On the Riemann-Hilbert Problem IV

Vladimir Ryazanov

Abstract - It is proved the existence of solutions for the Riemann-Hilbert problem in the fairly general settings of arbitrary Jordan domains, measurable coefficients and measurable boundary data. The theorem is formulated in terms of harmonic measure and principal asymptotic values. It is also given the corresponding reinforced criterion for domains with arbitrary rectifiable boundaries stated in terms of the natural parameter and nontangential limits. Furthermore, it is shown that the dimension of the spaces of solutions is infinite.

Key words and phrases : Riemann-Hilbert problem, Jordan domains, harmonic measure, principal asymptotic values, nontangential limits.

Mathematics Subject Classification (2010) : primary 31A05, 31A20, 31A25, 31B25, 35Q15; secondary 30E25, 31C05, 34M50, 35F45.

1 Introduction

Boundary value problems for analytic functions are due to the well-known Riemann dissertation (1851) contained a general setting of a problem on finding analytic functions with a connection between its real and imaginary parts on the boundary. However, it has contained no concrete boundary value problems.

The first concrete problem of such a type has been proposed by Hilbert (1904) and called by the Hilbert problem or the Riemann-Hilbert problem. That consists in finding an analytic function \( f \) in a domain bounded by a rectifiable Jordan curve \( C \) with the linear boundary condition

\[
\lim_{z \to \zeta} \text{Re} \left\{ \lambda(\zeta) \cdot f(z) \right\} = \varphi(\zeta) \quad \forall \zeta \in C
\]

(1)

where it was assumed by him that the functions \( \lambda \) and \( \varphi \) are continuously differentiable with respect to the natural parameter \( s \) on \( C \) and, moreover, \( |\lambda| \neq 0 \) everywhere on \( C \). Hence without loss of generality one can assume that \( |\lambda| \equiv 1 \) on \( C \).

The first way for solving this problem based on the theory of singular integral equations was given by Hilbert (1904), see [7]. This attempt was
not quite successful because of the theory of singular integral equations has
been not yet enough developed at that time. However, just that way became
the main approach in this research direction with important contributions of
Georgian and Russian mathematicians and mechanicians, see e.g. [3], [12]
and [19]. In particular, the existence of solutions to this problem was in
that way proved for Hölder continuous $\lambda$ and $\varphi$. But subsequent weakening
conditions on $\lambda$ and $\varphi$ led to strengthening conditions on the contour $C$, say
to the Lyapunov curves or the Radon condition of bounded rotation or even
to smooth curves.

However, Hilbert (1905) has proposed the second way for solving his
problem in setting to (1) above based on the reduction it to solving the
corresponding two Dirichlet problems, see e.g. [8]. The goal of this paper
is to show that this approach is more simple and leads to perfectly general
results. That requests to apply some fundamental concepts and facts related
to the Dirichlet problem.

2 The case of the unit circle

The following brilliant result of Frederick Gehring is key for our goals, see
[5].

Proposition 2.1 Let $\varphi(\vartheta)$ be real, measurable, almost everywhere finite and
have the period $2\pi$. Then there exists a function $u(z)$, harmonic in $|z| < 1$,
such that $u(z) \to \varphi(\vartheta)$ for a.e. $\vartheta$ as $z \to e^{i\vartheta}$ along any nontangential path.

Since the Gehring proof is very short and nice and has a common interest,
we give it for completeness here.

Proof. By a theorem of Lusin, see e.g. Theorem VII(2.3) in [18], p. 217,
we can find a continuous function $\Phi(\vartheta)$ such that $\Phi'(\vartheta) = \varphi(\vartheta)$ for a.e. $\vartheta$.
Let
$$U(re^{i\vartheta}) = \frac{1}{2\pi} \int_{0}^{2\pi} \frac{1 - r^2}{1 - 2r \cos(\vartheta - t) + r^2} \Phi(t) \, dt$$
for $r < 1$. Next, by the well-known result due to Fatou, see e.g. 3.441 in [20],
p. 53, $\frac{\partial}{\partial \vartheta} U(z) \to \Phi'(\vartheta)$ as $z \to e^{i\vartheta}$ along any nontangential path whenever
$\Phi'(\vartheta)$ exists. Thus, the conclusion follows for the function $u(z) = \frac{\partial}{\partial \vartheta} U(z)$.

