ON A CONJECTURE OF TARSKI ON PRODUCTS OF CARDINALS

THOMAS JECH\textsuperscript{1} AND SAHARON SHELAH\textsuperscript{2}

Abstract\textsuperscript{3}

We look at an old conjecture of A. Tarski on cardinal arithmetic and show that if a counterexample exists, then there exists one of length $\omega_1 + \omega$.

*Keywords: Cardinal arithmetic, singular cardinals problem, pcf
In the early days of set theory, Hausdorff and Tarski established basic rules for exponentiation of cardinal numbers. In [T] Tarski showed that for every limit ordinal $\beta$, $\prod_{\xi<\beta} \aleph_\xi = \aleph_\beta^{\aleph_0}$, and conjectured that

\[(1) \quad \prod_{\xi<\beta} \aleph_{\sigma_\xi} = \aleph_\alpha^{\aleph_0}\]

holds for every ordinal $\beta$ and every increasing sequence $\{\sigma_\xi\}_{\xi<\beta}$ such that $\lim_{\xi<\beta} \sigma_\xi = \alpha$. He remarked that (1) holds for every countable ordinal $\beta$.

Remarks. 1. The left hand side of (1) is less than or equal to the right hand side.

2. If $\beta$ has $|\beta|$ disjoint cofinal subsets then the equality (1) holds. Thus the first limit ordinal that can be the length of a counterexample to (1) is $\omega_1 + \omega$.

[Proof. Let $\{A_i : i < |\beta|\}$ be disjoint cofinal subsets of $\beta$. Then $\prod_{\xi<\beta} \aleph_{\sigma_\xi} \geq \prod_{i<|\beta|} \prod_{\xi \in A_i} \aleph_{\sigma_\xi} \geq \prod_{i<|\beta|} \aleph_\alpha = \aleph_\alpha^{\aleph_0}$.]

It is not difficult to see that if one assumes the Singular Cardinals Hypothesis then (1) holds. With the hindsight given by results obtained in the last twenty years, it is also not difficult to find a counterexample to Tarski’s conjecture. For instance, using the model described in [M], one can have an increasing sequence $\lambda$ such that $\lim_{\xi<\beta} \sigma_\xi = \alpha$. Also, if $\lambda > \aleph_1$ is a strong limit singular cardinal of cofinality $\aleph_1$ such that $\lambda^{\aleph_1} > \lambda^{+ (2^{\aleph_0})}$ then we have a counterexample as $\lambda^{\aleph_1} > \lambda^{+ (2^{\aleph_0})}$ (by [ShA2, Ch. XIII, 5.1]).

The rest of this paper is devoted to the proof that the condition is necessary.

Assume that Tarski’s conjecture fails, and let $\beta$ be a limit ordinal for which there exists a sequence $\{\sigma_\xi\}_{\xi<\beta}$ that gives a counterexample:

\[(2) \quad \prod_{\xi<\beta} \aleph_{\sigma_\xi} < \aleph_\alpha^\kappa,\]

where $\kappa = |\beta|$ and $\alpha = \lim_{\xi<\beta} \sigma_\xi$.

Lemma 1. If (2) holds then $\kappa < \kappa < \beta$, and there exists an ordinal $\gamma < \alpha$ such that $\aleph_\gamma^\kappa < \aleph_\alpha$.

Proof. If (2) holds then $\beta$ does not have $|\beta|$ disjoint cofinal subsets, and it follows that $\beta$ is not a cardinal, and that $\text{cf} \beta < |\beta|$.

Assuming that $\aleph_\gamma^\kappa \leq \aleph_\alpha$ holds for all $\gamma < \alpha$, we pick a cofinal sequence $\{\alpha_i\}_{i<\text{cf} \beta}$ with limit $\alpha$, and then

$$\aleph_\alpha^\kappa = \left( \sum_{i<\text{cf} \beta} \aleph_{\alpha_i} \right)^\kappa \leq \prod_{i<\text{cf} \beta} \aleph_{\alpha_i}^\kappa \leq \prod_{i<\text{cf} \beta} \aleph_\alpha = \aleph_\alpha^{\text{cf} \beta} = \prod_{i<\text{cf} \beta} \aleph_{\alpha_i} \leq \prod_{\xi<\beta} \aleph_{\sigma_\xi},$$

contrary to (2). \qed

Now consider the shortest counterexample to Tarski’s conjecture.
Lemma 2. If $\beta$ is the least ordinal for which (2) holds then $\beta = \kappa + \omega$ where $\kappa$ is an uncountable cardinal.

