Ostracod faunas in the Purbeck and Wealden of England

F. W. ANDERSON†

ABSTRACT — The occurrence and abundance of ostracods found in 98 subdivisions (Faunicycles) of late Jurassic to early Cretaceous age in the English Purbeck and Wealden are summarised. Most of the taxa found are illustrated from holotype or other material and details of their ranges and abundance given in relation to each faunicycle. The characters of the ostracod assemblages and zones are described. Three new species (Cypridea brendae, C. hispida and Eoparacypris edmundsi); also two new subspecies (Cypridea setimpelota and C. tuberculata dorsiclavata) are described and figured. A lectotype for Palaecytheridea pellucida is selected and figured.

PREFACE

The late Dr. F. W. Anderson's geological career was particularly notable for his application of the study of ostracods to the stratigraphy and environmental history of the Purbeck and Wealden Beds of south-east England. This paper incorporates Dr. Anderson's latest views on Purbeck-Wealden faunicycles, records the distribution of the ostracod species and illustrates them with SEM photographs, many for the first time.

It seemed desirable to publish this major contribution as far as possible as Dr. Anderson compiled it a number of years ago. The stratigraphic terminology has, therefore, been left as he used it so that it is consistent with his other papers and reports and in unpublished charts and diagrams.

Dr. W. A. Read explains "that the chief problems arise in the nomenclature of the Ashdown Beds and strata formerly assigned to the 'Upper Purbeck'. Dr. Anderson used the terms 'Ashdown Sand' (for the upper arenaceous division) and both 'Fairlight Clays' and 'Upper Purbeck' for a lower argillaceous division. These are not used in current Geological Survey publications as it is considered an impracticable lithostratigraphic division; the Fairlight Clays are regarded as a recurring facies within the broad spectrum of fluvial environments in which the Ashdown Beds were laid down. The Purbeck succession in the Sussex inliers and adjacent boreholes has been revised by Lake & Holliday (1978) and Morter (1984) who now take the base of the Wealden at the top of the Greens Limestones. Anderson (in Anderson & Bazley, 1971) referred the Greens Limestones to the Middle Purbeck and the shales and clays above to the Upper Purbeck. The latter are currently referred to the 'Ashdown Beds Formation' comprising the top of the Greens Limestones to the base of the Wadhurst Clay. The beds labelled Fairlight Clays and Upper Purbeck mudstones and silts in Dr. Anderson's figures form the lower part of this formation and of the Fairlight division as used informally by Morter (1984); those labelled Ashdown Sand form the Ashdown Sand division (Morter, 1984); both are variable lithologically and are not considered formal, laterally persistent lithostratigraphic units."

Dr. R. H. Bate comments "This paper summarises the outstanding contribution made by the late F. W. Anderson to modern ostracod research, particularly the recognition of the importance of ostracods in biostratigraphy. His interpretation of the salinity tolerance of some ostracods in the Purbeck-Wealden is, however, at variance with that of other ostracod workers especially for the genus Darwinula – presently found living in freshwater. If this environment was also occupied by this taxa at that time, there would be a change of emphasis from the 'S' phase to the 'C' phase for the genus."

The work was nearly completed at the time of Dr. Anderson's death in 1982. The manuscript was further prepared for the press by Dr. H. C. Ivimey-Cook of the British Geological Survey (B.G.S.) and is published with the approval of the Director, B. G. S. (N.E.R.C.). Communications regarding it should be addressed to the Biostratigraphy Research Group, B.G.S. Keyworth, Nottingham NG12 5GG. The B.G.S. holds many of Dr. Anderson's original diagrams and notes, as well as range charts which are too large and complex to be published, (see Appendix herein).

On his behalf we would also like to acknowledge the skill of Mrs. B. E. Coleman who took most of the photographs of these ostracods on a Cambridge Model 2A Stereoscan. Some extra photographs were taken by Mr. I. P. Wilkinson and Dr. J. Whittaker (B.M.(N.H.)) to complete the plates.

In view of the size and format, the Editor has allowed some departure from the usual instructions to authors in its presentation.

The cost of publication has been partly covered by the receipt of a grant from the British Geological Survey.

† See Preface.
INTRODUCTION

The Purbeck and Wealden beds in England span the Jurassic to Cretaceous boundary and present a range of sedimentary environments from hypersaline through varying degrees of salinity to virtually freshwater. The sediments range from clays, often sphaerosideritic, through mudstones, limestones and siltstones to coarse, commonly fluvial sandstones (Allen, 1976; 1981).

Geographically, two distinct areas can be recognised (Fig. 1). To the east, a steadily subsiding basin occupied what is now the Weald of Sussex and Kent and part of east Hampshire; to the west, a lagoon covered west Hampshire, Dorset, the Isle of Wight, and parts of Buckinghamshire, Berkshire and Wiltshire. Everywhere the water remained shallow, and particularly in the Wealden, plant beds with lignite are common. The fauna includes bivalves, gastropods, foraminifera, ostracods, fish, reptiles and primitive mammals.

The most abundant and widely distributed fossils are ostracods which afford the most suitable material for stratigraphical correlation. Under the stress of a shallow water environment varying in salinity, they produced a large number of species and varieties, some of which had a limited salinity tolerance with consequent variation in their numbers in any particular assemblage. Thus, there developed what the writer has referred to as Faunicycles, i.e. an alternation of ostracod faunas with a high salinity tolerance with those having a preference for fresher water. Several faunicycles are found within each characteristic faunal assemblage (Figs. 2 and 3) and these allow much closer stratigraphical correlation than is possible using the faunal assemblage or zonal distribution alone. This is important in view of the difficulty of lithological comparison in such a varied sequence of sediments.

