INNER UNIFORM DOMAINS AND THE APOLLONIAN INNER METRIC

YAXIANG LI AND XIANTAO WANG

Abstract. In this paper, we characterize inner uniform domains in \( \mathbb{R}^n \) in terms of Apollonian inner metric and the metric \( j_D' \) when \( D \) are Apollonian. As an application, a new characterization for \( A \)-uniform domains is obtained.

1. Introduction and main results

Throughout the paper, we assume that \( D \) is a proper subdomain of the Euclidean \( n \)-space \( \mathbb{R}^n \), \( n \geq 2 \), \( [x, y] \) denotes the closed segment between \( x \) and \( y \), and \( B^n(x, r) \) stands for the open ball centered at \( x \) with radius \( r > 0 \), i.e., \( B^n(x, r) = \{ y \in \mathbb{R}^n : |y - x| < r \} \). In particular, we use \( \mathbb{B}^n \) to denote the unit ball \( B^n(0, 1) \). For \( x, y \in D \), the Apollonian distance is defined by

\[
\alpha_D(x, y) = \sup_{a, b \in \partial D} \left\{ \log \frac{|a - x||b - y|}{|a - y||b - x|} \right\},
\]

where \( \partial D \) means the boundary of \( D \). If one of \( a, b \) equals to \( \infty \), we understand that \( |\infty - x| = |\infty - y| = 1 \). We note that this metric is invariant under Möbius transformations and equals the hyperbolic distance in balls and half spaces (cf. [2]). It is in fact a metric if and only if the complement of \( D \) is not contained in a hyperplane as was noted in [2, Theorem 1.1] (see also [9]). In this paper, these domains are called to be Apollonian. This metric was introduced in [2] and considered in [1, 5, 8, 9, 10, 11, 12, 19, 20].

Let \( \gamma : [0, 1] \to D \) be a path, i.e., a continuous function. If \( d \) is a metric in \( D \), then the \( d \)-length of \( \gamma \) is defined by

\[
d(\gamma) = \sup \left\{ \sum_{i=0}^{k-1} d(\gamma(t_i), \gamma(t_{i+1})) \right\},
\]

where the supremum is taken over all \( k < \infty \) and all sequences \( \{t_i\} \) satisfying \( 0 = t_0 < t_1 < \cdots < t_k = 1 \). All the paths in this paper are assumed to be rectifiable, that is, they have the finite Euclidean arc length. The inner metric of \( d \) is defined by the formula

\[
\tilde{d}(x, y) = \inf_{\gamma} \{d(\gamma)\},
\]

where the infimum is taken over all paths connecting $x$ and $y$ in $D$. Particularly, we use $\tilde{\alpha}_D$ to denote the inner metric of the Apollonian metric $\alpha_D$ and call it the Apollonian inner metric. Also we use $\lambda_D(x, y)$ to denote $\tilde{d}(x, y)$ when $d(\gamma)$ is the Euclidean arc length.

In [8, theorem 1.2], Hästö proved that $\tilde{\alpha}_D$ is a metric if and only if the complement of $D$ is not contained in an $(n - 2)$-dimensional hyperplane in $\mathbb{R}^n$. Further, in [8], Hästö showed

**Theorem A.** ([8, Theorem 1.5]) Let $D$ be Apollonian. Then for $x, y \in D$, there exists a path $\gamma$ in $D$ connecting $x$ and $y$ such that

$$\alpha_D(\gamma) = \tilde{\alpha}_D(x, y).$$

And further, in [13], the authors got the following.

**Theorem B.** ([13, Lemma 2.4]) Let $x, y \in D$ and let $\gamma \subset D$ be a path such that $\tilde{\alpha}_D(x, y) = \alpha_D(\gamma)$. Then for each $z, w \in \gamma$, we have

$$\tilde{\alpha}_D(z, w) = \alpha_D(\gamma[z, w]),$$

where $\gamma[z, w]$ denotes the part of $\gamma$ between $z$ and $w$.

**Definition 1.** A domain $D$ is called inner $c$-uniform provided there exists a positive constant $c$ such that each pair of points $z_1, z_2$ in $D$ can be joined by a rectifiable arc $\gamma$ in $D$ satisfying (cf. [21])

1. $\min\{\ell(\gamma[z_1, z]), \ell(\gamma[z_2, z])\} \leq c d_D(z)$ for all $z \in \gamma$; and
2. $\ell(\gamma) \leq c \lambda_D(z_1, z_2)$.

where $d_D(z)$ denotes the distance from $z$ to the boundary $\partial D$ of $D$.

