $A(F)$. Assume that for almost every prime $v$ of $\mathcal{O}_F$ and for every integer $m$ the following condition holds in $A_v(k_v)$

$$mr_v(P) = 0 \quad \text{implies} \quad mr_v(Q) = 0.$$ 

Then there exist $a \in \mathbb{Z} - \{0\}$ and $f \in \mathcal{O}_E - \{0\}$ such that $aP + fQ = 0$ in $A(F)$.

There are two important special cases of abelian varieties satisfying conditions of (2) of Theorem C: abelian varieties $A$ with $\text{End}_F(A) = \mathbb{Z}$ such that $\text{dim} A$ is an odd integer [Se1] (cf. example 3.7 (b)) and abelian varieties with real multiplication by a totally real number field $E = \text{End}_F(A) \otimes \mathbb{Q}$, such that $e = g$ [R1] (cf. example 3.7 (a)). Note that for these abelian varieties the analogues of the open image theorem of Serre have been proven [R1] and [Se1]. The proof of Theorem C relies on the analysis of the image of the corresponding Galois representation. The necessary information on the image of Galois representations on $l$-torsion points of abelian varieties from (1) and (2) of Theorem C is provided by Theorem 2.1 and Theorem 3.5 of [BGK1]. It is worth mentioning that Theorem C given above provides an answer to the question of Corrales-Rodríguez and Schoof about the support problem for higher dimensional abelian varieties [C-RS], p. 277.
Acknowledgements: We thank the ICTP in Trieste, the MPI in Bonn, the SFB 343 in Bielefeld, CRM in Barcelona, Mathematics Departments of the Ohio State University, Northwestern University and the Isaac Newton Institute in Cambridge for hospitality and financial support during our visits to the institutions, while the work on this paper continued. We would like to thank the anonymous referee for useful remarks and suggestions which improved the exposition. The research was partially financed by a KBN grant 2 PO3A 048 22.

Notation

\( l \) is an odd prime number.

\( F \) is a number field, \( \mathcal{O}_F \) its ring of integers.

\( G_F = G(\overline{F}/F) \)

\( v \) denotes a finite prime of \( \mathcal{O}_F \).

\( \mathcal{O}_{F,S} \) is the ring of \( S \)-integers in \( F \), for a finite set \( S \) of prime ideals in \( \mathcal{O}_F \).

\( G_{F,S} \) is the Galois group of the maximal extension of \( F \) unramified outside \( S \)

\( F_v \) is the completion of \( F \) at \( v \) and \( k_v \) denotes the residue field \( \mathcal{O}_F/v \)

\( G_v = G(\overline{F}_v/F_v) \)

\( I_v \) is the inertia subgroup of \( G_v \)

\( g_v = G(\overline{k}_v/k_v) \)

\( T_l \) denotes a free \( \mathbb{Z}_l \)-module of finite rank \( d \).

\( V_l = T_l \otimes_{\mathbb{Z}_l} \mathbb{Q}_l \)

\( A_l = V_l/T_l \)

\( \rho_l : G_F \to GL(T_l) \) is a representation unramified outside a fixed finite set \( S_l \) of primes of \( \mathcal{O}_F \), containing all primes over \( l \).

\( \overline{\rho_l} \) denotes the residual representation \( G_F \to GL(T_l/l) \) induced by \( \rho_l \).

\( F_l = F(A_l[l]) \) denotes the number field \( \overline{F}_{ker(\overline{\rho_l})} \).

\( G_l = G(F_l/F) \); observe that \( G_l \cong \overline{\rho_l}(G_F) \) is isomorphic to a subgroup of \( GL(T/l) \cong GL_d(\mathbb{Z}/l) \). Let \( L/F \) be a finite extension and \( w \) a finite prime in \( L \). To indicate that \( w \) is not over any prime in \( S_l \) we will write \( w \not\in S_l \), slightly abusing notation.

\([H,H]\) denotes the commutator subgroup of an abstract group \( H \).

\( H^1(G,M) \) denotes Galois cohomology group of the \( G \)-module \( M \).

2. \( l \)-adic Intermediate Jacobians.

Definition 2.1. Define

\[ H^1_l(G_F; T_l), \quad (\text{resp. } H^1_f(G_F; V_l)) \]

the kernel of the natural map:

\[ H^1(G_F; T_l) \to \prod_v H^1(G_v; T_l)/H^1_f(G_v; T_l) \]
where $H^1_f(G_v; T_l) = i_v^{-1} H^1_f(G_v; V_l)$ via the natural map

$$i_v : H^1(G_v; T_l) \rightarrow H^1(G_v; V_l).$$

The group $H^1_f(G_v; V_l)$ is defined in [BK] p. 353 (see also [F] p. 115) as follows:

$$H^1_f(G_v; V_l) = \begin{cases} 
\text{Ker} \left( H^1(G_v; V_l) \rightarrow H^1(I_v; V_l) \right) & \text{if } v \nmid l \\
\text{Ker} \left( H^1(G_v; V_l) \rightarrow H^1(G_v; V_l \otimes \mathbb{Q}_l \otimes B_{	ext{cris}}) \right) & \text{if } v \mid l,
\end{cases}$$

where $B_{	ext{cris}}$ is the ring defined by Fontaine (cf. [BK] p. 339).

We have the natural maps

$$H^1_f(G_F; T_l) \rightarrow \prod_v H^1_f(G_v; T_l),$$

$$H^1_f(G_F; V_l) \rightarrow \prod_v H^1_f(G_v; V_l).$$

**Definition 2.2.** We also define

$$H^1_{f,S_l}(G_F; T_l) \quad (\text{resp. } H^1_{f,S_l}(G_F; V_l))$$

as the kernel of the natural map:

$$H^1(G_F; T_l) \rightarrow \prod_{v \not\in S_l} H^1(G_v; T_l)/H^1_f(G_v; T_l)$$

( resp. $H^1(G_F; V_l) \rightarrow \prod_{v \not\in S_l} H^1(G_v; T_l)/H^1_f(G_v; V_l)$).

Here $S_l$ denotes a fixed finite set of primes of $\mathcal{O}_F$ containing primes over $l$ and such that the representation $\rho_l$ is unramified outside of $S_l$.

Obviously

$$H^1_f(G_F; T_l) \subset H^1_{f,S_l}(G_F; T_l) \quad \text{and} \quad H^1_f(G_F; V_l) \subset H^1_{f,S_l}(G_F; V_l).$$

Below we define various intermediate Jacobians associated with the representation $\rho_l$, (cf. [Sc], chapter 2).
Definition 2.3. We put

\[ J(T_l) = \lim_{L/F} H^1(G_L; T_l), \quad J(V_l) = \lim_{L/F} H^1(G_L; V_l) \]

\[ J_f(T_l) = \lim_{L/F} H^1_f(G_L; T_l), \quad J_f(V_l) = \lim_{L/F} H^1_f(G_L; V_l) \]

\[ J_{f,S_l}(T_l) = \lim_{L/F} H^1_{f,S_l}(G_L; T_l), \quad J_{f,S_l}(V_l) = \lim_{L/F} H^1_{f,S_l}(G_L; V_l) \]

where the direct limits are taken over all finite extensions \( L/F \) of the number field \( F \), which are contained in some fixed algebraic closure \( \overline{F} \).

Remark 2.4. Observe that the groups \( J(V_l) \), \( J_f(V_l) \) and \( J_{f,S_l}(V_l) \) are vector spaces over \( \mathbb{Q}_l \).

Remark 2.5. Note that we also could have defined the intermediate Jacobians of the module \( T_l \) for the cohomology groups of \( G_F, \Sigma \) for any \( \Sigma \) containing \( S_l \). However, if \( H^0(g_v; A_l(-1)) \) is finite for all \( v \notin S_l \), (as it often happens for interesting examples of \( T_l \)), then

\[ H^1(G_F, \Sigma; T_l) = H^1(G_F; T_l). \]

In the sequel we will only consider \( l \)-adic representations which satisfy the following condition.

Assumption I. Assume that for each \( l \), each finite extension \( L/F \) and any prime \( w \) of \( \mathcal{O}_L \), such that \( w \notin S_l \), we have

\[ T_l^{Fr_w} = 0, \]

(or equivalently \( V_l^{Fr_w} = 0 \)), where \( Fr_w \in g_w \) denotes the arithmetic Frobenius at \( w \).

Example 2.6. Let \( X \) be a smooth projective variety defined over a number field \( F \) with good reduction at primes \( v \notin S_l \). Let \( X' \) be the regular, proper model of \( X \) over \( \mathcal{O}_{F,S_l} \) and let \( X_v \) be its reduction at the prime \( v \) of \( \mathcal{O}_{F,S_l} \). Put \( \overline{X} = X \otimes_F \overline{F} \) and \( \overline{X}_v = X_v \otimes_{\mathbb{k}_v} \overline{\mathbb{k}}_v \). In the case when \( H^i_{et}(\overline{X}; \mathbb{Z}_l(j)) \) is torsion free for some \( i, j \) such that \( i \neq 2j \) we put

\[ T_l = H^i_{et}(\overline{X}; \mathbb{Z}_l(j)). \]
By the theorem of proper and smooth base change ([Mi] VI, Cor. 4.2) there is a natural isomorphism of $G_v$-modules

(2.7) \[ H^i_{et}(\mathcal{X}; \mathbb{Z}_l(j)) \cong H^i_{et}(\mathcal{X}_v; \mathbb{Z}_l(j)). \]

(cf. [Ja] p. 322). Since the inertia subgroup $I_v \subset G_v$ acts trivially on $H^i_{et}(\mathcal{X}_v; \mathbb{Z}_l(j))$, we observe by (2.7) that the representation $\rho_l : G_F \to GL(T_l)$ is unramified outside $S_l$. It follows by the theorem of Deligne [D1] (proof of the Weil conjectures, see also [Har] Appendix C, Th. 4.5) that for an ideal $w$ of $\mathcal{O}_L$ such that $w \notin S_l$, the eigenvalues of $Fr_w$ on the vector space

\[ V_l = H^i_{et}(\mathcal{X}; \mathbb{Q}_l(j)) \]

are algebraic integers of the absolute value $N(w)^{-i/2+j}$, where $N(w)$ denotes the absolute norm of $w$. It follows that $T^F_{Fr_w} = 0$. In the special case when $X = A$ is an abelian variety defined over $F$, we have

\[ T_l = H^1_{et}(\mathcal{X}; \mathbb{Z}_l(j)) \cong \wedge^i H^1_{et}(\mathcal{X}; \mathbb{Z}_l)(j) \cong \wedge^i Hom_{\mathbb{Z}_l}(T_l(A); \mathbb{Z}_l)(j), \]

which is a free $\mathbb{Z}_l$ module of rank $\left(\binom{gq}{q}\right)$ by [Mi2] Th. 15.1. In this paper, most of the time we will consider the representation

\[ \rho_l : G_F \to GL(T_l(A)) \]

of the Galois group $G_F$ on the Tate module $T_l(A) = H^1_{et}(\mathcal{X}; \mathbb{Z}_l)^*$ of the abelian variety $A$ defined over $F$, where for a $\mathbb{Z}_l$-module $M$, we put $M^* = Hom_{\mathbb{Z}_l}(M; \mathbb{Z}_l)$. By the above discussion we see that $\rho_l$ satisfies Assumption I.