The earliest zonal division of the Purbeck beds by means of the ostracod faunas was that of Lyell (1855).

Fig. 1. Sketch map of the palaeogeography of the Purbeck with schematic isopachytes at 50 m intervals. A 'western basin', centred in the English Channel south of the Isle of Wight, received sediment dominantly from the west. A subsidiary depression was present in Lyme Bay. In the north, the 'River Chiltern' separated an area of shallows south-east of Swindon from the Aylesbury area and the southern edge of the London Platform. Sediment also accumulated in an eastern basin in the Weald of Sussex and Kent. This was separated from the western basin by the Central Ridge (Bognor Swell of Allen, 1976) which extended from the Vale of Wardour, across the Hampshire Basin north-east of the Isle of Wight and to the south of the South Downs.
who utilised species described by Fitton (1836) and Forbes (1855). The systematic work of T. R. Jones between 1878 and 1888, however, was a great step forward, and in 1885 Jones was able to list seven species from the Lower Purbeck, 13 from the Middle Purbeck and eight from the Upper Purbeck. Then followed a period of inactivity until the writer began work on the Dorset sections of the Purbeck beds in 1928, followed by Sylvester-Bradley (1941 b) in Dorset and Wiltshire, by W. Heap, an enthusiastic amateur geologist resident in Swanage, and by Barker (1966 a and b; 1975) in Dorset.

Knowledge of the succession of ostracod faunas, particularly in the Weald, has been greatly increased by boreholes put down during the search for coal in Kent (Lamplugh, Kitchin & Pringle, 1923), for oil and gas in Hampshire and the Weald (Falcon & Kent, 1960), for gypsum in Sussex (Howitt, 1964) and as part of the Geological Survey six-inch mapping and exploratory drilling programme in Surrey and Sussex. A list of some of the diagrams now deposited with B.G.S., giving additional details of some of these faunal sequences and their correlations is given in the Appendix to this paper.

GENERAL STRATIGRAPHY

PURBECK

Except in marginal areas such as Swindon and Aylesbury, where there is an alternation between Purbeck and Portland-type sediments, the transition from one lithology to the other is abrupt. After a relatively brief period at the beginning of the Purbeck, evaporitic environments prevailed in both the eastern and the western areas (Fig. 1) giving rise to beds of gypsum and/or anhydrite with mudstones and algal limestones (Fig. 2). Then followed a series of Lower Purbeck mudstones and limestones, the Adit and Ice-House limestones of the Weald (eastern basin) and the Cypris Freestones of Dorset, culminating in the Dunkshaws Limestone in the east and its equivalent, the Hard Cockle Limestone (part of the Hard Cockle Beds) in the west. Similar sedimentary conditions prevailed throughout the remainder of the Lower Purbeck Soft Cockle Beds, continuing up into the Middle Purbeck as the Marly Freshwater and Cherty Freshwater Beds of Dorset. This sequence was interrupted by a marine episode which produced thick shell beds throughout the area (the so-called Cinder Beds) which are locally rich in oysters in the Isle of Purbeck. Though the area appears to have been flooded with sea water, the Cinder Beds are not known to extend beyond the area of deposition of the underlying less marine sediments and they show no evidence of a general discontinuity at their base. Their characteristic ostracod, Galliaecytheridea postsinuata, had already appeared in small numbers below the Cinder Beds and is also present in the beds immediately above. Moreover, when conditions again became more brackish, the pre-Cinder Beds ostracod fauna was re-established with no major change. Probably this more saline episode, though dramatic, was of short duration in view of the relatively small amount of interstitial sediment binding the oyster shells. However, both in the east and west it took some time to revert entirely to earlier conditions, hence the term Intermarine Beds for the sediments that followed in Dorset. The next unit is the Scallop Limestone, part of the Scallop Beds of Dorset, followed by shales-with-'beef' (layers of fibrous calcite).

The base of the Upper Purbeck in Dorset is marked by the Upper Broken Shell Limestone which is succeeded by shales and limestones apparently laid down in fresher water and containing beds largely composed of Viviparus [Paludina] shells – the Purbeck Marbles.

WEALDEN

(a) Wessex (Hampshire, Dorset and adjoining areas)

The bulk of the Wealden of the western lagoon consists of sands and mottled clays which are poorly known at outcrop. They are generally unfossiliferous except near the base of the sequence, where early Wealden faunas have been found, and also at the top, where the Weald Shales of the Isle of Wight contain an ostracod assemblage comparable with that of the upper Weald Clay of the Weald.

(b) Weald (Surrey, Sussex and Kent)

Hastings Beds

Fairlight Clay and Ashdown Sand. The earliest Wealden sediments were essentially deposited as a continuation of the Upper Purbeck type sedimentation and there is no break in the ostracod faunas. The sediments consist of mudstones, shales, silts and sands.

Wadhurst Clay. Few Purbeck species of ostracods persist into this unit of some 60 m of mudstones, but the entry of many new species provides very characteristic faunas. The base of the Wadhurst Clay would in many ways be a suitable horizon at which to take the base of the Wealden.

Tunbridge Wells Sand, including Grinstead Clay. These sands and clays contain a similar ostracod fauna to the upper part of the Wadhurst Clay, but with fewer species.