If $\lambda_D(z_1, z_2)$ is replaced by $|z_1 - z_2|$ in Definition 1, then $D$ is said to be $c$-uniform.

Obviously, uniformity implies inner uniformity.

**Definition 2.** A domain $D$ is called a $c$-John domain provided there exists a positive constant $c$ such that each pair of points $z_1, z_2$ in $D$ can be joined by a rectifiable arc $\gamma$ in $D$ satisfying (cf. [18])

$$\min\{\text{diam}(\gamma[z_1, w]), \text{diam}(\gamma[w, z_2])\} \leq c d_D(w).$$

In [21], Väisälä showed the following two theorems.

**Theorem C.** ([21, Theorem 3.3 and Theorem 3.4]) Suppose that $D \subset \mathbb{R}^n$ is an inner $c$-uniform domain. Then for $x, y \in D$, we have

$$\lambda_D(x, y) \leq \nu_1 \varrho_D(x, y),$$

where $\nu_1 \geq 6c$ is a constant depending on $c$ and $n$, and $\varrho_D(x, y)$ denotes the inner diameter metric, defined by

$$\varrho_D(x, y) = \inf_{\gamma} \{\text{diam}(\gamma)\}$$

over all arcs $\gamma$ joining $x$ and $y$ in $D$. 

Theorem D. ([21, Theorem 3.11]) For a domain $D \subset \mathbb{R}^n$, the following conditions are quantitatively equivalent:

1. $D$ is inner $c$-uniform.

2. Each pair of points $z_1, z_2 \in D$ can be joined by an arc $\gamma$ such that for $w \in \gamma$, $\min\{\text{diam}(\gamma[z_1, w]), \text{diam}(\gamma[z_2, w])\} \leq \nu_2 d_D(w)$ and $\text{diam}(\gamma) \leq \nu_2 \varrho_D(z_1, z_2)$, where the constants $c$ and $\nu_2$ depend on each other and $n$.

Let $D$ be a domain and $x, y \in D$. We write

$$j_D(x, y) = \log \left(1 + \frac{|x - y|}{\min\{d_D(x), d_D(y)\}}\right).$$

Kim [14] (see also [21]) introduced the following version of the $j$-metric:

$$j'_D(x, y) = \log \left(1 + \frac{\varrho_D(x, y)}{\min\{d_D(x), d_D(y)\}}\right),$$

and the quasihyperbolic metric [7] is defined by

$$k_D(x, y) = \inf_{\gamma} \int_{\gamma} \frac{|dz|}{d_D(z)},$$

where the infimum is taken over all paths $\gamma$ joining $x$ and $y$ in $D$.

We easily know from the proof of [23, Lemma 2.2] that for $x, y \in D$,

$$j_D(x, y) \leq j'_D(x, y) \leq k_D(x, y).$$

Further, we have

Theorem E. For $x, y \in D$, the following hold true.

1. ([2, Corollary 3.2]) $|\log \frac{d_D(x)}{d_D(y)}| \leq \alpha_D(x, y) \leq 2j_D(x, y)$;

2. ([9, Lemma 5.3]) $\tilde{j}_D(x, y) = k_D(x, y)$;

3. ([9, Corollary 5.4]) $\tilde{\alpha}_D(x, y) \leq 2k_D(x, y)$.

In [6], Gehring and Osgood got a characterization of uniform domains in terms of $k_D$ and $j_D$.

Theorem F. ([6, Corollary 1]) A domain $D$ is $\mu$-uniform if and only if there exists a constant $\mu_1$ such that

$$k_D(z_1, z_2) \leq \mu_1 j_D(z_1, z_2)$$

for all $z_1, z_2 \in D$, where the constants $\mu$ and $\mu_1$ depend only on each other.

As a matter of fact, the above inequality appeared in [6] in a form with an additive constant on the right hand side: it was shown by Vuorinen [25, 2.50] that the additive constant can be chosen to be 0. Moreover, in [13], the authors proved the following.

