Abstract

The Concise Guide to PHARMACOLOGY 2019/20 is the fourth in this series of biennial publications. The Concise Guide provides concise overviews of the key properties of nearly 1800 human drug targets with an emphasis on selective pharmacology (where available), plus links to the open access knowledgebase source of drug targets and their ligands (www.guidetopharmacology.org), which provides more detailed views of target and ligand properties. Although the Concise Guide represents approximately 400 pages, the material presented is substantially reduced compared to information and links presented on the website. It provides a permanent, citable, point-in-time record that will survive database updates. The full contents of this section can be found at http://onlinelibrary.wiley.com/doi/10.1111/bph.14752. Enzymes are one of the six major pharmacological targets into which the Guide is divided, with the others being: G protein-coupled receptors, ion channels, nuclear hormone receptors, calcium channels, kinase receptors and transporters. These are presented with nomenclature guidance and summary information on the best available pharmacological tools, alongside key references and suggestions for further reading. The landscape format of the Concise Guide is designed to facilitate comparison of related targets from material contemporary to mid-2019, and supersedes data presented in the 2017/18, 2015/16 and 2013/14 Concise Guides and previous Guides to Receptors and Channels. It is produced in close conjunction with the International Union of Basic and Clinical Pharmacology Committee on Receptor Nomenclature and Drug Classification (NC-IUPHAR), therefore, providing official IUPHAR classification and nomenclature for human drug targets, where appropriate.

Conflict of interest

The authors state that there are no conflicts of interest to disclose.

Overview: Enzymes are protein catalysts facilitating the conversion of substrates into products. The Nomenclature Committee of the International Union of Biochemistry and Molecular Biology (NC-IUBMB) classifies enzymes into families, using a four number code, on the basis of the reactions they catalyse. There are six main families:

- EC 1... Oxidoreductases;
- EC 2... Transferases;
- EC 3... Hydrolases;
- EC 4... Lyases;
- EC 5... Isomerases;
- EC 6... Ligases.

Although there are many more enzymes than receptors in biology, and many drugs that target prokaryotic enzymes are effective medicines, overall the number of enzyme drug targets is relatively small [454, 492], which is not to say that they are of modest importance. The majority of drugs which act on enzymes act as inhibitors; one exception is metformin, which appears to stimulate activity of AMP-activated protein kinase, albeit through an imprecisely defined mechanism. Kinetic assays allow discrimination of competitive, non-competitive, and un-competitive inhibitors. The majority of inhibitors are competitive (acting at the enzyme’s ligand recognition site), non-competitive (acting at a distinct site; potentially interfering with co-factor or co-enzyme binding) or of mixed type. One rare example of an uncompetitive inhibitor is lithium ions, which are effective inhibitors at inositol monophosphatase only in the presence of high substrate concentrations. Some inhibitors are irreversible, including a group known as suicide substrates, which bind to the ligand recognition site and then...

Family structure

- AAA ATPases
  - S301 Acetylcholine turnover
  - S302 Adenosine turnover
  - S303 Amino acid hydroxylases
  - S304 1-Arginine turnover
  - S307 Carnitine acyltransferases
  - S308 Carboxylases and decarboxylases
  - S309 Decarboxylases
  - S311 Catecholamine turnover
  - S313 Ceramide turnover
  - S313 Serine palmitoyltransferase
  - S314 Ceramide synthase
  - S314 Sphingolipid Δ4-desaturase
  - S315 Sphingomyelin synthase
  - S315 Sphingomyelin phosphodiesterase
  - S316 Neutral sphingomyelinase coupling factors
  - S316 Ceramide glucosyltransferase
  - S316 Acid ceramidase
  - S317 Neutral ceramidases
  - S317 Alkaline ceramidases
  - S318 Ceramide kinase
  - S319 Chitinases
    - S319 Chromatin modifying enzymes
      - S319.1.14.11 Histone demethylases
    - S319 2.1.1.- Protein arginine N-methyltransferases
      - S319.2.1.1.43 Histone methyltransferases (HMTs)
        - S319.2.1.1.43.1 Histone acetyltransferases (HATs)
        - S320 3.5.1.- Histone deacetylases (HDACs)
          - S320 3.6.1.3 ATPases
            - S320 3.6.1.3.3 ATPases
              - S320 Enzymatic bromodomain-containing proteins
                - S320 Bromodomain kinase (BRDK) family
                - S320 TAFI family
                - S320 TIF1 family
                - S321 Cyclic nucleotide turnover/signalling
                  - S321 Adenyl cyclases (ACs)
                    - S321 Exchange protein activated by cyclic AMP (EPACs)
                      - S321 Phosphodiesterases, 3',5'-cyclic nucleotide (PDEs)
                        - S321 Cytochrome P450
                          - S321 CYP1 family
                            - S321 CYP2 family
                              - S321 CYP3 family
                                - S321 CYP4 family
                                  - S321 CYP5, CYP7 and CYP8 families
                                    - S321 CYP11, CYP17, CYP19, CYP20 and CYP21 families
                                      - S321 CYP24, CYP26 and CYP27 families
                                          - S321 CYP29, CYP46 and CYP51 families
                                            - DNA glycosylases
                                              - S321 DNA topoisomerases
                                                - S321 Endonuclease
                                                    - S321 N-Acetylenolamine turnover
                                                      - S321 2-Azacyclolactone turnover
                                                        - S321 Eicosanoid turnover
                                                          - S321 Cyclooxygenase
                                                            - S321 Prostaglandin synthases
                                                              - S321 Lipooxygenases
                                                                - S321 Leukotriene and lipoxin metabolism
                                                                  - S321 GABA turnover
                                                                    - S321 Glycerocephospholipid turnover
                                                                      - S321 Phosphoinositol-specific phospholipase C
                                                                        - S321 Phospholipase A2
                                                                          - S321 Phosphatidylcholine-specific phospholipase D
                                                                            - S321 Lipid phosphate phosphatases
                                                                              - S321 Phosphatidylinositol kinases
                                                                                - S321 1-Phosphatidylinositol-4-kinase family
                                                                                  - S321 Phosphatidylinositol-4-phosphate 3-kinase family
                                                                                    - S321 Phosphatidylinositol-3-kinase family
                                                                                      - S321 Phosphatidylinositol-4,5-bisphosphate 3-kinase family
                                                                                       - S321 Phosphatidylinositol-3-phosphate 5-kinase family
                                                                                       - S321 Type I PIP kinases
                                                                                       (1-Phosphatidylinositol-4-phosphate 5-kinase family)
                                                                                       - S321 Type II PIP kinases
                                                                                       (1-Phosphatidylinositol-5-phosphate 4-kinase family)
                                                                                       - S321 Sphingosine kinase
                                                                                       - S321 Phosphatidylinositol phosphate kinases
                                                                                       - S321 Haem oxygenase
                                                                              - S321 Hydrogen sulphide synthesis
                                                                                  - S321 Hydroxylases
                                                                                    - S321 Inositol phosphate turnover
                                                                                       - S321 Inositol 1,4,5-trisphosphate 3-kinases
                                                                                       - S321 Inositol polyphosphate phosphatases
                                                                                       - S321 Inositol monophosphatase
                                                                                       - Itaconate biosynthesis
                                                                                       - Kinases (EC 2.7.x.x)
                                                                                       - AGC: Containing PKA, PKG, PKC families
                                                                                       - G protein-coupled receptor kinases (GRKs)
                                                                                       - Beta-adrenergic receptor kinases (βARKs)
                                                                                       - Opsin/rhodopsin kinases
                                                                                       - GRK4 subfamily
                                                                                       - MAST family
                                                                                       - NDR family
                                                                                       - PDK1 family
                                                                                       - Protein kinase A (PKA) family
                                                                                       - Akt (Protein kinase B, PKB) family
                                                                                       - Protein kinase C (PKC) family
                                                                                       - Alpha subfamily
                                                                                       - Delta subfamily
                                                                                       - Eta subfamily
                                                                                       - Iota subfamily
                                                                                       - Protein kinase G (PKG) family
                                                                                       - Protein kinase N (PKN) family
                                                                                       - RSK family
                                                                                       - MSK subfamily
                                                                                       - p70 subfamily
                                                                                       - RSK subfamily
                                                                                       - RSKR subfamily
                                                                                       - SKL family
                                                                                       - SGK family
                                                                                       - YANK family
                                                                                       - Atypical
                                                                                       - ABC1 family

Some of these are used in the catalytic steps, while others promote a particular conformational change. Co-factors are tightly bound to the enzyme and include metal ions and heme groups. Co-enzymes are typically small molecules which accept or donate functional groups to assist in the enzymatic reaction. Examples include ATP, NAD, NADP and S-adenosylmethionine, as well as a number of vitamins, such as riboflavin (vitamin B1) and thiamine (vitamin B2). Where co-factors/co-enzymes have been identified, the Guide indicates their involvement.

Many enzymes require additional entities for functional activity. Some of these are used in the catalytic steps, while others promote a particular conformational change. Co-factors are tightly bound to the enzyme and include metal ions and heme groups. Co-enzymes are typically small molecules which accept or donate functional groups to assist in the enzymatic reaction. Examples include ATP, NAD, NADP and S-adenosylmethionine, as well as a number of vitamins, such as riboflavin (vitamin B1) and thiamine (vitamin B2). Where co-factors/co-enzymes have been identified, the Guide indicates their involvement.
| Family                          | Subfamily                      |
|--------------------------------|--------------------------------|
| **PIKK family**                |                                |

**Full Contents of ConciseGuide:** [http://onlinelibrary.wiley.com/doi/10.1111/bph.14752/full](http://onlinelibrary.wiley.com/doi/10.1111/bph.14752/full)
Overview: Acetylcholine is familiar as a neurotransmitter in the central nervous system and in the periphery. In the somatic nervous system, it activates nicotinic acetylcholine receptors at the skeletal neuromuscular junction. It is also employed in the autonomic nervous system, in both parasympathetic and sympathetic branches; in the former, at the smooth muscle neuromuscular junction, activating muscarinic acetylcholine receptors. In the latter, acetylcholine is involved as a neurotransmitter at the ganglion, activating nicotinic acetylcholine receptors. Acetylcholine is synthesised in neurones through the action of choline O-acetyltransferase and metabolised after release through the extracellular action of acetylcholinesterase and cholinesterase. Choline is accumulated from the extracellular medium by selective transporters (see SLC5A7 and the SLC44 family). Acetylcholine is accumulated in synaptic vesicles through the action of the vesicular acetylcholine transporter SLC18A3.

Nomenclature:
- Choline O-acetyltransferase (Cartwright blood group)
- Acetylcholinesterase
- Butyrylcholinesterase

Common abbreviation:
- ChAT
- AChE
- BCHE

HGNC, UniProt:
- ChAT, P28329
- AChE, P22303
- BCHE, P06276

EC number:
- 2.3.1.6: acetyl CoA + choline = acetylcholine + coenzyme A
- 3.1.1.7: acetylcholine + H₂O = acetic acid + choline + H⁺
- 3.1.1.7: acetylcholine + H₂O = acetic acid + choline + H⁺

Inhibitors:
- Compound 2 (pIC₅₀ 6.5) [216] – Mouse
- Tacrine (pKᵢ 7.5) [67], galantamine (pIC₅₀ 6.3) [108], rivastigmine (pIC₅₀ 5.4) [380]
- Physostigmine (pIC₅₀ 7.6–7.8) [380]
- Donepezil (pIC₅₀ 7.7–8.3) [78, 193, 380], BW284C51 (pIC₅₀ 7.7) [205]
- Bambuterol (pIC₅₀ 8.5) [205]

Selective inhibitors:
- Splice variants of choline O-acetyltransferase are suggested to be differentially distributed in the periphery and CNS (see [40]).

Comments: A number of organophosphorus compounds inhibit acetylcholinesterase and cholinesterase irreversibly, including pesticides such as chlorpyrifos-oxon, and nerve agents such as tabun, soman and sarin. AChE is unusual in its exceptionally high turnover rate which has been calculated at 740 000/min/molecule [644].

Adenosine turnover

Enzymes → Adenosine turnover

Overview: A multifunctional, ubiquitous molecule, adenosine acts at cell-surface G protein-coupled receptors, as well as numerous enzymes, including protein kinases and adenylyl cyclase. Extracellular adenosine is thought to be produced either by export or by metabolism, predominantly through ecto-5’-nucleotidase activity (also producing inorganic phosphate). It is inactivated either by extracellular metabolism via adenosine deaminase (also producing ammonia) or, following uptake by nucleoside transporters, via adenosine deaminase or adenosine kinase (requiring ATP as co-substrate). Intracellular adenosine may be produced by cytosolic 5’-nucleotidases or through S-adenosylhomocysteine hydrolase (also producing L-homocysteine).

| Comments                      | –                   | The enzyme exists in two isoforms derived from alternative splicing of a single gene product: a short isoform, ADK-S, located in the cytoplasm is responsible for the regulation of intra- and extracellular levels of adenosine and hence adenosine receptor activation; a long isoform, ADK-L, located in the nucleus contributes to the regulation of DNA methylation [57, 642]. | Pharmacological inhibition of CD73 is being investigated as a novel cancer immunotherapy strategy [622]. | – |

Comments: An extracellular adenosine deaminase activity, termed ADA2 or adenosine deaminase growth factor (ADGF, CECRI, Q9NZK5), has been identified [117, 387], which is insensitive to EHNA [671]. Other forms of adenosine deaminase act on ribonucleic acids and may be divided into two families: ADAT1 (Q9BUB4) deaminates transfer RNA; ADAR (EC 3.5.4.37, also known as 136 kDa double-stranded RNA-binding protein, P136, K88SRRPB, Interferon-inducible protein 4); ADARB1 (EC 3.5.4.36, also known as dsRNA adenosine deaminase) and ADARB2 (EC 3.5.4.37, also known as dsRNA adenosine deaminase B2, RNA-dependent adenosine deaminase 3) act on double-stranded RNA. Particular polymorphisms of the ADA gene result in loss-of-function and severe combined immunodeficiency syndrome. Adenosine deaminase is able to complex with dipeptidyl peptidase IV (EC 3.4.14.5, DPP4, also known as T-cell activation antigen CD26, TP103, adenosine deaminase complexing protein 2) to form a cell-surface activity [301].

Amino acid hydroxylases

**Enzymes** → Amino acid hydroxylases

**Overview:** The amino acid hydroxylases (monooxygenases), EC.1.14.16.-, are iron-containing enzymes which utilise molecular oxygen and *sapropterin* as co-substrate and co-factor, respectively. In humans, as well as in other mammals, there are two distinct L-Tryptophan hydroxylase 2 genes. In humans, these genes are located on chromosomes 11 and 12 and encode two different homologous enzymes, TPH1 and TPH2.

| Nomenclature                  | L-Phenylalanine hydroxylase | L-Tyrosine hydroxylase | L-Tryptophan hydroxylase 1 | L-Tryptophan hydroxylase 2 |
|-------------------------------|-----------------------------|------------------------|-----------------------------|-----------------------------|

L-Arginine turnover

Overview: L-arginine is a basic amino acid with a guanidino sidechain. As an amino acid, metabolism of L-arginine to form L-ornithine, catalysed by arginase, forms the last step of the urea production cycle. L-Ornithine may be utilised as a precursor of polyamines (see Carboxylases and Decarboxylases) or recycled via L-argininosuccinic acid to L-arginine. L-Arginine may itself be decarboxylated to form agmatine, although the prominence of this pathway in human tissues is uncertain. L-Arginine may be used as a precursor for guanidoacetic acid formation in the creatine synthesis pathway under the influence of arginine:glycine amidinotransferase with L-ornithine as a byproduct. Nitric oxide synthase uses L-arginine to generate nitric oxide, with L-citrulline also as a byproduct. L-Arginine in proteins may be subject to post-translational modification through methylation, catalysed by protein arginine methyltransferases. Subsequent proteolysis can liberate asymmetric N^G,N^G-dimethyl-L-arginine (ADMA), which is an endogenous inhibitor of nitric oxide synthase activities. ADMA is hydrolysed by dimethylarginine dimethylhydrolase activities to generate L-citrulline and dimethylamine.

2.1.1.- Protein arginine N-methyltransferases

Overview: Protein arginine N-methyltransferases (PRMT, EC 2.1.1.-) encompass histone arginine N-methyltransferases (PRMT4, PRMT7, EC 2.1.1.125) and myelin basic protein N-methyltransferases (PRMT7, EC 2.1.1.126). They are dimeric or tetrameric enzymes which use S-adenosyl methionine as a methyl donor, generating S-adenosylhomocysteine as a by-product. They generate both mono-methylated and dimethylated products; these may be symmetric (SDMA) or asymmetric (N^G,N^G-dimethyl-L-arginine) versions, where both guanidine nitrogens are monomethylated or one of the two is dimethylated, respectively.

Information on members of this family may be found in the online database.
Arginase

Overview: Arginase (EC 3.5.3.1) are manganese-containing isoforms, which appear to show differential distribution, where the ARG1 isoform predominates in the liver and erythrocytes, while ARG2 is associated more with the kidney.

Information on members of this family may be found in the online database.

Comments: Nω-hydroxyarginine, an intermediate in NOS metabolism of L-arginine acts as a weak inhibitor and may function as a physiological regulator of arginase activity. Although isoform-selective inhibitors of arginase are not available, examples of inhibitors selective for arginase compared to NOS are Nω-hydroxy-nor-L-arginine [592], S-(2-boronoethyl)-L-cysteine [111, 312] and 2(5)-amino-6-boronohexanoic acid [32, 111].