Weald Clay. The lower part of the Weald Clay consists of a series of siltstones, including the Horsham Stone, with a fauna dominated by Cypridea dorsispinata. The overlying clays, about 60 m thick, contain a rich, varied and distinctive ostracod fauna referred to as the Henfield phase. In Anderson (1967), the terms Horsham Group and Henfield Group were used for two ostracod assemblages in the Lower Weald Clay, but in view of the lithological connotation now attributed to the word ‘Group’,
| Lithostratigraphy | Biostratigraphy |
|-------------------|----------------|
| Western basin DORSET | Eastern basin WEALD |
| Wealden Shales | Weald Clay (upper division) |
| Wealden | Clay |
| Weald | Clay |
| Marl (Horsham Stone) (sands and silts) | Upper Tunbridge Wells Sand |
| Lower Tunbridge Wells Sand | Grinstead Clay |
| Wedhurst | Clay |

Fig. 2.
Ostracod faunas in the Purbeck & Wealden of England

Fig. 2... contd.

Fig. 2. Generalised lithological and biostratigraphical sequences in the Purbeck and Wealden of southern England.
these are here re-named as a 'phase'. Above the Henfield phase (Figs. 5 and 6) are 300 m + of sandstones, silts and clays with occasional thin 'Paludina' limestones (Sussex Marble).

In Fig. 6, the sequences in the central Weald are compared with those towards the northern and southern margins. Parts of the sequences are shown in greater detail to clarify the variations in the lithological and faunicycle successions. In the south-east, the clays are frequently sideritic and there is a lack of coarse sediment near the southern margin. Fig. 6 also shows that the preserved thickness of sediment representing a faunicycle may be very variable.

THE FAUNICYCLE

The sequence of ostracod faunas in Purbeck and Wealden strata shows that there is repeated alternation between faunas dominated by species of Cypridea (the C-phase) and those by species belonging to genera other than Cypridea, some of which clearly have a more saline provenance (the S-phase). These two phases appear to be antipathetic, from which it is assumed that salinity was an important factor in determining their composition. Thus, the S-phases are believed to represent periods of higher salinity, perhaps resulting from reduced rainfall, but in the Purbeck and Wealden, these probably never reaching true marine conditions. Conversely, the less saline waters of the C-phase were probably never completely fresh. The combination of an S-phase with the succeeding C-phase fauna represents a Faunicycle, 98 of which have so far been recognised (Figs. 3 and 4). Faunicycles form a basis for correlation throughout the Purbeck and Wealden of southern England which is more detailed than is possible by other means. There are, however, some complications. For example, where it has been possible to study a Faunicycle in detail – in a uniform lithology and at close intervals (see Anderson & Bazley, 1971, figs. 6 and 7) – it is evident that the transition from the S-phase to the C-phase assemblages is anything but uniform, consisting rather of a series of minor rhythms. Furthermore, the salinity tolerance of S-phase genera varied greatly, from those like Macroductina that clearly favoured a more saline environment, to the darwinulids that are generally most abundant in the middle range of a Faunicycle. In the Purbeck especially, extreme lithological variation affected the sequence of faunal changes. There are 'Dirt Beds', probably fossil soils, representing near terrestrial conditions; evaporites, generally beds of gypsum or anhydrite; and layers of 'beet' (fibrous calcite) – probably resulting from penecontemporaneous pre-consolidation crystallisation.

In general, however, there appears to have been a trend from the more saline waters of the Lower Purbeck, where the C-phase species in a faunicycle may represent only a small percentage of the total fauna, to the Upper Purbeck and Wealden, where they generally account for at least 50%. This change is briefly interrupted at times by a return to more saline conditions as in the Cinder Beds Faunicycle of the Purbeck (97% S-phase species) and in the Henfield Faunicycle of the Weald Clay (80% S-phase species).

SALINITY

Since the concept of a Faunicycle is based on the assumption that some, if not all, ostracods exhibit a salinity preference, it is essential to attempt some kind of estimate as to what this salinity range is. For the Purbeck-Wealden faunas, this has proved particularly difficult although Morter (1984) has suggested salinity ranges for certain bivalves and gastropods. It is easy to demonstrate by association that some genera occurred in more saline water than others, but to establish the degree of salinity is another matter. An arbitrary grouping, therefore, has been adopted according to which all the species of the genus Cypridea are classed as C-phase forms (i.e. nearer to freshwater), and the species of all other genera as S-phase forms which are assumed to indicate marine or brackish-water conditions.

It was at one time thought that the Purbeck-Wealden deposits were laid down in a predominantly freshwater environment and therefore that the non-terrestrial fauna, including the ostracods, was freshwater and presumably lacustrine. These deposits, however, contain a variety of taxa some of which may indicate proximity to land but not necessarily preservation in freshwater deposits (e.g. mammal, crocodile, turtle and dinosaur remains, the insect and isopod beds and the occurrence of gastropods such as Physa, Valvata and Viviparus [Paludina]). There are also fossil soils. On the other hand, there are fish, including sharks, marine gastropods (Procerithium (Rhabdocolpus) and Promathildia) and bivalves (Grammatodon, 'Mesosacella' [Nuculana], Modiolus, Myrene, Myophorella, 'Pecten', Pinna, Protocardia and Venilicardia), the echinoid Hemicidaris and some foraminifera of more marine aspect. Taxa such as Liostrea, Neomiodon, Cassiope and Hydrobia may be more tolerant of salinity fluctuations.