**Lemma 2.8.** For every prime $w$ of $\mathcal{O}_L$ which is not over primes in $S_l$, we have:

1. the natural map $H^1(G_w; T_l)/H^1_f \hookrightarrow H^1(G_w; V_l)/H^1_f$ is an imbedding,
2. $H^1_f(G_w; T_l)_{tor} = H^1(G_w; T_l)_{tor} = H^0(G_w; A_l) = H^0(g_w; A_l)$
3. $H^1_f(G_w; T_l) = H^1(g_w; T_l)$.

**Proof.** First part of the lemma is obvious from the definition of $H^1_f(G_w; T_l)$. The second part follows immediately from the first part and the diagram (2.9). Note that $H^1(G_w; V_l)/H^1_f(G_w; V_l)$ is a $\mathbb{Q}_l$-vector space. To prove the third part consider again the diagram (2.9).

\[
\begin{array}{cccccc}
H^0(g_w; A_l) & \longrightarrow & H^1(g_w; T_l) & \longrightarrow & H^1_f(G_w; V_l) \\
\downarrow & & \downarrow & & \downarrow \\
H^0(G_w; A_l) & \longrightarrow & H^1(G_w; T_l) & \longrightarrow & H^1(G_w; V_l) \\
\downarrow & & \downarrow & & \downarrow \\
H^0(I_w; A_l) & \longrightarrow & H^1(I_w; T_l) & \longrightarrow & H^1(I_w; V_l) \\
(2.9)
\end{array}
\]
The horizontal rows are exact. The middle and the right vertical columns are also exact. The left bottom horizontal arrow is zero because $I_w$ acts on $T_l$, $V_l$ and $A_l$ trivially by assumption. This gives the exactness of the following short exact sequence.

$$0 \to H^0(I_w; T_l) \to H^0(I_w; V_l) \to H^0(I_w; A_l) \to 0$$

In addition because of Assumption I we have

$$H^0(g_w; V_l) = H^0(G_w; V_l) = 0.$$  

Therefore the left upper and middle horizontal arrows are imbeddings. The right, upper horizontal arrow is defined because of the commutativity of the lower, right square in the diagram. The middle vertical column is the inflation restriction sequence. It is actually inverse limit on coefficients of the inflation-restriction sequence but it remains exact with infinite coefficients because we deal with $H^1$. Now the claim follows by diagram chasing. □

Remark 2.10. Observe that the Assumption I implies, that $H^0(g_w; A_l)$ and $H^1(g_w; T_l)$ are finite for all $w \not\in S_l$.

Lemma 2.11. For any finite extension $L/F$ the following equalities hold.

$$H^1_{f,S_l}(G_L; T_l)_{tor} = H^1(G_L; T_l)_{tor} = H^0(G_L; A_l)$$

Proof. The first equality follows from Lemma 2.8 and the exact sequence.

$$0 \to H^1_f(G_L; T_l) \to H^1(G_L; T_l) \to \prod_{w \notin S_l} H^1(G_w; T_l)/H^1_f(G_w; T_l).$$

Consider the exact sequence (see [T], p. 261):

$$H^0(G_L; V_l) \longrightarrow H^0(G_L; A_l) \xrightarrow{\partial_L} H^1(G_L; T_l).$$

By Assumption I we get $H^0(G_L; V_l) = 0$. Hence by [T], Prop. 2.3, p. 261

$$H^0(G_L; A_l) = H^1(G_L; T_l)_{tor}.$$  

Thus, the second equality in the statement of Lemma 2.11 also holds. □

For $w \notin S_l$ consider the following commutative diagram
The bottom horizontal arrow is obviously an injection. Hence, by Lemmas 2.8 and 2.11, we obtain the following:

**Lemma 2.13.** For any finite extension $L/F$ and any prime $w \notin S_l$ in $O_L$ the natural map

$$r_w : H^1_{f,S_l}(G_L; T_l)_{tor} \longrightarrow H^1(g_w; T_l)$$

is an imbedding.

**Proposition 2.14.** We have the following exact sequences

$$0 \rightarrow A_l \rightarrow J(T_l) \rightarrow J(V_l) \rightarrow 0$$

$$0 \rightarrow A_l \rightarrow J_{f,S_l}(T_l) \rightarrow J_{f,S_l}(V_l) \rightarrow 0$$

In particular

$$J(T_l)_{tor} = J_{f,S_l}(T_l)_{tor} = A_l$$

and the groups

$$J(T_l) \quad \text{and} \quad J_{f,S_l}(T_l)$$

are divisible.

**Proof.** Consider the following long exact sequence (see [T] p. 261)

$$H^0(G_L; A_l) \rightarrow H^1(G_L; T_l) \rightarrow H^1(G_L; V_l) \rightarrow H^1(G_L; A_l).$$

Taking direct limits with respect to finite extensions $L/F$ gives the following short exact sequence.

$$0 \rightarrow A_l \rightarrow J(T_l) \rightarrow J(V_l) \rightarrow 0$$

This short exact sequence fits into the following commutative diagram
The rows and columns of the diagram are exact. The exactness on the right of the bottom horizontal sequence follows from the injectivity of the top, nontrivial, horizontal arrow by Lemma 2.8. □

Proposition 2.16. Let $L$ be a finite extension of $F$. Then we have isomorphisms:

1. $H^1(G_L; T_l) \cong J(T_l)^{G_L}$,
2. $H^1_{f,S_l}(G_L; T_l) \cong J_{f,S_l}(T_l)^{G_L}$.

Proof. Under condition of Assumption I the proof of claim (1) is done in the same way as the proof of (4.1.1) of [BE]. To prove (2) take an arbitrary finite Galois extension $L'/L$ and consider the following commutative diagram.

\[
\begin{array}{ccccccccc}
0 & \to & 0 & \to & \lim_{L/F} \prod_{w \not\in S_l} H^1(G_w; T_l)/H^1_f & \to & \lim_{L/F} \prod_{w \in S_l} H^1(G_w; V_l)/H^1_f & \to & 0 \\
\downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
0 & \to & A_l & \to & J(T_l) & \to & J(V_l) & \to & 0 \\
\downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
0 & \to & J_{f,S_l}(T_l) & \to & J_{f,S_l}(V_l) & \to & 0 \\
\downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
0 & & 0 & & 0 & & 0 & & 
\end{array}
\]

The columns of this diagram are exact. The upper horizontal arrow is trivially an imbedding. The middle horizontal arrow is an isomorphism. This follows directly from claim (1). Since the representation $\rho_l$ is unramified outside $S_l$ then using Th. 8.1 and Cor. 8.3 Chap. I of [CF] and Kummer pairing we get the following commutative diagram

\[
\begin{array}{cccccc}
H^1_{f,S_l}(G_L; T_l) & \to & H^1_{f,S_l}(G_L'; T_l)^{G(L'/L)} \\
\downarrow & & \downarrow \\
H^1(G_L; T_l) & \cong & H^1(G_L'; T_l)^{G(L'/L)} \\
\downarrow & & \downarrow \\
\prod_{w \not\in S_l} H^1(I_w; T_l) & \to & \prod_{w \not\in S_l} (\prod_{w' | w} H^1(I_{w'}; T_l))^{G(L'/L)} 
\end{array}
\]
Since $L_{w'}/L_w$ is a finite extension, the bottom horizontal arrow is induced by a nontrivial (hence injective) homomorphism of $\mathbb{Z}_l$-modules $\mathbb{Z}_l(1) \to \mathbb{Z}_l(1)$. Because $T_l$ is a free $\mathbb{Z}_l$-module, every nontrivial homomorphism of $\mathbb{Z}_l$-modules $\mathbb{Z}_l(1) \to T_l$ is injective. Hence the bottom horizontal arrow in the diagram (2.18) is injective. So the bottom horizontal arrow in diagram (2.17) is also an imbedding. Now claim (2) follows by taking direct limits over $L'$ in diagram (2.17) and chasing the resulting diagram. □

At the end of this section we give some additional information about the reduction map

$$r_v: H^1_{f,S_l}(G_F; T_l) \to H^1(g_v; T_l).$$

**Proposition 2.19.** Let $\hat{\mathcal{P}} \in H^1_{f,S_l}(G_F; T_l)$ be a nontorsion element. Given $M_1 = l^{m_1}$ a fixed power of $l$, there exist infinitely many primes $v \notin S_l$ such that $r_v(\hat{\mathcal{P}}) \in H^1(g_v; T_l)$ is an element of order at least $M_1$.

**Proof.** Let $M$ be a power of $l$ which we will specify below. Let $F_M$ denote the extension $F(A[M])$. Consider the following commutative diagram.

\[
\begin{array}{cccccc}
H^1_{f,S_l}(G_F; T_l)/M & \xrightarrow{r_v} & H^1(g_v; T_l)/M \\
\downarrow{h_1} & & \downarrow \\
H^1_{f,S_l}(G_F; A[M]) & \xrightarrow{r_v} & H^1(g_v; A[M]) \\
\downarrow{h_2} & & \downarrow \\
H^1_{f,S_l}(G_{F_M}; A[M]) & \xrightarrow{r_v} & H^1(g_{w}; A[M]) \\
\downarrow{h_3} & & \downarrow \\
\text{Hom}(G_{F_M}; A[M]) & \xrightarrow{r_v} & \text{Hom}(g_{w}; A[M]) \\
\downarrow{h_4} & \cong & \downarrow \\
\text{Hom}(G_{F_M}^{ab}; A[M]) & \xrightarrow{r_v} & \text{Hom}(g_{w}; A[M])
\end{array}
\]
The horizontal arrows in the diagram (2.20) are induced by the reduction maps. We describe the vertical map. The map \( h_2 \) is an injection (cf. Prop. 4.3 (1)). The map \( h_3 \) is the injection which comes from the long exact sequence in cohomology associated to the following exact sequence of \( G_{F,l} \)-modules:

\[
(2.21) \quad 0 \longrightarrow A[l] \longrightarrow J_{f,S_l}(T_l) \longrightarrow J_{f,S_l}(T_l) \longrightarrow 0.
\]

The vertical maps on the right hand side of the diagram (2.20) are defined in the similar way. Consider the nontorsion element \( \hat{P} \in H^1_{f,S_l}(G_F; T_l) \). Let \( l^s \) be the largest power of \( l \) such that \( \hat{P} = l^s \hat{R} \) for an \( \hat{R} \in H^1_{f,S_l}(G_F; T_l) \). Such an \( l^s \) exists since \( H^1_{f,S_l}(G_F; T_l) \) is a finitely generated \( \mathbb{Z}_l \)-module. We put \( M = M_1 l^s \). Let \( P' \) be the image of \( \hat{P} \) in \( \text{Hom}(G_{F,l}^d, A[M]) \) under the composition of the maps \( h_1, h_2, h_3 \) and \( h_4 \). Since the maps \( h_1, h_2, h_3 \) and \( h_4 \) are injective, the element \( P' \) is of order \( M_1 \). By the Chebotarev density theorem there exist infinitely many primes \( w \notin S_l \) such that the map \( r_w \) preserves the order of \( P' \). Hence, for those \( w \) the element \( \hat{P} \) is mapped by the composition of left vertical and lower horizontal arrows onto an element whose order is \( M_1 \). The commutativity of (2.20) implies that \( r_w(\hat{P}) \in H^1(g_w; T_l) \) is of order at least \( M_1 \) for the primes \( v = w \cap O_{F,S_l} \).