Arginine:glycine amidinotransferase

Nomenclature

| Nomenclature | Arginine:glycine amidinotransferase |
|--------------|-----------------------------------|
| Common abbreviation | AGAT |
| HGNC, UniProt | GATM, P50440 |
| EC number | 2.1.4.1 |

Dimethylarginine dimethylaminohydrolases

Overview: Dimethylarginine dimethylaminohydrolases (DDAH, EC 3.5.3.18) are cytoplasmic enzymes which hydrolyse Nω,Nω-dimethyl-L-arginine to form dimethylamine and L-citrulline.

| Nomenclature | Nω,Nω-Dimethylarginine dimethylaminohydrolase 1 | Nω,Nω-Dimethylarginine dimethylaminohydrolase 2 |
|--------------|-----------------------------------------------|-----------------------------------------------|
| Common abbreviation | DDAH1 | DDAH2 |
| HGNC, UniProt | DDAH1, O94760 | DDAH2, O95865 |

| Cofactors | Zn²⁺ | – |
| Inhibitors | compound 2e (pKi 5.7) [324] | – |
Nitric oxide synthases

Overview: Nitric oxide synthases (NOS, EC 1.14.13.39) are a family of oxidoreductases that synthesize nitric oxide (NO) via the NADPH and oxygen-dependent consumption of L-arginine with the resultant by-product, L-citrulline. There are 3 NOS isoforms and they are related by their capacity to produce NO, highly conserved organization of functional domains and significant homology at the amino acid level. NOS isoforms are functionally distinguished by the cell type where they are expressed, intracellular targeting and transcriptional and post-translation mechanisms regulating enzyme activity. The nomenclature suggested by NC-IUPHAR of NOS I, II and III [420] has not gained wide acceptance, and the 3 isoforms are more commonly referred to as neuronal NOS (nNOS), inducible NOS (iNOS) and endothelial NOS (eNOS) which reflect the location of expression (nNOS and eNOS) and inducible expression (iNOS). All are dimeric enzymes that shuttle electrons from NADPH, which binds to a C-terminal reductase domain, through the flavins FAD and FMN to the oxygenase domain of the other monomer to enable the BH4-dependent reduction of heme bound oxygen for insertion into the substrate, L-arginine. Electron flow from reductase to oxygenase domain is controlled by calmodulin binding to canonical calmodulin binding motif located between these domains. eNOS and nNOS isoforms are activated at concentrations of calcium greater than 100 nM, while iNOS shows higher affinity for Ca2+/calmodulin (CALM1 CALM2 CALM3, P62158) with great avidity and is essentially calcium-independent and constitutively active. Efficient stimulus-dependent coupling of nNOS and eNOS is achieved via subcellular targeting through respective N-terminal PDZ and fatty acid acylation domains whereas iNOS is largely cytosolic and function is independent of intracellular location. nNOS is primarily expressed in the brain and neuronal tissue, iNOS in immune cells such as macrophages and eNOS in the endothelial layer of the vasculature although exceptions in other cells have been documented. L-NAME and related modified arginine analogues are inhibitors of all three isoforms, with IC50 values in the micromolar range.

| Nomenclature | Endothelial NOS | Inducible NOS | Neuronal NOS |
|--------------|----------------|---------------|--------------|
| Common abbreviation | eNOS | iNOS | nNOS |
| HGNC, UniProt | NOS3, P29474 | NOS2, P35228 | NOS1, P29475 |
| EC number | 1.14.13.39 | 1.14.13.39 | 1.14.13.39 |
| Endogenous Substrate | L-arginine | L-arginine | L-arginine |
| Products | NO, L-citrulline | NO, L-citrulline, flavin mononucleotide, flavin adenine dinucleotide, heme, oxygen, NADPH, Zn2+, BH4 | flavin adenine dinucleotide, heme, oxygen, BH4, flavin mononucleotide, NADPH, Zn2+ |
| Cofactors | oxygen, BH4, Zn2+, flavin mononucleotide, NADPH, heme, flavin adenine dinucleotide | 1400W (pIC50 8.2) [201], 2-amino-4-methylpyridine (pIC50 7.4) [164], PBTU (pIC50 7.3) [202], NIL (pIC50 5.5) [421], aminoguanidine [115] | 3-bromo-7NI (pIC50 6.1–6.5) [52], 7NI (pIC50 5.3) [24] |
| Selective inhibitors | – | – | – |

Comments: The reductase domain of NOS catalyses the reduction of cytochrome c and other redox-active dyes [400]. NADPH2 oxidoreductase catalyses the formation of superoxide anion/H2O2 in the absence of L-arginine and sapropterin.

Carboxic anhydrases

Enzymes → Carbonic anhydrases

**Overview:** Carbonic anhydrases facilitate the interconversion of water and carbon dioxide with bicarbonate ions and protons (EC 4.2.1.1), with over a dozen gene products identified in man. The enzymes function in acid-base balance and the movement of carbon dioxide and water. They are targeted for therapeutic gain by particular antiglaucoma agents and diuretics.

| Nomenclature                  | carbonic anhydrase 1 | carbonic anhydrase 7 | carbonic anhydrase 12 | carbonic anhydrase 13 | carbonic anhydrase 14 |

Carboxylases and decarboxylases

Enzymes → Carboxylases and decarboxylases

Carboxylases

Enzymes → Carboxylases and decarboxylases → Carboxylases

Overview: The carboxylases allow the production of new carbon-carbon bonds by introducing HCO$_3^-$ or CO$_2$ into target molecules. Two groups of carboxylase activities, some of which are bidirectional, can be defined on the basis of the cofactor requirement, making use of biotin (EC 6.4.1.-) or vitamin K hydroquinone (EC 4.1.1.-).

| Nomenclature          | Pyruvate carboxylase | Acetyl-CoA carboxylase 1 | Acetyl-CoA carboxylase 2 | Propionyl-CoA carboxylase | γ-Glutamyl carboxylase |
|-----------------------|----------------------|--------------------------|-------------------------|---------------------------|------------------------|

| Comments              | –                    | Citrate and other dicarboxylic acids are allosteric activators of acetyl-CoA carboxylase. | Citrate and other dicarboxylic acids are allosteric activators of acetyl-CoA carboxylase. | Propionyl-CoA carboxylase is able to function in both forward and reverse activity modes, as a ligase (carboxylase) or lyase (decarboxylase), respectively. | Loss-of-function mutations in γ-glutamyl carboxylase are associated with clotting disorders. |

Comments: Dicarboxylic acids including citric acid are able to activate ACC1/ACC2 activity allosterically. PCC is able to function in forward and reverse modes as a ligase (carboxylase) or lyase (decarboxylase) activity, respectively. Loss-of-function mutations in GGCX are associated with clotting disorders.
Decarboxylases

Enzymes → Carboxylases and decarboxylases → Decarboxylases

**Overview**: The decarboxylases generate CO₂ and the indicated products from acidic substrates, requiring pyridoxal 5-phosphate or pyruvic acid as a co-factor.

| Nomenclature          | Glutamic acid decarboxylase 1 | Glutamic acid decarboxylase 2 | Histidine decarboxylase |
|-----------------------|-------------------------------|-------------------------------|-------------------------|
| Common abbreviation   | GAD1                          | GAD2                          | HDC                     |
| HGNC, UniProt         | GAD1, Q99259                  | GAD2, Q05329                  | HDC, P19113             |
| EC number             | 4.1.1.15: L-glutamic acid + H⁺ -> GABA + CO₂ | 4.1.1.15: L-glutamic acid + H⁺ -> GABA + CO₂ | 4.1.1.22 |
| Endogenous substrates | L-glutamic acid, L-aspartic acid | L-glutamic acid, L-aspartic acid | L-histidine            |
| Products              | GABA                          | GABA                          | histamine               |
| Cofactors             | pyridoxal 5-phosphate         | pyridoxal 5-phosphate         | pyridoxal 5-phosphate   |
| Selective inhibitors  | s-allylglycine                | s-allylglycine                | AMA, FMH [198]          |
| Comments              | L-aspartic acid is a less rapidly metabolised substrate of mouse brain glutamic acid decarboxylase generating β-alanine [650]. Autoantibodies against GAD1 and GAD2 are elevated in type 1 diabetes mellitus and neurological disorders (see Further reading). | – | – |
| Nomenclature                      | L-Arginine decarboxylase | L-Aromatic amino-acid decarboxylase | Malonyl-CoA decarboxylase | Ornithine decarboxylase | Phosphatidylserine decarboxylase | S-Adenosylmethionine decarboxylase |

Catecholamine turnover

Overview: Catecholamines are defined by the presence of two adjacent hydroxyls on a benzene ring with a sidechain containing an amine. The predominant catecholamines in mammalian biology are the neurotransmitter/hormones dopamine, (-)-noradrenaline (norepinephrine) and (-)-adrenaline (epinephrine). These hormone/transmitters are synthesized by sequential metabolism from L-phenylalanine via L-tyrosine. Hydroxylation of L-tyrosine generates levodopa, which is decarboxylated to form dopamine. Hydroxylation of the ethylamine sidechain generates (-)-noradrenaline (norepinephrine), which can be methylated to form (-)-adrenaline (epinephrine). In particular neuronal and adrenal chromaffin cells, the catecholamines dopamine, (-)-noradrenaline and (-)-adrenaline are accumulated into vesicles under the influence of the vesicular monoamine transporters (VMAT1/SLC18A1 and VMAT2/SLC18A2). After release into the synapse or the bloodstream, catecholamines are accumulated through the action cell-surface transporters, primarily the dopamine (DAT/SLC6A3) and norepinephrine transporter (NET/SLC6A2). The primary routes of metabolism of these catecholamines are oxidation via monoamine oxidase activities of methylation via catechol O-methyltransferase.

| Nomenclature         | Tyrosine aminotransferase | L-Tyrosine hydroylase | Dopamine beta-hydroxylase (dopamine beta-monoxygenase) |

- Phenylethanolamine N-methyltransferase
- Catechol-O-methyltransferase

### Common abbreviation
- AADC
- PNMT
- COMT

### HGNC, UniProt
- DDC, P20711
- PNMT, P11086
- COMT, P21964

### EC number
- 4.1.1.28: levodopa \( \rightarrow \) dopamine + CO\(_2\)
- 5-hydroxy-L-trytophan \( \rightarrow \) 5-hydroxytryptamine + CO\(_2\)
- This enzyme also catalyses the following reaction::
  - L-tryptophan \( \rightarrow \) tryptamine + CO\(_2\)

### Endogenous substrates
- levodopa, 5-hydroxy-L-tryptophan, L-tryptophan

### Products
- 5-hydroxytryptamine
- dopamine

### Cofactors
- pyridoxal 5-phosphate
- S-adenosyl methionine

### Inhibitors
- LY134046 (pKi 7.6) [186]

### Selective inhibitors
- 3-hydroxybenzylhydrazine, L-\(\alpha\)-methyldopa, benserazide [125], carbidopa

### Comments
- AADC is a homodimer.

### Nomenclature
- Monoamine oxidase A
- Monoamine oxidase B

### Common abbreviation
- MAO-A
- MAO-B

### HGNC, UniProt
- MAOA, P21397
- MAOB, P27338

### EC number
- 1.4.3.4

### Cofactors
- flavin adenine dinucleotide +
- rasagiline (pIC\(_{50}\) 7.8) [668], phenelzine (Irreversible inhibition) (pKi 7.8) [49], lazabemide (pKi 7.1) [230, 599], selegiline (pKi 5.7–6) [141, 413], tranylcypromine (pIC\(_{50}\) 4.7) [664]

### Inhibitors
- \(\text{flavin adenine dinucleotide} +\)
- rasagiline (pKi 7.1) [230, 599], selegiline (pKi 5.7–6) [141, 413], tranylcypromine (pIC\(_{50}\) 4.7) [664]

### Selective inhibitors
- safinamide (pKi 6.3) [48]

### Comments
- moclobemide (pKi 8.3) [284], phenelzine (Irreversible inhibition) (pKi 7.3) [49], tranylcypromine (pIC\(_{50}\) 4.7) [664], selegiline (pKi 4.2) [413], belfofoxatone [124], clorgiline, pinindole [406]
Ceramide turnover

**Overview:** Ceramides are a family of sphingophospholipids synthesized in the endoplasmic reticulum, which mediate cell stress responses, including apoptosis, autophagy and senescence. Serine palmitoyltransferase generates 3-ketosphinganine, which is reduced to sphinganine (dihydrosphingosine). N-Acylation allows the formation of dihydroceramides, which are subsequently reduced to form ceramides. Once synthesized, ceramides are trafficked from the ER to the Golgi bound to the ceramide transfer protein, CERT (COL4A3BP, Q9Y5P4). Ceramide can be metabolized via multiple routes, ensuring tight regulation of its cellular levels. Addition of phosphocholine generates sphingomyelin while carbohydrate is added to form glucosyl- or galactosylceramides. Ceramidase re-forms sphingosine or sphinganine from ceramide or dihydroceramide. Phosphorylation of ceramide generates ceramide phosphate. The determination of accurate kinetic parameters for many of the enzymes in the sphingolipid metabolic pathway is complicated by the lipophilic nature of the substrates.
Ceramide synthase

**Overview:** This family of enzymes, also known as sphingosine N-acyltransferase, is located in the ER facing the cytosol with an as-yet undefined topology and stoichiometry. Ceramide synthase *in vitro* is sensitive to inhibition by the fungal derived toxin, fumonisin B1.

| Nomenclature | Ceramide synthase 1 | Ceramide synthase 2 | Ceramide synthase 3 | Ceramide synthase 4 | Ceramide synthase 5 | Ceramide synthase 6 |

Sphingolipid Δ⁴-desaturase

**Overview:** DEGS1 and DEGS2 are 4TM proteins.

| Nomenclature | Delta 4-desaturase, sphingolipid 1 | Delta 4-desaturase, sphingolipid 2 |
|--------------|-----------------------------------|-----------------------------------|
| HGNC, UniProt | DEGS1, O15121                     | DEGS2, Q6QHC5                      |
| EC number    | 1.14.-.                           | 1.14.-.                           |
| Cofactors    | NAD                              | NAD                              |
| Inhibitors   | SKI II (pKᵢ 6.5) [107], R8M2-1B (pIC₅₀ 4.7) [73] | –                                 |
| Comments     | Myristoylation of DEGS1 enhances its activity and targets it to the mitochondria [37]. | –                                 |

**Comments:** DEGS1 activity is inhibited by a number of natural products, including curcumin and Δ⁹-tetrahydrocannabinol [163].

Sphingomyelin synthase

Enzymes → Ceramide turnover → Sphingomyelin synthase

**Overview:** Following translocation from the ER to the Golgi under the influence of the ceramide transfer protein, sphingomyelin synthases allow the formation of sphingomyelin by the transfer of phosphocholine from the phospholipid phosphatidylcholine. Sphingomyelin synthase-related protein 1 is structurally related but lacks sphingomyelin synthase activity.

| Nomenclature | sphingomyelin synthase 1 | sphingomyelin synthase 2 | sterile alpha motif domain containing 8 |
|--------------|-------------------------|-------------------------|---------------------------------------|
| HGNC, UniProt| SGMS1, Q8BVZ5            | SGMS2, Q8NHU3            | SAMD8, Q96LT4                         |
| EC number    | 2.7.8.27: ceramide + phosphatidylcholine -> sphingomyelin + diacylglycerol | 2.7.8.27: ceramide + phosphatidylcholine -> sphingomyelin + diacylglycerol | 2.7.8.-: ceramide + phosphatidylethanolamine -> ceramide phosphoethanolamine |
| Inhibitors   | compound 1j (pIC50 5.7) [350] | compound D24 (pIC50 4.9) [134] | –                                     |
| Comments     | –                       | Palmitylation of sphingomyelin synthase 2 may allow targeting to the plasma membrane [S85]. | –                                     |

Sphingomyelin phosphodiesterase

Enzymes → Ceramide turnover → Sphingomyelin phosphodiesterase

**Overview:** Also known as sphingomyelinase.

| Nomenclature | sphingomyelin phosphodiesterase 1 | sphingomyelin phosphodiesterase 2 | sphingomyelin phosphodiesterase 3 | sphingomyelin phosphodiesterase 4 | sphingomyelin phosphodiesterase acid-like 3A | sphingomyelin phosphodiesterase acid-like 3B |
|--------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|
| HGNC, UniProt| SMPD1, P17405                  | SMDP2, Q60906                  | SMDP3, Q9NY59                   | SMDP4, Q9NXE4                   | SMDP3A, Q92484                 | SMDP3B, Q92485                 |
| EC number    | 3.1.4.12: sphingomyelin -> ceramide + phosphocholine | 3.1.4.12: sphingomyelin -> ceramide + phosphocholine | 3.1.4.12: sphingomyelin -> ceramide + phosphocholine | 3.1.4.12: sphingomyelin -> ceramide + phosphocholine | 3.1.4.-: sphingomyelin -> ceramide + phosphocholine | 3.1.4.-: sphingomyelin -> ceramide + phosphocholine |
| Inhibitors   | inhibitor A (pK<sub>i</sub> 5.8) [663] – Bovine | –                              | –                              | –                              | –                              | –                              |

Inhibitors – inhibitor A (pK<sub>i</sub> 5.8) [663] – Bovine

Comments – Palmitoylation of sphingomyelin synthase 2 may allow targeting to the plasma membrane [S85].
### Neutral sphingomyelinase coupling factors

**Overview:** Protein FAN [4] and polycomb protein EED [469] allow coupling between TNF receptors and neutral sphingomyelinase phosphodiesterases.