Ostracods are the most abundant fossils in the Purbeck and Wealden and are found in association with all these other forms. It could be expected, therefore, that some at least were marine, and some belong to genera already established earlier in the Jurassic. From the Fyleadal Clay (Kimmeridgian-Portlandian) Christensen (1968) listed Rhinocypris (Ilyocypris), Klieana, Macroductina, Eocythereopteron, Fabanella, Galliacytheridea and Dicorygma (Stenestromia). Barker (1966a) found Procythereopteron, Macroductina, Paraschuleridea, Protocythere, Orthonotocythere and Galliacytheridea.
in the Portlandian. Bate† (1965) recorded Darwinula, Limnocythere, Bisulcocypris, Theriosynoecum and Timiriasevia from the Bathonian of Oxfordshire and he regarded these as freshwater forms despite their association with a marine fauna.

The determination of δ18O ratios by Allen & Keith (1965), though as yet inconclusive, supported the suggestion that some at least of the Purbeck-Wealden ostracods were marine forms. Samples (of calcitic shells and some limestones) which gave a δ18O value of -2 or more and are therefore thought to be marine may also contain ostracods such as Macroductina, Procytheropteron, Galliaecytheridea, Eoparacypris, Bisulcocypris, Scabriculocypris, Timiriasevia and Rhinocypris.

Association with marine genera in earlier parts of the Jurassic does not necessarily mean that Purbeck-Wealden ostracod genera were marine, but neither does an association in the Tertiary with freshwater forms indicate the contrary. If such genera as Fabanella, Mantelliana and Theriosynoecum were freshwater, they must have been either fluviatile or lacustrine. If they were freshwater, this should be indicated by their geographical distribution (i.e. they should be more abundant at or near the effluents), but this has not been established. Fabanella is abundant in the Lower Purbeck, and Theriosynoecum in the Upper Weald Clay in all areas examined, not only in certain marginal areas. If lacustrine, they should be associated with freshwater molluses such as Unio. Instead, the association is with Corbula and Liostrae.

Eoparacypris, Fabanella, Galliaecytheridea, Macroductina, Orthonotacythere, Paraschuleridea, Procytheropteron, Strenestroemia and Wolburgia are found in the Portlandian associated with Serpula, Isognomon, Liostrae, Myophorella, Protocardia and Aptyxiella. This type of assemblage, with the addition of rare specimens of Cypridea, dominates the basal beds of the Purbeck and continues upwards, especially in Faunicycles like the Hard Cockle, but with species of Cypridea becoming increasingly abundant. This faunal progression is interrupted by the Cinder Beds, where Galliaecytheridea is the dominant form and is accompanied by Myophorella, Protocardia, Isognomon, serpulids and the echinoid Hemicidaris.

Although the S-phases of faunicycles above the Cinder Beds still contain examples of such genera as Macroductina and some Liostrae, they were relatively less important, and species of Cypridea became more abundant and varied. In the Wealden it is probable that S-phase brackish-water conditions occurred intermittently for example in the Wadhurst Clay, in the Henfield phase at the base of the Weald Clay and, in particular, near the top of the Weald Clay, where Fabanella reappears and Theriosynoecum is very abundant – possibly heralding the marine transgression of the Lower Greensand.

†Bate interpreted the freshwater ostracods as having been brought into a marine environment by rivers but they could also have been re-worked and redeposited (Ed.).
The relative abundance of each species is shown as the percentage of all the examples of that species collected.

Scale: 0% 50% 100%

The relative abundance of each species is shown as the percentage of all the examples of that species collected.
Indicates the period of maximum abundance of the species.
FAUNAL ASSEMBLAGES

The rate of evolution of the Purbeck-Wealden ostracods varied considerably. New forms of *Cypridea* were constantly appearing, whereas evolution in the S-phase genera was much slower and some species continued throughout, virtually unchanged. This appears to be generally the case with most animals and the production of new species can be correlated with stress conditions such as those associated with shallow water and rapidly changing environments. Changes in the composition of the ostracod faunas in the Purbeck-Wealden are superimposed on the variations due to salinity and sedimentary changes. Thus, the divisions determined by sedimentation, salinity and evolutionary changes coincide only rarely. There does, however, appear to have been some recognisable changes in the character of the assemblage about every seven faunicycles (see Figs. 3 and 4), so that the evolutionary rate of the genus *Cypridea* at least appears to have been constant.

Assemblage 1 includes species found also in the Upper Portland beds. This assemblage is followed by 13 others after which, in Assemblage 15, the approach to more saline conditions becomes evident. In Anderson (1973) the Purbeck-Wealden faunas were divided into 10 Assemblages, but as more evidence has become available, this is now considered to be inadequate and to be too much influenced by changes in sedimentation.

SEQUENCE OF OSTRACOD FAUNAS

Locality data are denoted by abbreviations that can be identified from the list on pages 38-40. To show the extent of the change in the ostracod faunas between the Portland Beds and Assemblage 1 of the Purbeck, the species with an asterisk (*) are those that continue into overlying beds and the species with a dagger (†) are first recorded in that unit. Where authors of species are not given in this section, they are given in “Notes on the Species” which also gives a reference to a figure in Plates 1-12 for species from the Purbeck and Wealden.