**Corollary 2.22.**
Let \( \hat{P} \in H^1_{f,S_l}(G_F; T_l) \) be an element which maps onto a generator of the free \( \mathbb{Z}_l \)-module \( H^1_{f,S_l}(G_F; T_l)/\text{tor} \). There exist infinitely many primes \( v \notin S_l \) such that \( r_v(\hat{P}) \) is a generator of a cyclic summand in the \( l \)-primary decomposition of the group \( H^1(g_v; T_l) \).

### 3. Specification of \( l \)-adic representations

In addition to Assumption I the representations which we consider are supposed to satisfy Assumption II stated below. In order to formulate the assumption we introduce more notation. We fix a finite extension \( E/\mathbb{Q} \) of degree \( e = [E : \mathbb{Q}] \) such that the Hilbert class field \( E^H \) of \( E \) is contained in \( F \). We assume that each prime \( l \) splits completely in \( F \). Let

\[
(l) = \lambda_1 \ldots \lambda_e
\]

be the decomposition of the ideal \((l)\) in \( O_E \). We also assume that \( O_E \) acts on \( T_l \) in such a way that \( T_l \) is a free \( O_{E,l} = O_E \otimes \mathbb{Z}_l \)-module of rank \( h \) and that the action of \( O_{E,l} \) commutes with the action of \( G_F \) given by the representation \( \rho_l \). It is clear that \( e \) divides \( d = \dim \rho_l \) and \( h = \frac{d}{e} \). Put \( E_l = O_{E,l} \otimes \mathbb{Q}_l \). In addition, we denote by \( E_{\lambda_i} \) the completion of \( E \) at \( \lambda_i \) and by \( O_{\lambda_i} \) the ring of integers in \( E_{\lambda_i} \). Now, it is obvious that

\[
O_{E,l} = \prod_{i=1}^e O_{\lambda_i} \quad \text{and} \quad E_l = \prod_{i=1}^e E_{\lambda_i}.
\]
Since $T_l$ has the $O_{E,l}$-module structure, we can represent $V_l$ and $A_l$ as follows:

\[ V_l = T_l \otimes O_{E,l} E_l \]

\[ A_l = T_l \otimes O_{E,l} E_l / O_{E,l} = \bigoplus_{i=1}^e T_l \otimes O_{E,l} E_{\lambda_i} / O_{\lambda_i} = \bigoplus_{i=1}^e A_{\lambda_i}, \]

where we put $A_{\lambda_i} = T_l \otimes O_{E,l} E_{\lambda_i} / O_{\lambda_i}$.

Note that every prime ideal $\lambda_i$ is principal, because by assumption $E^H \subset F$. Hence, $\lambda_i = (\pi_i)$ for some $\pi_i \in O_E$. In this case $E_{\lambda_i} / O_{\lambda_i} \cong \mathbb{Q}_l / \mathbb{Z}_l$ for each $i$, hence all $A_{\lambda_i}$ are divisible groups of the same corank $h$. Observe that $A_l[\lambda_i^{k_i}] = A_{\lambda_i}[\lambda_i^{k_i}]$ and

\[(3.1) \quad A_l[\lambda_i] \cong \bigoplus_{i=1}^e A_l[\lambda_i], \]

where $\text{dim}_{\mathbb{Z}/l} A_l[\lambda_i] = h$, for all $1 \leq i \leq e$. By assumptions and decomposition (3.1) it is clear that the image $\overline{\pi}_l(G_F)$ of the representation $\overline{\pi}_l$ is contained in the subgroup of $GL_d(\mathbb{Z}/l)$ which consists of matrices of the form

\[
\begin{pmatrix}
C_1 & 0 & \ldots & 0 \\
0 & C_2 & \ldots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \ldots & C_e
\end{pmatrix},
\]

where $C_i \in GL_h(\mathbb{Z}/l)$, for all $1 \leq i \leq e$. Hence, we can consider the image of $\overline{\pi}_l$ as a subgroup of the product $\prod_{i=1}^e GL_h(\mathbb{Z}/l)$.

**Assumption II.** Let $\mathcal{P} = \mathcal{P}(\rho)$ be an infinite set of prime numbers $l > 3$, which split completely in $F$ and such that the $l$-adic representation $\rho_l$ satisfies the following conditions.

1. If $h > 1$, then for each $1 \leq i \leq e$, there is a subgroup $H_i \leq G(F(A[\lambda_i])/F) \subset GL_h(\mathbb{Z}/l) \cong GL(A_l[\lambda_i])$ such that:
   1. the subgroup $H_1 \times \cdots \times H_i \times \cdots \times H_e$ of the group $\prod_{i=1}^e GL_h(\mathbb{Z}/l)$ is contained in $\text{Im} \overline{\pi}_l = G_l$ and $H_1 \times \cdots \times H_i \times \cdots \times H_e$ has index prime to $l$ in $G_l$.
   2. $H_i$ acts irreducibly on $A_l[\lambda_i] \cong (\mathbb{Z}/l)^h$.
   3. $H_i/[H_i, H_i]$ has order prime to $l$.
   4. there exist matrices $\sigma_i, \beta_i \in H_i$ such that $1$ is an eigenvalue of $\sigma_i$ with eigenspace of dimension $1$ and $1$ is not an eigenvalue of $\beta_i$.
   5. the centralizer of $H_i$ in $GL_h(\mathbb{Z}/l)$ is $(\mathbb{Z}/l)^h I_h$ i.e. if $\sigma \in GL_h(\mathbb{Z}/l)$ and $\sigma \gamma = \gamma \sigma$ for all $\gamma \in H_i$, then $\sigma$ is a scalar matrix,
(vi) for each \(1 \leq i \leq e\) the group \(H_i\) contains a nontrivial subgroup \(D_i^0\) of the group \(\{aI_h; \ a \in (\mathbb{Z}/l)\times\} \subset GL_h(\mathbb{Z}/l)\) of scalar matrices.

(2) If \(h = 1\), we require that \(G_l = G(F_l/F)\) satisfies two conditions:

(i) for every \(1 \leq i \leq d\), there is a diagonal matrix \(\sigma_i = \text{diag}(\mu_1, \ldots, \mu_d)\) in the group \(G_l\) with \(\mu_i = 1\) and \(\mu_j \neq 1\), for all \(j \neq i\),

(ii) there is an isomorphism of rings \(\mathbb{Z}/l[G_l] \cong \mathcal{O}_E/l\), where \(\mathbb{Z}/l[G_l]\) denotes a subring of \(\mathcal{O}_E/l\) generated by \(\mathbb{Z}/l\) and the image of \(G_l\) in \(\mathcal{O}_E/l\) via the natural imbedding \(G_l \to (\mathcal{O}_E/l)\times\).

**Definition 3.2.** Let \(\{B(L)\}_L\) be a direct system of \(\mathcal{O}_E\)-modules indexed by all finite field extensions \(L/F\). The structure maps of the system are induced by inclusions of fields. We assume that for every embedding of fields \(L \to L'\) the structure map \(B(L) \to B(L')\) is a homomorphism of \(\mathcal{O}_E\)-modules. Let us put \(B(\mathbb{F}) = \varprojlim_{L/F} B(L)\). Let \(\rho\) and \(\mathcal{P}\) be as in Assumption II. The system \(\{B(L)\}_L\) is called the Mordell-Weil \(\mathcal{O}_E\)-module of the pair \((\rho, \mathcal{P})\) if the following conditions are satisfied:

(1) \(B(L)\) is a finitely generated \(\mathcal{O}_E\)-module for all \(L\).

(2) There are functorial homomorphisms of \(\mathcal{O}_E\)-modules

\[
\psi_{L,l} : B(L) \to H^1_{f,S_l}(G_L; T_l),
\]

where \(L\) is as above and \(l \in \mathcal{P}\), such that:

(i) for every \(l \in \mathcal{P}\), the induced map

\[
\psi_{L,l} \otimes \mathbb{Z}_l : B(L) \otimes \mathbb{Z}_l \to H^1_{f,S_l}(G_L; T_l)
\]

is an isomorphism or

(ii) for every \(l \in \mathcal{P}\), the map \(\psi_{L,l} \otimes \mathbb{Z}_l\) is an imbedding, the group \(B(\mathbb{F})\) is a discrete \(G_F\)-module which is divisible by \(l\), and for every \(L\) we have: \(B(\mathbb{F})^{G_L} \cong B(L)\) and \(H^0(G_L; A_l) \subset B(L)\).

We end this section with the examples of Mordell-Weil \(\mathcal{O}_E\)-modules related to \(l\)-adic representations which satisfy Assumptions I and II.

**Example 3.3.** Consider the \(l\)-adic representation

\[
\rho_{\mathbb{F}} : G(\bar{\mathbb{F}}/\mathbb{F}) \to GL(\mathbb{Z}_l(1)) \cong GL_1(\mathbb{Z}_l) \cong \mathbb{Z}_l\times
\]

given by the cyclotomic character. In this case \(T_l = \mathbb{Z}_l(1), V_l = \mathbb{Q}_l(1)\) and \(A_l = \mathbb{Q}_l/\mathbb{Z}_l(1)\). This representation is given by the action of \(G_F\) on the Tate module of
the multiplicative group scheme $\mathbb{G}_m/F$. Let $S$ be any finite set of primes in $O_F$.
Denote by $S_l$ the set of primes consisting of primes in $S$ and primes in $F$ over $l$. 
Put $B(L) = \mathbb{G}_m(O_{L,S}) = O_{L,S}^*$ for any finite extension $L/F$. The Kummer map (which is obviously injective)
$$B(L) \otimes \mathbb{Z}_l \to H^1(G_{L,S_l}; \mathbb{Z}_l(1)) \to H^1(G_L; \mathbb{Z}_l(1))$$
factors naturally through
$$\psi_{L,l} : B(L) \otimes \mathbb{Z}_l \to H^1_{f,S_l}(G_F; \mathbb{Z}_l(1))$$
In this case we take $E = \mathbb{Q}$ hence $O_E = \mathbb{Z}$. We take $\mathcal{P}$ to be the set of all prime numbers $l$ such that $G(F(\mu_l)/F)$ is nontrivial.