| Nomenclature                              | Description                                      |
|-------------------------------------------|--------------------------------------------------|
| embryonic ectoderm development           | neutral sphingomyelinase activation associated factor |

| HGNC, UniProt   | EED, O75530        |
|-----------------|--------------------|
| Selective inhibitors | A-395 (Binding) (pKᵢ 9.4) [252] |

### Ceramide glucosyltransferase

**Overview:** Glucoceramides are an extended family of sphingolipids, differing in the content and organization of the sugar moieties, as well as the acyl sidechains.

| Nomenclature                                      | Description                                      |
|---------------------------------------------------|--------------------------------------------------|
| UDP-glucose ceramide glucosyltransferase          | glucoceramides                                    |

| HGNC, UniProt | UGCC, Q16739 |
|---------------|--------------|
| EC number     | 2.4.1.80: UDP-glucose + ceramide = uridine diphosphate + glucosylceramide |
| Inhibitors    | miglustat (pKᵢ 5.1) [68] |
| Comments      | Glycoceramides are an extended family of sphingolipids, differing in the content and organization of the sugar moieties, as well as the acyl sidechains. |

### Acid ceramidase

**Overview:** The six human ceramidases may be divided on the basis of pH optimae into acid, neutral and alkaline ceramidases, which also differ in their subcellular location.

| Nomenclature                                      | Description                                      |
|---------------------------------------------------|--------------------------------------------------|
| N-acylsphingosine amidohydrolase 1                |                                                  |

| HGNC, UniProt | ASAHI, Q13510 |
|---------------|---------------|
| EC number     | 3.5.1.23: ceramide -> sphingosine + a fatty acid |
| Comments      | This lysosomal enzyme is proteolysed to form the mature protein made up of two chains from the same gene product [318]. |
Neutral ceramidases

Enzymes → Ceramide turnover → Neutral ceramidases

Overview: The six human ceramidases may be divided on the basis of pH optima into acid, neutral and alkaline ceramidases, which also differ in their subcellular location.

| Nomenclature | Neutral ceramidase 1 | Neutral ceramidase 2 | Neutral ceramidase 3 |
|--------------|----------------------|----------------------|----------------------|
| HGNC, UniProt| ACER1, Q8TDN7        | ACER2, Q5QJU3        | ACER3, Q9NUN7        |
| EC number   | 3.5.1.23: ceramide -> sphingosine + a fatty acid | 3.5.1.23: ceramide -> sphingosine + a fatty acid | 3.5.1.23: ceramide -> sphingosine + a fatty acid |
| Comments    | ACER1 is associated with the ER [572]. | ACER2 is associated with the Golgi apparatus [657]. | ACER3 is associated with the ER and Golgi apparatus [391]. |

Comments: ASAH2B appears to be an enzymatically inactive protein, which may result from gene duplication and truncation.

Alkaline ceramidases

Enzymes → Ceramide turnover → Alkaline ceramidases

Overview: The six human ceramidases may be divided on the basis of pH optima into acid, neutral and alkaline ceramidases, which also differ in their subcellular location.

| Nomenclature | Alkaline ceramidase 1 | Alkaline ceramidase 2 | Alkaline ceramidase 3 |
|--------------|----------------------|----------------------|----------------------|
| HGNC, UniProt| ACER1, Q8TDN7        | ACER2, Q5QJU3        | ACER3, Q9NUN7        |
| EC number   | 3.5.1.23: ceramide -> sphingosine + a fatty acid | 3.5.1.23: ceramide -> sphingosine + a fatty acid | 3.5.1.23: ceramide -> sphingosine + a fatty acid |
| Comments    | ACER1 is associated with the ER [572]. | ACER2 is associated with the Golgi apparatus [657]. | ACER3 is associated with the ER and Golgi apparatus [391]. |
Ceramide kinase

Enzymes → Ceramide turnover → Ceramide kinase

Nomenclature  ceramide kinase

HGNC, UniProt  CERK, Q8TCT0

EC number  2.7.1.138: ceramide + ATP -→ ceramide 1-phosphate + ADP

Inhibitors  NVP 231 (pIC$_{50}$ 7.9) [214]

Comments: A ceramide kinase-like protein has been identified in the human genome (CERKL, Q49MI3).

Chromatin modifying enzymes

Overview: Chromatin modifying enzymes, and other chromatin-modifying proteins, fall into three broad categories: writers, readers and erasers. The function of these proteins is to dynamically maintain cell identity and regulate processes such as differentiation, development, proliferation and genome integrity via recognition of specific 'marks' (covalent post-translational modifications) on histone proteins and DNA [325]. In normal cells, tissues and organs, precise co-ordination of these proteins ensures expression of only those genes required to specify phenotype or which are required at specific times, for specific functions. Chromatin modifications allow DNA modifications not coded by the DNA sequence to be passed on through the genome and underlies heritable phenomena such as X chromosome inactivation, aging, heterochromatin formation, reprogramming, and gene silencing (epigenetic control).

To date at least eight distinct types of modifications are found on histones. These include small covalent modifications such as acetylation, methylation, and phosphorylation, the attachment of larger modifiers such as ubiquitination or sumoylation, and ADP ribosylation, proline isomerization and deimination. Chromatin modifications and the functions they regulate in cells are reviewed by Kouzarides (2007) [325].

Writer proteins include the histone methyltransferases, histone acetyltransferases, some kinases and ubiquitin ligases. Readers include proteins which contain methyl-lysine-recognition motifs such as bromodomains, chromodomains, tudor domains, PHD zinc fingers, PWWP domains and MBT domains.

Erasers include the histone demethylases and histone deacetylases (HDACs and sirtuins).

Dysregulated epigenetic control can be associated with human diseases such as cancer [161], where a wide variety of cellular and protein aberrations are known to perturb chromatin structure, gene transcription and ultimately cellular pathways [35, 544]. Due to the reversible nature of epigenetic modifications, chromatin regulators are very tractable targets for drug discovery and the development of novel therapeutics. Indeed, small molecule inhibitors of writers (e.g. azacitidine and decitabine target the DNA methyltransferases DNMT1 and DNMT3 for the treatment of myelodysplastic syndromes [199, 637]) and erasers (e.g. the HDAC inhibitors vorinostat, romidepsin and belinostat for the treatment of T-cell lymphomas [177, 309]) are already being used in the clinic. The search for the next generation of compounds with improved specificity against chromatin-associated proteins is an area of intense basic and clinical research [71]. Current progress in this field is reviewed by Simo-Riudalbas and Esteller (2013) [545].

2.1.1.- Protein arginine N-methyltransferases

Overview: Protein arginine N-methyltransferases (PRMT, EC 2.1.1.1) encompass histone arginine N-methyltransferases (PRMT4, PRMT7, EC 2.1.1.125) and myelin basic protein N-methyltransferases (PRMT7, EC 2.1.1.126). They are dimeric or tetrameric enzymes which use S-adenosyl methionine as a methyl donor, generating S-adenosylhomocysteine as a by-product. They generate both mono-methylated and dimethylated products; these may be symmetric (SDMA) or asymmetric (N\textsuperscript{G,N\textsuperscript{G}}-dimethyl-L-arginine) versions, where both guanine nitrogens are monomethylated or one of the two is dimethylated, respectively.

Information on members of this family may be found in the online database.
Overview: Histone deacetylases act as erasers of epigenetic acetylation marks on lysine residues in histones. Removal of the acetyl groups facilitates tighter packing of chromatin (heterochromatin formation) leading to transcriptional repression. The histone deacetylase family has been classified into five subfamilies based on phylogenetic comparison with yeast homologues:

- Class I contains HDACs 1, 2, 3 and 8
- Class IIa contains HDACs 4, 5, 7 and 9
- Class IIb contains HDACs 6 and 10
- Class III contains the sirtuins (SIRT1-7)
- Class IV contains only HDAC11.

Class III contains the sirtuins (SIRT1-7)
Class IV contains only HDAC11.

Dysregulated HDAC activity has been identified in cancer cells and tumour tissues [355, 509], making HDACs attractive molecular targets in the search for novel mechanisms to treat cancer [639]. Several small molecule HDAC inhibitors are already approved for clinical use: romidepsin, belinostat, vorinostat, panobinostat, belinostat, valproic acid and tucidinostat. HDACs and HDAC inhibitors currently in development as potential anti-cancer therapeutics are reviewed by Simó-Rualbas and Esteller (2015) [545].

Nomenclature
- histone deacetylase 6
- HGNC, UniProt: HDAC6, Q9UBN7
- EC number: 3.5.1.98
- Inhibitors: trichostatin A (pKᵢ 9) [61], vorinostat (pKᵢ 8.8) [61], romidepsin (pKᵢ 8) [61]
- Selective inhibitors: ricolinostat (pIC₅₀ 8.3) [518]

Cyclic nucleotide turnover/signalling

Overview: Cyclic nucleotides are second messengers generated by cyclase enzymes from precursor triphosphates and hydrolysed by phosphodiesterases. The cellular actions of these cyclic nucleotides are mediated through activation of protein kinases (cAMP- and cGMP-dependent protein kinases), ion channels (cyclic nucleotide-gated, CNG, and hyperpolarization and cyclic nucleotide-gated, HCN) and guanine nucleotide exchange factors (GEFs, Epac).

Adenylyl cyclases (ACs)

Overview: Adenylyl cyclase, E.C. 4.6.1.1, converts ATP to cyclic AMP and pyrophosphate. Mammalian membrane-delimited adenylyl cyclases (nomenclature as approved by the NC-IUPHAR Subcommittee on Adenylyl cyclases) are typically made up of two clusters of six TM domains separating two intracellular, overlapping catalytic domains that are the target for the nonselective activators Gαs (the stimulatory G protein α subunit) and forskolin (except AC9, [479]). Adenosine and its derivatives (e.g. 2',5'-dideoxyadenosine), acting through the P-site, are inhibitors of adenylyl cyclase activity [594]. Four families of membranous adenylyl cyclase are distinguishable: calmodulin (CALM1 CALM2 CALM3, P62158)-stimulated (AC1, AC3 and AC8), Ca^{2+}- and Gβγ-inhibitable (AC5, AC6 and AC9), Gβγ-stimulated and Ca^{2+}-insensitive (AC2, AC4 and AC7), and forskolin-insensitive (AC9) forms. A soluble adenylyl cyclase (AC10) lacks membrane spanning regions and is insensitive to G proteins. It functions as a cytoplasmic bicarbonate (pH-insensitive) sensor [93].

| Nomenclature | adenylyl cyclase 1 | adenylyl cyclase 2 | adenylyl cyclase 3 | adenylyl cyclase 4 | adenylyl cyclase 5 |

Exchange protein activated by cyclic AMP (EPACs)

Enzymes → Cyclic nucleotide turnover/signalling → Exchange protein activated by cyclic AMP (EPACs)

**Overview:** Epacs are members of a family of guanine nucleotide exchange factors (ENSFM00250000000899), which also includes RapGEFS (GFR, KIAA0277, MR-GEF, Q92565) and RapGEFL1 (Link-GEFII, Q9UHV5). They are activated endogenously by cyclic AMP and with some pharmacological selectivity by 8-pCPT-2'-O-Me-cAMP [158]. Once activated, Epacs induce an enhanced activity of the monomeric G proteins, Rap1 and Rap2 by facilitating binding of guanosine-5'-triphosphate in place of guanosine 5'-diphosphate, leading to activation of phospholipase C [524].

| Nomenclature | Common abbreviation | Epac1 | Epac2 |

Phosphodiesterases, 3',5'-cyclic nucleotide (PDEs)

Enzymes → Cyclic nucleotide turnover/signalling → Phosphodiesterases, 3',5'-cyclic nucleotide (PDEs)

**Overview:** 3',5'-Cyclic nucleotide phosphodiesterases (PDEs, 3',5'-cyclic-nucleotide 5'-nucleotidohydrolase). E.C. 3.1.4.17, catalyse the hydrolysis of a 3',5'-cyclic nucleotide (usually cyclic AMP or cyclic GMP). Isobutylmethylxanthine is a nonselective inhibitor with an IC50 value in the millimolar range for all isoforms except PDE 8A, 8B and 9A. A 2',3'-cyclic nucleotide 3'-phosphodiesterase (E.C. 3.1.4.37 CNPase) activity is associated with myelin formation in the development of the CNS.

| Selective inhibitors | – | mardepodect (pIC$_{50}$ 9.4) [613] | – |

Comments: PDE1A, 1B and 1C appear to act as soluble homodimers, while PDE2A is a membrane-bound homodimer. PDE3A and PDE3B are membrane-bound. PDE4 isoforms are essentially cyclic AMP specific. The potency of YM976 at other members of the PDE4 family has not been reported. PDE4B-D long forms are inhibited by extracellular signal-regulated kinase (ERK)-mediated phosphorylation [260, 261]. PDE4A-D splice variants can be membrane-bound or cytosolic [265]. PDE4 isoforms may be labelled with [$^3$H]Rolipram. PDE6 is a membrane-bound tetramer composed of two catalytic chains (PDE6A or PDE6C and PDE6B), an inhibitory chain (PDE6G or PDE6H) and the PDE6D chain. The enzyme is essentially cyclic GMP specific and is activated by the ε-subunit of transducin (Gε) and inhibited by sildenafil, zaprinast and dipyridamole with potencies lower than those observed for PDE5A. Defects in PDE6B are a cause of retinitis pigmentosa and congenital stationary night blindness.

Cytochrome P450

Overview: The cytochrome P450 enzyme family (CYP450), E.C. 1.14.-.-, were originally defined by their strong absorbance at 450 nm due to the reduced carbon monoxide-complexed haem component of the cytochromes. They are an extensive family of haem-containing monoxygenases with a huge range of both endogenous and exogenous substrates. These include sterols, fat-soluble vitamins, pesticides and carcinogens as well as drugs. The substrates of some orphan CYP are not known. Listed below are the human enzymes; their relationship with rodent CYP450 enzyme activities is obscure in that the species orthologue may not catalyse the metabolism of the same substrates. Although the majority of CYP450 enzyme activities are concentrated in the liver, the extra-hepatic enzyme activities also contribute to patho/physiological processes. Genetic variation of CYP450 isoforms is widespread and likely underlies a significant proportion of the individual variation to drug administration.

CYP1 family

| Nomenclature | CYP1A1 | CYP1A2 | CYP1B1 |
|--------------|--------|--------|--------|
| HGNC, UniProt | CYP1A1, P04798 | CYP1A2, P05177 | CYP1B1, Q16678 |
| EC number   | 1.14.1.1 | 1.14.1.1 | 1.14.1.1 |
| Inhibitors  | 5H3'FPE (pIC_{50} 7.4) [359] | 5H3'FPE (pIC_{50} 6.4) [359] | stilbenes [154] |
| Comments    | CYP1A1 is an extra-hepatic enzyme. It shows a preference for linear planar aromatic molecules [561]. | CYP1A2 is constitutively expressed in liver. It shows a preference for triangular planar aromatic molecules [561]. | Mainly expressed in extra-hepatic tissues. Can metabolise 17β-estradiol [154], leukotrienes and eicosanoids [146]. Mutations have been associated with primary congenital glaucoma [569]. |

## CYP3 family

**Enzymes → Cytochrome P450 → CYP3 family**

| Nomenclature | CYP3A4 | CYP3A5 | CYP3A7 | CYP3A43 |
|--------------|--------|--------|--------|---------|
| HGNC, UniProt | CYP3A4, P08684 | CYP3A5, P20815 | CYP3A7, P24462 | CYP3A43, Q9HB55 |
| EC number | 1.14.14.56: 1,8-cineole + NADPH + O2 = 2-exo-hydroxy-1,8-cineole + NADP⁺ + H₂O | 1.14.14.1 | 1.14.14.1 | 1.14.14.1 |
| | 1.14.13.97: Taurochenodeoxycholate + NADPH + O₂ = taurohyocholate + NADP⁺ + H₂O | 1.14.14.55: quinine + NADPH + O₂ = 3-hydroxyquinine + NADP⁺ + H₂O |  |  |
| Substrates | nifedipine [225], midazolam [641] | – | – | – |
| Inhibitors | troleandomycin (pKᵢ 7.8) [534], ketoconazole (pKᵢ 7) [217], ritonavir (pKᵢ > 7) [310] | ritonavir (pKᵢ 6.9) [175] | – | – |
| Comments | Metabolises a vast range of xenobiotics, including antidepressants, benzodiazepines, calcium channel blockers, and chemotherapeutic agents [675]. The active site is plastic, with both homotropic and heterotropic cooperativity observed with some substrates [534]. CYP3A4 catalyses the 25-hydroxylation of trihydroxycholestane in liver microsomes [189]. | CYP3A5 is expressed extrahepatically, including in the small intestine. It has overlapping substrate specificity with CYP3A4 [126, 641]. | Fetal form, rarely expressed in adults. Has overlapping substrate specificity with CYP3A4 [126, 641]. | Fetal expression only and considered an orphan fCYP [224]. Testosterone may be a substrate [220]. |

- 17-octadecynoic acid (pK_i 5.9) [537]

**Comments**
- Converts lauric acid to 12-hydroxylauric acid.
- Reported to be enzymatically inactive [191].
- Responsible for ω-hydroxylation of LTB_4, LXB_4 [415], and tocopherols, including vitamin E [559].
- Responsible for ω-hydroxylation of LTB_4, LXH_4 [415], and polyunsaturated fatty acids [168, 241].