Proof. Without loss of generality, the sequence $\sigma$ is continuous. (We can replace each $\sigma_\xi$ by the limit of the sequence at $\xi$, for each limit ordinal $\xi$.)

Let $\kappa = |\beta|$. We claim that for every limit ordinal $\eta < \beta$, $\mathfrak{K}_{\sigma_\eta} \kappa < \mathfrak{K}_\alpha$. If this were not true then, because $\beta > \kappa$, there would be a limit ordinal $\eta$ such that $\kappa \leq \eta < \beta$ and that $\mathfrak{K}_{\sigma_\eta} |\sigma_\eta| \geq \mathfrak{K}_\kappa > \prod_{\xi<\eta} \mathfrak{K}_{\sigma_\xi}$, which would make the sequence $\{\sigma_\xi\}_{\xi<\eta}$ a counterexample to Tarski’s conjecture as well, contrary to the minimality of $\beta$.

Thus $\beta = \delta + \omega$ for some limit ordinal $\delta$. It is clear that the sequence

$$\{\mathfrak{K}_{\sigma_\xi} : \xi \leq \kappa \text{ or } \xi > \delta\}$$

of length $\kappa + \omega$ is also a counterexample, and by the minimality of $\beta$ we have $\beta = \kappa + \omega$. □

Now consider the least ordinal $\gamma$ such that $\mathfrak{K}_\gamma \kappa > \mathfrak{K}_\alpha$. We shall show that $cf\gamma = \kappa$ (and so $\kappa$ is a regular uncountable cardinal). We also establish other properties of $\mathfrak{K}_\gamma$.

Lemma 3. If Tarski’s conjecture fails, then there is a cardinal $\mathfrak{K}_\gamma$ of uncountable cofinality $\kappa$ such that $\gamma > \kappa$, and that

(3) \quad \text{for every } \nu < \gamma, \mathfrak{K}_\nu \kappa < \mathfrak{K}_\gamma

(4) \quad \mathfrak{K}_\gamma \kappa > \mathfrak{K}_{\gamma + \omega} \kappa_0.

Proof. Let $\beta = \kappa + \omega$ be the least ordinal for which (2) holds, for some increasing continuous sequence $\{\sigma_\xi : \xi < \beta\}$ with limit $\alpha$, and let $\gamma$ be the least ordinal such that $\mathfrak{K}_\gamma \kappa > \mathfrak{K}_\alpha$.

First we observe that for every $\nu < \gamma$, $\mathfrak{K}_\nu \kappa < \mathfrak{K}_\gamma$. This is because if $\mathfrak{K}_\nu \kappa \geq \mathfrak{K}_\gamma$ then $\mathfrak{K}_\nu \kappa \geq \mathfrak{K}_\gamma \kappa > \mathfrak{K}_\alpha$, contradicting the minimality of $\gamma$.

As a consequence, we have $cf\gamma \leq \kappa$: otherwise, we would have $\mathfrak{K}_\gamma \kappa = \sum_{\nu<\gamma} \mathfrak{K}_\nu \kappa = \mathfrak{K}_\gamma < \mathfrak{K}_\alpha$, a contradiction. Also, if $\gamma = \lim_{i \to <cf\gamma} \gamma_i$, then $\mathfrak{K}_\gamma \kappa = \left(\sum_{i<cf\gamma} \mathfrak{K}_{\gamma_i}\right)^\kappa \leq \prod_{i<cf\gamma} \mathfrak{K}_{\gamma_i} \kappa \leq \prod_{i<cf\gamma} \mathfrak{K}_\gamma = \mathfrak{K}_{\gamma \cdot cf\gamma}$ and so we have