Portland Beds

Portland Sand (after Barker 1966a, b); from FW, H.O, Pq, WW:
*Cytherelloidea parawebberi* Oertli
*Eocytheridea eusarca* Bassioni
*Galliaecytheridea postrotunda* Oertli
*Galliaecytheridea wolburgi* (Steghaus)
*Macrodentina retirugata* Malz
*Macrodentina rudis* (T. R. Jones)
*Orthonotacythere elongata* Barker
*Orthonotacythere levis* Barker
*Orthonotacythere rimosa* Barker
*Protocythere serpentina* Oertli
*Protocythere serpentina* Anderson

Portland Stone (after Anderson 1941, Sylvester-Bradley 1941, Barker 1966a, b); from Bu, FW, HO, Pq, Sw, WW:
*Cypridea dunkeri* Anderson
*Cypridea tumescens* Anderson
*Eocytheridea eusarca* Anderson
*Eoparacypris weedonensis* Oertli
*Fabanella boloniensis* Anderson
*Macrodentina retirugata* Anderson
*Macrodentina rugulata* Anderson
*Macrodentina transiens* Anderson
*Orthonotacythere levis* Anderson
*Orthonotacythere rimosa* Anderson
*Paraschuleridea buglensis* Barker
*Protocythere serpentina* Anderson
*Procytheropteron bicosta* Barker
*Stenestroemia calyptroides* Anderson
*Wolburgia visceralis* Anderson

Wolburgia visceralis accounts for 35% of the specimens recovered, the three species of *Macrodentina* for 26%, *P. buglensis* for 19% and *P. serpentina* for 19%.

Purbeck Beds

In the following account, the number of ostracod specimens used to determine the fauna of each faunicycle is recorded so that the significance of the percentages quoted for the species within the fauna can be assessed. Poorly preserved material or ostracods of uncertain horizon are omitted. The latter represent almost half of the total specimens (about 400,000) recovered. Fig. 2 tabulates the main lithostratigraphical units and Assemblages 1-15, relating these also to the faunicycles and zones based in species of *Cypridea*. Figs. 3 and 4 show the ranges of species of *Cypridea* and other taxa of ostracods respectively. On both figures, the relative abundance of each species is shown as the percentage of all the examples of that species collected. i.e. it shows maxima-minima in the occurrence of species. Fig. 5 illustrates the inferred relationships of some of the species of *Cypridea* and also indicates the dominant species at various times and relates these to the lithostratigraphical units. Examples of the real thicknesses of these units are shown in Fig. 6.

ASSEMBLAGE 1

Represents the transition from Portland to Purbeck faunas. As seen at Swindon and in the Aylesbury area. S-phase genera such as *Macrodentina* and *Wolburgia* are gradually superceded by *Fabanella* and *Mantelliana* and this may indicate a reduction in salinity. Four faunicycles have been recognised:

**Faunicycle 1, Quainton.** 5485 specimens from Ay and Sw.

S-phase species represent 99% of the fauna:
*Eocytheropteron eusarca* Anderson
*Eoparacypris weedonensis* Anderson

- Weald Boreholes
- Ripe Borehole

Southern Margin

(Wadhurst Clay

(Combined, see Anderson 19617)
and revised)
*Fabanella ansata* 23%
*F. boloniensis*
*Kleane alata*
*Macrodentina retirugata*
*M. rugulata*
*M. transiens*
*Mantelliana purbeckensis*
*Orthonotocythere rimoso*
*Paraschuleridea buglensis*
*Protocythere serpentina*
*Procytheropteron Barkeri*
*Scabriculocypris acanthoides*
*S. trapezoides*
*Wolburgia visceralis*

C-phase species represent less than 1% of this fauna:
*Cypridea dunkeri* and *C. tumescens*
This faunicycle does not appear to be represented other than in the marginal areas at Swindon and near Aylesbury.

**Faunicycle 2, Warren.** 2814 specimens from Ay, Pq, Sw and WN.

S-phase species represent 98% of the fauna:
†*Damonella ellipsioidea*
†*D. pygmaea*
†*Darwinula leguminella*
*Fabanella ansata* 67%
*F. boloniensis*
*Kleane alata*
*Macrodentina retirugata*
*M. rugulata*
*Mantelliana purbeckensis*
*Paraschuleridea buglensis*
*Protocythere serpentina*
*Procytheropteron Barkeri*
*Rhinocypris decipiens Anderson*
†*R. jurassica*
*Scabriculocypris acanthoides*
†*S. cerastes*
*S. trapezoides*
†*Theriosynoeicum forbesi*
*Wolburgia visceralis*

C-phase species represent less than 2% of the fauna:
*Cypridea dunkeri,* †*C. primaeva* and †*C. tumescens*
This Faunicycle also appears to be present only in the marginal areas.

**Faunicycle 3, Ridgeway.** 1107 specimens from Ay, Pq and Sw.

S-phase species represent 92% of the fauna:
*Darwinula leguminella*
*Fabanella ansata*
*F. boloniensis* 19%
*Kleane alata* 25%
*Mantelliana purbeckensis* 33%
*Paraschuleridea buglensis*
*Protocythere serpentina*
*Procytheropteron Barkeri*
*Rhinocypris decipiens Anderson*
†*R. jurassica*
*Scabriculocypris cerastes*
*S. trapezoides*
†*Stenestroemia fragilis*

C-phase species represent 8% of the fauna:
*Cypridea dunkeri,* †*C. primaeva* and †*C. tumescens*

**Faunicycle 4, Stair.** 72 specimens from He, Pq, PU and WN.
Most of this cycle consists of evaporite deposits and few ostracods were seen. The fauna appears to be similar to that of the previous cycle.