Example 3.4. Let $n$ be a positive integer. Let $T_l = \mathbb{Z}_l(n+1)$, hence $V_l = \mathbb{Q}_l(n+1)$ and $A_l = \mathbb{Q}_l/\mathbb{Z}_l(n+1)$. Consider the one dimensional representation
$$\rho_l : G_F \to GL(T_l) \cong \mathbb{Z}_l^{\times}$$
which is given by the $(n+1)$-th tensor power of the cyclotomic character. For each odd prime number $l$ and for a finite extension $L/F$ consider the Dwyer-Friedlander map [DF]
$$K_{2n+1}(L) \to K_{2n+1}(L) \otimes \mathbb{Z}_l \to H^1(G_L; \mathbb{Z}_l(n+1)).$$
Let $C_L$ be the subgroup of $K_{2n+1}(L)$ which is generated by the $l$-parts of kernels of Dwyer-Friedlander maps for all odd primes $l$. We define the group $B(L)$ by putting
$$B(L) = K_{2n+1}(L)/C_L.$$ 
Note that the group $C_L$ is finite by [DF] and it should vanish if the Quillen-Lichtenbaum conjecture holds. Note that in this case
$$H^1(G_L; \mathbb{Z}_l(n+1)) \cong H^1(G_{L,S_l}; \mathbb{Z}_l(n+1)) \cong H^1_{f,S_l}(G_L; \mathbb{Z}_l(n+1)).$$
It follows by the definition of $B(L)$ and surjectivity of the Dwyer-Friedlander map that
$$\psi_{L,l} : B(L) \otimes \mathbb{Z}_l \cong H^1(G_L; \mathbb{Z}_l(n+1)).$$

In the following three examples we discuss representations which come from Tate modules of abelian varieties. Let $A/F$ be a simple abelian variety of dimension $d$ over a number field $F$. As usual, we denote by $T_l = T_l(A)$ the Tate module of $A$. Consider the $l$-adic representation
$$\rho_l : G_F \to GL(T_l(A)).$$
Assumption I holds due to the Weil conjectures (cf. [Sil], pp. 132-134). Let $S$ be the set of prime ideals of $F$ at which $A$ has bad reduction. By the Kummer pairing and Serre-Tate theorem ([ST], Th. 1, p. 493 and Corollaries 1 and 2 of Manin’s Appendix II to the book [M]) we have a natural imbedding

$$\psi_{L,l} : A(L) \otimes \mathbb{Z}_l \rightarrow H^1_{f,S_l}(G_L; T_l(A)).$$

Put $B(L) = A(L)$ for any finite extension $L/F$.

Example 3.5. Let $A/F$ be a simple abelian variety with complex multiplication by a CM field $E$ (cf. [La]) such that $E^H \subset F$, where $E^H$ is the Hilbert class field of $E$. We assume that CM type of $A$ is nondegenerate (cf. Def.2.1, [BGK1]) and defined over $F$. Condition (i) of Assumption II (2) holds by Theorem 2.1, [BGK1] (for CM elliptic curves it also follows by an alternative argument cf. [C-RS], Lemma 5.1, p. 286). Condition (ii) of Assumption II (2) follows by Proposition, p. 72 of [R2]. We take $P$ to be the set of prime numbers $l$ which split completely in $F$ and such that $A$ has a good reduction at $l$.

Example 3.6. Consider a simple, principally polarised abelian variety $A/F$ such that $E = \text{End}_F(A) \otimes \mathbb{Q} = \text{End}_F(A) \otimes \mathbb{Q}$ (cf. [R1] and [C]) where $e = [E : \mathbb{Q}]$ and $2he = 2g$ with $h$ and odd integer. In addition, we choose $F$ to be a number field satisfying conditions indicated in the discussion which follows Theorem 3.1 of [BGK1] and such that $E^H \subset F$. We take $P$ to be the set of prime numbers $l \gg 0$ which split completely in $F$, and such that $A$ has good reduction at $l$. Hence by Theorem 3.5 of [BGK1] we get

$$\prod_{i=1}^{e} Sp_{2h}(\mathbb{F}_l) = [G_l, G_l].$$

Taking $H_i = Sp_{2h}(\mathbb{F}_l)$, for all $1 \leq i \leq e$, we observe that conditions of Assumption II (1) are fulfilled since

(i) $\prod_{i=1}^{e} Sp_{2h}(\mathbb{F}_l) \subset G_l$, and the quotient group $GSp_{2h}(\mathbb{F}_l)/Sp_{2h}(\mathbb{F}_l)$ has order prime to $l$,

(ii) $Sp_{2h}(\mathbb{F}_l)$ acts on $A_l[\lambda_i] \cong (\mathbb{Z}/l)^{2h}$, in an irreducible way.

(iii) $Sp_{2h}(\mathbb{F}_l)$ modulo its center is a simple group.

(iv) matrix $\sigma_i \in Sp_{2h}(\mathbb{F}_l)$

$$\sigma_i = \begin{pmatrix} J_h(1) & J_h(1) \\ O & (J_h(1)^t)^{-1} \end{pmatrix}$$

has eigenvalue 1 with the eigenspace of dimension 1 where $J_h(1)$ is the $h \times h$ Jordan block matrix with 1 as the eigenvalue and $\beta_i = -I_{2h} \in Sp_{2h}(\mathbb{F}_l)$ does not have 1 as an eigenvalue.
(v) The centralizer of $Sp_{2h}(\mathbb{F}_l)$ in $GL_{2h}(\mathbb{F}_l)$ is $(\mathbb{F}_l)^{\times}I_{2h}$.

Observe that condition (1) (vi) of Assumption II is satisfied since obviously $-I_{2h} \in Sp_{2h}(\mathbb{F}_l)$.

There are two special cases of Example 3.6 that have been considered extensively in the past.

Example 3.7. (a) Let $A/F$ be a simple, principally polarised abelian variety with real multiplication by a totally real field $E = \text{End}_F(A) \otimes \mathbb{Q} = \text{End}_{\bar{F}}(A) \otimes \mathbb{Q}$ such that $e = g$ and $h = 1$ (cf. [R1]). We choose $F$ to be such a number field that $E^H \subset F$. We take $\mathcal{P}$ to be the set of prime numbers $l$ which split completely in $F$ and such that $A$ has a good reduction at $l$. Theorem 5.5.2, p. 801, [R1] or Theorem 3.5 of [BGK1] implies that the image of the representation $\bar{\rho}_l$ contains the subgroup

$$\prod_{i=1}^g SL_2(\mathbb{F}_l) = \prod_{i=1}^g Sp_2(\mathbb{F}_l),$$

therefore the representation $\bar{\rho}_l$ satisfies Assumption II (1).

(b) Let $A/F$ be a simple, principally polarised abelian variety with the property that $\text{End}_F(A) = \mathbb{Z}$ and $g = \dim A$ is odd or equal to 2 or 6. In this case $E = \mathbb{Q}$ hence $e = 1$ and $h = g$. By the theorem of Serre ([Se1] Th. 3) the image of the representation $\bar{\rho}_l$ equals $GSp_{2g}(\mathbb{F}_l)$ (hence contains $Sp_{2g}(\mathbb{F}_l)$) for almost all $l$. We take $\mathcal{P}$ to be the set of prime numbers such that the image of $\bar{\rho}_l$ equals $GSp_{2g}(\mathbb{F}_l)$ and $A$ has good reduction at $l$. Hence the image of the representation $\bar{\rho}_l$ satisfies condition (1) of Assumption II.

It is rather hard to find further examples of Mordell-Weil $O_E$-modules satisfying condition (2)(i) of Definition 3.2. Indeed, if we concentrate on finding a Mordell-Weil $O_E$-module associated to $T_i$ coming from étale cohomology of a smooth proper scheme $X$ over $F$, then we should first prove Conjecture 5.3 (ii) p. 370 of [BK], for such an $X$.

4. Key Propositions.

**Definition 4.1.** Let

$$\phi_P : G_{F_l} \to A_l[l]$$

be the map:

$$\phi_P(\sigma) = \sigma(\frac{1}{l}\hat{P}) - \frac{1}{l}\hat{P}$$
where \( P \in B(F) \) and \( \hat{P} \) is the image of \( P \) via the natural map

\[
B(F) \to B(F) \otimes \mathbb{Z}_l \to H^1_{J_S}(G_F; T_l) \subset J_{f,S_i}(T_l)
\]

**Remark 4.2.** Note that \( \frac{1}{d} \hat{P} \) makes sense in \( J_{f,S_i}(T_l) \) since the last group is divisible due to Proposition 2.14. The element \( \frac{1}{d} \hat{P} \) is defined up to an element of the group \( A_l[l] \).

**Proposition 4.3.** Suppose that the Assumptions I and II are fulfilled. Then the following properties hold.

1. \( H^r(G(F_i/F); A_l[l]) = 0 \) for \( r \geq 0 \) and all \( l \in \mathcal{P} \), except the case of trivial \( G_l \)-module \( A_l[l] \) when \( r = 0 \) and \( d = 1 \).
2. The map \( H^1_{J_S}(G_F; T_i)/l \to H^1_{J_S}(G_{F_i}; T_i)/l \) is injective for all \( l \in \mathcal{P} \).
3. The map \( B(F)/lB(F) \to B(F)/lB(F_i) \) is injective for all \( l \in \mathcal{P} \).
4. Let \( P \in B(F) \). If \( l \in \mathcal{P} \) does not divide \( \frac{1}{d} B(F)_{tor} \) and \( P \notin \lambda_i B(F) \) for all \( 1 \leq i \leq e \), then the map \( \phi_P \) is surjective.