| Nomenclature | CYP4F8 | CYP4F11 | CYP4F12 | CYP4F22 | CYP4V2 | CYP4X1 | CYP4Z1 |
|--------------|--------|---------|---------|---------|--------|--------|--------|
| HGNC, UniProt | CYP4F8, P98187 | CYP4F11, Q9HB16 | CYP4F12, Q9HC52 | CYP4F22, Q6NT55 | CYP4V2, Q6ZW13 | CYP4X1, Q8N118 | CYP4Z1, Q86W10 |
| EC number   | 1.14.14.1 | 1.14.14.1 | 1.14.14.1 | 1.14.14.1 | 1.14.14.1 | 1.14.14.1 | 1.14.14.1 |

**Comments**
- Converts PGH_2 to 19-hydroxyPGH_2 [69] and 8,9-EET or 11,12-EET to 18-hydroxy-8,9-EET or 18-hydroxy-11,12-EET [435].
- AC004597.1 (ENSG00000225607) is described as being highly similar to CYP4F12.
- Converts arachidonic acid to 16-HETE and 18-HETE [435].
- Converts myristic acid to 14-hydroxymyristic acid [429].
- Converts anandamide to 14,15-epoxyeicosatrienoic ethanolamide [566].
- Converts lauric acid to 12-hydroxylauric acid.
## CYP5, CYP7 and CYP8 families

**Enzymes → Cytochrome P450 → CYP5, CYP7 and CYP8 families**

| Nomenclature | CYP5A1 | CYP7A1 | CYP7B1 | CYP8A1 | CYP8B1 |

| EC number | 5.3.99.5: PGH₂ = thromboxane A₂ | 1.14.14.23 | 1.14.14.29 | 5.3.99.4 | 1.14.14.139 1.14.18.8 |
| Inhibitors | ozagrel (pIC₅₀ 8.4) [259] | – | – | compound 7p (pIC₅₀ > 6) [166] | – |
| Comments | Inhibited by dazoxiben [489], camonagrel [222] and furegrelate sodium (U-63557A; PubChem CID 23663954) [213]. Converts cholesterol to 7α-hydroxycholesterol [437]. | Converts dehydroepiandrosterone to 7α-DHEA [510]. | Converts PGH₂ to PGL₂ [244]. Inhibited by tranylcypromine [221]. | Converts 7α-hydroxycholesterol-4-en-3-one to 7α,12α-dihydroxycholesterol-4-en-3-one (in rabbit) [278] in the biosynthesis of bile acids. |
## CYP11, CYP17, CYP19, CYP20 and CYP21 families

**Enzymes → Cytochrome P450 → CYP11, CYP17, CYP19, CYP20 and CYP21 families**

| Nomenclature | CYP11A1 | CYP11B1 | CYP11B2 | CYP17A1 | CYP19A1 | CYP20A1 | CYP21A2 |
|--------------|---------|---------|---------|---------|---------|---------|---------|
| Common abbreviation | – | – | Aldosterone synthase | – | Aromatase | – | – |
| HGNC, UniProt EC number | CYP11A1, P05108 1.14.15.6 | CYP11B1, P15538 1.14.15.4 | CYP11B2, P19099 1.14.15.5 | CYP17A1, P05093 1.14.14.19 | CYP19A1, P11511 1.14.14.14 | CYP20A1, Q6UW02 1.14.-. | CYP21A2, P08686 1.14.14.16 |
| Inhibitors | mitotane [343, 353] | metyrapone (pIC₅₀ 7.8) [679], mitotane | osilodrostat (pIC₅₀ 9.7) [662] | abiraterone (pIC₅₀ 7.1–8.4) [472, 477] | anastrozole (pIC₅₀ 7.8) [424], aminogluthethimide [463] | – | (25,45)-ketoconazole (pIC₅₀ 5.3) [512] – Rat |
| Selective inhibitors | – | – | – | galeterone (pIC₅₀ 6.5) [238] | – | – | – |
| Comments | Converts cholesterol to pregnenolone plus 4-methylpentanal. | Converts deoxycortisone and 11-deoxycortisol to cortisol and cortisol, respectively. Loss-of-function mutations are associated with familial adrenal hyperplasia and hypertension. Inhibited by metyrapone [629] | Converts corticosterone to aldosterone | Converts pregnenolone and progesterone to 17α-hydroxyprogrenolone and 17α-hydroxyprogesterone, respectively. Converts 17α-hydroxyprogrenolone and 17α-hydroxyprogesterone to dehydroepiandrosterone and androstenedione, respectively. Converts corticosterone to cortisol. | Converts androstenedione and testosterone to estrone and 17β-estradiol, respectively. Inhibited by anastrozole [475], and letrozole [46] | Converts progesterone and 17α-hydroxyprogesterone to deoxycortisone and 11-deoxycortisol, respectively |
## CYP24, CYP26 and CYP27 families

**Enzymes → Cytochrome P450 → CYP24, CYP26 and CYP27 families**

| Nomenclature | CYP24A1 | CYP26A1 | CYP26B1 | CYP26C1 | CYP27A1 | CYP27B1 | CYP27C1 |
|--------------|---------|---------|---------|---------|---------|---------|---------|

DNA topoisomerases

Enzymes → DNA topoisomerases

Overview: DNA topoisomerases regulate the supercoiling of nuclear DNA to influence the capacity for replication or transcription. The enzymatic function of this series of enzymes involves cutting the DNA to allow unwinding, followed by re-attachment to reseal the backbone. Members of the family are targeted in anti-cancer chemotherapy.

| Nomenclature       | DNA topoisomerase I                      | DNA topoisomerase II alpha                  |
|--------------------|-----------------------------------------|---------------------------------------------|
| HGNC, UniProt      | TOP1, P11387                            | TOP2A, P11388                               |
| EC number          | 5.99.1.2                                 | 5.99.1.2                                    |
| Inhibitors         | irinotecan [148, 586] – Bovine           | etoposide (PCI50 7.3), teniposide [151] – Mouse |

Endocannabinoid turnover

Overview: The principle endocannabinoids are 2-acylglycerol esters, such as 2-arachidonoylglycerol (2-AG), and N-acylethanolamines, such as anandamide (N-arachidonoylethanolamine, AEA). The glycerol esters and ethanolamides are synthesised and hydrolysed by parallel, independent pathways. Mechanisms for release and re-uptake of endocannabinoids are unclear, although potent and selective inhibitors of facilitated diffusion of endocannabinoids across cell membranes have been developed [232]. FABP5 (Q01469) has been suggested to act as a canonical intracellular endocannabinoid transporter in vivo [99]. For the generation of 2-arachidonoylglycerol, the key enzyme involved is diacylglycerol lipase (DAGL), whilst several routes for anandamide synthesis have been described, the best characterized of which involves N-acylphosphatidylethanolamine-phospholipase D (NAPE-PLD, [543]). A transacylation enzyme which forms N-acylphosphatidylethanolamines has been identified as a cytosolic enzyme, PLA2G4E (Q3MJ16) [443]. In vitro experiments indicate that the endocannabinoids are also substrates for oxidative metabolism via cyclooxygenase, lipoxygenase and cytochrome P450 enzyme activities [14, 179, 555].
**N-Acylethanolamine turnover**

Enzymes → Endocannabinoid turnover → N-Acylethanolamine turnover

| Nomenclature | N-Acylphosphatidylethanolamine-phospholipase D | Fatty acid amide hydrolase | Fatty acid amide hydrolase-2 | N-Acylethanolamine acid amidase |
|--------------|-------------------------------------------------|-----------------------------|-----------------------------|-------------------------------|
| Common abbreviation | NAPE-PLD | FAAH | FAAH2 | NAAA |
| HGNC, UniProt | NAPEPLD, Q6IQ20 | FAAH, Q00519 | FAAH2, Q6CMR7 | NAAA, Q02083 |
| EC number | – | 3.5.1.99: anandamide + H2O ⇌ arachidonic acid + ethanolamine oleamide + H2O ⇌ oleic acid + NH3 | 3.5.1.99: anandamide + H2O ⇌ arachidonic acid + ethanolamine oleamide + H2O ⇌ oleic acid + NH3 | 3.5.1.- |
| Rank order of affinity | – | anandamide > oleamide > N-oleoylethanolamide > N-palmitoylethanolamine [634] | oleamide > N-oleoylethanolamide > anandamide > N-palmitoylethanolamine [634] | N-palmitoylethanolamine > MEA > SEA > N-oleoylethanolamide > anandamide [606] |
| Selective inhibitors | – | ASP8477 (pIC50 8.4) [628], NIH661010 (pIC50 7.8) [308], PF750 (pIC50 6.3–7.8) [7], OL135 (pIC50 7.4) [634], MM-433593 (pIC50 7) [634], URB8957 (pIC50 6.3–7) [634], PF3845 (pIC50 6.6) [8] | OL135 (pIC50 7.9–8.4) [305, 634], URB8957 (pIC50 7.5–8.3) [305, 634], ASP8477 (pIC50 7.2) [628] | F215 (pIC50 8.1) [348, 349], ARN726 (Irreversible inhibition) (pIC50 7.6) [499], S-OOPP (pIC50 6.4) [557] – Rat, CCP (pIC50 5.3) [601] |
| Comments | NAPE-PLD activity appears to be enhanced by polyamines in the physiological range [362], but fails to transphosphatidylate with alcohols [467] unlike phosphatidylcholine-specific phospholipase D. | – | The FAAH2 gene is found in many primate genomes, marsupials, and other distantly related vertebrates, but not a variety of lower placental mammals, including mouse and rat [634]. | – |

**Comments:** Routes for N-acylethanolamine biosynthesis other than through NAPE-PLD activity have been identified [602].
2-Acylglycerol ester turnover

Enzymes → Endocannabinoid turnover → 2-Acylglycerol ester turnover

Overview: ABHD12 is a 398-aa protein, with serine hydrolase activity. It has a molecular weight of 45 kDa. A single TM is predicted at 75-95, with an extracellular catalytic domain. ABHD12 is a monoacylglycerol hydrolase [432], but may also regulate lysophosphatidylserine levels [300]. Loss-of-function mutations in ABHD12 are associated with a disorder known as PHARC (polyneuropathy, hearing loss, ataxia, retinitis pigmentosa, and cataracts) [172].

| Nomenclature | Diacylglycerol lipase α | Diacylglycerol lipase β | Monoacylglycerol lipase | αβ-Hydrolase 6 | αβ-Hydrolase 12 |
|--------------|------------------------|------------------------|------------------------|----------------|----------------|
| Common abbreviation | DAGLα | DAGLβ | MAGL | ABHD6 | – |
| HGNC, UniProt | DAGL, Q9Y4D2 | DAGL, Q8NCG7 | MGLL, Q99685 | ABHD6, Q9BV23 | ABHD12, Q8N2K0 |
| EC number | 3.1.1.- | 3.1.1.- | 3.1.1.23 | 3.1.1.23 | 3.1.1.23 |
| Endogenous substrates | diacylglycerol | diacylglycerol | 2-oleoylglycerol = 2-arachidonoylglycerol > anandamide [204] | – | – |
| Inhibitors | LEI105 (pIC50 8.5) [30], DH376 (pIC50 8.2) [441], DO34 (pIC50 8.2) [441], KT-109 (pIC50 5.6) [268] | DH376 (pIC50 8.6) [441], DO34 (pIC50 8.1) [441], LEI105 (pIC50 8.1) [30], KT-109 (pIC50 7.1) [268] | MJN110 (pIC50 8) [436] | – | – |
| Selective inhibitors | – | – | JJKK 048 (pIC50 9.3) [1], KML29 (pIC50 8.5) [88], JZL184 (pIC50 8.1) [367] | – | – |
| Comments | – | – | – | – | – |

Comments on Endocannabinoid turnover: Many of the compounds described as inhibitors are irreversible and so potency estimates will vary with incubation time. FAAH2 is not found in rodents [634] and a limited range of inhibitors have been assessed at this enzyme activity. 2-arachidonoylglycerol has been reported to be hydrolysed by multiple enzyme activities from neural preparations [31], including ABHD6 (P08910) [412] and carboxylesterase 1 (CES1, P23141 [656]). ABHD2 (P08910) has also been described as a triacylglycerol lipase and ester hydrolase [384], while ABHD12 (Q8N2K0) is also able to hydrolyse lysophosphatidylserine [598]. ABHD12 (Q8N2K0) has been described to be inhibited selectively by pentacyclic triterpenoids, such as oleanolic acid [460].

Eicosanoid turnover

**Overview**: Eicosanoids are 20-carbon fatty acids, where the usual focus is the polyunsaturated analogue arachidonic acid and its metabolites. Arachidonic acid is thought primarily to derive from phospholipase A2 action on membrane phosphatidylcholine, and may be re-cycled to form phospholipid through conjugation with coenzyme A and subsequently glycerol derivatives. Oxidative metabolism of arachidonic acid is conducted through three major enzymatic routes: cyclooxygenases, lipoxygenases and cytochrome P450-like epoxygenases, particularly CYP2J2. Isoprostanes are structural analogues of the prostanoids (hence the nomenclature D-, E-, F-isoprostanes and isothromboxanes), which are produced in the presence of elevated free radicals in a non-enzymatic manner, leading to suggestions for their use as biomarkers of oxidative stress. Molecular targets for their action have yet to be defined.

Cyclooxygenase

**Overview**: Prostaglandin (PG) G/H synthase, most commonly referred to as cyclooxygenase (COX, \((5Z,8Z,11Z,14Z)\)-icosa-5,8,11,14-tetraenoate,hydrogen-donor : oxygen oxidoreductase) activity, catalyses the formation of \(\text{PGG}_2\) from arachidonic acid. Hydroperoxidase activity inherent in the enzyme catalyses the formation of \(\text{PGH}_2\) from \(\text{PGG}_2\). COX-1 and -2 can be nonspecifically inhibited by ibuprofen, ketoprofen, naproxen, indomethacin and paracetamol (acetaminophen). \(\text{PGH}_2\) may then be metabolised to prostaglandins and thromboxanes by various prostaglandin synthases in an apparently tissue-dependent manner.

| Nomenclature | COX-1 | COX-2 |

Overview: Subsequent to the formation of PGH₂, the cytochrome P450 activities thromboxane synthase (CYP5A1, TBXAS1, P24557, EC 5.3.99.5) and prostacyclin synthase (CYP8A1, PTGIS, Q16647, EC 5.3.99.4) generate thromboxane A₂ and prostacyclin (PGI₂), respectively. Additionally, multiple enzyme activities are able to generate prostaglandin E₂ (PGE₂), prostaglandin D₂ (PGD₂) and prostaglandin F₂α (PGF₂α). PGD₂ can be metabolised to 9α,11β-prostaglandin F₂α through the multifunctional enzyme activity of AKR1C3. PGE₂ can be metabolised to 9α,11β-prostaglandin F₂α through the 9-ketoreductase activity of CBR1. Conversion of the 15-hydroxyeicosanoids, including prostaglandins, lipoxins and leukotrienes to their keto derivatives by the NAD-dependent enzyme HPGD leads to a reduction in their biological activity.

| Comments | Inhibited by dazoxiben [489], camonagrel [222] and furegrelate sodium (U-63557A: PubChem CID 23663954) [213]. | Converts PGH₂ to PGI₂ [244]. Inhibited by tranilcypromine [221] | – | – | Phosphorylated and activated by casein kinase 2 (CK2) [317]. Appears to regulate steroid hormone function by interaction with dimeric hsp90 [85, 292]. |
### Nomenclature

| Nomenclature | H-PGDS | AKR1C3 | CBR1 | HPGD |
|--------------|--------|--------|------|------|
| HGNC, UniProt | *HPGDS*, O60760 | *AKR1C3*, P42330 | *CBR1*, P16152 | *HPGD*, P15428 |

### EC number

- 5.3.99.2: PGH₂ = PGD₂
  - 1.3.1.20
  - 1.1.1.188: PGD₂ + NADP⁺ = PGF₂α + NADPH + H⁺
  - 1.1.1.64
  - 1.1.1.239
  - 1.1.1.213
- 1.1.1.84
- 1.1.1.189: PGE₂ + NADP⁺ = PGF₂α + NADPH + H⁺
- 1.1.1.197

### Cofactors

- NADP⁺
- NADP⁺

### Inhibitors

- HQL-79 (pIC₅₀ 5.3–5.5) [19]
- tolfenamic acid (pKᵢ 8.1) [481]
- flufenamic acid
- indomethacin
- flavonoids such as 2’-Hydroxyflavanone (pIC₅₀ 6.5) [398, 550]
- wedelolactone (pIC₅₀ 5.4) [681]
- compound 3 (pIC₅₀ 8.1) [653]

### Comments

- AKR1C3 also exhibits an hydroxysteroid dehydrogenase activity.
- YS121 has been reported to inhibit mPGES1 and 5-LOX with a pIC₅₀ value of 5.5 [320].
Lipoxygenases

Enzymes → Eicosanoid turnover → Lipoxygenases

**Overview:** The lipoxygenases (LOXs) are a structurally related family of non-heme iron dioxygenases that function in the production, and in some cases metabolism, of fatty acid hydroperoxides. For arachidonic acid as substrate, these products are hydroperoxyeicosatetraenoic acids (HPETEs). In humans there are five lipoxygenases, the 5S-(arachidonate : oxygen 5-oxidoreductase), 12R-(arachidonate 12-lipoxygenase, 12R-type), 12S-(arachidonate : oxygen 12-oxidoreductase), and two distinct 15S-(arachidonate : oxygen 15-oxidoreductase) LOXs that oxygenate arachidonic acid in different positions along the carbon chain and form the corresponding 5S-, 12S-, 12R-, or 15S-hydroperoxides, respectively.

| Nomenclature | 5-LOX | 12R-LOX | 12S-LOX | 15-LOX-1 | 15-LOX-2 | E-LOX |
|--------------|-------|---------|---------|----------|----------|-------|
| HGNC, UniProt | ALOX5, P09917 | ALOX12B, O75342 | ALOX12, P18054 | ALOX15, P16050 | ALOX15B, O15296 | ALOXE3, Q9BYJ1 |
| EC number | 1.13.11.34: arachidonic acid + O2 → LT A4 + H2O | 1.13.11.31: arachidonic acid + O2 → 12R-HPETE | 1.13.11.31: arachidonic acid + O2 → 12S-HPETE | 1.13.11.33: arachidonic acid + O2 → 15S-HPETE | 1.13.11.33: arachidonic acid + O2 → 15S-HPETE | 1.13.11.33: arachidonic acid + O2 → 15S-HPETE |
| Substrates | – | methyl arachidonate | – | – | – | – |
| Endogenous substrates | arachidonic acid | – | – | – | – | 12R-HPETE |
| Endogenous activators | 5-LOX activating protein (ALOX5AP, P20292) | – | – | – | – | – |
| Endogenous inhibitors | Protein kinase A-mediated phosphorylation [379] | – | – | – | – | – |
| Inhibitors | – | – | – | ML351 (pIC50 6.7) [485] | compound 21n (pIC50 7.3) [636] | – |
| Selective inhibitors | CJ13610 (pIC50 7.2) [169], PF-04191834 (pIC50 6.6) [396], zileuton (pIC50 6.4) [81] | – | ML355 (pIC50 6.5) [374] | compound 34 (pKi > 8) [486] | – | – |
| Comments | FLAP activity can be inhibited by MK-886 [147] and BAY-X1005 [245] leading to a selective inhibition of 5-LOX activity | – | – | – | Inhibited by MLS000536924 (pKi 5.6) [286]. | E-LOX metabolises the product from the 12R-lipoxygenase (12R-HPETE) to a specific epoxyalcohol compound [669]. |

**Comments:** An 8-LOX (EC 1.13.11.40, arachidonate:oxygen 8-oxidoreductase) may be the mouse orthologue of 15-LOX-2 [190]. Some general LOX inhibitors are nordihydroguaiaretic acid and esculetin. Zileuton and caffeic acid are used as 5-lipoxygenase inhibitors, while baicalein and CDC are 12-lipoxygenase inhibitors. The specificity of these inhibitors has not been rigorously assessed with all LOX forms: baicalein, along with other flavonoids, such as fisetin and luteolin, also inhibits 15-LOX-1 [514].