Remark 2.1 Recall also the preceding result of W. Kaplan on the existence
of a harmonic function $u(z)$ with the radial limits $\varphi(\vartheta)$ a.e., see [9].
It is known that every harmonic function \( u(z) \) in \( D = \{ z \in \mathbb{C} : |z| < 1 \} \) has a conjugate function \( v(z) \) such that \( f(z) = u(z) + iv(z) \) is an analytic function in \( \mathbb{D} \). Hence we have the following consequence of Proposition 2.1.

**Corollary 2.1** Under the conditions of Proposition 2.1, there exists an analytic function \( f \) in \( D \) such that \( \text{Re } f(z) \to \varphi(\vartheta) \) for a.e. \( \vartheta \) as \( z \to e^{i\vartheta} \) along any nontangential path.

Note that the boundary values of the conjugate function \( v \) cannot be prescribed arbitrarily and simultaneously with the boundary values of \( u \) because \( v \) is uniquely determined by \( u \) up to an additive constant.

Denote by \( h^p, p \in (0, \infty) \), the class of all harmonic functions \( u \) in \( D \) with

\[
\sup_{r \in (0,1)} \left\{ \int_0^{2\pi} |u(re^{i\vartheta})|^p \, d\vartheta \right\}^{\frac{1}{p}} < \infty.
\]

It is clear that \( h^p \subseteq h^{p'} \) for all \( p > p' \) and, in particular, \( h^p \subseteq h^1 \) for all \( p > 1 \). It is important that every function in the class \( h^1 \) has a.e. nontangential boundary limits, see e.g. Corollary IX.2.2 in [6].

Note also that \( v \in h^p \) whenever \( u \in h^p \) for all \( p > 1 \) by the M. Riesz theorem, see [16]. Generally speaking, this fact is not trivial but it follows immediately for \( p = 2 \) from the Parseval equality. The latter will be sufficient for our goals.

**Theorem 2.1** Let \( \lambda : \partial \mathbb{D} \to \mathbb{C}, |\lambda(\zeta)| \equiv 1 \), and \( \varphi : \partial \mathbb{D} \to \mathbb{R} \) be measurable functions. Then there exist analytic functions \( f : \mathbb{D} \to \mathbb{C} \) such that along any nontangential path

\[
\lim_{z \to \zeta} \text{Re } \{\lambda(\zeta) \cdot f(z)\} = \varphi(\zeta) \quad \text{for a.e. } \zeta \in \partial \mathbb{D}. \tag{2}
\]

**Proof.** First, consider the function \( \alpha(\zeta) = \text{arg } \lambda(\zeta) \) where \( \text{arg } \omega \) is the principal value of the argument of \( \omega \in \mathbb{C} \) with \( |\omega| = 1 \), i.e., the unique number \( \alpha \in (-\pi, \pi] \) such that \( \omega = e^{i\alpha} \). Note that the function \( \text{arg } \omega \) is continuous on \( \partial \mathbb{D} \setminus \{-1\} \) and the sets \( \lambda^{-1}(\partial \mathbb{D} \setminus \{-1\}) \) and \( \lambda^{-1}(-1) \) are measurable because the function \( \lambda(\zeta) \) is measurable. Thus, the function \( \alpha(\zeta) \) is measurable on \( \partial \mathbb{D} \). Furthermore, \( \alpha \in L^\infty(\partial \mathbb{D}) \) because \( |\alpha(\zeta)| \leq \pi \) for all \( \zeta \in \partial \mathbb{D} \). Hence

\[
g(z) = \frac{1}{2\pi i} \int_{\partial \mathbb{D}} \alpha(\zeta) \frac{z + \zeta}{z - \zeta} \, d\zeta, \quad z \in \mathbb{D}, \tag{3}
\]
is an analytic function in $D$ with $u(z) = \Re g(z) \to \alpha(\zeta)$ as $z \to \zeta$ along any nontangential path in $D$ for a.e. $\zeta \in \partial D$, see, e.g., Corollary IX.1.1 in [6] and Theorem I.E.1 in [10]. Denote $A(z) = \exp\{ig(z)\}$ that is an analytic function.