**Proof.** (1) First let us consider the case \( h > 1 \). The group \( D^0 = \prod_{j=1}^e D^0_j \) can be regarded as a subgroup of \( G_l \) once we identify \( G_l \) with its image via \( \pi_l \). \( D^0 \) is a normal subgroup of \( G_l \). Assumption II (1) (vi) allows us to consider the Hochschild-Serre spectral sequence

\[
E_2^{r,s} = H^r(G_l/D^0; H^s(D^0; A_l[l])) \Rightarrow H^{r+s}(G_l; A_l[l]).
\]

Observe that \( H^0(D^0; A_l[l]) = \oplus_{i=1}^e H^0(D^0_i; A_l[\lambda_i]) = 0 \) because by definition \( D^0_i \) is nontrivial and acts by matrix multiplication (actually scalar multiplication) on the \( \mathbb{Z}_l \)-vector space \( A_l[\lambda_i] \cong (\mathbb{Z}_l)^h \). The groups \( H^s(D^0; A_l[l]) \) vanish for \( s > 0 \), since \( l \) is odd by assumption and the order of \( D^0 \) is prime to \( l \). Hence the claim (1) follows for \( h > 1 \). Now let \( h = 1 \). Note that \( G_l \) is isomorphic to a subgroup of diagonal matrices in \( GL(A_l[l]) = GL_d(\mathbb{Z}_l) \). Since \( G_l \) has order relatively prime to \( l \), \( H^s(G_l; A_l[l]) = 0 \) for \( s > 0 \). It follows easily by Assumption II (2) (i) that \( H^0(G_l; A_l[l]) = 0 \), for all \( l \in \mathcal{P} \) and \( d > 1 \). This proves (1) in the case \( h = 1 \). If \( d = 1 \), then \( H^0(G_l; A_l[l]) = 0 \) (\( = A_l[l] \) resp.) if \( A_l[l] \) is nontrivial (trivial resp.) \( G_l \)-module.

(2) By Prop. 2.14, we have the following short exact sequence:

\[
0 \to A_l[l] \to J_{f,S_i}(T_l) \to J_{f,S_i}(T_l) \to 0.
\]

By the long exact sequence in cohomology associated to this exact sequence and Proposition 2.16, we obtain the commutative diagram in which the horizontal maps are injections.
(3) Let us first consider the case (2) (i) of Definition 3.2. Because the map

$$B(L) \otimes \mathbb{Z}_l \to H^1_{f,S_i}(G_L; T_l),$$

is an isomorphism, the group $B(L)/l$ is isomorphic to $H^1_{f,S_i}(G_L; T_l)/l$. This shows that the horizontal maps in the commutative diagram

$$B(F)/l \to H^1_{f,S_i}(G_F; T_l)/l$$

are isomorphisms. Since we have proved in (2) that the map $\alpha$ is an injection, diagram (4.6) gives the claim (3). Now consider the case (2) (ii) of Definition 3.2. We get the exact sequence of $G_F$-modules:

$$0 \to A_l[l] \to B(F) \xrightarrow{\iota} B(F) \to 0$$

This gives the following commutative diagram with injective horizontal arrows:

$$0 \to 0 \downarrow \downarrow \ker \beta \to H^1(G_l; A_l[l]) \downarrow \downarrow \downarrow \downarrow \downarrow$$

$$B(F)/l \to H^1(G_F; A_l[l]) \downarrow \downarrow \downarrow$$

However, $\ker \alpha = 0$, since it injects into the group $H^1(G_l; A_l[l])$ which vanishes by part (1) of the proposition.
Since by (1) the map $\gamma$ is injective for all $l \in \mathcal{P}$, the map $\beta$ is also injective for all $l \in \mathcal{P}$.

(4) We easily check that the image of the map $\phi_P$ is $G_F$-invariant. If $\phi_P$ were not surjective, then $\text{Im} \phi_P$ would be a proper $G_F$ submodule of $A_l[l]$. It is clear from the decomposition (3.1) of $A_l[l]$ and Assumption II (1) and (2) (ii) that every $G_F$ submodule of $A_l[l]$ is of the form $A_l[\lambda_{i_1}] \oplus \cdots \oplus A_l[\lambda_{i_r}]$ for some $i_1, \ldots, i_r \in \{1, \ldots, e\}$. Hence if $\text{Im} \phi_P$ were a proper $G_F$ submodule, we could assume that

$$
\text{Im} \phi_P \subset A_l[\lambda_1] \oplus \cdots \oplus A_l[\lambda_{i-1}] \oplus A_l[\lambda_i+1] \oplus \cdots \oplus A_l[\lambda_e]
$$

for some $1 \leq i \leq e$. This implies that

$$
(4.8) \quad \pi_1 \cdots \pi_{i-1} \pi_{i+1} \cdots \pi_e (\sigma \left( \frac{1}{l} \hat{P} \right) - \frac{1}{l} \hat{P}) = 0
$$

for every $\sigma \in G(F/F_i)$. The equality (4.8) takes place in $J_{f_1,S_i}(T_i)$ under the (2) (i) part of Definition 3.2 (resp. in $B(F)$ under the case (2) (ii) of Definition 3.2) and it implies that

$$
(4.9) \quad \sigma(\pi_1 \cdots \pi_{i-1} \pi_{i+1} \cdots \pi_e \frac{1}{l} \hat{P}) = \pi_1 \cdots \pi_{i-1} \pi_{i+1} \cdots \pi_e \frac{1}{l} \hat{P}
$$

for every $\sigma \in G(F/F_i)$. Hence by Proposition 2.16 (2) (resp. by Def. 3.2, of the Mordell-Weil $\mathcal{O}_F$-module $\{B(L)\}$) we get

$$
(4.10) \quad \pi_1 \cdots \pi_{i-1} \pi_{i+1} \cdots \pi_e \frac{1}{l} \hat{P} \in H_{f_1,S_i}(G_{F_i}; T_i) \quad (\in B(F) \text{ resp.}).
$$

So $\pi_1 \cdots \pi_{i-1} \pi_{i+1} \cdots \pi_e \hat{P} = 0$ in the group $H_{f_1,S_i}(G_{F_i}; T_i)/l$ (in $B(F)/lB(F)$, resp.). By parts (2) and (3) of the Proposition (see also the diagram (4.6)) this implies $\pi_1 \cdots \pi_{i-1} \pi_{i+1} \cdots \pi_e \hat{P} = 0$ in the group $B(F)/lB(F)$ in both cases. Hence there is $P_1 \in B(F)$ such that $\pi_1 \cdots \pi_{i-1} \pi_{i+1} \cdots \pi_e \hat{P} = lP_1$. This gives the equality

$$
(4.11) \quad \pi_1 \cdots \pi_{i-1} \pi_{i+1} \cdots \pi_e (\hat{P} - \pi_i P_2) = 0
$$

where $P_2 = uP_1 \in B(F)$ for some $u \in \mathcal{O}_E^\times$. Multiplying equation (4.11) by $\pi_i$ we obtain the equality $l(P - \pi_i P_2) = 0$ in the group $B(F)$. Since, by assumption, $\not\exists B(F)/lG(F)$ we get $P = \pi_i P_2$, hence $P \in \lambda_i B(F)$ which contradicts the assumptions. □

For a given $l$ let $\bar{\rho}_i$ denote the representation:

$$
\bar{\rho}_i : G_F \to GL(A_l[\lambda_i])
$$

Similarly to the definition of $F_l$ we put $F_l = \bar{F}^{\ker \bar{\rho}_i}$. In analogy with the Definition 4.1 we introduce a homomorphism

$$
\phi_i : G_{F_i} \to A_l[\lambda_i],
$$

$$
\phi_i(\sigma) = \sigma \left( \frac{1}{\pi_i} \hat{P} \right) - \frac{1}{\pi_i} \hat{P}.
$$
Proposition 4.12. We have the following properties.

(1) $H^r(G(F_l/F); A_l[\lambda_i]) = 0$ for $r \geq 0$, all $l \in \mathcal{P}$, and $1 \leq i \leq e$ except the case of trivial $G(F_l/F)$-module $A_l[\lambda_i]$ when $r = 0$.

(2) The map $H^1_{f,S_l}(G_F; T_l)/\lambda_i \rightarrow H^1_{f,S_l}(G_{F_l}; T_l)/\lambda_i$ is injective for all $l \in \mathcal{P}$ and $1 \leq i \leq e$.

(3) The map $B(F)/\lambda_i B(F) \rightarrow B(F_l)/\lambda_i B(F_l)$ is injective for all $l \in \mathcal{P}$ and $1 \leq i \leq e$.

(4) Let $P \in B(F)$. If $l \in \mathcal{P}$ does not divide $\sharp B(F)_{tor}$ and $P \notin \lambda_i B(F)$, then the map $\phi_i$ is surjective.

Proof. Proofs of (1), (2), and (3) are done in the same way as the corresponding proofs in Proposition 4.3. Statement (4) holds because $\phi_i$ is obviously $G_F$ equivariant, $\phi_i$ is nontrivial since $P \notin \lambda_i B(F)$, and $A_l[\lambda_i]$ is an irreducible $\mathbb{Z}/l[G_F]$ module due to Assumption II. □

Let $P, Q$ be two nontorsion elements of the group $B(F)$. Let $S_l$ be the finite set of primes which contains primes for which $\rho_l$ is ramified and primes over $l$. For $v \notin S_l$ let

$$r_v : H^1_{f,S_l}(G_F; T_l) \rightarrow H^1(g_v; T_l)$$

denote the reduction map at a prime ideal $v$ of $\mathcal{O}_F$. We will investigate the linear dependence of $P$ and $Q$ over $\mathcal{O}_E$ in $B(F)$ under some local conditions for the maps $r_v$, (see statement of Theorem 5.1 below). We need some additional notation. Let $\mathcal{P}^*$ be the set of rational primes $l \in \mathcal{P}$ such that $P \notin \lambda_i B(F)$ and $Q \notin \lambda_i B(F)$ for all $1 \leq i \leq e$. The set $\mathcal{P} \setminus \mathcal{P}^*$ is finite, since $B(F)$ is finitely generated $\mathcal{O}_E$ - module. Let $\hat{R} \in J_f,S_l(T_l)$ be such that $l\hat{R} = \hat{P}$. The element $\hat{R}$ exists by Proposition 2.14. The Galois group $G_{F_l}$ acts on the set

$$\{\hat{R} + t : t \in A_l[l]\}$$

which is contained in $J_{f,S_l}(T_l)$. Let $N_P \subset G_{F_l}$ be the kernel of this action. Note that $N_P$ is a normal subgroup of $G_{F_l}$ of finite index. Define the field

$$F_l(\frac{1}{l} \hat{P}) = F^{N_P}.$$

Let $F_l(\frac{1}{l} \hat{Q})$ denote the corresponding field defined for $Q$. Observe that $F_l(\frac{1}{l} \hat{P})/F$ and $F_l(\frac{1}{l} \hat{Q})/F$ are Galois extensions and we have isomorphisms

$$\text{Gal}(F_l(\frac{1}{l} \hat{P})/F) \cong H_2 \rtimes G_l \quad \text{and} \quad \text{Gal}(F_l(\frac{1}{l} \hat{Q})/F) \cong H_1 \rtimes G_l,$$

where

$$H_1 = \text{Gal}(F_l(\frac{1}{l} \hat{Q})/F_l) \quad \text{and} \quad H_2 = \text{Gal}(F_l(\frac{1}{l} \hat{P})/F_l).$$
By Proposition 4.3 (4) the group $H_1$ ( $H_2$, respectively) can be identified with $A_l[l]$ via the map $\phi_Q$ ( $\phi_P$, resp.). Put $K = F_i(\frac{1}{\pi_i}\hat{P})F_i(\frac{1}{\pi_i}\hat{Q})$.