Theorem G. ([13, Theorem 1.2]) A domain $D \subset \mathbb{R}^n$ is $\mu$-uniform if and only if there exists a constant $\mu_2$ such that $\tilde{\alpha}_D(x, y) \leq \mu_2 j_D(x, y)$ for any $x, y \in D$, where the constants $\mu$ and $\mu_2$ depend only on each other.
See [3, 4, 6, 13, 15, 16, 17, 21, 22, 24] for more details on uniform domains and inner uniform domains.

By Theorem G, one may ask that if we can characterize inner uniform domains in terms of $\tilde{\alpha}_D$ and $j'_D$. The main aim of this paper is to consider this problem. Our result shows that the answer to this problem is affirmative. Combining with [15, Theorem 2.1] and Theorem D, we state our result in the following form.

**Theorem 1.** Let $D$ be a proper subdomain of $\mathbb{R}^n$. If $D$ is Apollonian, then the followings are quantitatively equivalent.

1. $D$ is an inner $c$-uniform domain;
2. There exists a constant $c_1$ such that $k_D(x, y) \leq c_1 j'_D(x, y)$ $\forall x, y \in D$;
3. There exists a constant $c_2$ such that $\tilde{\alpha}_D(x, y) \leq c_2 j'_D(x, y)$ $\forall x, y \in D$;
4. Each pair of points $x, y \in D$ can be joined by an arc $\gamma$ such that for $w \in \gamma$, $\min\{\text{diam}(\gamma[x, w]), \text{diam}(\gamma[y, w])\} \leq c_3 d_D(w)$ and $\text{diam}(\gamma) \leq c_3 \varphi_D(x, y)$, where $c, c_1, c_2$ and $c_3$ are constants greater than 1, and depend on each other and $n$.

In [9], Hästö proved the following result.

**Theorem H.** ([9, Proposition 6.6]) Let $D \subset \mathbb{R}^n$ be a domain. The following conditions are quantitatively equivalent:

1. $D$ is $A$-uniform with coefficient $K$, that is, there exist some constant $K$ such that for $x, y \in D$, $k_D(x, y) \leq K \alpha_D(x, y)$;
2. $D$ is $\mu$-uniform and has the comparison property with some constant $L$;
3. $D$ is $\mu_3$-quasi-isotropic and $\tilde{\alpha}_D \leq \mu_4 \alpha_D$,

where the constants $K, L, \mu, \mu_3$ and $\mu_4$ depend only on each other.

Here we say that a domain $D \subset \mathbb{R}^n$ has the comparison property if there exists a constant $L$ such that $j_D/L \leq \alpha_D \leq 2j_D$, and $D$ is $\mu_3$-quasi-isotropic if

$$\limsup_{r \to 0} \sup \frac{\sup \{\alpha_D(x, z) : |x - z| = r\}}{\inf \{\alpha_D(x, y) : |x - y| = r\}} \leq \mu_3$$

for every $x \in D$ (See [9]).

As an application of Theorem 1, we get a new characterization for $A$-uniform domains.

**Corollary 1.** Let $D \subset \mathbb{R}^n$ be an Apollonian domain. The following conditions are quantitatively equivalent:

1. $D$ is $A$-uniform with coefficient $K$;
2. $D$ is $c$-inner uniform and $j'_D(x, y) \leq \mu_5 \alpha_D(x, y)$ for all $x, y \in D$,

where the constants $c, K$ and $\mu_5$ depend on each other and $n$. 
In the next section, we will prove Theorem 1 and Corollary 1.

2. Proofs of Theorem 1 and Corollary 1

2.1. Proof of Theorem 1. The implication (1) $\Rightarrow$ (2) follows from [15, Theorem 2.1] and Theorem C, and Theorem E shows that (2) $\Rightarrow$ (3) is true. The implication (4) $\Rightarrow$ (1) follows from Theorem D. Hence to finish the proof of Theorem 1, it remains only one implication (3) $\Rightarrow$ (4) to be checked.

Suppose that the assertion (3) in the theorem holds. To prove the truth of the assertion of (4) in the theorem, we let $x, y \in D$. Without loss of generality, we assume that $d_D(x) < d_D(y)$. We consider the case where $|x - y| < d_D(x)$ and the case where $|x - y| \geq d_D(x)$, separately.

Case 1. $|x - y| < d_D(x)$.

Let $\gamma = [x, y]$ be the Euclidean line segment joining $x$ and $y$. Clearly, $\gamma \subset D$,

$$\text{diam}(\gamma) = |x - y| = \varrho_D(x, y)$$

and

$$\min\{\text{diam}(\gamma[x, w]), \text{diam}(\gamma[y, w])\} \leq d_D(w)$$

for $w \in \gamma$. Thus the assertion (4) in the theorem is true in this case.