Since $\alpha \in L^\infty(\partial D)$, we have that $u \in h^p$ for all $p \geq 1$, see, e.g., Theorem IX.2.3 in [6], and then $v = \Im g \in h^p$ for all $p \geq 1$ by the theorem of M. Riesz. Hence there exists a function $\beta : \partial D \to \mathbb{R}$, $\beta \in L^p$, for all $p \geq 1$ such that $v(z) \to \beta(\zeta)$ as $z \to \zeta$ for a.e. $\zeta \in \partial D$ along any nontangential path, see e.g. Theorem IX.2.3 and Corollary IX.2.2 in [6]. Thus, by Corollary 2.1 there exists an analytic function $B : D \to \mathbb{C}$ such that $\Re B(z) = B(\zeta) : = \varphi(\zeta) \cdot \exp\{\beta(\zeta)\}$ as $z \to \zeta$ along any nontangential path for a.e. $\zeta \in \partial D$. Finally, elementary calculations show that one of the desired analytic functions in (2) is $f = A \cdot B$. □

**Remark 2.2** As it follows from the formula (3), the first analytic function $A$ in the proof is calculated in the explicit form. The function $\beta : \partial D \to \mathbb{R}$ in the proof can also explicitly be calculated by the following formula, see, e.g., Theorem I.E.4.1 in [10], for a.e. $\zeta \in \partial D$

$$\beta(\zeta) = \lim_{\varepsilon \to +0} \frac{1}{\pi} \int_{\varepsilon}^{\pi} \frac{\alpha(\zeta e^{-it}) - \alpha(\zeta e^{it})}{2 \tan \frac{t}{2}} \, dt . \quad (4)$$

The second analytic function $B$ in the proof is equal to $\frac{\partial}{\partial \vartheta} G(z)$, $z = re^{i\vartheta}$, with

$$G(z) = \frac{1}{2\pi i} \int_{\partial D} \Phi(\zeta) \frac{z + \zeta}{z - \zeta} \frac{d\zeta}{\zeta}, \quad z \in D , \quad (5)$$

where $\Phi : \partial D \to \mathbb{R}$ is a continuous function such that $\frac{\partial}{\partial \vartheta} \Phi(\zeta) = B(\zeta)$, $\zeta = e^{i\vartheta}$, for a.e. $\vartheta \in [0,2\pi]$, see the nontrivial construction of Theorem VII(2.3) in [18].

### 3 The case of a rectifiable Jordan curve

**Theorem 3.1** Let $D$ be a Jordan domain in $\mathbb{C}$ with a rectifiable boundary and let $\lambda : \partial D \to \mathbb{C}$, $|\lambda(\zeta)| \equiv 1$ and $\varphi : \partial D \to \mathbb{R}$ be measurable functions with respect to the natural parameter on $\partial D$. Then there exist analytic functions $f : D \to \mathbb{C}$ such that along any nontangential path

$$\lim_{z \to \zeta} \Re \{\lambda(\zeta) \cdot f(z)\} = \varphi(\zeta) \quad \text{for a.e. } \zeta \in \partial D \quad (6)$$

with respect to the natural parameter on $\partial D$. 
Proof. This case is reduced to the case of the unit disk $\mathbb{D}$ in the following way. First, by the Riemann theorem, see e.g. Theorem II.2.1 in [6], there exists a conformal mapping $\omega$ of any Jordan domain $D$ onto $\mathbb{D}$. By the Caratheodory (1912) theorem $\omega$ can be extended to a homeomorphisms of $\overline{D}$ onto $\overline{\mathbb{D}}$ and, if $\partial D$ is rectifiable, then by the theorem of F. and M. Riesz (1916) length $\omega^{-1}(E) = 0$ whenever $E \subset \partial \mathbb{D}$ with $|E| = 0$, see e.g. Theorem II.C.1 and Theorems II.D.2 in [10]. Conversely, by the Lavrentiev (1936) theorem $|\omega(E)| = 0$ whenever $E \subset \partial D$ and length $E = 0$, see [11], see also the point III.1.5 in [15].

