Supplemental Figure 4. Evaluation of the reproducibility of the TMT quantitation. Pair-wised comparison of the normalized reporter ion intensities among the triplicated samples in the experiments TMT_Light (A) and TMT_dark (B). In each experiment three biological replicates were included (R1-R3). The scatter-plots show the comparison between two representative biological replicates in each experiment. The corresponding correlation coefficient ($R^2$) values for each comparison are shown in the tables.