**ASSEMBLAGE 2**
Species of *Macrodentina* are no longer seen; instead, *Fabanella boloniensis* is the dominant form (46%). C-phase species are more abundant, forming up to 25% of the assemblage, with *Cypridea dunkeri* as the dominant species.

**Faunicycle 5, Swindon.** 32 specimens from Br, DB, Fa, GD and He.
This faunicycle follows the main evaporite phase and the ostracod fauna was not fully re-established. S-phase species, mainly *F. boloniensis* and *Mantelliana purbeckensis,* represent 75% of the fauna. The C-phase species are as before: *Cypridea dunkeri,* *C. primaeva* and *C. tumescens.*

**Faunicycle 6, Upwey.** 586 specimens from Bg, Br, CD, DB, Fa, Mo, Pe and Wa.
The fauna is still dominated by S-phase species (72%), mostly *M. purbeckensis* (38%) with *Kleane alata* (27%). Two new forms are *Wolburgia polyphema* and *Darwinula oblonga.* *C. dunkeri* is the most abundant C-phase species (23%) and is accompanied by *C. primaeva,* *C. tumescens* and a new form, *C. simplissima* nom. nov. (see later).

**Faunicycle 7, Hard Cockle.** 3316 specimens from Bg, Br, CD, DB, Fa, GD, Gu, He, Ki, Mo, NP, Pe, Po and Wa.
The fauna is still dominated by S-phase species (72%), mostly *M. purbeckensis* (38%) with *Kleane alata* (27%). Two new forms are *Wolburgia polyphema* and *Darwinula oblonga.* *C. dunkeri* is the most abundant C-phase species (23%) and is accompanied by *C. primaeva,* *C. tumescens* and a new form, *C. simplissima* nom. nov. (see later).

**Faunicycle 8, Wardour.** 1280 specimens from Bg, Br, CD, DB, Fa, Gu, Ki, Mo, Ne, NP and Wa.
S-phase species represent 63% of the fauna, mainly *M. purbeckensis* (44%) and *F. boloniensis* (17%).
The dominant C-phase species are *C. dunkeri* (17%) and *C. tumescens* (17%).
Faunicycle 9, Lower Soft Cockle. 1943 specimens from As, Bg, Br, CD, DB, Fa, Gu, Ki, Mo, NP, Po and Wa.

S-phase species represent 84% of the fauna suggesting an increase in salinity. *F. boloniensis* is the dominant form (66%) with *Bisulcocypris striata* (8%).

C-phase species are mainly *C. tumescens* and *C. dunkeri*. *Cypridea granulosa protogranaulosa*, the earliest subspecies of *C. granulosa*, appears in this faunicycle but is very scarce.

Faunicycle 10, Upper Soft Cockle. 1133 specimens from Bg, Br, DB, Fa, GD, Gu, He, Ki, Mo, NP, Po and Wa.

Salinity as before, S-phase species represent 85% of the fauna, mostly *F. boloniensis* (83%).

The C-phase species are mainly *C. dunkeri* and *C. peltoides*. *Cypridea peltoides eurygaster* is a new subspecies which appears in this cycle but is rare.

Faunicycle 11, Penshurst. 858 specimens from Bg, Br, DB, Fa, Gu and Wa.

S-phase species represent 60% of the fauna. They are mainly *F. boloniensis* (55%).

Of the C-phase species, 26% are *C. peltoides*.

**ASSEMBLAGE 3**

In this assemblage C-phase species for the first time, in the Mountfield Faunicycle, represent more than 50% of the ostracod fauna. The dominant forms are *Cypridea dunkeri* and *C. granulosa*. In the S-phase, *F. boloniensis* is still the dominant species.

Faunicycle 12, Ringstead. 1616 specimens from As, Br, CD, DB, Fa, GD, Gu, He, Mo, NP and Wa.

S-phase species total 75% of the fauna. *F. boloniensis* is still dominant (54%), accompanied by *M. purbeckensis* (6%).

C-phase species. As before, *C. tumescens* (15%), *C. peltoides* (7%), *C. dunkeri* (5%) and rare specimens of *C. granulosa*.

Faunicycle 13, Robertsbridge. 1484 specimens from Br, CD, Fa, GD, Gu, Mo, NP, Pe, Po and Wa.

S-phase species represent 84% of the fauna, mainly *F. boloniensis* (74%), with some *M. purbeckensis* (5%).

Of the C-phase species, *C. dunkeri* is the dominant form with *C. tumescens*.

Faunicycle 14, Burwash. 4359 specimens from Br, CD, Fa, GD, Gu, He, Mo and Wa.

S-phase species represent 61% of the fauna, again mainly *F. boloniensis* (40%), with *Scabriculocypris trapezoides* (6%) and *Darwinula leguminella* (6%).

C-phase species are now more abundant (39%). The dominant species is *C. peltoides* (29%); *C. sagena* is a new form whilst *C. granulosa* is still rare.

Faunicycle 15, Mountfield. 8597 specimens from As, Bg, Br, DB, Fa, GD, Gu, Hd, He, Ki, Mo and NP.

S-phase species represent 41% of the fauna. *F. boloniensis* (14%), *D. leguminella* and *D. oblonga* (together 11%), *Pseudoparacypridopsis mountfieldensis* (5%) and *S. trapezoides* (4%).

Of the C-phase species, *Cypridea granulosa* is now the dominant species (34%), with *C. dunkeri* (9%) and *C. sagena* (7%). New forms appearing are *Cypridea lata* and *C. varians*. From this cycle, up to and including the Royal Faunicycle, *C. granulosa* is the most abundant and characteristic species.