Case 2. $|x - y| \geq d_D(x)$.

By Theorem A there exists a path $\gamma \subset D$ connecting $x$ and $y$ such that

$$\tilde{\alpha}_D(x, y) = \alpha_D(\gamma).$$

By compactness we see that there is a point $z_0$ in $\gamma$ which is the first point along the direction from $x$ to $y$ satisfying

$$d_D(z_0) = \sup_{w \in \gamma} \{d_D(w)\}.$$ 

Let $m \geq 0$ be the integer such that

$$2^m d_D(x) \leq d_D(z_0) < 2^{m+1} d_D(x),$$

and let $x_0$ be the first point of $\gamma[x, z_0]$ from $x$ to $z_0$ with

$$(2.1) \quad d_D(x_0) = 2^m d_D(x).$$

Then we have $d_D(x_0) \leq d_D(z_0) < 2d_D(x_0)$.

Let $x_1 = x$, and let $x_2, \ldots, x_{m+1}$ be the points such that for each $i \in \{2, \ldots, m+1\}$, $x_i$ denotes the first point in $\gamma[x, z_0]$ along the direction from $x$ to $z_0$ satisfying

$$d_D(x_i) = 2^{i-1} d_D(x_1).$$

Apparenty, $x_{m+1} = x_0$. If $x_0 \neq z_0$, we denote $z_0$ by $x_{m+2}$. By the choice of $x_i$, we know that for each $i \in \{1, 2, \ldots, m\}$,

$$(2.3) \quad d_D(x_{i+1}) = 2d_D(x_i),$$

$$(2.4) \quad d_D(x_{m+2}) = d_D(z_0).$$
and so
\[(2.4)\quad g_D(x_i, x_{i+1}) \geq d_D(x_{i+1}) - d_D(x_i) = d_D(x_i).\]

For each \(i \in \{1, 2, \ldots, m\}\) and \(w \in \gamma[x_i, x_{i+1}]\), it easily follows that
\[(2.5)\quad d_D(w) \leq d_D(x_{i+1}) = 2d_D(x_i).\]

Let \(w_0\) be the first point of \(\gamma\) along the direction from \(y\) to \(x\) satisfying
\[d_D(w_0) = \sup_{w \in \gamma}\{d_D(w)\}.
\]

Obviously, \(d_D(w_0) = d_D(z_0)\). It is possible that \(w_0 = z_0\). A similar argument as above shows that there are points \(\{y_j\}_{j=1}^{s+1}\) in \(\gamma[y, w_0]\) such that for each \(j \in \{1, \ldots, s + 1\}\), \(y_j\) denotes the first point in \(\gamma[y, w_0]\) along the direction from \(y\) to \(w_0\) satisfying
\[d_D(y_j) = 2^{j-1}d_D(y_1),\]
where \(y_1 = y\) and \(d_D(y_{s+1}) = 2^sd_D(y_1)\). We also use \(y_0\) to denote \(y_{s+1}\). If \(y_0 \neq w_0\), we use \(y_{s+2}\) to denote \(w_0\).

**Lemma 1.** For each \(i \in \{1, 2, \ldots, m\}\), we have

1. \(\text{diam}(\gamma[x_i, x_{i+1}]) \leq b_1g_D(x_i, x_{i+1})\) with \(b_1 = 24c'_2\) and \(c'_2 = [c_2] + 1\). Here and in the following, \([\cdot]\) always denotes the greatest integer part;
2. \(g_D(x_i, x_{i+1}) \leq b_2d_D(x_i)\) with \(b_2 = (1 + b_1)^2\);
3. \(d_D(x_i) \leq b_3d_D(w)\) for all \(w \in \gamma\) with \(b_3 = (1 + b_2)^{2}\),

where \(c_2\) is the same constant as in the inequality \((1.2)\).