$$\mathfrak{K}_\gamma \cdot cf\gamma = \mathfrak{K}_{\gamma \kappa}.$$

Since $\mathfrak{K}_\alpha < \mathfrak{K}_\gamma \kappa$, we have $\mathfrak{K}_\alpha \kappa \leq \mathfrak{K}_\gamma \kappa = \mathfrak{K}_\gamma \cdot cf\gamma \leq \mathfrak{K}_\alpha \cdot cf\gamma$, and so $\mathfrak{K}_\alpha \cdot cf\gamma = \mathfrak{K}_\alpha \kappa$, and $\mathfrak{K}_\alpha \cdot cf\gamma > \prod_{\xi<\beta} \mathfrak{K}_{\sigma_\xi}$. Hence the sequence

$$\{\mathfrak{K}_{\sigma_\xi} : \xi \leq cf\gamma \text{ or } \xi > \kappa\}$$

of length $\kappa \cdot cf\gamma + \omega$ is also a counterexample, and it follows that $\kappa = cf\gamma$.

For every limit $\eta < \beta$ we have $\mathfrak{K}_{\sigma_\eta} \kappa < \mathfrak{K}_\alpha$, and in particular $\mathfrak{K}_{\sigma_\eta} \kappa < \mathfrak{K}_\alpha$. Since $\mathfrak{K}_\kappa \kappa > \mathfrak{K}_\alpha$, we have $\gamma > \kappa$. Finally,

$$\prod_{\xi<\beta} \mathfrak{K}_{\sigma_\xi} = \prod_{\xi<\kappa} \mathfrak{K}_{\sigma_\xi} \cdot \prod_{n<\omega} \mathfrak{K}_{\sigma_{\xi+n}} = \mathfrak{K}_{\sigma_\kappa} \cdot \mathfrak{K}_\alpha \kappa_0 = \mathfrak{K}_\alpha \kappa_0,$$

and because $\mathfrak{K}_\gamma \kappa = \mathfrak{K}_\alpha \kappa > \prod_{\xi<\beta} \mathfrak{K}_{\sigma_\xi}$, we have $\mathfrak{K}_\gamma \kappa > \mathfrak{K}_\alpha \kappa_0$. Since $\alpha = \lim_{n \to \omega} \sigma_{\kappa+n} \geq \gamma + \omega$, we have

$$\mathfrak{K}_\gamma \kappa > \mathfrak{K}_{\gamma + \omega} \kappa_0,$$

completing the proof. □

The cardinal $\mathfrak{K}_\gamma$ obtained in Lemma 3 satisfies all the conditions stated in the Theorem except for the requirement that its cofinality be $\mathfrak{K}_1$. Thus the following lemma will complete the proof:

Lemma 4. Let $\mathfrak{K}_\gamma$ be a singular cardinal of cofinality $\kappa > \mathfrak{K}_1$ such that $\gamma > \kappa$ and that

(5) \quad \text{for every } \nu < \gamma, \mathfrak{K}_\nu \kappa < \mathfrak{K}_\gamma.
Assume further that for every $\delta$, $\omega_1 < \delta < \gamma$, of cofinality $\aleph_1$,
\begin{equation}
\text{if for every } \nu < \delta, \mathbb{N}_\nu^{\aleph_1} < \mathbb{N}_\delta, \text{ then } \mathbb{N}_\delta^{\aleph_1} \subseteq \mathbb{N}_{\delta + \omega}^{\aleph_0}.
\end{equation}
Then $\aleph_\gamma^\kappa \subseteq \aleph_{\gamma + \omega}^{\aleph_0}$.

Lemma 4 implies that the least $\gamma$ in Lemma 3 has cofinality $\aleph_1$, and the theorem follows. The rest of the paper is devoted to the proof of Lemma 4. We use the second author’s analysis of $\text{pcf}$.