Hence $\omega$ and $\omega^{-1}$ transform measurable sets into measurable sets. Indeed, every measurable set is the union of a sigma-compact set and a set of measure zero, see e.g. Theorem III(6.6) in [18], and continuous mappings transform compact sets into compact sets. Thus, a function $\varphi : \partial D \to \mathbb{R}$ is measurable with respect to the natural parameter on $\partial D$ if and only if the function $\Phi = \varphi \circ \omega^{-1} : \partial \mathbb{D} \to \mathbb{R}$ is measurable with respect to the linear measure on $\partial \mathbb{D}$.

By the Lindelöf (1917) theorem, see e.g. Theorem II.C.2 in [10], if $\partial D$ has a tangent at a point $\zeta$, then $\arg [\omega(\zeta) - \omega(z)] - \arg [\zeta - z] \to \text{const}$ as $z \to \zeta$. In other words, the conformal images of sectors in $D$ with a vertex at $\zeta$ is asymptotically the same as sectors in $\mathbb{D}$ with a vertex at $w = \omega(\zeta)$. Thus, nontangential paths in $D$ are transformed under $\omega$ into nontangential paths in $\mathbb{D}$. Finally, a rectifiable Jordan curve has a tangent a.e. with respect to the natural parameter and, thus, Theorem 3.1 follows from Theorem 2.1. □

In particular, choosing $\lambda \equiv 1$ in (6), we obtain the following statement.

**Proposition 3.1** Let $D$ be a domain in $\mathbb{C}$ bounded by a rectifiable Jordan curve and $\varphi : \partial D \to \mathbb{R}$ be measurable. Then there exists an analytic function $f : D \to \mathbb{C}$ such that

$$
\lim_{z \to \zeta} \Re f(z) = \varphi(\zeta) \quad \text{for a.e. } \zeta \in \partial D
$$

(7)

with respect to the natural parameter on $\partial D$ along any nontangential path.

**Corollary 3.1** Under the conditions of Proposition 3.1, there exists a harmonic function $u$ in $D$ such that $u(z) \to \varphi(\zeta)$ for a.e. $\zeta \in \partial D$ as $z \to \zeta$ along any nontangential path.
4 The case of an arbitrary Jordan curve

The conceptions of a harmonic measure introduced by R. Nevanlinna in [13] and a principal asymptotic value based on one nice result of F. Bagemihl [1] make possible with a great simplicity and generality to formulate the existence theorems for the Dirichlet and Riemann-Hilbert problems.

First of all, given a measurable set \( E \subseteq \partial \mathbb{D} \) and a point \( z \in \mathbb{D} \), a harmonic measure of \( E \) at \( z \) relative to \( \mathbb{D} \) is the value at \( z \) of the harmonic function \( u \) in \( \mathbb{D} \) with the boundary values 1 a.e. on \( E \) and 0 a.e on \( \partial \mathbb{D} \setminus E \), see Proposition 2.1. In particular, by the mean value theorem for harmonic functions, the harmonic measure of \( E \) at 0 relative to \( \mathbb{D} \) is equal to \( |E|/2\pi \). In general, the geometric sense of the harmonic measure of \( E \) at \( z_0 \) relative to \( \mathbb{D} \) is the angular measure of view of \( E \) from the point \( z_0 \) in radians divided by \( 2\pi \).