**Proof.** We now prove the first assertion in the lemma. Suppose on the contrary that there is some \(i \in \{1, \ldots, m\}\) satisfying
\[\text{diam}(\gamma[x_i, x_{i+1}]) > b_1g_D(x_i, x_{i+1}).\]

Let \(u_{i,1} = x_i\), and take the points \(u_{i,2}, u_{i,3}, \ldots, u_{i,c'_2+1}\) in \(\gamma\) such that for each \(t \in \{2, \ldots, c'_2 + 1\}\), \(u_{i,t}\) is the first point of \(\gamma\) from \(x_i\) to \(x_{i+1}\) satisfying
\[|x_i - u_{i,t}| = 6(t - 1)g_D(x_i, x_{i+1}).\]

Then for each \(t \in \{1, \ldots, c'_2\}\), we have
\[(2.6)\quad |u_{i,t} - u_{i,t+1}| \geq |x_i - u_{i,t+1}| - |u_{i,t} - x_i| \geq 6g_D(x_i, x_{i+1}).\]

Let \(p \in \partial D\) be such that \(d_D(u_{i,t+1}) = |u_{i,t+1} - p|\). Then \((2.4), (2.5)\) and \((2.6)\) yield
\[(2.7)\quad |u_{i,t} - p| \geq |u_{i,t} - u_{i,t+1}| - d_D(u_{i,t+1})
\geq 6g_D(x_i, x_{i+1}) - 2d_D(x_i)
\geq 2g_D(x_i, x_{i+1}) + 2d_D(x_i).\]

Similarly, for \(q \in \partial D\) with \(d_D(u_{i,t}) = |u_{i,t} - q|\), we get
\[(2.8)\quad |u_{i,t+1} - q| \geq 2g_D(x_i, x_{i+1}) + 2d_D(x_i).\]

Thus we infer from \((2.5), (2.7)\) and \((2.8)\) that
\[\alpha_D(u_{i,t}, u_{i,t+1}) \geq \log \left(\frac{|u_{i,t} - p| |u_{i,t+1} - q|}{d_D(u_{i,t+1}) d_D(u_{i,t})}\right)
\geq 2 \log \left(1 + \frac{g_D(x_i, x_{i+1})}{d_D(x_i)}\right),\]
which together with Theorem B show that
\[
\tilde{\alpha}_D(x_i, x_{i+1}) = \alpha_D(\gamma[x_i, x_{i+1}]) \\
\geq \sum_{t=1}^{c_2'} \alpha_D(u_{i,t}, u_{i,t+1}) \\
\geq 2c_2' \log \left(1 + \frac{\varrho_D(x_i, x_{i+1})}{d_D(x_i)}\right) \\
\geq 2c_2 \log \left(1 + \frac{\varrho_D(x_i, x_{i+1})}{d_D(x_i)}\right) \\
= 2c_2' j'_D(x_i, x_{i+1}),
\]
which contradicts with (1.2). Hence (1) is true.

Then we come to prove the second assertion. Suppose on the contrary that there is some \(i \in \{1, 2, \ldots, m\}\) satisfying
\[
(2.9) \quad \varrho_D(x_i, x_{i+1}) > b_2 d_D(x_i).
\]

Obviously, there exists some point \(v \in \gamma[x_i, x_{i+1}]\) such that \(|x_i - v| \geq \frac{1}{b_1} \varrho_D(x_i, x_{i+1})\).
We let \(v_{i,1} = x_i\), and let \(v_{i,2}, \ldots, v_{i, b_1/2 + 1}\) be the points in \(\gamma\) such that for each \(h \in \{2, \ldots, b_1/2 + 1\}\), \(v_{i,h}\) is the first point of \(\gamma\) from \(x_i\) to \(x_{i+1}\) satisfying
\[
|x_i - v_{i,h}| = \frac{6(h - 1)}{b_1} \varrho_D(x_i, x_{i+1}).
\]

Then
\[
(2.10) \quad |v_{i,h} - v_{i,h+1}| \geq |v_{i,h+1} - x_i| - |v_{i,h} - x_i| \geq \frac{6}{b_1} \varrho_D(x_i, x_{i+1}).
\]

Let \(p \in \partial D\) satisfy \(d_D(v_{i,h+1}) = |v_{i,h+1} - p|\). Then it follows from (2.4), (2.5), (2.9) and (2.10) that
\[
(2.11) \quad |v_{i,h} - p| \geq |v_{i,h} - v_{i,h+1} - d_D(v_{i,h+1}) \\
\geq \frac{6}{b_1} \varrho_D(x_i, x_{i+1}) - 2d_D(x_i) \\
> \frac{2}{b_1} \varrho_D(x_i, x_{i+1}) + 2d_D(x_i).
\]