Faunicycle 16, Goldspur. 8973 specimens from Bg, Br, CD, DB, Fa, GD, Gu, Hd, He, Ki, Mo and NP.

S-phase species represent 43% of the fauna. *F. boloniensis* is the dominant form (20%) with *S. trapezoides* (6%) and *D. leguminella* (5%).

C-phase species are *C. granulosa* (31%), *C. peltoides* (11%) and *C. dunkeri* (6%). There are three new forms: *Cypridea orientalis*, *C. coelnothi* and *C. delicatula*.

The base of the Goldspur Faunicycle marks the base of the Middle Purbeck Beds, but in general the fauna is not very different from that of the previous cycle.

Faunicycle 17, Ashdown. 4341 specimens from As, Bg, Br, CD, DB, Fa, GD, Mo, NP, Pe and Wa.

S-phase species represent 42% of the fauna; *M. wealdensis* is the dominant form (23%) with *F. boloniensis* (9%) and *S. trapezoides* (4%).

Of the C-phase species, *C. granulosa* (42%) is dominant. For the first time, the subspecies *C. granulosa granulosa* is the most abundant subspecies (26%). *C. delicatula* represents 7% of the fauna, *C. dunkeri* (4%) and *C. sagena* (4%).

Faunicycle 18, Swanage. 4564 specimens from Br, CD, DB, Fa, GD, Hd, Ki, Mo, NP and Wa.

S-phase species represent 44% of the fauna. The dominant species are *F. boloniensis* (14%), *D. leguminella* (14%) and *Eoparacypris weedonensis*. As the salinity decreases, darwinulids become more important in the S-phase and *F. boloniensis* less so.

Of the C-phase species, *C. granulosa* accounts for 32% of the fauna (mainly the subspecies *granulosa*, 29%), with *C. dunkeri* (9%) and *C. sagena* (5%).

**ASSEMBLAGE 4**

*Cypridea granulosa* reaches its maximum abundance as the dominant C-phase species in this Assemblage and a new subspecies, *C. granulosa fasciculata*, appears which eventually becomes the commonest form of the species.

There appears to be a steady progression towards a less saline environment, this is only briefly interrupted by the Cinder Beds episode.

In the S-phases, darwinulids become increasingly abundant.
Faunicycle 19, Netherfield. 5337 specimens from Br, CD, DB, Fa, GD, Hd, Mo, NP, Po and Wa.

S-phase species represent 28% of the fauna, mainly *D. leguminella* (8%) and *F. boloniensis* (4%).

Of the C-phase species, *C. granulosa* is the dominant form (33%). The subspecies *C. granulosa fasciculata* appears for the first time but is not abundant. There are several new forms: *Cypridea swanagensis*, *C. dolabra*, *C. inaequalis*, *C. penshurstensis*, *C. aemulans* nom. nov. (see later) and the important species, *C. posticalis*, which has only been found in this and the following faunicycle.

C. *inaequalis*, *C. penshurstensis*, *C. aemulans* appears for the first time but is not abundant. There are several new forms:

Faunicycle 20, Durlston. 5668 specimens from Br, CD, DB, GD, Hd, Ki, Mo, MW, NP and Wa.

S-phase species represent 33% of the fauna, mainly *F. boloniensis* (9%), *D. leguminella* (5%) and *Orthonotocythere diglypta* (5%).

C-phase species are *Cypridea granulosa* (23%), *C. posticalis* (10%), *C. lata* (10%), *C. swanagensis* (7%), *C. coelnothi* (6%) etc.

Faunicycle 21, Peveril. 4468 specimens from Br, CD, DB, Fa, GD, Hd, Mo and Wa.

S-phase species represent 26% of the fauna, mainly *F. boloniensis* (8%) and *D. leguminella* (7%).

Of the C-phase species, *C. granulosa* is dominant (64%), in particular the subspecies *C. granulosa fasciculata* (56%).

Faunicycle 22, Cinder Beds. 3177 specimens from As, Br, CD, DB, Fa, GD, Hd, Ki, Mo, NW, PC and Wa.

S-phase species represent 97% of the fauna with *Galliaecytheridea postsinuata* (66%) as the dominant form, with *Klieana dictyota*, *D. leguminella* and other species. This unit is an ostreid rich shell bed usually about 3m thick. In Dorset, it is almost entirely composed of shells but in the Weald there is a muddy matrix.

C-phase species are much reduced and are mainly *C. granulosa fasciculata*. The species *Cypridea altissima* is present but this may only be an unornamented form of *C. granulosa*.

This faunicycle represents a dramatic increase in salinity which, however, need not have been of long duration. There is little overall disturbance in the composition of the C-phase faunas and they become re-established in the succeeding cycle.

Faunicycle 23, Nothe. 1012 specimens from Ar, As, Br, CD, DB, Fa, Gu, Hd, Ki, Mo, NP, Pe and Po.

S-phase species represent 43% of the fauna. *G. postsinuata* (18%) is still present with *D. leguminella* (13%).

Of the C-phase species, *C. granulosa* is dominant (37%) and the dominant form. *Cypridea amisia* is a new form at this level.

Faunicycle 24, Croydon. 579 specimens from Br, CD, DB, Fa, Hd and Mo.

S-phase species represent 63% of the fauna in which *G. postsinuata* is still the dominant form (34%) with *Bisulcocypris striata* (16%) and *D. leguminella* (11%).