**Definition.** If $A$ is a set of regular cardinals, let
\[ \Pi A = \{ f : \text{dom} f = A \text{ and } f(\lambda) < \lambda \text{ for all } \lambda \in A \}. \]

If $I$ is an ideal on $A$ then $\Pi A / I$ is a partially ordered set under
\[ f \leq_I g \text{ iff } \{ \lambda : f(\lambda) > g(\lambda) \} \in I, \]
and similarly for filters on $A$. If $D$ is an ultrafilter on $A$, then $\Pi A / D$ is a linearly ordered set, and $\text{cf}(\Pi A / D)$ denotes its cofinality. Let
\[ \text{pcf}(A) = \{ \text{cf}(\Pi A / D) : D \text{ an ultrafilter on } A \}. \]

It is clear that
\[ A \subseteq \text{pcf}(A), A_1 \subseteq A_2 \text{ implies } \text{pcf}(A_1) \subseteq \text{pcf}(A_2), \text{ and } \]
\[ \text{pcf}(A_1 \cup A_2) = \text{pcf}(A_1) \cup \text{pcf}(A_2), \]
and it is not difficult to show (using ultrapowers of ultrapowers) that
\[ \text{if } |\text{pcf}(A)| < \min A \text{ then } \text{pcf}(\text{pcf}(A)) = \text{pcf}(A) \text{ and } \]
\[ \text{pcf}(A) \text{ has a greatest element.} \]

**Theorem** (Shelah [Sh345]). If $2^{|A|} < \min(A)$ then there exists a family $\{ B_\nu : \nu \in \text{pcf}(A) \}$ of subsets of $A$ such that
\begin{equation}
\text{for every ultrafilter } D \text{ on } A, \text{cf}(\Pi A / D) = \text{the least } \nu \text{ such that } B_\nu \in D.
\end{equation}
For every $\lambda \in \text{pcf}(A)$ there exists a family $\{ f_\alpha : \alpha < \lambda \} \subseteq \Pi A$ such that
\begin{equation}
\alpha < \beta \text{ implies } f_\alpha < f_\beta \mod J_{<\lambda}, \text{ where } J_{<\lambda} \text{ is the ideal generated } \\
\text{by } \{ B_\nu : \nu < \lambda \}, \text{ and the } f_\alpha \text{'s are cofinal in } \Pi B_{\lambda} \mod J_{<\lambda}.
\end{equation}

An immediate consequence of (7) is that $|\text{pcf}(A)| \leq 2^{|A|}$. The sets $B_\nu (\nu \in \text{pcf}(A))$ are called generators for $A$. Note that $\max B_\nu = \nu$ when $\nu \in A$, and that $\max(\text{pcf}(B_\nu)) = \nu$ for all $\nu$.

We shall use some properties of generators.

**Lemma 5** [Sh345]. Let $B_\nu$ be generators for $A$. For every $X \subseteq A$ there exists a finite set $F \subseteq \text{pcf}(X)$ such that $X \subseteq \bigcup \{ B_\nu : \nu \in F \}$.

**Proof.** Let $Y = \text{pcf}(X)$, and assume that the lemma fails. Then $\{ X - B_\nu : \nu \in Y \}$ has the finite intersection property and so there is an ultrafilter $D$ on $A$ such that $X \in D$ and $B_\nu \notin D$ for all $\nu \in Y$. Let $\mu = \text{cf}(\Pi A / D)$. Then $\mu \in \text{pcf}(X)$ and by (7), $B_\mu \in D$. A contradiction. \qed

For each $X \subseteq A$, let $s(X)$ (a support of $X$) denote a finite set $F \subseteq \text{pcf}(X)$ with the property that $X \subseteq \bigcup_{\nu \in F} B_\nu$.

The set $\text{pcf}(A)$ has a set of generators that satisfy a transitivity condition:
As C

Pro of Lemma 4. Let \( \nu \in \text{pcf}(A) \), then \( \nu = \text{pcf}(A) \) and \( \nu \) has a set of functions \( \{ B_\nu : \nu \in A \} \) that satisfy, in addition to (7),

\[
(9) \quad \text{if } \xi \in B_\nu \text{ then } B_\xi \subseteq B_\nu.
\]

We use the transitivity to prove the next lemma.

Lemma 7. Assume that \( 2^{[\ell]} < \min(A) \), let \( \hat{A} = \text{pcf}(A) \), let \( B_\nu, \nu \in \hat{A} \), be transitive generators for \( \hat{A} \), and for each \( X \subseteq \hat{A} \) let \( s(X) \) be a support of \( X \). If \( A = \bigcup_{i \in I} A_i \), then

\[
\hat{A} = \bigcup \left\{ \text{pcf}(B_\nu) : \nu \in \text{pcf} \left( \bigcup_{i \in I} s(\text{pcf}(A_i)) \right) \right\}.
\]

Corollary. \( \max(\hat{A}) = \max \text{pcf} \bigcup_{i \in I} s(\text{pcf}(A_i)) \).