Since the harmonic measure zero is invariant under conformal mappings between Jordan domains, given a Jordan domain \( D \), a set \( E \subseteq \partial D \) will be called measurable with respect to harmonic measures in \( D \) if \( E = \omega(E) \) is measurable with respect to the linear measure on \( \partial \mathbb{D} \) where \( \omega \) is a conformal mapping of \( D \) onto the unit disk \( \mathbb{D} \), cf. the proof of Theorem 3.1. Correspondingly, the harmonic measure of \( E \subseteq \partial D \) at \( z_0 \in D \) relative to \( D \) is the harmonic measure of \( \omega_0(E) \) at 0 relative to \( \mathbb{D} \) where \( \omega_0 \) is a conformal mapping of \( D \) onto \( \mathbb{D} \) with the normalization \( \omega_0(z_0) = 0 \), i.e., the quantity \( |\omega_0(E)|/2\pi \).

Next, a Jordan curve generally speaking has no tangents. Hence we need a replacement for the notion of a nontangential limit. In this connection, recall Theorem 2 in [1], see also Theorem III.1.8 in [14], stating that, for any function \( \Omega : \mathbb{D} \to \mathbb{C} \), for all pairs of arcs \( \gamma_1 \) and \( \gamma_2 \) in \( \mathbb{D} \) terminating at \( \zeta \in \partial \mathbb{D} \), except a countable set of \( \zeta \in \partial \mathbb{D} \),

\[
C(\Omega, \gamma_1) \cap C(\Omega, \gamma_2) \neq \emptyset
\]

where \( C(\Omega, \gamma) \) denotes the cluster set of \( \Omega \) at \( \zeta \) along \( \gamma \), i.e.,

\[
C(\Omega, \gamma) = \{ w \in \mathbb{C} : \Omega(z_n) \to w, \ z_n \to \zeta, \ z_n \in \gamma \}
\]
Immediately by the theorems of Riemann and Caratheodory, this result is extended to an arbitrary Jordan domain $D$ in $\mathbb{C}$. Given a function $\Omega : D \to \mathbb{C}$ and $\zeta \in \partial D$, denote by $P(\Omega, \zeta)$ the intersection of all cluster sets $C(\Omega, \gamma)$ for arcs $\gamma$ in $D$ terminating at $\zeta$. Later on, we call the points of the set $P(\Omega, \zeta)$ \textit{principal asymptotic values} of $\Omega$ at $\zeta$. Note that, if $\Omega$ has a limit along at least one arc in $D$ terminating at a point $\zeta \in \partial D$ with the property \([8]\), then the principal asymptotic value is unique.

Thus, by the Bagemihl theorem, we obtain the following result directly from Theorem 2.1.

\textbf{Theorem 4.1} Let $D$ be a Jordan domain in $\mathbb{C}$ and let $\lambda : \partial D \to \mathbb{C}$, $|\lambda(\zeta)| \equiv 1$, and $\varphi : \partial D \to \mathbb{R}$ be measurable functions with respect to harmonic measures in $D$. Then there exist analytic functions $f : D \to \mathbb{C}$ such that
\[
\lim_{z \to \zeta} \text{Re} \{\lambda(\zeta) \cdot f(z)\} = \varphi(\zeta) \quad \text{for a.e. } \zeta \in \partial D \quad (9)
\]
with respect to harmonic measures in $D$ in the sense of the unique principal asymptotic value.

In particular, choosing $\lambda \equiv 1$ in (9), we obtain the following consequence.

\textbf{Proposition 4.1} Let $D$ be a Jordan domain and $\varphi : \partial D \to \mathbb{R}$ be measurable with respect to harmonic measures in $D$. Then there exists an analytic function $f : D \to \mathbb{C}$ such that
\[
\lim_{z \to \zeta} \text{Re} \ f(z) = \varphi(\zeta) \quad \text{for a.e. } \zeta \in \partial D \quad (10)
\]
with respect to harmonic measures in $D$ in the sense of the unique principal asymptotic value.