Leukotriene and lipoxin metabolism

Overview: Leukotriene A4 (LTA4), produced by 5-LOX activity, and lipoxins may be subject to further oxidative metabolism; ω-hydroxylation is mediated by CYP4F2 and CYP4F3, while β-oxidation in mitochondria and peroxisomes proceeds in a manner dependent on coenzyme A conjugation. Conjugation of LTA4 at the 6 position with reduced glutathione to generate LTC4 occurs under the influence of leukotriene C4 synthase, with the subsequent formation of LTD4 and LTE4, all three of which are agonists at CysLT receptors. LTD4 formation is catalysed by γ-glutamyltransferase, and subsequently dipeptidase 2 removes the terminal γ-glutamyl group from LTD4 to generate LTE4. Leukotriene A4 hydrolase converts the 5,6-epoxide LTD4 to the 5,6-hydroxylated LTD4, an agonist for BLT receptors. LTD4 is also acted upon by 12S-LOX to produce the trihydroxyicosatetraenoic acids lipoxins LXA4 and LXB4. Treatment with a LTA4 hydrolase inhibitor in a murine model of allergic airway inflammation increased LXA4 levels, in addition to reducing LTD4 in lung lavage fluid [491]. LTA4 hydrolase is also involved in biosynthesis of resolvins. Aspirin has been reported to increase endogenous formation of 18S-hydroxyeicosapentaenoate (18S-HEPE) compared with 18R-HEPE, a resolvin precursor. Both enantiomers may be metabolised by human recombinant 5-LOX; recombinant LTA4 hydrolase converted chiral 5S(6S)-epoxide-containing intermediates to resolvins E1 and 18S-resolvins E1 [444].

| Nomenclature | Leukotriene C4 synthase | γ-Glutamyltransferase | Dipeptidase 1 | Dipeptidase 2 | Leukotriene A4 hydrolase |
|--------------|------------------------|----------------------|--------------|--------------|-------------------------|
| HGNC, UniProt | LTC4S, Q16873           | GGCT, O7522          | DPEP1, P16444| DPEP2, Q9H4A9| LT4H, P09960            |
| EC number    | 4.4.1.20: LTC4 = glutathione + LTA4 | 2.3.2.2: (5-L-glutamyl) - peptide + an amino acid = a peptide + a 5-L-glutamyl amino acid | 3.4.13.19: LTD4 + H2O = LTE4 + glycine | 3.4.13.19: LTD4 + H2O = LTE4 + glycine | 3.3.2.6 |
| Inhibitors   | example 36 (pIC50 8.1) [508], compound 39 (pIC50 <5.5) [541] | GGsTop (pKi 3.8) [235] | cilastatin (pKi 6) [215] | – | bestatin (pKi 5.4) [450] |

Comments: LT4H is a member of a family of arginyl aminopeptidases (ENSM000250000001673), which also includes aminopeptidase B (RNPEP, 9H4A4) and aminopeptidase B-like 1 (RNPEPL1, Q9HAU8). Dipeptidase 1 and 2 are members of a family of membrane dipeptidases, which also includes (DPEP3, 9H4BB8) for which LTD4 appears not to be a substrate.

### GABA turnover

**Overview:** The inhibitory neurotransmitter γ-aminobutyrate (GABA, 4-aminobutyrate) is generated in neurones by glutamic acid decarboxylase. GAD1 and GAD2 are differentially expressed during development, where GAD2 is thought to subserve a trophic role in early life and is distributed throughout the cytoplasm. GAD1 is expressed in later life and is more associated with nerve terminals [160] where GABA is principally accumulated in vesicles through the action of the vesicular inhibitory amino acid transporter SLC32A1. The role of γ-aminobutyraldehyde dehydrogenase (ALDH9A1) in neurotransmitter GABA synthesis is less clear. Following release from neurones, GABA may interact with either GABA_A or GABA_B receptors and may be accumulated in neurones and glia through the action of members of the SLC6 family of transporters. Successive metabolism through GABA transaminase and succinate semialdehyde dehydrogenase generates succinic acid, which may be further metabolized in the mitochondria in the tricarboxylic acid cycle.

| Nomenclature | Glutamic acid decarboxylase 1 | Glutamic acid decarboxylase 2 |
|--------------|-------------------------------|-------------------------------|
| Common abbreviation | GAD1                          | GAD2                          |
| HGNC, UniProt | GAD1, Q99259                  | GAD2, Q05329                  |
| EC number    | 4.1.1.15: L-glutamic acid + H⁺ → GABA + CO₂ | 4.1.1.15: L-glutamic acid + H⁺ → GABA + CO₂ |
| Endogenous substrates | L-glutamic acid, L-aspartic acid | L-glutamic acid, L-aspartic acid |
| Products     | GABA                          | GABA                          |
| Cofactors    | pyridoxal 5-phosphate         | pyridoxal 5-phosphate         |
| Selective inhibitors | s-allylglycine                 | s-allylglycine                 |
| Comments     | L-aspartic acid is a less rapidly metabolised substrate of mouse brain glutamic acid decarboxylase generating β-alanine [65]. Autoantibodies against GAD1 and GAD2 are elevated in type 1 diabetes mellitus and neurological disorders (see Further reading). |

Glycerophospholipid turnover

Overview: Phospholipids are the basic barrier components of membranes in eukaryotic cells divided into glycerophospholipids (phosphatidic acid, phosphatidylethanolamine, phosphatidylcholine, phosphatidylserine, phosphatidylinositol and its phosphorylated derivatives) and sphingolipids (ceramide phosphorylecholine and ceramide phosphorylethanolamine).

Phosphoinositide-specific phospholipase C

Overview: Phosphoinositide-specific phospholipase C (PLC, EC 3.1.4.11), catalyses the hydrolysis of PIP2 to IP3 and 1,2-diacylglycerol, each of which have major second messenger functions. Two domains, X and Y, essential for catalytic activity, are conserved in the different forms of PLC. Isoforms of PLC-β are activated primarily by G protein-coupled receptors through members of the Gq/11 family of G proteins. The receptor-mediated activation of PLC-γ involves their phosphorylation by receptor tyrosine kinases (RTK) in response to activation of a variety of growth factor receptors and immune system receptors. PLC-ε1 may represent a point of convergence of signalling via both G protein-coupled and catalytic receptors. Ca2+ ions are required for catalytic activity of PLC isoforms and have been suggested to be the major physiological form of regulation of PLC-δ activity. PLC has been suggested to be activated non-selectively by the small molecule m3M3FBS [29], although this mechanism of action has been questioned [330]. The aminosteroid U73122 has been described as an inhibitor of phosphoinositide-specific PLC [552], although its selectivity among the isoforms is untested and it has been reported to occupy the H1 histamine receptor [272].

### Overview
Phospholipase A₂ (PLA₂, EC 3.1.1.4) cleaves the sn-2 fatty acid of phospholipids, primarily phosphatidylcholine, to generate lysophosphatidylcholine and arachidonic acid. Most commonly-used inhibitors (e.g., bromoenol lactone, arachidonyl trifluoromethyl ketone or methyl arachidonyl fluorophosphonate) are either non-selective within the family of phospholipase A₂ enzymes or have activity against other eicosanoid-metabolising enzymes.

**Selective inhibitors**

- rilapladib (Competitive)

**Comments**

The sequence of PLA<sub>2</sub>-2C suggests a lack of catalytic activity, while PLA<sub>2</sub>-12B (GXIIB, GXIII sPLA<sub>2</sub>-like) appears to be catalytically inactive [513]. A further fragment has been identified with sequence similarities to Group II PLA<sub>2</sub> members. Otoconin 90 (OC90) shows sequence homology to PLA<sub>2</sub>-G10.

A binding protein for secretory phospholipase A<sub>2</sub> has been identified which shows modest selectivity for sPLA<sub>2</sub>-1B over sPLA<sub>2</sub>-2A, and also binds snake toxin phospholipase A<sub>2</sub> [16]. The binding protein appears to have clearance function for circulating secretory phospholipase A<sub>2</sub>, as well as signalling functions, and is a candidate antigen for idiopathic membraneous nephropathy [38].

PLA<sub>2</sub>-G7 and PAFAH2 also express platelet-activating factor acetylhydrolase activity (EC 3.1.1.47).

Phosphatidylcholine-specific phospholipase D

**Overview**: Phosphatidylcholine-specific phospholipase D (PLD, EC 3.1.4.4) catalyses the formation of phosphatidic acid from phosphatidylcholine. In addition, the enzyme can make use of alcohols, such as butanol in a transphosphatidylation reaction [490].

| Nomenclature | PLD1 | PLD2 | PLD3 | PLD4 | PLD5 |
|--------------|------|------|------|------|------|
| HGNC, UniProt | PLD1, Q13393 | PLD2, O14939 | PLD3, Q8IV08 | PLD4, Q96BZ4 | PLD5, Q8N7P1 |

**Comments**: A lysophospholipase D activity (ENPP2, Q13822, also known as ectonucleotide pyrophosphatase/phosphodiesterase 2, phosphodiesterase 1, nucleotide pyrophosphatase 2, autotaxin) has been described, which not only catalyses the production of lysophosphatidylcholine (LPA) from lysophosphatidylcholine, but also cleaves ATP (see Goding et al., 2003 [209]). Additionally, an N-acylthanolamine-specific phospholipase D (NAPEPLD, Q6lQ20) has been characterized, which appears to have a role in the generation of endocannabinoids/endovanilloids, including anandamide [448]. This enzyme activity appears to be enhanced by polyamines in the physiological range [362] and fails to transphosphatidylate with alcohols [467]. Three further, less well-characterised isoforms are PLD3 (PLD3, Q8IV08, other names Choline phosphatase 3, HindIII K4L homolog, Hu-K4), PLD4 (PLD4, Q96BZ4, other names Choline phosphatase 4, Phosphatidylcholine-hydrolyzing phospholipase, D4C14orf175 UNQ2488/PRO5775) and PLD5 (PLD5, Q8N7P1). PLD3 has been reported to be involved in myogenesis [451]. PLD4 is described not to have phospholipase D catalytic activity [665], but has been associated with inflammatory disorders [447, 574, 593]. Sequence analysis suggests that PLD5 is catalytically inactive.

Lipid phosphate phosphatases

Overview: Lipid phosphate phosphatases, divided into phosphatidic acid phosphatases or lipins catalyse the dephosphorylation of phosphatidic acid (and other phosphorylated lipid derivatives) to generate inorganic phosphate and diacylglycerol. PTEN, a phosphatase and tensin homolog (BZS, MHAM, MMAC1, PTEN1, TEP1) is a phosphatidylinositol 3,4,5-trisphosphate 3-phosphatase which acts as a tumour suppressor by reducing cellular levels of PI 3,4,5-P₃, thereby toning down activity of PDK1 and PKB. Loss-of-function mutations are frequently identified as somatic mutations in cancers.

Phosphatidylinositol kinases

Overview: Phosphatidylinositol may be phosphorylated at either 3- or 4-positions on the inositol ring by PI 3-kinases or PI 4-kinases, respectively. Phosphatidylinositol 3-kinases Phosphatidylinositol 3-kinases (PI3K, provisional nomenclature) catalyse the introduction of a phosphate into the 3-position of phosphatidylinositol (PI), phosphatidylinositol 4-phosphate (PIP) or phosphatidylinositol 4,5-bisphosphate (PIP2). There is evidence that PI3K can also phosphorylate serine/threonine residues on proteins. In addition to the classes described below, further serine/threonine protein kinases, including ATM (Q13315) and mTOR (P42345), have been described to phosphorylate phosphatidylinositol and have been termed PI3K-related kinases. Structurally, PI3Ks have common motifs of at least one C2, calcium-binding domain and helical domains, alongside structurally-conserved catalytic domains. Wortmannin and LY 294002 are widely-used inhibitors of PI3K activities. Wortmannin is irreversible and shows modest selectivity between Class I and Class II PI3K, while LY294002 is reversible and selective for Class I compared to Class II PI3K.

Class I PI3Ks (EC 2.7.1.153) phosphorylate phosphatidylinositol 4,5-bisphosphate to generate phosphatidylinositol 3,4,5-trisphosphate and are heterodimeric, matching catalytic and regulatory subunits. Class IA PI3Ks include p110α, p110β and p110δ catalytic subunits, with predominantly p85 and p55 regulatory subunits. The single catalytic subunit that forms Class IB PI3K is p110γ. Class IA PI3Ks are more associated with receptor tyrosine kinase pathways, while the Class IB PI3K is linked more with GPCR signalling.
Class II PI3Ks (EC 2.7.1.154) phosphorylate phosphatidylinositol to generate phosphatidylinositol 3-phosphate (and possibly phosphatidylinositol 4-phosphate to generate phosphatidylinositol 3,4-bisphosphate). Three monomeric members exist, PI3K-C2α, β and δ, and include Ras-binding, Phox homology and two C2domains. The only class III PI3K isoform (EC 2.7.1.137) is a heterodimer formed of a catalytic subunit (VPS34) and regulatory subunit (VPS15).

Phosphatidylinositol 4-kinases (EC 2.7.1.67) generate phosphatidylinositol 4-phosphate and may be divided into higher molecular weight type III and lower molecular weight type II forms.

Phosphatidylinositol-4,5-bisphosphate 3-kinase family

Enzymes → Kinases (EC 2.7.x.x) → Lipid modifying kinases → Phosphatidylinositol-4,5-bisphosphate 3-kinase family

**Overview:** PI3K activation is one of the most important signal transduction pathways used to transmit signals from cell-surface receptors to regulate intracellular processes (cell growth, survival, proliferation and movement). PI3K catalytic (and regulatory) subunits play vital roles in normal cell function and in disease. Progress made in developing PI3K-targeted agents as potential therapeutics for treating cancer and other diseases is reviewed by Fruman et al. (2017) [182].