Similarly, for \(q \in \partial D\) with \(d_D(v_{i,h}) = |v_{i,h} - q|\), we know
\[
(2.12) \quad |v_{i,h+1} - q| \geq \frac{2}{b_1} \varrho_D(x_i, x_{i+1}) + 2d_D(x_i).
\]
Thus we infer from (2.5), (2.9), (2.11) and (2.12) that
\[ \alpha_D(v_{i,h}, v_{i,h+1}) \geq \log \left( \frac{|v_{i,h} - p| |v_{i,h+1} - q|}{d_D(v_{i,h+1}) d_D(v_{i,h})} \right) \]
\[ \geq 2 \log \left( 1 + \frac{\varrho_D(x_i, x_{i+1})}{b_1 d_D(x_i)} \right) \]
\[ > \frac{12c_2}{b_1} \log \left( 1 + \frac{\varrho_D(x_i, x_{i+1})}{d_D(x_i)} \right). \]

Whence Theorem B yields
\[ \tilde{\alpha}_D(x_i, x_{i+1}) = \alpha_D(\gamma[x_i, x_{i+1}]) \]
\[ \geq \sum_{h=1}^{b_1} \alpha_D(v_{i,h}, v_{i,h+1}) \]
\[ > c_2 \log \left( 1 + \frac{\varrho_D(x_i, x_{i+1})}{d_D(x_i)} \right) \]
\[ = c_2 j_D'(x_i, x_{i+1}), \]
which is the desired contradiction.

To finish the proof of Lemma 1, it remains to check (3). Let \( w \in \gamma \). Then (2) in the lemma, (1.2), Theorems B and E lead to
\[ 2 \log \frac{d_D(x_i)}{d_D(w)} < \alpha_D(x_i, w) + \alpha_D(w, x_{i+1}) \]
\[ \leq \alpha_D(\gamma[x_i, x_{i+1}]) \]
\[ = \tilde{\alpha}_D(x_i, x_{i+1}) \]
\[ \leq c_2 \log \left( 1 + \frac{\varrho_D(x_i, x_{i+1})}{d_D(x_i)} \right) \]
\[ \leq c_2 \log(1 + b_2), \]
which shows that
\[ d_D(x_i) \leq (1 + b_2) \tilde{c}_2 d_D(w), \]
which shows that (3) is true by taking \( b_3 = (1 + b_2) \tilde{c}_2 \). Hence the proof of Lemma 1 is complete. \( \square \)

Similarly, we know that

**Lemma 2.** For each \( j \in \{1, \ldots, s\} \), we have

1. \( \text{diam}(\gamma[y_j, y_{j+1}]) \leq b_1 \varrho_D(y_j, y_{j+1}); \)
2. \( \varrho_D(y_j, y_{j+1}) \leq b_2 d_D(y_j); \)
3. \( d_D(y_j) \leq b_3 d_D(w) \) for all \( w \in \gamma \).

Suppose \( x_0 \neq y_0 \). Then
Lemma 3. For \( w \in \gamma[x_0, y_0] \), we have
\[
d_D(x_0) \leq b_3^2 d_D(w) \quad \text{and} \quad \text{diam}(\gamma[x_0, y_0]) \leq b_4 d_D(w),
\]
where \( b_4 = b_1 b_2 b_3^2 \).

Proof. We note by (2.2) that
\[
\frac{1}{2} d_D(y_0) < d_D(x_0) < 2d_D(y_0),
\]
and for \( w \in \gamma[x_0, y_0] \), we have
\[
d_D(w) < d_D(z_0) < 2d_D(x_0).
\]
We prove this lemma by considering the case where \( \rho_D(x_0, y_0) \geq d_D(x_0) \) and the case where \( \rho_D(x_0, y_0) < d_D(x_0) \), separately.

Suppose first that \( \rho_D(x_0, y_0) \geq d_D(x_0) \). Then by (2.13), (2.14) and a similar argument as in the proof of Lemma 1, we get for each \( w \in \gamma[x_0, y_0] \),
\[
d_D(x_0) \leq b_3^2 d_D(w) \quad \text{(2.15)}
\]
and
\[
\text{diam}(\gamma[x_0, y_0]) \leq b_4 d_D(w), \quad \text{(2.16)}
\]
where \( b_4 = b_1 b_2 b_3^2 \).