All fields introduced above are displayed in the diagram below.

\[
\begin{array}{c}
K \\
\downarrow \\
F_i(\frac{1}{\pi_i}\hat{P}) \quad F_i(\frac{1}{\pi_i}\hat{Q}) \\
\downarrow \quad \downarrow \\
F(\hat{R}) \quad F_i \quad F(\hat{R}') \\
\downarrow \quad \downarrow \quad \downarrow \quad \downarrow \quad \downarrow \quad \downarrow \\
F \\
\end{array}
\]

\hspace*{2.5cm} (4.13)

Similarly, let $\hat{R}_i \in J_{f_i,T_i}(T_l)$ be such that $\pi_i\hat{R}_i = \hat{P}$. The element $\hat{R}_i$ exists by Proposition 2.14. The Galois group $G_{F_i}$ acts on the set

$$\{\hat{R}_i + t : \ t \in A_l[\lambda_i]\}$$

which is contained in $J_{f_i,T_i}(T_l)$. Let $N_i \subset G_{F_i}$ be the kernel of this action. Note that $N_i$ is a normal subgroup of $G_{F_i}$ of finite index. Define the field

$$F_i(\frac{1}{\pi_i}\hat{P}) = \bar{F}^{N_i}.$$ 

Let $F_i(\frac{1}{\pi_i}\hat{Q})$ denote the corresponding field defined in the same way for $Q$. Observe that $F_i(\frac{1}{\pi_i}\hat{P})/F$ and $F_i(\frac{1}{\pi_i}\hat{Q})/F$ are Galois extensions and there are isomorphisms

$$\text{Gal}(F_i(\frac{1}{\pi_i}\hat{P})/F) \cong H_{2,i} \rtimes G(F_i/F) \quad \quad \text{Gal}(F_i(\frac{1}{\pi_i}\hat{Q})/F) \cong H_{1,i} \rtimes G(F_i/F),$$

where

$$H_{1,i} = \text{Gal}(F_i(\frac{1}{\pi_i}\hat{Q})/F_i) \quad \quad H_{2,i} = \text{Gal}(F_i(\frac{1}{\pi_i}\hat{P})/F_i).$$

By Proposition 4.12 (4) the group $H_{1,i}$ ( $H_{2,i}$, respectively) can be identified with $A_l[\lambda_i]$ via the map $\phi_i$ for $Q$ (for $P$ resp.) Put $K_i = F_i(\frac{1}{\pi_i}\hat{P})F_i(\frac{1}{\pi_i}\hat{Q})$. 

\begin{center}
\hspace{1.5cm} (4.13)
\end{center}
Fields introduced above are displayed in the left diagram below. In the right diagram we depicted the relevant prime ideals that will be used in the proof of Theorem 5.1 below.

\[
\begin{array}{ccc}
K_i & F(\hat{R}_i) & F(\hat{R}_i') \\
F_i(\frac{1}{\pi_i} \hat{P}) & F_i(\frac{1}{\pi_i} \hat{Q}) & w \\
F_i & F_i & w' \\
F & F & \beta \\
\end{array}
\]

(4.14)

\[
\begin{array}{ccc}
\beta & \beta' \\
u & \beta' \\
u' & \beta \\
F_i(\hat{R}_i) & F_i(\hat{R}_i') & F \\
\end{array}
\]

Remark 4.15. Observe that

\[
F_i(\frac{1}{l} \hat{P}) = F_i(\frac{1}{\pi_1} \hat{P}) \ldots F_i(\frac{1}{\pi_i} \hat{P}) \ldots F_e(\frac{1}{\pi_e} \hat{P}),
\]

\[
F_i(\frac{1}{l} \hat{Q}) = F_i(\frac{1}{\pi_1} \hat{Q}) \ldots F_i(\frac{1}{\pi_i} \hat{Q}) \ldots F_e(\frac{1}{\pi_e} \hat{Q}).
\]

In addition there is an equality

\[
[F(\hat{R}_i) : F] = [F_i(\frac{1}{\pi_i} \hat{P}) : F_i],
\]

since by Proposition 4.12 (4) there are \([F_i(\frac{1}{\pi_i} \hat{P}) : F_i]\) different imbeddings of \(F(\hat{R}_i)\) into \(\tilde{F}\) that fix \(F\). Hence from the diagram (4.14) we find out that \(F(\hat{R}_i) \cap F_i = F\).

5. The support problem for \(l\)-adic representations.

**Theorem 5.1.** Let \(\mathcal{P}^*\) be the infinite set of prime numbers introduced after the proof of Prop.4.12. Assume that for every \(l \in \mathcal{P}^*\) the following condition holds in the group \(H^1(g_v; T_l)\).

For every integer \(m\) and for almost every \(v \notin S_l\)

\[
m r_v(\hat{P}) = 0 \quad \text{implies} \quad m r_v(\hat{Q}) = 0.
\]

Then there exist \(a \in \mathbb{Z}\) and \(f \in \mathcal{O}_E\) such that \(aP + fQ = 0\) in \(B(F)\).
Lemma 5.2. Let $H_{1,i}$ and $H_{2,i}$ be two $h$-dimensional $F_l$-vector spaces equipped with the natural action of the group $G_i = \text{Im} \tilde{\rho}_i \subset GL_h(F_l)$. Let us denote by $\Omega_i$ the semidirect product $(H_{1,i} \oplus H_{2,i}) \rtimes G_i$. Assume that we are given $\sigma_i \in G_i$ such that for every $h_1 \in H_{1,i}$ the element $(h_1, 0, \sigma_i) \in (H_{1,i} \oplus \{0\}) \rtimes G_i$ is conjugate to an element $(0, h_2, \tau_i) \in (\{0\} \oplus H_{2,i}) \rtimes G_i$. Then 1 is not an eigenvalue of the matrix $\sigma_i$.

Proof. cf. [C-RS], Lemma 4.2. $\square$

Remark 5.3. Observe, that by Assumption II, for every $1 \leq i \leq e$ and every $l \in \mathcal{P}$ there exists a matrix $\sigma_i \in G_i$, such that 1 is an eigenvalue of $\sigma_i$ with an eigenspace of dimension 1.

Proof of Theorem 5.1. We want to prove that

\begin{equation}
F_i(\frac{1}{\pi_i} \hat{P}) = F_i(\frac{1}{\pi_i} \hat{Q}).
\end{equation}

Hence it is enough to prove that for each $1 \leq i \leq e$ we have

\begin{equation}
F_i(\frac{1}{\pi_i} \hat{P}) = F_i(\frac{1}{\pi_i} \hat{Q}).
\end{equation}

Suppose this is false for some $i$. Then we observe that

\[ F_i(\frac{1}{\pi_i} \hat{P}) \cap F_i(\frac{1}{\pi_i} \hat{Q}) = F_i, \]

since both groups $H_{1,i} = G(F_i(\frac{1}{\pi_i} \hat{Q})/F_i)$ and $H_{2,i} = G(F_i(\frac{1}{\pi_i} \hat{P})/F_i)$ are irreducible $G_i = G(F_i/F)$ modules by Assumption II (1) (ii). Hence

\begin{equation}
\text{Gal}(K_i/F_i) \cong H_{1,i} \oplus H_{2,i} \cong A_l[\lambda_i] \oplus A_l[\lambda_i].
\end{equation}

We need the following result.

Lemma 5.7. We have the following equality

\[ K_i \cap F_l = F_i. \]

Proof. By (5.6) the group $G(K_i/F_i)$ is abelian of order $l^{2h}$. If $h = 1$, then $G(F_i/F_i) \subset \prod_{j=1, j \neq i}^d GL_1(\mathbb{Z}/l)$ has order relatively prime to $l$ and it is clear that $K_i \cap F_l = F_i$. 
Now assume that $h > 1$. We observe that

$$
\prod_{j=1, j \neq i}^e [H_j, H_j] \subset \prod_{j=1, j \neq i}^e H_j \subset G(F_l/F_i),
$$

hence by Assumption II (1) (i) and (iii) the subgroup $\prod_{j=1, j \neq i}^e [H_j, H_j]$ has index prime to $l$ in $G(F_l/F_i)$. On the other hand

$$
\prod_{j=1, j \neq i}^e [H_j, H_j] \subset [G(F_l/F_i), G(F_l/F_i)] \subset G(F_l/F_i),
$$

hence the group $G(F_l/F_i)^{ab} = G(F_l/F_i)/[G(F_l/F_i), G(F_l/F_i)]$ has order prime to $l$. Let $K_0 = K_i \cap F_i$. Then $K_0/F_i$, as a subextension of $K_i/F_i$, is abelian with order equal to some power of $l$. On the other hand $G(K_0/F_i)$ is a quotient of the abelian group $G(F_l/F_i)^{ab}$, which has order prime to $l$. This implies that the group $G(K_0/F_i)$ is trivial. Hence $K_0 = F_i$. □

Let us now return to the proof of Theorem 5.1. Consider the following tower of fields.

We can regard $G_l = G(F_l/F)$ as the subgroup of $\prod_{j=1}^e GL_h(\mathbb{F}_l)$. Let us pick $\sigma_l \in G_l$ such that $\sigma_l|F_i = \sigma_i$ and $\sigma_l|F_j = \beta_j$ for all $j \neq i$. Such a $\sigma_l$ exists by Assumption II (1) (iv). Note that $\sigma_l$ considered as a linear operator on the $\mathbb{F}_l$ vector space $A_i[l]$ has an eigenvalue 1 with the eigenspace of dimension 1. Let $h_1 \in H_{1,i}$ be an arbitrary element. Let us pick an element of $G(K_i/F_i) \cong H_{1,i} \oplus H_{2,i}$ such that its projection onto $H_{1,i}$ is $h_1$ and its projection onto $H_{2,i}$ is a trivial element. We denote this element as $(h_1, 0)$. Taking into account Lemma 5.7, Remark 4.15 and the isomorphism of Galois groups $Gal(K_i/F) \cong (H_{1,i} \oplus H_{2,i}) \rtimes G(F_l/F)$, we can define an element $\gamma \in G(K_i F_l/F)$ such that $\gamma|K_i = (h_1, 0, \sigma_i)$, $\gamma|F(\hat{R}_i) = id_{F(\hat{R}_i)}$.
and $\gamma | F_l = \sigma_l$. By Chebotarev density theorem there exists a prime $\tilde{w}$ of $K_i F_l$ such that:

(i) $Fr_{\tilde{w}} = \gamma \in G(K_i F_l / F)$,

(ii) the unique prime $v$ in $F$ below $\tilde{w}$ is not in $S_l$ and satisfies the assumptions of Theorem 5.1.