Sphingosine kinase

Overview: SphK1 and SphK2 are encoded by different genes with some redundancy of function; genetic deletion of both SphK1 and Sphk2, but not either alone, is embryonic lethal in mice. There are splice variants of each isoform (SphK1a-c and SphK2a, b), distinguished by their N-terminal sequences. SphK1 and SphK2 differ in tissue distribution, sub-cellular localisation, biochemical properties and regulation. They regulate discrete pools of S1P. Receptor stimulation induces SphK1 translocation from the cytoplasm to the plasma membrane. SphK1 translocation is regulated by phosphorylation/dephosphorylation, specific protein:protein interactions and interaction with specific lipids at the plasma membrane. SphK1 is a dimeric protein, as confirmed by its crystal structure which forms a positive cluster, between protomers, essential for interaction with anionic phospholipids in the plasma membrane. SphK2 is localised to the ER or associated with mitochondria or shuttles in/out of the nucleus, regulated by phosphorylation. Intracellular targets of nuclear S1P include the catalytic subunit of telomerase (TERT) and regulators of gene expression including histone deacetylases (HDAC 1/2) and peroxisome proliferator-activated receptor gamma (PPARγ). SphK2 phosphorylates the pro-drug FTY720 (fingolimod, which is used to treat some forms of multiple sclerosis) to a mimic of S1P and that acts as a functional antagonist of S1P1 receptors. Inhibitors of SphK1 and SphK2 have therapeutic potential in many diseases.

| Nomenclature | sphingosine kinase 1 | sphingosine kinase 2 |
|---------------|----------------------|----------------------|
| Common abbreviation | SphK1 | SphK2 |
| HGNC, UniProt | SPHK1, Q9NYA1 | SPHK2, Q9NAO |
| EC number | 2.7.1.91: sphingosine + ATP = sphingosine 1-phosphate + ADP | 2.7.1.91: sphingosine + ATP = sphingosine 1-phosphate + ADP |
| EC number | dihydro sphingosine + ATP = sphingosine 1-phosphate + ADP | dihydro sphingosine + ATP = sphingosine 1-phosphate + ADP |
| Cofactors | Mg\(^{2+}\) [536] | Mg\(^{2+}\) |
| Inhibitors | SKI II (pKi 4.8) [181], MP-A08 (pIC\(_{50}\) 4.6) [474] | MP-A08 (pKi 5.2) [474], SKI II (pKi 5.1) [196] |
| Selective inhibitors | PF-S43 (pKi 8.4) [527] | SLC4101431 (pKi 7.1) [100], compound 27d (pIC\(_{50}\) 6.8) [526], opaganib (pKi 5) [181], ROMe (pKi 4.8) [354] |
| Comments | SK1 inhibitors induce its proteasomal degradation [373, 404]. SK1 crystal structures confirm that it is dimeric [5]; there is no crystal structure available for SK2. | There is no crystal structure available for SK2. |

Comments: MP-A08 is competitive with ATP; other SphK inhibitors are competitive with sphingosine. ABC294640 (opaganib) has known off-target effects on dihydroceramide desaturase (DEGS1) [404, 610] and induces proteasomal degradation of SK1 [404]. ABC294640 is in clinical trials for advanced cholangiocarcinoma, advanced hepatocellular carcinoma and refractory/relapsed multiple myeloma (to view ClinicalTrials.gov list click here).

Haem oxygenase

Enzymes → Haem oxygenase

Overview: Haem oxygenase (heme,hydrogen-donor:oxygen oxidoreductase (α-methene-oxidizing, hydroxylating)), E.C. 1.14.99.3, converts *heme* into *biliverdin* and carbon monoxide, utilizing NADPH as cofactor.

Searchable database: http://www.guidetopharmacology.org/index.jsp
Full Contents of ConciseGuide: http://onlinelibrary.wiley.com/doi/10.1111/bph.14752/full
Nomenclature | Haem oxygenase 1 | Haem oxygenase 2
Common abbreviation | HO1 | HO2
HGNC, UniProt | HMOX1, P09601 | HMOX2, P30519
EC number | 1.14.14.18 | 1.14.14.18
Inhibitors | – | compound 1 (pIC50 3.5) [616] – Rat

Protoheme + 3 [reduced NADPH-hemoprotein reductase] + 3 O(2) \(\rightleftharpoons\) biliverdin + Fe(2+) + CO + 3 [oxidized NADPH-hemoprotein reductase] + 3 H(2)O

Protoheme + 3 [reduced NADPH–hemoprotein reductase] + 3 O(2) \(\rightleftharpoons\) biliverdin + Fe(2+) + CO + 3 [oxidized NADPH–hemoprotein reductase] + 3 H(2)O

**Comments:** The existence of a third non-catalytic version of haem oxygenase, HO3, has been proposed, although this has been suggested to be a pseudogene [250]. The chemical tin protoporphyrin IX acts as a haem oxygenase inhibitor in rat liver with an IC50 value of 11 nM [152].

Hydrogen sulphide synthesis

**Overview:** Hydrogen sulfide is a gasotransmitter, with similarities to nitric oxide and carbon monoxide. Although the enzymes indicated below have multiple enzymatic activities, the focus here is the generation of hydrogen sulphide (H$_2$S) and the enzymatic characteristics are described accordingly. Cystathionine β-synthase (CBS) and cystathionine γ-lyase (CSE) are pyridoxal phosphate (PLP)-dependent enzymes. 3-mercaptopurvate sulfo transferase (3-MPST) functions to generate H$_2$S; only CAT is PLP-dependent, while 3-MPST is not. Thus, this third pathway is sometimes referred to as PLP-independent. CBS and CSE are predominantly cytosolic enzymes, while 3-MPST is found both in the cytosol and the mitochondria. For an authoritative review on the pharmacological modulation of H$_2$S levels, see Szabo and Papa petropoulos, 2017 [575].

| Nomenclature | Cystathionine β-synthase | Cystathionine γ-lyase | L-Cysteine:2-oxoglutarate aminotransferase | 3-Mercaptopurvate sulfo transferase |
|--------------|--------------------------|-----------------------|-----------------------------------------------|-----------------------------------|
| Common abbreviation | CBS | CSE | CAT | MPST |
| HGNC, UniProt | CBS, P35520 | CTTH, P32929 | KTYAT1, Q16773 | MPST, P25325 |
| EC number | 4.2.1.22 | 4.4.1.1 | 4.4.1.13 | 2.8.1.2 |
| Endogenous substrates | L-cysteine (Km 6x10$^{-3}$M) [92], L-homocysteine [92] | L-cysteine | L-cysteine | 3-mercapto pyruvic acid (Km 1.2x10$^{-3}$M) [426] |
| Products | cystathionine | NH$_3$, pyruvic acid | NH$_3$, pyruvic acid | pyruvic acid |
| Cofactors | pyridoxal 5-phosphate | pyridoxal 5-phosphate | pyridoxal 5-phosphate | Zn$^{2+}$ |
| Inhibitors | aminoxy acetic acid (pIC$_{50}$ 5.1) [20] | aminooxy vinylglycine (pIC$_{50}$ 6) [20], aminooxy acetic acid (pIC$_{50}$ 6) [20], β-Cyano-L-alanine (pIC$_{50}$ 5.8) [20], propargylglycine (pIC$_{50}$ 4.4) [20] | L3MT-3 (pIC$_{50}$ 5.6) [237] | – |

Hydrolases

**Overview:** Listed in this section are hydrolases not accumulated in other parts of the Concise Guide, such as monoacylglycerol lipase and acetylcholinesterase. Pancreatic lipase is the predominant mechanism of fat digestion in the alimentary system; its inhibition is associated with decreased fat absorption. CES1 is present at lower levels in the gut than CES2 [P23141], but predominates in the liver, where it is responsible for the hydrolysis of many aliphatic, aromatic and steroid esters. Hormone-sensitive lipase is also a relatively non-selective esterase associated with steroid ester hydrolysis and triglyceride metabolism, particularly in adipose tissue. Endothelial lipase is secreted from endothelial cells and regulates circulating cholesterol in high density lipoproteins.
| Nomenclature | pancreatic lipase | lipase E, hormone sensitive type | lipase G, endothelial type | carboxylesterase 1 | ectonucleoside triphosphate diphosphohydrolase 1 | ectonucleoside triphosphate diphosphohydrolase 2 |
|--------------|------------------|-------------------------------|--------------------------|-----------------|----------------------------------|----------------------------------|
| Systematic nomenclature | – | – | – | – | – | – |
| Common abbreviation | PNLIP | LIPE | LIPG | CES1 | NTPDase-1 | NTPDase-2 |
| HGNC, UniProt | PNLIP, P16233 | LIPE, Q05469 | LIPG, Q9YSX9 | CES1, P23141 | ENTPD1, P49961 | ENTPD2, Q9YSL3 |
| EC number | 3.1.1.3 | 3.1.1.79 | 3.1.1.3 | 3.1.1.1 | 3.6.1.5 | 3.6.1.5 |

Inositol phosphate turnover

Overview: The sugar alcohol D-myo-inositol is a component of the phosphatidylinositol signalling cycle, where the principal second messenger is inositol 1,4,5-trisphosphate, IP$_3$, which acts at intracellular ligand-gated ion channels, IP$_3$ receptors to elevate intracellular calcium. IP$_3$ is recycled to inositol by phosphatases or phosphorylated to form other active inositol polyphosphates. Inositol produced from dephosphorylation of IP$_3$ is recycled into membrane phospholipid under the influence of phosphatidylinositol synthase activity (CDP-diacylglycerol-inositol 3-phosphatidyltransferase [EC 2.7.8.1]).

Inositol 1,4,5-trisphosphate 3-kinases

Overview: Inositol 1,4,5-trisphosphate 3-kinases (E.C. 2.7.1.127, ENSFM00250000001260) catalyse the generation of inositol 1,3,4,5-tetrakisphosphate (IP$_4$) from IP$_3$. IP$_3$ kinase activity is enhanced in the presence of calcium/calmodulin (CALM1 CALM2 CALM3, P62158) [113].

Information on members of this family may be found in the online database.

Inositol polyphosphate phosphatases

Overview: Members of this family exhibit phosphatase activity towards IP$_3$, as well as towards other inositol derivatives, including the phospholipids PIP$_2$ and PIP$_3$. With IP$_3$ as substrate, 1-phosphatase (EC 3.1.3.57) generates 4,5-IP$_2$, 4-phosphatases (EC 3.1.3.66, ENSFM00250000001432) generate 1,5-IP$_2$ and 5-phosphatases (E.C. 3.1.3.36 or 3.1.3.56) generate 1,4-IP$_2$.

Information on members of this family may be found in the online database.

Comments: In vitro analysis suggested IP$_3$ and IP$_4$ were poor substrates for SKIP, synaptojanin 1 and synaptojanin 2, but suggested that PIP$_2$ and PIP$_3$ were more efficiently hydrolysed [523].
Inositol monophosphatase

**Overview:** Inositol monophosphatase (E.C. 3.1.3.25, IMPase, myo-inositol-(1 or 4)-phosphate phosphohydrolase) is a magnesium-dependent homodimer which hydrolyses myo-inositol monophosphate to generate myo-inositol and phosphate. Glycerol may be a physiological phosphate acceptor. Li⁺ is a non-selective un-competitive inhibitor more potent at IMPase 1 (pK₅ ca. 3.5, [402]; pIC₅₀ 3.2, [445]) than IMPase 2 (pIC₅₀ 1.8-2.1, [445]). IMPase activity may be inhibited competitively by L690330 (pK₅ 5.5, [402]), although the enzyme selectivity is not yet established.

| Nomenclature | IMPase 1 | IMPase 2 |
|--------------|----------|----------|
| HGNC, UniProt | IMPA1, P29218 | IMPA2, O14732 |
| EC number | 3.1.3.25 | 3.1.3.25 |
| Rank order of affinity | inositol 4-phosphate > inositol 3-phosphate > inositol 1-phosphate [402] | – |
| Inhibitors | Li⁺ (pK₅ 3.5) [402] | – |

**Comments:** Polymorphisms in either of the genes encoding these enzymes have been linked with bipolar disorder [548, 549, 666]. Disruption of the gene encoding IMPase 1, but not IMPase 2, appears to mimic the effects of Li⁺ in mice [121, 122].

**Kinases (EC 2.7.x.x)**

**Overview:** Protein kinases (E.C. 2.7.11.-) use the co-substrate ATP to phosphorylate serine and/or threonine residues on target proteins. Analysis of the human genome suggests the presence of 518 protein kinases in man (divided into 15 subfamilies), with over 100 protein kinase-like pseudogenes [390]. It is beyond the scope of the Concise Guide to list all these protein kinase activities, but full listings are available on the 'Detailed page' provided for each enzyme. Most inhibitors of these enzymes have been assessed in cell-free investigations and so may appear to 'lose' potency and selectivity in intact cell assays. In particular, ambient ATP concentrations may be influential in responses to inhibitors, since the majority are directed at the ATP binding site [128].

Rho kinase

Overview: Rho kinase (also known as P160ROCK, Rho-activated kinase) is activated by members of the Rho small G protein family, which are activated by GTP exchange factors, such as ARHGEF1 (Q92888, p115-RhoGEF), which in turn may be activated by Gα12/13 subunits [327].

Nomenclature

- Rho associated coiled-coil containing protein kinase 1
- Rho associated coiled-coil containing protein kinase 2
- ROCK1
- ROCK2
- p160ROCK
- ROCK1, Q13464
- ROCK2, O75116
- Common abbreviation: ROCK1, ROCK2
- EC number: 2.7.11.1

Inhibitors

Protein kinase C (PKC) family

Overview: Protein kinase C is the target for the tumour-promoting phorbol esters, such as tetradecanoyl-β-phorbol acetate (TPA, also known as phorbol 12-myristate 13-acetate).

Classical protein kinase C isoforms: PKCα, PKCβ, and PKCγ are activated by Ca2+ and diacylglycerol, and may be inhibited by GF109203X, calphostin C, Gö 6983, chelerythrine and Ro31-8220.

Novel protein kinase C isoforms: PKCδ, PKCe, PKCζ, PKCθ and PKCε are activated by diacylglycerol and may be inhibited by calphostin C, Gö 6983 and chelerythrine.

Atypical protein kinase C isoforms: PKCy, PKCζ.

Cyclin-dependent kinase (CDK) family

Overview: Five of the cyclin-dependent kinases (CDKs: 7, 8, 9, 12, and 13) are involved in the phosphorylation of serine residues in the C-terminal domain of RNA polymerase II, the enzyme that is responsible for the transcription of protein-coding genes into mRNA in eukaryotes. Phosphorylation of RNA polymerase II at Ser5 is essential for transcriptional initiation, and phosphorylation of Ser2 contributes to transcriptional elongation and termination. All five of the C-terminal domain kinases can phosphorylate Ser5, but only CDK9, CDK12, and CDK13 can phosphorylate at Ser2.

CDK4 subfamily

| Nomenclature        | cyclin dependent kinase 4 | cyclin dependent kinase 6 |
|---------------------|---------------------------|---------------------------|

Comments on Cyclin-dependent kinase (CDK) family: The development of CDK inhibitors as anticancer drugs is reviewed in [576], with detailed content covering CDK4 and CDK6 inhibitors that are under clinical evaluation. Data produced by Jorda et al. (2018) highlights the caution that must be used when deploying commercially available CDK inhibitors as pharmacological probes [296], as most of them are more promiscuous in their selectivity than indicated. To make their findings easily accessible the Jorda data is hosted on the cyclin-dependent kinase inhibitor database (CDKiDB).
GSK subfamily

Enzymes → Kinases (EC 2.7.x.x) → CMGC: Containing CDK, MAPK, GSK3, CLK families → Glycogen synthase kinase (GSK) family → GSK subfamily

| Nomenclature        | glycogen synthase kinase 3 beta |
|---------------------|---------------------------------|
| Common abbreviation | GSK3B                            |
| HGNC, UniProt       | GSK3B, P49841                    |
| EC number           | 2.7.11.26                       |
| Inhibitors          | CHIR-98014 (pIC_{50} 9.2) [504], LY2090314 (pIC_{50} 9) [157], CHIR-99021 (pIC_{50} 8.2) [504], SB 216763 (pIC_{50} ~8.1) [109], 1-azakenpaullone (pIC_{50} 7.7) [331], SB-415286 (pIC_{50} ~7.4) [109], IM-12 (pIC_{50} 7.3) [525] |
| Selective inhibitors| AZD2858 (pK_{i} 8.3) [41] |
| Comments            | Due to its Tau phosphorylating activity, small molecule inhibitors of GSK-3β are being investigated as potential treatments for Alzheimer’s disease (AD) [41]. GSK-3β also plays a role in canonical Wnt pathway signalling, the normal activity of which is crucial for the maintenance of normal bone mass. It is hypothesised that small molecule inhibitors of GSK-3β may provide effective therapeutics for the treatment of diseases characterised by low bone mass [393]. |

Janus kinase (JakA) family

Overview: Janus kinases (JAKs) are a family of four enzymes; JAK1, JAK2, JAK3 and tyrosine kinase 2 (TYK2). They are essential for cytokine signalling and are strongly linked to both cancer and inflammatory diseases.

| Nomenclature | Janus kinase 1 | Janus kinase 2 | Janus kinase 3 | tyrosine kinase 2 |
|--------------|---------------|---------------|---------------|------------------|
| Common abbreviation | JAK1 | JAK2 | JAK3 | Tyk2 |
| HGNC, UniProt | JAK1, P23458 | JAK2, O60674 | JAK3, P52333 | TYK2, P29597 |
| EC number | 2.7.10.2 | 2.7.10.2 | 2.7.10.2 | 2.7.10.2 |
| Inhibitors | ruxolitinib (pIC_{50} 8.5–10.1) [236, 483], filgotinib (pIC_{50} 8) [608] | ilginatinib (pIC_{50} 9.1) [431], BMS-911543 (pIC_{50} 9) [480], AT-9283 (pIC_{50} 8.9) [266], XL019 (pIC_{50} 8.7) [176], fedratinib (pIC_{50} 8.3) [389, 638], gandotinib (pIC_{50} 8.4) [385] | – | AT-9283 (pIC_{50} 9) [266] |
| Selective inhibitors | – | compound 1d (pIC_{50} > 9) [624] | – | – |
| Comments | – | The JAK2V617F mutation, which causes constitutive activation, plays an oncogenic role in the pathogenesis of the myeloproliferative disorders, polycythemia vera, essential thrombocythemia, and idiopathic myelofibrosis [74, 133]. Small molecule compounds which inhibit aberrant JAK2 activity are being developed as novel anti-cancer pharmaceuticals. | – | – |

Src family

Overview: Activation of Src-family kinases leads to both stimulatory and inhibitory signaling responses, with cell-specific and signaling pathway-specific outcomes and redundancy of kinase function.