[Proof of Corollary. Let \( \lambda = \max(\hat{A}) \); \( \lambda \in \text{pcf}(B_\nu) \) for some \( \nu \in \text{pcf}(\bigcup_{i \in I} s(A_i)) \). Since \( \max(\text{pcf}(B_\nu)) = \nu \), we have \( \lambda \leq \nu \).]

Proof. Let \( X = \bigcup_{i \in I} s(\text{pcf}(A_i)) \) and \( F = s(X) \). We have

\[
A = \bigcup_{i \in I} A_i \subseteq \bigcup_{i \in I} \text{pcf}(A_i) \subseteq \bigcup_{i \in I} \{ B_\xi : \xi \in s(\text{pcf}(A_i)) \} = \bigcup_{i \in I} \{ B_\xi : \xi \in X \} \subseteq \bigcup_{i \in I} \{ B_\xi : \xi \in \bigcup_{\nu \in F} B_\nu \} \subseteq \bigcup_{\nu \in F} \bigcup_{\nu \in F} B_\nu
\]

(the last inclusion is a consequence of transitivity (9)). Therefore

\[
\hat{A} = \text{pcf}(A) \subseteq \text{pcf} \left( \bigcup_{\nu \in F} B_\nu \right) = \bigcup_{\nu \in F} \text{pcf}(B_\nu) \subseteq \bigcup_{\nu \in F} \{ \text{pcf}(B_\nu) : \nu \in \text{pcf}(X) \}.
\]

Toward the proof of Lemma 4, let \( \{ \gamma_i : i < \ell \} \) be a continuous increasing sequence of limit ordinals of cofinality \( < \ell \), such that \( \lim_{i \to \ell} \gamma_i = \gamma, 2^\gamma < \aleph_0 \), and that for all \( i < \ell \),

\[
(10) \quad \text{for all } \nu < \gamma_i, \aleph_0^\nu < \aleph_0.
\]

Lemma 8. There is a closed unbounded set \( C \subseteq \ell \) such that for all \( n = 1, 2, \ldots \),

\[
\max \text{pcf}(\{ \aleph_0^{\gamma_i} : i < \ell \}) \leq \aleph_0.
\]

Proof. We show that for each \( n \) there exists a closed unbounded set \( C_n \subseteq \ell \) such that \( \max \text{pcf}(\{ \aleph_0^{\gamma_i} : i < \ell \}) \leq \aleph_0 \). To prove this, let \( n \geq 1 \) be fixed and let \( A = \{ \aleph_0^{\gamma_i} : i < \ell \} \). Let \( \lambda \) be the least element of \( \text{pcf}(A) \) above \( \aleph_0 \) (if there is none there is nothing to prove). Let \( \{ B_\nu : \nu \in \text{pcf}(A) \} \) be subsets of \( A \) that satisfy (7), and let \( \{ S_\nu : \nu \in \text{pcf}(A) \} \) be the subsets of \( \lambda \) such that \( B_\nu = \{ \aleph_0^{\gamma_i} : i < \ell \} \). It suffices to prove that the set \( S = \{ S_\nu : \nu < \lambda \} \) is stationary. Let \( J_{<\lambda} \) be the ideal on \( \lambda \) generated by \( \{ B_\nu : \nu < \lambda \} \). By Shelah’s Theorem there exists a family \( \{ f_\alpha : \alpha < \lambda \} \) in \( HA \) such that \( \alpha < \beta \) implies \( f_\alpha < f_\beta \) mod \( J_{<\lambda} \). Since all the sets \( B_\nu, \nu < \aleph_0 \), are bounded, we get a family \( \{ g_\alpha : \alpha < \lambda \} \) of functions on \( S \) such that \( g_\alpha(i) < \aleph_0 \) for all \( i \in S \), and such that \( \alpha < \beta \) implies \( g_\alpha(i) < g_\beta(i) \) for eventually all \( i \in S \). This contradicts the results in [GH] by which, under the assumption (5), any family of almost disjoint functions in \( \prod_{i \in S} \aleph_0 \) has size at most \( \aleph_0 \).