\textbf{Corollary 4.1} Under the conditions of Proposition 4.1, there exists a harmonic function $u$ in $D$ such that in the same sense
\[
\lim_{z \to \zeta} u(z) = \varphi(\zeta) \quad \text{for a.e. } \zeta \in \partial D \quad . \quad (11)
\]

\textbf{Remark 4.1} In view of the theorems of Riemann and Caratheodory, this approach makes possible also to formulate the corresponding theorems for arbitrary simply connected domains $D$ in $\mathbb{C}$ having at least 2 boundary points. The only difference is that the functions $\lambda$ and $\varphi$ should be given as functions of prime ends of $D$ but not of points of $\partial D$ and harmonic measures of sets of prime ends are given through the natural one-to-one correspondence between the prime ends of $D$ and the boundary points of $\mathbb{D}$ under Riemann mappings $\omega : D \to \mathbb{D}$, see e.g. \([2]\).
5 On the dimension of spaces of solutions

By the Lindelöf maximum principle, see e.g. Lemma 1.1 in [4], it follows the uniqueness theorem for the Dirichlet problem in the class of bounded harmonic functions on the unit disk \( \mathbb{D} = \{ z \in \mathbb{C} : |z| < 1 \} \). In general there is no uniqueness theorem in the Dirichlet problem for the Laplace equation.

Furthermore, it was proved in [17] that the space of all harmonic functions in \( \mathbb{D} \) with nontangential limit 0 at a.e. point of \( \partial \mathbb{D} \) has the infinite dimension. Thanking to it, the statements on the infinite dimension of the space of solutions can be extended to the Riemann-Hilbert problem because above we have reduced the latter to the corresponding two Dirichlet problems.

**Theorem 5.1** Let \( \lambda : \partial \mathbb{D} \to \mathbb{C}, \ |\lambda(\zeta)| \equiv 1 \), and \( \varphi : \partial \mathbb{D} \to \mathbb{R} \) be measurable functions. Then the space of all analytic functions \( f : \mathbb{D} \to \mathbb{C} \) such that along any nontangential path
\[
\lim_{z \to \zeta} \text{Re} \{ \lambda(\zeta) \cdot f(z) \} = \varphi(\zeta) \quad \text{for a.e. } \zeta \in \partial \mathbb{D}
\] (12)
has the infinite dimension.

**Proof.** Let \( u : \mathbb{D} \to \mathbb{R} \) be a harmonic function with nontangential limit 0 at a.e. point of \( \partial \mathbb{D} \) from Theorem 1 in [17]. Then there is the unique harmonic function \( v : \mathbb{D} \to \mathbb{R} \) with \( v(0) = 0 \) such that \( \mathcal{C} = u + iv \) is an analytic function. Thus, setting in the proof of Theorem 2.1 \( g = \mathcal{A} (\mathcal{B} + \mathcal{C}) \), we obtain by Theorem 1 in [17] the space of solutions of the Riemann-Hilbert problem [13] for analytic functions of the infinite dimension. \( \square \)

Arguing as above we also obtain the corresponding statements in the Jordan domains.

**Theorem 5.2** Let \( D \) be a Jordan domain in \( \mathbb{C} \) with a rectifiable boundary and let \( \lambda : \partial D \to \mathbb{C}, \ |\lambda(\zeta)| \equiv 1 \), and \( \varphi : \partial D \to \mathbb{R} \) be measurable functions with respect to the natural parameter on \( \partial D \). Then the space of all analytic functions \( f : \mathbb{D} \to \mathbb{C} \) such that along any nontangential path
\[
\lim_{z \to \zeta} \text{Re} \{ \lambda(\zeta) \cdot f(z) \} = \varphi(\zeta) \quad \text{for a.e. } \zeta \in \partial D
\] (13)
with respect to the natural parameter on \( \partial D \) has the infinite dimension.
Theorem 5.3 Let $D$ be a Jordan domain in $\mathbb{C}$ and let $\lambda : \partial D \to \mathbb{C}$, $|\lambda(\zeta)| \equiv 1$, and $\varphi : \partial D \to \mathbb{R}$ be measurable functions with respect to harmonic measures in $D$. Then the space of all analytic functions $f : \mathbb{D} \to \mathbb{C}$ such that
\[
\lim_{z \to \zeta} \Re \{\lambda(\zeta) \cdot f(z)\} = \varphi(\zeta) \quad \text{for a.e. } \zeta \in \partial D
\]
with respect to harmonic measures in $D$ in the sense of the unique principal asymptotic value has the infinite dimension.