Immune system: In immune cells Src kinases are involved in many signalling pathways, including ITAM- and ITIM-domain-containing receptor signaling, integrin signaling, and responses to chemokines/chemoattractants, cytokines, innate immune stimuli and a large variety of non-immune cell specific stimuli (UV irradiation, heat, osmotic shock etc.). In many cases Src kinases signal to MAP kinase or NF-κB pathways, but they can also modulate other pathways through less well characterized mechanisms.

The primary T cell Src kinases are Lck and Fyn; the main B cell Srcs are Lyn, Fyn and Blk. Mast cells express Fyn and Lyn, with low expression of Src.
### Tec family

**Enzymes → Kinases (EC 2.7.x.x) → TK: Tyrosine kinase → Non-receptor tyrosine kinases (nRTKs) → Tec family**

| Nomenclature | BMX non-receptor tyrosine kinase | Bruton tyrosine kinase | TXK tyrosine kinase |
|--------------|----------------------------------|------------------------|---------------------|
| Common abbreviation | Etk | Btk | TXK |
| HGNC, UniProt | BMX, P51813 | 8TX, Q06187 | TXK, P42681 |

Lanosterol biosynthesis pathway

**Overview:** Lanosterol is a precursor for cholesterol, which is synthesized primarily in the liver in a pathway often described as the mevalonate or HMG-CoA reductase pathway. The first two steps (formation of acetoacetyl CoA and the mitochondrial generation of (S)-3-hydroxy-3-methylglutaryl-CoA) are also associated with oxidation of fatty acids.

### Nomenclature

| Enzyme Name                      | HGNC, UniProt     | EC Number                                      | Comments                                                                 |
|----------------------------------|-------------------|------------------------------------------------|--------------------------------------------------------------------------|
| acetyl-CoA acetyltransferase 1   | ACAT1, P24752     | 2.3.1.9: acetoacetyl CoA + coenzyme A          | HMGCoA synthase is found in cytosolic (HMGCoA synthase 1) and mitochondrial (HMGCoA synthase 2) versions; the former associated with (R)-mevalonate synthesis and the latter with ketogenesis. |
| acetyl-CoA acetyltransferase 2   | ACAT2, Q9BWD1     | 2.3.1.9: acetoacetyl CoA + coenzyme A          |                                                                          |
| hydroxymethylglutaryl-CoA synthase 1 | HMGS1, Q01581     | 2.3.3.10: acetyl CoA + H2O + acetoacetyl CoA + (S)-3-hydroxy-3-methylglutaryl-CoA + coenzyme A |                                                                          |
| hydroxymethylglutaryl-CoA synthase 2 | HMGS2, P54868     | 2.3.3.10: acetyl CoA + H2O + acetoacetyl CoA + (S)-3-hydroxy-3-methylglutaryl-CoA + coenzyme A |                                                                          |
| hydroxymethylglutaryl-CoA reductase | HMGCR, P04035     | 1.1.1.34: (S)-3-hydroxy-3-methylglutaryl-CoA + NADPH -> (R)-mevalonate + coenzyme A + NADP⁺ |                                                                          |
| mevalonate kinase                | MVK, Q03426       | 2.7.1.36: ATP + (R)-mevalonate -> ADP + (R)-5-phosphomevalonate | Mevalonate kinase activity is regulated by the downstream products farnesyl diphosphate and geranyl diphosphate as an example of feedback inhibition. |
| phosphomevalonate kinase         | PMVK, Q15126      | 2.7.4.2: ATP + (R)-5-phosphomevalonate = ADP + (R)-5-diphosphomevalonate |                                                                          |
| diphosphomevalonate decarboxylase | MVD, P53602       | 4.1.1.33: ATP + (R)-5-diphosphomevalonate -> ADP + isopentenyl diphosphate + CO₂ + PO₃⁴⁻ |                                                                          |

**Inhibitors**

- lovastatin (Competitive) (pKi 9.2) [12], rosuvastatin (Competitive) (pIC₅₀ 8.3) [280], cerivastatin (Competitive) (pKi 8.2) [77], atorvastatin (Competitive) (pIC₅₀ 8.1) [280], simvastatin (Competitive) (pIC₅₀ 8) [595], fluvastatin (Competitive) (pIC₅₀ 7.6) [280]

**Reaction mechanism:**

1. **First step:** (S)-3-hydroxy-3-methylglutaryl-CoA + NADPH -> mevaldyl-CoA + NADP⁺
2. **Second step:** mevaldyl-CoA + H₂O -> (R)-mevalonate + NADP⁺ + ADP

**Comments**

- HMGCoA reductase is associated with intracellular membranes; enzymatic activity is inhibited by phosphorylation by AMP-activated kinase.
- The enzymatic reaction is a three-step reaction involving the intermediate generation of mevaldehyde-CoA and mevaldehyde.
### Nomenclature

| Substance                        | ID     | Uniprot ID   |
|----------------------------------|--------|--------------|
| Isopentenyl-diphosphate Δ-isomerase 1 | ID1    | Q13907       |
| Isopentenyl-diphosphate Δ-isomerase 2 | ID2    | Q9BXS1       |
| Geranylgeranyl diphosphate synthase |        |              |

| EC Number | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|

**Nucleoside synthesis and metabolism**

**Overview:** The de novo synthesis and salvage of nucleosides have been targeted for therapeutic advantage in the treatment of particular cancers and gout. Dihydrofolate reductase produces tetrahydrofolate, a cofactor required for synthesis of purines, pyrimidines and amino acids. GART allows formylation of phosphoribosylglycinamide, an early step in purine biosynthesis. Dihydroorotate dehydrogenase produces orotate, a key intermediate in pyrimidine synthesis. IMP dehydrogenase generates xanthosine monophosphate, an intermediate in GTP synthesis.

| Nomenclature                                      | dihydrofolate reductase | phosphoribosylglycinamid formyltransferase, phosphoribosylglycinamide synthetase, phosphoribosylaminimidazole synthetase | dihydroorotate dehydrogenase (quinone) | inosine monophosphate dehydrogenase 1 | inosine monophosphate dehydrogenase 2 | thymidylate synthetase |

| Inhibitors                          | –                      | febuxostat (pIC<sub>50</sub> 8.9) [162]     | –                                            | –                                                             |

**Comments**: TYMS allows the interconversion of dUMP and dTMP, thereby acting as a crucial step in DNA synthesis. PNP allows separation of a nucleoside into the nucleobase and ribose phosphate for nucleotide salvage. XDH generates urate in the purine degradation pathway. Post-translational modifications of XDH convert the enzymatic reaction to a xanthine oxidase, allowing the interconversion of hypoxanthine and xanthine, with the production (or consumption) of reactive oxygen species.

## Paraoxonase (PON) family

### Enzymes → Paraoxonase (PON) family

**Overview:** Paraoxonases (PON) are calcium-dependent esterases, which may be involved in lipoprotein turnover and the conversion of lactone statin prodrugs, as well as being targets of organophosphates, such as the insecticide paraoxon.

| Nomenclature     | paraoxonase 1                  | paraoxonase 2                  | paraoxonase 3                  |
|------------------|-------------------------------|-------------------------------|-------------------------------|
| Common abbreviation | PON1                          | PON2                          | PON3                          |
| HGNC, UniProt    | PON1, P27169                   | PON2, Q15165                  | PON3, Q15166                  |
| EC number        | 3.1.8.1                        | 3.1.1.2                       | 3.1.8.1                       |
|                  | An aryl dialkyl phosphate + H(2)O $\leftrightarrow$ dialkyl phosphate + an aryl alcohol | A phenyl acetate + H(2)O $\leftrightarrow$ a phenol + acetate | An aryl dialkyl phosphate + H(2)O $\leftrightarrow$ dialkyl phosphate + an aryl alcohol |
|                  | 3.1.1.2                         | 3.1.1.81                      | 3.1.8.1                       |
|                  | A phenyl acetate + H(2)O $\leftrightarrow$ a phenol + acetate | A N-acyl-L-homoserine lactone + H(2)O $\leftrightarrow$ a N-acyl-L-homoserine | A phenyl acetate + H(2)O $\leftrightarrow$ a phenol + acetate |
|                  | 3.1.1.81                         |                               | 3.1.8.1                       |
|                  | An N-acyl-L-homoserine lactone + H(2)O $\leftrightarrow$ an N-acyl-L-homoserine |                               | A N-acyl-L-homoserine lactone + H(2)O $\leftrightarrow$ a N-acyl-L-homoserine |
| Comments         | PON1 forms homodimers. Loss-of-function mutations in PON1 are associated with microvascular complications of diabetes [303, 304]. | PON2 forms heterotrimers [150]. | PON3 likely forms heterodimers in vivo [150]. |

Peptidases and proteinases

Overview: Peptidases and proteinases hydrolyse peptide bonds, and can be simply divided on the basis of whether terminal peptide bonds are cleaved (exopeptidases and exoproteinases) at the amino terminus (aminopeptidases) or carboxy terminus (carboxypeptidases). Non-terminal peptide bonds are cleaved by endopeptidases and endoproteinases, which are divided into serine endopeptidases (EC 3.4.21.-), cysteine endopeptidases (EC 3.4.22.-), aspartate endopeptidases (EC 3.4.23.-), metalloendopeptidases (EC 3.4.24.-) and threonine endopeptidases (EC 3.4.25.-). Since it is beyond the scope of the Guide to list all peptidase and proteinase activities, this summary focuses on selected enzymes of significant pharmacological interest that have ligands (mostly small-molecules) directed against them. For those interested in detailed background we recommend the MEROPS database [493] (with whom we collaborate) as an information resource [494].

A1: Pepsin

| Nomenclature   | renin         |
|----------------|---------------|
| HGNC, UniProt  | REN, P00797   |
| EC number      | 3.4.23.15     |
| Inhibitors     | aliskiren (pIC50 9.2) [655] |

Overview: Pepsin (PS)-1 or -2 act as the catalytic component/essential co-factor of the γ-secretase complex responsible for the final carboxy-terminal cleavage of amyloid precursor protein (APP) [302] in the generation of amyloid beta (Aβ) [9, 579]. Given that the accumulation and aggregation of Aβ in the brain is pivotal in the development of Alzheimer’s disease (AD), inhibition of PS activity is one mechanism being investigated as a therapeutic option for AD [211]. Several small molecule inhibitors of PS-1 have been investigated, with some reaching early clinical trials, but none have been formally approved. Dewji et al. (2015) have reported that small peptide fragments of human PS-1 can significantly inhibit Aβ production (total Aβ, Aβ40 and Aβ42) both in vitro and when infused in to the brains of APP transgenic mice [139]. The most active small peptides in this report were P4 and P8, from the amino-terminal domain of PS-1.

Information on members of this family may be found in the online database.
C14: Caspase

Overview: Caspases, (E.C. 3.4.22.-) which derive their name from Cysteine ASPartate-specific proteASES, include at least two families; initiator caspases (caspases 2, 8, 9 and 10), which are able to hydrolyse and activate a second family of effector caspases (caspases 3, 6 and 7), which themselves are able to hydrolyse further cellular proteins to bring about programmed cell death. Caspases are heterotetrameric, being made up of two pairs of subunits, generated by a single gene product, which is proteolysed to form the mature protein. Members of the mammalian inhibitors of apoptosis proteins (IAP) are able to bind the procaspases, thereby preventing maturation to active proteinases.

Information on members of this family may be found in the online database.

Comments: CARD16 (Caspase recruitment domain-containing protein 16, caspase-1 inhibitor COP, CARD only domain-containing protein 1, pseudo interleukin-1β converting enzyme, pseudo-ICE, ENSG00000204397) shares sequence similarity with some of the caspases.

M1: Aminopeptidase N

Overview: Aminopeptidases catalyze the cleavage of amino acids from the amino (N) terminus of protein or peptide substrates, and are involved in many essential cellular functions. Members of this enzyme family may be monomeric or multi-subunit complexes, and many are zinc metalloenzymes [590].

| Nomenclature | Leukotriene A₄ hydrolase |
|--------------|-------------------------|
| HGNC, UniProt| LTA4H, P09960            |
| EC number    | 3.3.2.6                 |
| Inhibitors   | bestatin (pKᵢ 5.4) [450]|

M2: Angiotensin-converting (ACE and ACE2)

Enzymes → Peptidases and proteinases → MA: Metallo (M) Peptidases → M2: Angiotensin-converting (ACE and ACE2)

| Nomenclature | Angiotensin-converting enzyme |
|--------------|-------------------------------|
| Common abbreviation | ACE |
| HGNC, UniProt | ACE, P12821 |
| EC number | 3.4.15.1 |
| Substrates | Ac-SDKP |
| Endogenous substrates | angiotensin I (AGT, P01019) > angiotensin II (AGT, P01019) |
| Inhibitors | zofenoprilat (pKi 9.4) [329] – Rabbit, captopril (pKi 8.4) [410], zofenopril |
| Selective inhibitors | perindoprilat (pIC50 9) [83], cilazaprilat (pIC50 8.7) [630] – Rabbit, imidaprilat (pIC50 8.2) [631], RXP-407 (N-domain selective inhibition) (pIC50 8.1) [538], fosinoprilat (pIC50 8) [131] – Rabbit, enalaprilat (pIC50 7.5) [98], benazeprilat (pIC50 6.6) [342] |
| Comments | Reports of ACE GPI hydrolase activity [322] have been refuted [344] |

M10: Matrix metalloproteinase

Enzymes → Peptidases and proteinases → MA: Metallo (M) Peptidases → M10: Matrix metalloproteinase

**Overview:** Matrix metalloproteinases (MMP) are calcium- and zinc-dependent proteinases regulating the extracellular matrix and are often divided (e.g. [614]) on functional and structural bases into gelatinases, collagenases, stromelysins and matrilysins, as well as membrane type-MMP (MT-MMP).

| Nomenclature | MMP2 | MMP8 |
|--------------|------|------|
| HGNC, UniProt | MMP2, P08253 | MMP8, P22894 |
| EC number | 3.4.24.24 | 3.4.24.34 |
| Selective inhibitors | ARPI00 [603] | – |
| Comments | MMP2 is categorised as a gelatinase with substrate specificity for gelatinase A. | MMP8 is categorised as a collagenase. |

**Comments:** A number of small molecule 'broad spectrum' inhibitors of MMP have been described, including marimastat and batimastat.

**Tissue inhibitors of metalloproteinase (TIMP) proteins** are endogenous inhibitors acting to chelate MMP proteins: TIMP1 (TIMP1, P01033), TIMP2 (TIMP2, P16035), TIMP3 (TIMP3, P35625), TIMP4 (TIMP4, Q99727)

**Searchable database:** [http://www.guidetopharmacology.org/index.jsp](http://www.guidetopharmacology.org/index.jsp)
M12: Astacin/Adamalysin

Enzymes → Peptidases and proteinases → MA: Metallo (M) Peptidases → M12: Astacin/Adamalysin

**Overview:** ADAM (A Disintegrin And Metalloproteinase domain containing proteins) metalloproteinases cleave cell-surface or transmembrane proteins to generate soluble and membrane-limited products. ADAMTS (with thrombospondin motifs) metalloproteinases cleave cell-surface or transmembrane proteins to generate soluble and membrane-limited products.

Information on members of this family may be found in the online database.

**Comments:** Additional ADAM family members include AC123767.2 (cDNA FLJ58962, moderately similar to mouse ADAM3, ENSG00000231168), AL160191.3 (ADAM21-like protein, ENSG00000235812), AC136428.3-2 (ENSG00000185520) and ADAMDEC1 (decysin 1, ENSG00000134028).

Other ADAMTS family members include AC104758.12-5 (FLJ00317 protein Fragment ENSG00000231463), AC139425.3-1 (ENSG00000225577), and AC126339.6-1 (ENSG00000225734).