Proof of Lemma 4. Let \( \gamma \) be a singular cardinal of cofinality \( \kappa > \aleph_0 \) that satisfies (5) and (6). Let \( \lambda \) be a regular cardinal such that \( \aleph_0 < \lambda \leq \aleph_0^\kappa \). We shall prove that \( \lambda < \aleph_0^\kappa \).

Let \( \{ \gamma_i : i < \ell \} \) be an increasing continuous sequence that satisfies (10), and let \( C \) be a closed unbounded subset of \( \kappa \) given by Lemma 8. Let

\[
S = \{ i \in C : cf \gamma_i = \aleph_0 \}
\]

As \( \kappa > \aleph_0 \), \( S \) is a stationary subset of \( \kappa \).
Lemma 9. There exist regular cardinals $\lambda_i$, $i \in S$, such that for each $i \in S$, $\aleph_{\gamma_i} < \lambda_i \leq \aleph_{\gamma_i}^{\aleph_1}$, and an ultrafilter $D$ on $S$ such that $\text{cf}(\prod_{i \in S} \lambda_i/D) = \lambda$.

Proof. Let $I_0$ be the nonstationary ideal on $S$. There are $\lambda$ cofinal subsets $X$ of $\omega_\gamma$ of size $|X| = \kappa$. For every such set $X$, let $F_X \in \prod_{i \in X}[\aleph_{\gamma_i}]^{\leq \kappa}$ be the function defined by $F_X(i) = X \cap \omega_{\gamma_i}$. Then when $X = Y$, $F_X$ and $F_Y$ are eventually distinct.

For every $i \in S$ we have $\aleph_{\gamma_i}^\kappa = \aleph_{\gamma_i}^{\aleph_1}$ (by (10)), and so there exist $\lambda$ $I_0$-distinct functions in $\prod_{i \in S} \aleph_{\gamma_i}^{\aleph_1}$.

[Proof and $g$ are $I_0$-distinct if $\{i : f(i) = g(i)\} \in I_0$.]

Consider the partial ordering $f \leq_{I_0} g$ defined by $\{i : f(i) \geq g(i)\} \in I_0$; since $I_0$ is $\sigma$-complete, $<_{I_0}$ is well-founded. Let $g$ be an $<_{I_0}$-minimal function with the property that $g(i) \leq \aleph_{\gamma_i}^{\aleph_1}$ and that there are there are $\lambda$ $I_0$-distinct functions below $g$.

Let $I$ be the extension of $I_0$ generated by all the stationary subsets $X$ of $S$ that have the property that $g$ is not minimal on $I_0[X]$ (i.e. there is a function $g'$ such that $g'(i) < g(i)$ almost everywhere on $X$ and below $g'$ there are $\lambda$ $I_0$-distinct functions).

Claim. $I$ is a normal $\kappa$-complete ideal on $S$.

[Proof. Let $X_i$, $i < \kappa$, be sets in $I$, and let for each $i < \kappa$, $g_i < g$ on $X_i$ and $\langle h^i : \xi < \lambda \rangle$ witness that $X_i \in I$. Then one constructs witnesses $\tilde{g}$ and $\langle \tilde{h}^i : \xi < \lambda \rangle$ for $X = \{j \in \kappa : j \in \bigcup_{i < j} X_i\}$ by letting $\tilde{g}(j) = g_i(j)$ and $\tilde{h}^i(j) = h^i_j(j)$ where $i < j$ such that $j \in X_i$.

For example, let us show that $\tilde{h}^i_\xi$ and $\tilde{h}^i_\eta$ are $I_0$-distinct if $\xi \neq \eta$. Assume that $\tilde{h}^i_\xi = \tilde{h}^i_\eta$ on a stationary subset $S_1$ of $S$. Then on a stationary subset $S_2$ of $S_1$ the $i$ less than $j \in S_2$ chosen such that $j \in X_i$ is the same $i$, and we have $\tilde{h}^i_\xi = \tilde{h}^i_\eta$ on $S_2$, a contradiction.]

Let $\{h^i : \xi < \lambda\}$ be a family of $I_0$-distinct functions below $g$.