Suppose next that \( \rho_D(x_0, y_0) < d_D(x_0) \). In this case, we need the following claim.

Claim 1. For \( w \in \gamma[x_0, y_0] \), we have \( |w - x_0| \leq (3c_2 + 1)d_D(x_0) \).

Obviously, to prove this claim, it suffices to consider the case \( |x_0 - w| \geq 2d_D(x_0) \). Let \( z \in \partial D \) satisfy \( |x_0 - z| = d_D(x_0) \). Then it follows from (1.2), (2.13), Theorems B and E that
\[
\log \left( \frac{|w - x_0|}{d_D(x_0)} - 1 \right) \leq \log \frac{|z - w|}{d_D(x_0)}
\]
\[
\leq \alpha_D(x_0, w)
\]
\[
\leq \alpha_D(\gamma[x_0, y_0])
\]
\[
= \tilde{\alpha}_D(x_0, y_0)
\]
\[
\leq c_2 \log \left( 1 + \frac{\rho_D(x_0, y_0)}{\min\{d_D(x_0), d_D(y_0)\}} \right)
\]
\[
\leq c_2 \log 3,
\]
from which the claim easily follows.

By Claim 1, we get
\[
\text{diam}(\gamma[x_0, y_0]) \leq 2(3c_2 + 1)d_D(x_0). \quad \text{(2.18)}
\]
Moreover, by Theorem E and a similar argument as in (2.17), we also have
\[
\log \frac{d_D(x_0)}{d_D(w)} \leq \alpha_D(x_0, w) \leq c_2 \log 3,
\]
and so
\[(2.19)\quad d_D(x_0) \leq 3c^2 d_D(w),\]
which together with (2.18) show that
\[(2.20)\quad \text{diam}(\gamma[x_0, y_0]) \leq 2(3c^2 + 1)^2 d_D(w) \leq b_4 d_D(w).\]
The inequalities (2.15), (2.16), (2.19) and (2.20) imply that the lemma is true. □

Now we come to prove that the first part of (4) in Theorem 1 holds with constant $2b_4$, i.e., for $w \in \gamma$,
\[(2.21)\quad \min\{\text{diam}(\gamma[x, w]), \text{diam}(\gamma[y, w])\} \leq 2b_4 d_D(w).\]

Let $w \in \gamma$. We divide the discussions into three cases.

**Case 3.** $w \in \gamma[x, x_0]$.

Clearly, there exists an integer $k \in \{1, 2, \ldots, m\}$ such that $w \in \gamma[x_k, x_{k+1}]$. By Lemma 1 and (2.3) we have
\[(2.22)\quad \text{diam}(\gamma[x, w]) \leq \sum_{i=1}^{k} \text{diam}(\gamma[x_i, x_{i+1}]) \leq b_1 b_2 \sum_{i=1}^{k} d_D(x_i) \leq 2b_1 b_2 d_D(x_k) \leq 2b_1 b_2 b_3 d_D(w) < b_4 d_D(w).\]

**Case 4.** $w \in \gamma[y, y_0]$.

By Lemma 2, we see from a similar argument as in the proof of Case 3 that
\[(2.23)\quad \text{diam}(\gamma[y, w]) < b_4 d_D(w).\]

**Case 5.** If $w \in \gamma[x_0, y_0]$.

It follows from Lemmas 1 and 3 that
\[(2.24)\quad \text{diam}(\gamma[x, w]) \leq \sum_{i=1}^{m} \text{diam}(\gamma[x_i, x_{i+1}]) + \text{diam}(\gamma[x_0, y_0]) \leq b_1 b_2 \sum_{i=1}^{m} d_D(x_i) + b_4 d_D(w) \leq b_1 b_2 d_D(x_{m+1}) + b_4 d_D(w) \leq 2b_4 d_D(w).\]
The proof for (2.21) easily follows from the combination of (2.22), (2.23) and (2.24).

Next we prove the second part of (4) in Theorem 1 with constant $b_6 = 2b_5 + 2b_4$, where $b_5 = c_2 \log_2(8b_4 + 1) + 1$, i.e.,
\[(2.25)\quad \text{diam}(\gamma[x, y]) \leq b_6 g_D(x, y).\]

We first prove a lemma.