M28: Aminopeptidase Y

Enzymes → Peptidases and proteinases → MH: Metallo (M) Peptidases → M28: Aminopeptidase Y

| Nomenclature | Folate hydrolase (prostate-specific membrane antigen) 1 |
|--------------|---------------------------------------------------------|
| HGNC, UniProt| FOLH1, Q04609                                          |
| EC number    | 3.4.17.21                                               |
| Antibodies   | capromab (Binding)                                     |
| Comments     | Folate hydrolase is also known as NAALADase as it is responsible for the hydrolysis of N-acetaspartylglutamate to form N-acetylaspartate and L-glutamate (L-glutamic acid). In the gut, the enzyme assists in the assimilation of folate by hydrolysing dietary poly-gamma-glutamy/folate. The enzyme is highly expressed in the prostate, and its expression is up-regulated in cancerous tissue. A tagged version of the antibody capromab has been used for imaging purposes. |

**Comments:** Folate hydrolase is also known as NAALADase as it is responsible for the hydrolysis of N-acetaspartylglutamate to form N-acetylaspartate and L-glutamate. In the gut, the enzyme assists in the assimilation of folate by hydrolysing dietary poly-gamma-glutamy/folate. The enzyme is highly expressed in the prostate, and its expression is up-regulated in cancerous tissue. A tagged version of the antibody capromab has been used for imaging purposes.
## M19: Membrane dipeptidase

**Enzymes** → **Peptidases and proteinases** → **MJ**: Metallo (M) Peptidases → **M19**: Membrane dipeptidase

| Nomenclature | Dipeptidase 1 |
|--------------|---------------|
| HGNC, UniProt | DPEP1, P16444 |
| EC number | 3.4.13.19: LTD₄ + H₂O = LTE₄ + glycine |
| Inhibitors | cilastatin (pKᵢ 6) [215] |

## S1: Chymotrypsin

**Enzymes** → **Peptidases and proteinases** → **PA**: Serine (S) Peptidases → **S1**: Chymotrypsin

| Nomenclature | complement C1r | coagulation factor II, thrombin | coagulation factor X |
|--------------|----------------|---------------------------------|---------------------|
| HGNC, UniProt | C1R, P00736 | F2, P00734 | F10, P00742 |
| EC number | 3.4.21.41 | 3.4.21.5 | 3.4.21.6 |
| Inhibitors | nafamostat (pIC₅₀ 4.9) [251] | lepirudin (pKᵢ 13) [626], desirudin (pKᵢ 12.7) [293], AZ12971554 (pKᵢ 9.5) [21], melagatran (pKᵢ 8.7) [228], bivalirudin (pKᵢ 8.6) [646], dabigatran (pKᵢ 8.3) [246], argatroban (pKᵢ 7.7) [276] | apixaban (pKᵢ 10.1) [647], rivaroxaban (pKᵢ 9.4) [466], edoxaban (pKᵢ 9.2) [471] |
| Selective inhibitors | – | Dup-714 (pKᵢ 10.4) [192], AR-H067637 (pIC₅₀ 8.4) [132] | – |

| Nomenclature | elastase, neutrophil expressed | plasminogen | plasminogen activator, tissue type | serine protease 1 | tryptase alpha/beta 1 |

**T1: Proteasome**

Enzymes → Peptidases and proteinases → PB: Threonine (T) Peptidases → T1: Proteasome

**Overview:** The T1 macropain beta subunits form the catalytic proteinase core of the 20S proteasome complex [106]. This catalytic core enables the degradation of peptides with Arg, Phe, Tyr, Leu, and Glu adjacent to the cleavage site. The β5 subunit is the principal target of the approved drug proteasome inhibitor bortezomib.

| Nomenclature | proteasome subunit beta 5 |
|--------------|--------------------------|
| HGNC, UniProt| PSMB5, P28074             |
| EC number   | 3.4.25.1                 |
| Inhibitors  | bortezomib (pIC50 7.7) [428] |
| Selective inhibitors | ixazomib (pKa 9) [332] |

**S8: Subtilisin**

Enzymes → Peptidases and proteinases → SB: Serine (S) Peptidases → S8: Subtilisin

**Overview:** One member of this family has garnered intense interest as a clinical drug target. As liver PCSK9 acts to maintain cholesterol homeostasis, it has become a target of intense interest for clinical drug development. Inhibition of PCSK9 can lower low-density cholesterol (LDL-C) by clearing LDLR-bound LDL particles, thereby lowering circulating cholesterol levels. It is hypothesised that this action may improve outcomes in patients with atherosclerotic cardiovascular disease [368, 516, 567]. Therapeutics which inhibit PCSK9 are viewed as potentially lucrative replacements for statins, upon statin patent expiry. Several monoclonal antibodies including alirocumab, evolocumab, bococizumab, RG-7652 and LY3015014 are under development. One RNAi therapeutic, code name ALN-PCS02, is also in development [123, 173, 180].

Information on members of this family may be found in the online database.
S9: Prolyl oligopeptidase

Enzymes → Peptidases and proteinases → SC: Serine (S) Peptidases → S9: Prolyl oligopeptidase

| Nomenclature | dipeptidyl peptidase 4 |
|--------------|------------------------|
| HGNC, UniProt| DPP4, P27487            |
| EC number    | 3.4.14.5               |
| Endogenous substrates | glucagon-like peptide 1 (GGC, P01275) |
| Inhibitors   | saxagliptin (pKᵢ 9.2) [226], linagliptin (pKᵢ 9) [155], sitagliptin (pIC₅₀ 8.1) [129], vildagliptin (pKᵢ 7.8) [226] |
| Selective inhibitors | ZY15557 (Competitive) (pKᵢ 8.3) [285] |

Poly ADP-ribose polymerases

Enzymes → Poly ADP-ribose polymerases

Overview: The Poly ADP-ribose polymerase family is a series of enzymes, where the best characterised members are nuclear proteins which are thought to function by binding to single strand breaks in DNA, allowing the recruitment of repair enzymes by the synthesis of NAD-derived ADP-ribose polymers, which are subsequently degraded by a glycohydrolase (PARG, Q86W56).

| Nomenclature | poly(ADP-ribose) polymerase 1 | poly(ADP-ribose) polymerase 2 | poly (ADP-ribose) polymerase 3 |
|--------------|-----------------------------|-----------------------------|-----------------------------|
| Common abbreviation | PARP1                      | PARP2                       | PARP3                       |
| HGNC, UniProt | PPAR1, P09874               | PPAR2, Q9UGNS                | PPAR3, Q9Y6F1               |
| EC number    | 2.4.2.30                    | 2.4.2.30                    | --                         |

Prolyl hydroxylases

Overview: Hypoxia-inducible factors (HIFs) are rapidly-responding sensors of reductions in local oxygen tensions, prompting changes in gene transcription. Listed here are the 4-prolyl hydroxylase family, members of which have been identified to hydroxylate proline residues in HIF1α (HIF1A; Q16665) leading to an increased degradation through proteasomal hydrolysis. This action requires molecular oxygen and 2-oxoglutarate, and so reduced oxygen tensions prevents HIF1α hydroxylation, allowing its translocation to the nucleus and dimerisation with HIF1β (also known as ARNT; P27540), thereby allowing interaction with the genome as a transcription factor.

Nomenclature

| Common abbreviation | egl-9 family hypoxia inducible factor 2 | egl-9 family hypoxia inducible factor 1 | egl-9 family hypoxia inducible factor 3 |
|---------------------|----------------------------------------|----------------------------------------|----------------------------------------|

Sphingosine 1-phosphate turnover

Overview: S1P (sphingosine 1-phosphate) is a bioactive lipid which, after release from cells via certain transporters, acts as a ligand for a family of five S1P-specific G protein-coupled receptors (S1P1-5). However, it also has a number of intracellular targets. S1P is formed by the ATP-dependent phosphorylation of sphingosine, catalysed by two isoforms of sphingosine kinase (EC 2.7.1.91). It can be dephosphorylated back to sphingosine by sphingosine 1-phosphate phosphatase (EC 3.1.3.3) or cleaved into phosphoethanolamine and hexadecenal by sphingosine 1-phosphate lyase (EC 4.1.2.27). Recessive mutations in the S1P lyase (SPL) gene underlie a recently identified sphingolipidosis: SPL Insufficiency Syndrome (SPLIS). In general, S1P promotes cell survival, proliferation, migration, adhesion and inhibition of apoptosis. Intracellular S1P affects epigenetic regulation, endosomal processing, mitochondrial function and cell proliferation/senescence. S1P has myriad physiological functions, including vascular development, lymphocyte trafficking and neurogenesis. However, S1P is also involved in a number of diseases such as cancer, inflammation and fibrosis. Therefore, its GPCRs and enzymes of synthesis and degradation are a major focus for drug discovery.

Sphingosine kinase

Enzymes → Sphingosine 1-phosphate turnover → Sphingosine kinase

Overview: SPHK1 and SPHK2 are encoded by different genes with some redundancy of function; genetic deletion of both Spk1 and Spk2, but not either alone, is embryonic lethal in mice. There are splice variants of each isoform (Spk1a-c and Spk2a-b), distinguished by their N-terminal sequences. SPHK1 and SPHK2 differ in tissue distribution, sub-cellular localisation, biochemical properties and regulation. They regulate discrete pools of S1P. Receptor stimulation induces SPHK1 translocation from the cytoplasm to the plasma membrane. SPHK1 translocation is regulated by phosphorylation/dephosphorylation, specific protein:protein interactions and interaction with specific lipids at the plasma membrane. SPHK1 is a dimeric protein, as confirmed by its crystal structure which forms a positive cluster, between promoters, essential for interaction with anionic phospholipids in the plasma membrane. SPHK2 is localised to the ER or associated with mitochondria or shuttles in/out of the nucleus, regulated by phosphorylation. Intracellular targets of nuclear S1P include the catalytic subunit of telomerase (TERT) and regulators of gene expression including histone deacetylases (HDAC 1/2) and peroxisome proliferator-activated receptor gamma (PPARγ). SPHK2 phosphorylates the pro-drug FTY720 (fingolimod, which is used to treat some forms of multiple sclerosis) to a mimic of S1P and that acts as a functional antagonist of S1P3 receptors. Inhibitors of SPHK1 and SPHK2 have therapeutic potential in many diseases.

| Nomenclature | sphingosine kinase 1 | sphingosine kinase 2 |
|--------------|----------------------|----------------------|
| Common abbreviation | SPHK1 | SPHK2 |
| HGNC, UniProt | SPHK1, Q9NYA1 | SPHK2, Q9NRA0 |
| EC number | 2.7.1.91: sphingosine + ATP = sphingosine 1-phosphate + ADP | 2.7.1.91: sphingosine + ATP = sphingosine 1-phosphate + ADP |
| | dihydrosphingosine + ATP = sphingosine 1-phosphate + ADP | dihydrosphingosine + ATP = sphingosine 1-phosphate + ADP |
| Cofactors | Mg2+ [536] | Mg2+ |
| Inhibitors | SKI II (pKi 4.8) [181], MP-A08 (pIC50 4.6) [474] | MP-A08 (pKi 5.2) [474], SKI II (pKi 5.1) [196] |
| Selective inhibitors | PF-S43 (pKi 8.4) [537] | SLC4101431 (pKi 7.1) [100], compound 27d (pIC50 6.8) [526], opaganib (pKi 5) [181], ROMe (pKi 4.8) [354] |
| Comments | SK1 inhibitors induce its proteosomal degradation [373, 404]. SK1 crystal structures confirm that it is dimeric [5]; there is no crystal structure available for SK2. | There is no crystal structure available for SK2. |

Comments: MP-A08 is competitive with ATP; other SPHK inhibitors are competitive with sphingosine. ABC294640 (opaganib) has known off-target effects on dihydroceramide desaturase (DEGS1) [404, 610] and induces proteosomal degradation of SK1 [404]. ABC294640 is in clinical trials for advanced cholangiocarcinoma, advanced hepatocellular carcinoma and refractory/relapsed multiple myeloma (to view ClinicalTrials.gov list click here).

Thyroid hormone turnover

**Enzymes → Thyroid hormone turnover**

**Overview:**
The thyroid hormones triiodothyronine and thyroxine, usually abbreviated as triiodothyronine and T4, respectively, are synthesized in the thyroid gland by sequential metabolism of tyrosine residues in the glycosylated homodimeric protein thyroglobulin (TG, P01266) under the influence of the haem-containing protein iodide peroxidase. Iodide peroxidase/TPO is a haem-containing enzyme, from the same structural family as eosinophil peroxidase (EPX, P11678), lactoperoxidase (LPO, P22079) and myeloperoxidase (MPO, P05164). Circulating thyroid hormone is bound to thyroxine-binding globulin (SERPINA7, P05543).

**Tissue deiodinases**
These are 1TM selenoproteins that remove an iodine from T4 (3,3',5,5'-tetraiodothyronine) to generate triiodothyronine (3,3',5-triiodothyronine, a more potent agonist at thyroid hormone receptors) or rT3 (rT3, 3,3',5'-triiodothyronine, a relatively inactive analogue). DIO1 is also able to deiodinate RT3 to form 3,3'-diiodothyronine (T2). Iodotyrosine deiodinase is a 1TM homodimeric enzyme.
### Nomenclature

| Nomenclature                        | thyroid peroxidase | iodothyronine deiodinase 1 | iodothyronine deiodinase 2 | iodothyronine deiodinase 3 | iodothyrosine deiodinase |

2.5.1.58 Protein farnesyltransferase

Enzymes → 2.5.1.58 Protein farnesyltransferase

Overview: Farnesyltransferase is a member of the prenyltransferases family which also includes geranylgeranyltransferase types I (EC 2.5.1.59) and II (EC 2.5.1.60) [82]. Protein farnesyltransferase catalyses the post-translational formation of a thioether linkage between the C-1 of an isoprenyl group and a cysteine residue fourth from the C-terminus of a protein (i.e. to the CaaX motif, where ‘a’ is an aliphatic amino acid and ‘X’ is usually serine, methionine, alanine or glutamine; leucine for EC 2.5.1.59) [188]. Farnesyltransferase is a dimer, composed of an alpha and beta subunit and requires Mg²⁺ and Zn²⁺ ions as cofactors. The active site is located between the subunits. Prenylation creates a hydrophobic domain on protein tails which acts as a membrane anchor. Substrates of the prenyltransferases include Ras, Rho, Rab, other Ras-related small GTP-binding proteins, G-protein γ-subunits, nuclear lamins, centromeric proteins and many proteins involved in visual signal transduction.

In relation to the causative association between oncogenic Ras proteins and cancer, farnesyltransferase has become an important mechanistic drug discovery target.

Information on members of this family may be found in the online database.

2.5.1.58 Protein farnesyltransferase S389
3.5.1.- Histone deacetylases (HDACs)

Overview: Histone deacetylases act as erasers of epigenetic acetylation marks on lysine residues in histones. Removal of the acetyl groups facilitates tighter packing of chromatin (heterochromatin formation) leading to transcriptional repression. The histone deacetylase family has been classified into five subfamilies based on phylogenetic comparison with yeast homologues:

- Class I contains HDACs 1, 2, 3 and 8
- Class IIa contains HDACs 4, 5, 7 and 9
- Class IIb contains HDACs 6 and 10
- Class III contains the sirtuins (SIRT1-7)
- Class IV contains only HDAC11.

These classes use different co-factors:

- Classes I, II and IV use Zn⁺ as a co-factor, whereas catalysis by Class III enzymes requires NAD⁺ as a co-factor, and members of this subfamily have ADP-ribosylase activity in addition to protein deacetylase function [521].

HDACs have more general protein deacetylase activity, being able to deacetylate lysine residues in non-histone proteins [104] such as microtubules [270], the hsp90 chaperone [326] and the tumour suppressor p53 [377].

Dysregulated HDAC activity has been identified in cancer cells and tumour tissues [355, 509], making HDACs attractive molecular targets in the search for novel mechanisms to treat cancer [639]. Several small molecule HDAC inhibitors are already approved for clinical use: romidepsin, belinostat, vorinostat, panobinostat, belinostat, valproic acid and tucidinostat. HDACs and HDAC inhibitors currently in development as potential anti-cancer therapeutics are reviewed by Simó-Ruibalbas and Esteller (2015) [545].

Nomenclature

- histone deacetylase 6
- HDAC6, Q9UBN7
- EC number 3.5.1.98
- Inhibitors
  - trichostatin A (pKi 9) [61], vorinostat (pKi 8.8) [61], romidepsin (pKi 8) [61]
- Selective inhibitors
  - ricolinostat (pIC50 8.3) [518]

3.5.3.15 Peptidyl arginine deiminases (PADI)

Overview: In humans, the peptidyl arginine deiminases (PADI; HGNC family link) are a family of five enzymes, PADI1-4 and PADI6. PADI catalyze the deimination of protein L-arginine residues to L-citrulline and ammonia, generating peptidyl-citrulline on histones, fibrinogen, and other biologically relevant proteins. The human isozymes exhibit tissue-specific expression patterns [294]. Overexpression and/or increased PADI activity is observed in several diseases, including rheumatoid arthritis, Alzheimer’s disease, multiple sclerosis, lupus, Parkinson’s disease, and cancer [47]. Pharmacological PADI inhibition reverses protein-hypercitrullination and disease in mouse models of multiple sclerosis [423].

Information on members of this family may be found in the online database.

3.6.5.2 Small monomeric GTPases

Overview: small G-proteins, are a family of hydrolase enzymes that can bind and hydrolyze guanosine triphosphate (GTP). They are a type of G-protein found in the cytosol that are homologous to the alpha subunit of heterotrimeric G-proteins, but unlike the alpha subunit of G proteins, a small GTPase can function independently as a hydrolase enzyme to bind to and hydrolyze a guanosine triphosphate (GTP) to form guanosine diphosphate (GDP). The best-known members are the Ras GTPases and hence they are sometimes called Ras subfamily GTPases.

RAS subfamily

Overview: The RAS proteins (HRAS, NRAS and KRAS) are small membrane-localised G protein-like molecules of 21 kd. They act as an on/off switch linking receptor and non-receptor tyrosine kinase activation to downstream cytoplasmic or nuclear events. Binding of GTP activates the switch, and hydrolysis of the GTP to GDP inactivates the switch. The RAS proto-oncogenes are the most frequently mutated class of proteins in human cancers. Common mutations compromise the GTP-hydrolysing ability of the proteins causing constitutive activation [564], which leads to increased cell proliferation and decreased apoptosis [674]. Because of their importance in oncogenic transformation these proteins have become the targets of intense drug discovery effort [33].

Information on members of this family may be found in the online database.

RAB subfamily

Enzymes → 3.6.5.2 Small monomeric GTPases → RAB subfamily

Overview: The Rab family of proteins is a member of the Ras superfamily of monomeric G proteins. Rab GTPases regulate many steps of membrane traffic, including vesicle formation, vesicle movement along actin and tubulin networks, and membrane fusion. These processes make up the route through which cell surface proteins are trafficked from the Golgi to the plasma membrane and are recycled. Surface protein recycling returns proteins to the surface whose function involves carrying another protein or substance inside the cell, such as the transferrin receptor, or serves as a means of regulating the number of a certain type of protein molecules on the surface (see HGNC RAB, 65 genes).

Information on members of this family may be found in the online database.