By the choice of prime $v$ we see that

$$H^0(g_v; A_l)[l] = \bigoplus_{j=1}^e H^0(g_v; A_l)[\pi_j] = H^0(g_v; A_l)[\pi_i]$$

and also $H^0(g_v; A_l)[l] \cong \mathbb{Z}/l$. Hence for each $k \geq 1$ we have

$$H^0(g_v; A_l)[l^k] = H^0(g_v; A_l)[\pi_i^k]$$

which, together with finiteness of $H^0(g_v; A_l)$, shows that there is an $m$ such that

$$H^0(g_v; A_l) = H^0(g_v; A_l)[l^m] = H^0(g_v; A_l)[\pi_i^m]$$

and $H^1(g_v; T_l) \cong H^0(g_v; A_l)$ is a finite, cyclic group.

Let $w$ ($u$ resp.) be the prime of $K_i (F(\hat{R_i})$ resp.) which is over $v$ and below $\tilde{w}$ (cf. diagram (4.14). Consider the following commutative diagram.

$$\begin{array}{cccc}
H^1_{f,S_l}(G_{K_i}; T_l) & \xrightarrow{r_w} & H^1(g_v; T_l) & \\
| & & | & \\
H^1_{f,S_l}(G_{F_i(\hat{R_i})}; T_l) & \xrightarrow{r_\beta} & H^1(g_\beta; T_l) & \\
| & & | & \\
H^1_{f,S_l}(G_{F(\hat{R_i})}; T_l) & \xrightarrow{r_u} & H^1(g_u; T_l) & \\
| & & \cong & \\
H^1_{f,S_l}(G_F; T_l) & \xrightarrow{r_v} & H^1(g_v; T_l) & \\
\end{array}$$

The lowest right vertical arrow in the diagram (5.10) is an isomorphism because, by the choices we have made the prime $v$ splits in $F(\hat{R_i})$ (which means that $k_v \cong k_u$. Note that prime ideal $v$ does not need to split completely in $F(\hat{R_i})/F$ since this extension is usually not Galois). The left vertical arrows are embeddings by Proposition 2.16. Since $v$ splits in $F(\hat{R_i})$, we have the following equality in the group $H^1(g_v; T_l)$

$$r_v(\hat{P}) = \pi_i r_u(\hat{R}_i).$$
Let $t_v = l^m$ denote the order of the finite cyclic group $H^1(g_v; T_l) \cong H^0(g_v; A_l)$. For some $c \in \mathcal{O}_E^\times$ we have

\begin{equation}
(5.11) \quad t_v \frac{r_v(\hat{P})}{l} = t_v \frac{\pi_i r_u(\hat{R}_i)}{l} = l^{m-1} \pi_i r_u(\hat{R}_i) = c \prod_{j \neq i} \pi_j^{m-1}(\pi_i^m r_u(\hat{R}_i)) = 0
\end{equation}

in the group $H^1(g_v; T_l)$, since $r_u(\hat{R}_i) \in H^0(g_v; A_l)[\pi_i^m]$ by (5.9).

By the assumption of Theorem 5.1, equality (5.11) implies that

\begin{equation}
(5.12) \quad \frac{t_v}{l} r_v(\hat{Q}) = 0.
\end{equation}

Since $H^1(g_v; T_l)$ is cyclic, the equality (5.12) implies that

$r_v(\hat{Q}) \in l H^1(g_v; T_l)$.

This gives

\begin{equation}
(5.13) \quad r_v(\hat{Q}) = \pi_i \hat{R}_i''
\end{equation}

for some $\hat{R}_i'' \in H^1(g_v; T_l)$. By Proposition 2.14 we can find an element $\hat{R}_i'' \in J_{f,S_l}(T_l)$ such that

\begin{equation}
(5.14) \quad \pi_i \hat{R}_i'' = \hat{Q},
\end{equation}

Choose a prime $u''$ in $F(\hat{R}_i'')$ over $v$. Let $u'$ be a prime over $u''$ in $K_i$. Observe that, by the diagram similar to diagram 5.10 with $\hat{P}$ and $\hat{R}_i$ replaced by $\hat{Q}$ and $\hat{R}_i''$ we obtain by (5.14) that

\begin{equation}
(5.15) \quad r_v(\hat{Q}) = \pi_i r_{u''}(\hat{R}_i'').
\end{equation}

in the group $H^1(g_{u''}; T_l)$, hence also in $H^1(g_{u'}; T_l)$. By (5.13) and (5.15) we get

$r_{u''}(\hat{R}_i'') - \hat{R}_i'' \in A_l[\pi_i] \cap H^1(g_{u''}; T_l)$.

Because $A_l[\pi_i] \subset H^1_{f,S_l}(G_{K_i}; T_l)$ (cf. proof of Lemma 2.11 and diagram (2.12)), by Lemma 2.13 there exists $\hat{P}_0 \in H^1_{f,S_l}(G_{K_i}; T_l)$ such that $r_{u'}(\hat{P}_0) = r_{u''}(\hat{R}_i'') - \hat{R}_i''$.

We have the following equality

$r_{u'}(\hat{R}_i'' - \hat{P}_0) = \hat{R}_i''$.

in the group $H^1(g_{u''}; T_l)$.

Let $\hat{R}_i' = \hat{R}_i'' - \hat{P}_0$. Since $F(\hat{R}_i') \subset F_l(\frac{1}{l} \hat{Q})$ there is a unique prime $u'$ in $F(\hat{R}_i')$ below $u'$ and above $v$. Of course $r_{u'}(\hat{R}_i') = \hat{R}_i''$. Consider the following commutative diagram.
Let $Fr_{w'} \in G(K_i/F)$ be an element of the conjugacy class of the Frobenius element of $w'$ over $v$. Observe that

$$Fr_{w'}(\hat{R}_i') = \hat{R}_i' + \hat{P}_0'$$

for some $\hat{P}_0' \in A_l[l]$. Note that

$$Fr_{w'}(r_{w'}(\hat{R}_i')) = r_{w'}(\hat{R}_i')$$

because

$$r_{w'}(\hat{R}_i') = r_{w'}(\hat{R}_i') = \hat{R}_i'' \in H^1(g_v; T_l).$$

On the other hand

$$Fr_{w'}(r_{w'}(\hat{R}_i')) = r_{w'}(Fr_{w'}(\hat{R}_i')) = r_{w'}(\hat{R}_i' + \hat{P}_0') = r_{w'}(\hat{R}_i') + r_{w'}(\hat{P}_0').$$

Equations (5.17) and (5.18) show that $r_{w'}(\hat{P}_0') = 0$. This by Lemma 2.13 implies that $\hat{P}_0' = 0$. So $Fr_{w'} \in G(K_i/F(\hat{R}_i')) \cong H_{1,i} \rtimes G_i$. Hence $Fr_{w'} = (h_1, 0, \sigma_i)$ is conjugate to $Fr_{w'} = (0, h_2, \tau_i)$ for some $h_2 \in H_{2,i}$ and $\tau_i \in G_i$. Lemma 5.2 implies that no eigenvalue of $\sigma_i$ is equal to 1. This contradicts the properties of $\sigma_i$ (cf. Assumption II). So we proved that the equality (5.5), and consequently the equality (5.4), holds. Equality (5.4) shows that $\ker \phi_P = \ker \phi_Q$, which gives the following commutative diagram

$$0 \longrightarrow \ker(\phi_Q) \longrightarrow G(\bar{F}/F_i) \overset{\phi_Q}{\longrightarrow} A[l] \longrightarrow 0$$

(5.19)

with $\psi$ a $G_l$-equivariant map. Hence due to Assumption II (1) (v) and (2) (ii) (observe that (2) (ii) implies that the centralizer of $G_i$ in the group $GL_d(\mathbb{F}_l)$ is
contained in the group of diagonal matrices $D_d \subset GL_d(F_l)$, it is clear, that $\psi$ as a linear operator is represented by a block matrix of the form

$$
\begin{pmatrix}
  b_1 I_h & 0 & \ldots & 0 \\
  0 & b_2 I_h & \ldots & 0 \\
  \vdots & \vdots & \ddots & \vdots \\
  0 & 0 & \ldots & b_e I_h
\end{pmatrix}
$$

for some $b_1, b_2, \ldots, b_e \in \mathbb{Z}/l$. Since $O_E/(l) \cong \prod_{j=1}^e \mathbb{Z}/l$, there is a $b \in O_E$ such that $b$ modulo the ideal $(lO_E)$ corresponds to the element $(b_1, \ldots, b_e) \in \prod_{j=1}^e \mathbb{Z}/l$ via this isomorphism. So diagram (5.19) implies that $\phi_P = b \phi_Q$, hence $\phi_P - bQ$ is a trivial map. On the other hand the natural map

$$
\theta: B(F)/lB(F) \to H^1(G_F; T_l/l) = \text{Hom}(G_F; A_l[1]/l)
$$

(where $\phi_X$ is the map from Def. 4.1) is an injection since it can be expressed as a composition of the injective map from Proposition 4.3 (3) and the bottom horizontal, injective maps from diagrams: (4.5), (4.6) and (4.7). Hence $P = bQ$ in $B(F)/lB(F)$. So the image of $P$ in

$$
B_0 = B(F)/\{cQ : c \in O_E\}
$$

is contained in the group $lB_0$ for all primes $l \in \mathcal{P}^*$. Since by our assumption $B(F)$ and therefore $B_0$ are finitely generated, we conclude that $\bigcap_{l \in \mathcal{P}^*} lB_0$ is finite. Hence $aP = bQ$ for some $a \in \mathbb{Z} - \{0\}$ and $b \in O_E$. For $f = -b$ we obtain $aP + fQ = 0$. □

6. Applications.

In this section we give applications of Theorem 5.1 to the $l$-adic representations which were already discussed in Examples 3.3 - 3.7.

**The cyclotomic character.**

Consider the cyclotomic character

$$
\rho_l : G(\bar{F}/F) \to GL(Z_l(1)) \cong GL_1(Z_l) \cong \mathbb{Z}_l^\times,
$$

(see Example 3.3). There is a commutative diagram.

$$
\begin{array}{ccc}
O_{F,S}^\times & \longrightarrow & \prod_{v \not\in S_i} (k_v)^\times_l \\
\downarrow & & \downarrow \\
H^1_{f,S_i}(G_F; \mathbb{Z}_l(1)) & \longrightarrow & \prod_{v \not\in S_i} H^1(g_v; \mathbb{Z}_l(1))
\end{array}
$$

(6.1)

where the left vertical arrow factors as:

$$
O_{F,S}^\times \rightarrow O_{F,S}^\times \otimes \mathbb{Z}_l \rightarrow H^1_{f,S_i}(G_F; \mathbb{Z}_l(1)).
$$

This map has finite kernel with order prime to $l$. Diagram (6.1) and Theorem 5.1 applied to $\rho_l$ imply the following corollary.
Corollary 6.2. Let $P, Q$ be two nontorsion elements of the group $\mathcal{O}_{F,S}^\times$. Assume that for almost every $v$ and every integer $m$ the following condition holds

$$mr_v(P) = 0 \text{ in } (k_v)^\times \text{ implies } mr_v(Q) = 0 \text{ in } (k_v)^\times.$$ 

Then there exist $a, f \in \mathbb{Z} - \{0\}$ such that $P^a = Q^f$ in $\mathcal{O}_{F,S}^\times$.