**Lemma 4.** $g_D(x, y) \geq 2^{m-b_5} d_D(x)$. 

Proof. If \( m \leq b_5 \), then it is obvious from the assumption “\(|x - y| \geq d_D(x)\)”. So we assume that \( m > b_5 \). In this case, we prove the lemma by contradiction. Suppose that

\[
\varrho_D(x, y) < 2^{m-b_5}d_D(x). \tag{2.26}
\]

Then

\[
d_D(y) \leq \varrho_D(x, y) + d_D(x) < (2^{m-b_5} + 1)d_D(x) \leq \frac{2^m}{(8b_4 + 1)c^2}d_D(x) < \frac{2^m}{(8b_4 + 1)^{\frac{c}{2}}}d_D(x). \tag{2.27}
\]

By (2.1) and (2.13) we have

\[
d_D(y_0) \geq \frac{1}{2}d_D(x_0) = 2^{m-1}d_D(x) > \frac{2^m}{(8b_4 + 1)^{\frac{c}{2}}}d_D(x), \tag{2.28}
\]

then we obtain from (2.27), (2.28) and the easy fact “\(\frac{2^m}{(8b_4 + 1)^{\frac{c}{2}}} = 2^{m-\frac{c}{2}}\log_2(8b_4 + 1) > 1\)” that there exist \( w_1 \in \gamma[x, x_0] \) and \( w_2 \in \gamma[y, y_0] \) such that

\[
d_D(w_1) = d_D(w_2) = \frac{2^m}{(8b_4 + 1)^{\frac{c}{2}}}d_D(x). \tag{2.29}
\]

On one hand, we obtain from (1.2), (2.1), (2.29), Theorems B and E that

\[
c_2 \log \left(1 + \frac{\varrho_D(w_1, w_2)}{d_D(w_1)}\right) \geq \tilde{\alpha}_D(w_1, w_2)
= \alpha_D(\gamma[w_1, w_2]) 
\geq \alpha_D(w_1, x_{m+1}) + \alpha_D(x_{m+1}, w_2) 
\geq 2 \log \frac{d_D(x_{m+1})}{d_D(w_1)} 
\geq c_2 \log(1 + 8b_4),
\]

which imply that

\[
\varrho_D(w_1, w_2) \geq 8b_4d_D(w_1). \tag{2.30}
\]

On the other hand, by (2.22), (2.23), (2.26) and (2.29) we obtain

\[
\varrho_D(w_1, w_2) \leq \varrho_D(w_1, x) + \varrho_D(x, y) + \varrho_D(y, w_2) 
\leq \text{diam}(\gamma[x, w_1]) + \varrho_D(x, y) + \text{diam}(\gamma[y, w_2]) 
< 2b_4d_D(w_1) + \varrho_D(x, y) 
\leq (2b_4 + \frac{2^m - b_5(8b_4 + 1)^{\frac{c}{2}}}{2^m})d_D(w_1) 
< (2b_4 + 1)d_D(w_1),
\]

which is contradict with (2.30). Hence the proof of the lemma is complete. \(\square\)
Now we are ready to conclude the proof of (2.25). It follows from (2.1), (2.13), (2.22), (2.23), (2.28), Lemmas 3 and 4 that
\[
\text{diam}(\gamma_{[x, y]}) \leq \text{diam}(\gamma_{[x, x_0]}) + \text{diam}(\gamma_{[x_0, y_0]}) + \text{diam}(\gamma_{[y_0, y]}) \\
\leq 4b_4d_D(x_{m+1}) \\
= 2^{m+2}b_4d_D(x) \\
\leq 2^{b_5+2}b_4D(x, y).
\]
Hence the proof of (4) of Theorem 1 is complete by taking \(c_3 = 2^{b_5+2}b_4\). \(\square\)

2.2. The proof of Corollary 1. (1) \(\Rightarrow\) (2). Suppose (1) holds. Then by Theorem H, we see that \(D\) is a \(\mu\)-uniform, so it is obvious inner uniform.

For the second part of (2), we can obtain easily from (1.1) and the definition of \(A\)-uniform (see Theorem H). Hence (2) is true.

(2) \(\Rightarrow\) (1). Suppose (2) holds. Then by Theorem 1, we know that for all \(x, y \in D\),
\[
k_D(x, y) \leq c_1j'_D(x, y) \leq c_1\mu_5\alpha_D(x, y),
\]
which shows that \(D\) is \(A\)-uniform with coefficient \(K = c_1\mu_5\). \(\square\)