Claim. For every $h < I g$ there is some $\xi_0 < \lambda$ such that for all $\xi \geq \xi_0$, $h < h_\xi$.

[Proof. If there are $\lambda$ many $\xi$’s such that $h \geq h_\xi$ on an $I$-positive set, then (because $2^\kappa < \lambda$) there is an $I$-positive set $X$ such that $h \geq h_\xi$ on $X$ for $\lambda$ many $\xi$, but this contradicts the definition of $I$.]

Using this Claim, one can construct a $<_I$-increasing $\lambda$-sequence (a subsequence of $\{h_\xi : \xi < \lambda\}$) of functions that is $<_I$-cofinal in $\prod_{i \in S} g(i)$, for each $i \in S$. The product $\prod_{i \in S} \lambda_i$ has a $<_I$-cofinal $<_I$-increasing sequence of length $\lambda$, and since $I$ is a normal ideal, we have $\lambda_i > \aleph_{\gamma_i}$ for $I$-almost all $i$. Now if $D$ is any ultrafilter extending the dual of $I$, $D$ satisfies $\text{cf}(\prod_{i \in S} \lambda_i/D) = \lambda$. \qed

Back to the proof of Lemma 4. For each $i \in S$ we have a regular cardinal $\lambda_i$ such that $\aleph_{\gamma_i} < \lambda_i \leq \aleph_{\gamma_i}^{\aleph_1}$. By the assumption (6) we have $\aleph_{\gamma_i}^\kappa \leq \aleph_{\gamma_i}^{\aleph_1}$, and so $\lambda_i \leq \aleph_{\gamma_i + \omega}^{\aleph_0}$. We use the following result:

Theorem (Shelah [ShA2], Chapter XIII, 5.1). Let $\kappa_\delta$ be such that $\aleph_\delta^{\aleph_0} < \aleph_{\delta + \omega}$. Then for every regular cardinal $\mu$ such that $\aleph_\delta < \mu \leq \aleph_{\delta + \omega}$ there is an ultrafilter $U$ on $\omega$ such that $\text{cf}(\prod_{\omega} \aleph_{\delta + \omega}/U) = \mu$. \quad \square

We apply the theorem to each $\aleph_{\gamma_i}$, and obtain for each $i \in S$ an ultrafilter $U_i$ on $\omega$ such that $\text{cf}(\prod_{\omega} \aleph_{\gamma_i + \omega}/U_i) = \lambda_i$. Combining the ultrafilters $U_i$ with the ultrafilter $D$ on $S$ from Lemma 9 we get an ultrafilter $\bar{U}$ on the set

$$A = \{\aleph_{\gamma_i + n} : i \in S, n = 1, 2, \ldots\}$$

such that $\text{cf}(\Pi A/U) = \lambda$. Hence $\lambda \in \text{pcf}(A)$.

We shall now complete the proof of Lemma 4 by showing that $\max \text{pcf}(A) \leq \aleph_{\gamma_i + \omega}^{\aleph_0}$.

We have $A = \bigcup_{n=1}^\infty A_n$, where

$$A_n = \{\aleph_{\gamma_i + n} : i \in S\},$$

and since $2^{\aleph_0} = 2^\kappa < \min(A)$, we apply the corollary of Lemma 7 and get

$$\max \text{pcf}(A) = \max \text{pcf} \bigcup_{n=1}^\infty s(\text{pcf}(A_n)),$$

where for each $n$, $s(\text{pcf}(A_n))$ is a finite subset of $\text{pcf}(\text{pcf}(A_n)) = \text{pcf}(A_n)$.  

Let $E = \bigcup_{n=1}^{\infty} s(\text{pcf}(A_n))$. Since (by Lemma 8) $\max \text{pcf}(A_n) \leq \aleph_{\gamma+n}$ for each $n$, $E$ is a countable subset of $\aleph_{\gamma+\omega}$. Hence $\max \text{pcf}(E) \leq \aleph_{\gamma+\omega}^{\aleph_0}$, and so
\[
\lambda \leq \max \text{pcf}(A) = \max \text{pcf}(E) \leq \aleph_{\gamma+\omega}^{\aleph_0}.
\]