**K-theory of number fields.**

Let $n$ be a positive integer. Consider the one dimensional representation

$$\rho_l : G_F \rightarrow GL(\mathbb{Z}_l(n+1)) \cong \mathbb{Z}_l^\times$$

which is given by the $(n+1)$-th tensor power of the cyclotomic character. We use the notation of Example 3.4. We have the following commutative diagram.

$$
\begin{array}{cccc}
K_{2n+1}(F)/C_F & \longrightarrow & \prod_{v \notin S_l} K_{2n+1}(k_v)_l \\
\downarrow \psi_{f,i} & & \downarrow \\
H^1(G_F; \mathbb{Z}_l(n+1)) & \longrightarrow & \prod_{v \notin S_l} H^1(g_v; \mathbb{Z}_l(n+1))
\end{array}
$$

(6.3)

Note that in this case

$$H^1(G_F; \mathbb{Z}_l(n+1)) \cong H^1(G_{F,S_l}; \mathbb{Z}_l(n+1)) \cong H^1_{f,S_l}(G_F; \mathbb{Z}_l(n+1))$$

and

$$K_{2n+1}(k_v)_l \cong H^1(g_v; \mathbb{Z}_l(n+1)) \cong H^0(g_v; \mathbb{Q}_l/\mathbb{Z}_l(n+1)).$$

It follows by the definition of $B(L)$ that

$$\psi_{L,i} : B(L) \otimes \mathbb{Z}_l \cong H^1(G_L; \mathbb{Z}_l(n+1)).$$

Hence as a consequence of Theorem 5.1 we get the following corollary (cf. [BGK]):

**Corollary 6.4.** Let $P, Q$ be two nontorsion elements of the group $K_{2n+1}(F)$. Assume that for almost every $v$ and every integer $m$ the following condition holds

$$mr_v(P) = 0 \text{ in } K_{2n+1}(k_v) \text{ implies } mr_v(Q) = 0 \text{ in } K_{2n+1}(k_v).$$

Then the elements $P$ and $Q$ of $K_{2n+1}(F)$ are linearly dependent over $\mathbb{Z}$.

Theorem 5.1 and Corollary 6.4 have the following consequence for the reduction maps

$$r'_v : H_{2n+1}(K(\mathcal{O}_F); \mathbb{Z}) \rightarrow H_{2n+1}(SL(k_v); \mathbb{Z})$$

defined on the integral homology of the K-theory spectrum $K(\mathcal{O}_F)$. 
**Corollary 6.5.** Let $P', Q'$ be two nontorsion elements of the group $H_{2n+1}(K(O_F); \mathbb{Z})$. Assume that for almost every prime ideal $v$ and for every integer $m$ the following condition holds in $H_{2n+1}(SL(k_v); \mathbb{Z})$:

$$mr'_v(P') = 0 \quad \text{implies} \quad mr'_v(Q') = 0.$$ 

Then the elements $P'$ and $Q'$ are linearly dependent in the group $H_{2n+1}(K(O_F); \mathbb{Z})$.

**Proof.** Consider the following commutative diagram.

$$
\begin{array}{ccc}
K_{2n+1}(O_F) & \longrightarrow & \prod_v K_{2n+1}(k_v) \\
\downarrow h_F & & \downarrow \prod_v h_v \\
H_{2n+1}(K(O_F); \mathbb{Z}) & \longrightarrow & \prod_v H_{2n+1}(SL(k_v); \mathbb{Z}).
\end{array}
$$

(6.6)

The horizontal maps in the diagram (6.6) are induced by the reductions at prime ideals of $O_F$. The vertical maps are the Hurewicz maps from $K$-theory to the integral homology of the special linear group. Since the rational Hurewicz map $h_F \otimes \mathbb{Q} : K_{2n+1}(O_F) \otimes \mathbb{Q} \to H_{2n+1}(K(O_F); \mathbb{Q})$ is an isomorphism cf. [Bo], we can find $c, d \in \mathbb{Z}$ and nontorsion elements $P, Q \in K_{2n+1}(O_F)$, such that

$$h_F(P) = cP' \quad \text{and} \quad h_F(Q) = dQ'.$$

Hence we can check that for every prime ideal $v$ the image of the reduction map $r'_v$ is contained in the torsion subgroup of $H_{2n+1}(SL(k_v); \mathbb{Z})$.

It follows by [A] that kernels of the Hurewicz maps $h_F$ and $h_v$, for any $v$, are finite groups of exponents which are divisible only by the number $\frac{n+1}{2}$. Let $P^*$ be the set of all prime numbers $l$ which are bigger than $\frac{n+1}{2}$ and relatively prime to $cd \sharp C_F$. Let $l \in P^*$. Consider the following diagram obtained from (6.6).

$$
\begin{array}{ccc}
K_{2n+1}(O_F) \otimes \mathbb{Z}_l & \longrightarrow & \prod_v K_{2n+1}(k_v)_l \\
\downarrow h_F & & \downarrow \prod_v h_v \\
H_{2n+1}(K(O_F); \mathbb{Z}) \otimes \mathbb{Z}_l & \longrightarrow & \prod_v H_{2n+1}(SL(k_v); \mathbb{Z})_l.
\end{array}
$$

(6.8)

To simplify notation we keep denoting the Hurewicz maps and the reduction maps in (6.8) by the same symbols as in the diagram (6.6). Let $\hat{P}$ ($\hat{Q}$ resp.) denote as before the image of $P$ ($Q$ resp.) via the map

$$K_{2n+1}(O_F) \to (K_{2n+1}(O_F)/C_F) \otimes_\mathbb{Z} \mathbb{Z}_l \cong H^1(G_F; \mathbb{Z}_l(n + 1)).$$
Let $S_l$ denote the finite set of primes of $\mathcal{O}_F$ which are over $l$. Let $v \not\in S_l$ and assume that $mr_v(\hat{P}) = 0$ in the group $K_{2n+1}(k_v)_l \cong H^1(g_v; \mathbb{Z}_l(n+1))$. Since $r_v(P) = r_v(\hat{P})$, it follows by the diagram (6.8) that

$$0 = mh_v(r_v(P)) = mr'_v h_F(P) = cmr'_v(P')$$

in the group $H_{2n+1}(SL(k_v); \mathbb{Z})_l$. Since $c$ is relatively prime to $l$, the last equality implies that

$$mr'_v(P') = 0.$$ 

Since $r'_v(P') \in H_{2n+1}(SL(k_v); \mathbb{Z})_{tor}$, there is a natural number $m_0$ which is prime to $l$ and such that

$$m_0 mr'_v(P') = 0$$

in the group $H_{2n+1}(SL(k_v); \mathbb{Z})$. Hence, by assumption

$$m_0 mr'_v(Q') = 0$$

in the group $H_{2n+1}(SL(k_v); \mathbb{Z})$. Since $m_0$ is prime to $l$ we get

$$mr'_v(Q') = 0$$

in the group $H_{2n+1}(SL(k_v); \mathbb{Z})_l$. We multiply the last equality by $d$. The commutativity of diagram (6.8) gives then the following equality in the group $H_{2n+1}(SL(k_v); \mathbb{Z})_l$.

$$0 = mr'_v(dQ') = mr'_v(h_F(Q)) = h_v(mr_v(Q))$$

Since by the choice of $l$ the map $h_v$ in the diagram (6.8) is injective, for $v \not\in S_l$, from the last equality we obtain the following:

$$mr_v(\hat{Q}) = mr_v(Q) = 0.$$ 

Thus we have checked that the elements $\hat{P}$ and $\hat{Q}$ satisfy the assumption of Theorem 5.1. Hence by Theorem 5.1, there are $a, b \in \mathbb{Z}$ such that

$$(6.9) \quad aP = bQ.$$ 

in the group $K_{2n+1}(\mathcal{O}_F)$. Applying $h_F$ to equality (6.9) and using (6.7) we get

$$acP' = bdQ'. \quad \square$$
Abelian varieties.

Let $A/F$ be a simple abelian variety of dimension $g$ defined over the number field $F$. As usual $T_l = T_l(A)$ denotes the Tate module of $A$. Consider the $l$-adic representation

$$\rho_l : G_F \rightarrow GL(T_l(A)).$$

We follow the notation introduced in Examples 3.5 - 3.7. For any abelian variety $A/F$ there is the following commutative diagram

$$\begin{array}{cccc}
A(F) & \longrightarrow & \prod_{v \not\in S_l} A_v(k_v) & \\
\phi_{L,l} & & & \\
H^1_{f,S_l}(G_F; T_l(A)) & \longrightarrow & \prod_v H^1(g_v; T_l(A)).
\end{array}$$

(6.10)

$A_v$ denotes the reduction of $A$ mod $v$. Observe that the right vertical arrow is an injection. Theorem 5.1, Examples 3.5, 3.6 and 3.7, and the diagram (6.10) imply the following corollary.

**Corollary 6.11.**

Let $A$ be an abelian variety of dimension $g \geq 1$, defined over the number field $F$ and such that $A$ satisfies one of the following conditions:

1. $A$ has the nondegenerate CM type with $End_F(A) \otimes \mathbb{Q}$ equal to a CM field $E$ such that $E^H \subset F$ (cf. example 3.5)

2. $A$ is a simple, principally polarized with real multiplication by a totally real field $E = End_F(A) \otimes \mathbb{Q}$ such that $E^H \subset F$, and the field $F$ is sufficiently large\(^1\). We also assume that $\dim A = eh$, where $e = [E : \mathbb{Q}]$ and $h$ is odd (cf. example 3.6) or $A$ is simple, principally polarized such that $End_F(A) = \mathbb{Z}$ and $\dim A$ is equal to 2 or 6 (cf. example 3.7 (b)).

Let $P, Q$ be two nontorsion elements of the group $A(F)$. Assume that for almost every prime $v$ of $\mathcal{O}_F$ and for every integer $m$ the following condition holds in $A_v(k_v)$

$$mr_v(P) = 0 \quad \text{implies} \quad mr_v(Q) = 0.$$

Then there exist $a \in \mathbb{Z} - \{0\}$ and $f \in \mathcal{O}_E - \{0\}$ such that $aP + fQ = 0$ in $A(F)$.