C-phase species are mostly *C. granulosa fasciculata* (35%).

Faunicycle 25, Royal. 55 specimens from Br, CD, DB, Hd and Mo? provide only a sparse fauna.

S-phase species represent 16% of the fauna, mainly *D. leguminella* (7%) and *B. striata* (4%). *G. postsinuata* was not found. A marked reduction in salinity is evident.

Of the C-phase species, *C. granulosa fasciculata* is dominant (69%), with *C. altissima* (16%), *C. lata*, *C. amisia* and *C. simplissima*.

ASSEMBLAGE 5

In this assemblage, *Cypridea granulosa*, though present, is no longer the dominant C-phase species, being replaced by *Cypridea amisia* and *C. vidrana*. In the S-phase, *Fabanella boloniensis* has been largely replaced by *Macrodenentina mediostricta*.

Faunicycle 26, Corfe. 1066 specimens from Bg, Br, CD, Gu, Hd, Mo and Wa.

S-phase species represent 62% of the fauna and include *F. boloniensis* (17%), *M. mediostricta* (11%), *Damonella ellipsoidea* (14%) and *Scabriculocypris durlestonensis* (9%).

C-phase species are *Cypridea lata* (16%) with *C. amisia*, *C. simplissima*, *C. aemulans* and a few *C. granulosa fasciculata*.

Faunicycle 27, Worth. 742 specimens from Bg, Br, CD, DB, Fa, Hd and Mo.

S-phase species represent 31% of the fauna with *F. boloniensis* (13%), *Theriosynoecum forbesi* (5%), *Klieana thoracina*, *M. mediostricta*, *O. diglypta* and other species.

C-phase species are *C. granulosa fasciculata* (16%), *C. altissima* (10%), *C. lata* (14%), with the two new forms *Cypridea darvelensis* (6%) and *C. tuberculata langtonensis* (6%).

Faunicycle 28, Langton. 1380 specimens from Br, CD, DB, Fa, Gu, Hd, Mo and Wa.

S-phase species represent 37% of the fauna. *B. striata* is dominant (10%) with *Rhinocypris jurassica*, *M. mediostricta*, darwinulids and other species.

C-phase species are *C. amisia* (dominant, 24%), *C. lata* (10%), *C. granulosa fasciculata* (7%), *C. penshurstensis* (7%) and *C. altissima* (6%). There are three new forms: *Cypridea vidrana*, *C. obliqua* and *C. andersoni*.
Faunicycle 29, Scallop. 1260 specimens from Br, CD, DB, Fa, Gu, Mo and Wa.
S-phase species represent 35% of the fauna. *M. mediostricta* is the dominant form (21%) with *D. leguminella* (4%) and other species.
C-phase species are *C. lata* (16%), *C. penshurtensis* (14%), *C. amisia* (12%), *C. simplessima* and others. New forms first seen here are *Cypridea propunctata*, *C. brevirostrata* and *C. bimammata*; forms resembling *C. alta* and *C. setina* are also found.

Faunicycle 30, Studland. 1028 specimens from Br, CD, Fa, Gu, Hd and Mo.
S-phase species represent 27% of the fauna with *Orthonotacythere nodosaria* (8%), *D. leguminella* (6%), *Stenestroemia fragilis* (5%), *M. mediostricta* (3%) and other species.
C-phase species are *C. lata* (dominant, 33%), *C. vidrana* (13%), *C. penshurtensis* (8%) and *C. simplessima* (7%). *C. setina* and *C. alta* are definite components of this fauna, but are rare. There is a new form which resembles *Cypridea wicheri*.

Faunicycle 31, Bacon. 2681 specimens from Br, CD, DB, Fa, Gu, Hd, Mo and Wa.
S-phase species represent 31% of the fauna and include *D. leguminella* (9%) and *M. mediostricta* (9%).
C-phase species include *C. vidrana* (19%), *C. amisia* (16%), *C. penshurtensis* (8%) and *C. lata* (6%). *Cypridea setina* is present but scarce.

Faunicycle 32, Poxwell. 2182 specimens from Br, CD, DB, Fa, Gu, Hd, Mo and Wa.
S-phase species represent 51% of the fauna. The dominant species are *Orthonotacythere rimosa* (22%) with *D. leguminella* (10%), *M. mediostricta* (7%) and *F. boloniensis* (6%).
C-phase species include *Cypridea vidrana* (dominant, 13%), *C. aemulans* (8%), *C. lata* (8%) and *C. orientalis* (6%).

ASSEMBLAGE 6
This assemblage is marked by the increasing dominance of such characteristic Upper Purbeck species as *Cypridea setina*, *C. propunctata* and *C. wicheri*.

Faunicycle 33, Greenwood. 1835 specimens from Br, CD, DB, Fa, Mo, NP and Wa.
S-phase species represent 36% of the fauna with *M. mediostricta* as the dominant form (20%) and darwinulids.
C-phase species include *C. penshurtensis* (42%), *C. brevirostrata* (9%), *C. simplessima* (7%) and other species. Both *C. setina* and *C. propunctata* are present but are rare.

Faunicycle 34, Lulworth. 2143 specimens from CD, DB, Fa, Mo, NP and Wa.
S-phase species represent 34% of the fauna, with *B. striata* (13%), *M. mediostricta* (6%), darwinulids (18%) and other species.
Of the C-phase species, *C. penshurtensis* (57%) is the most abundant form with *C. woburgi* (17%), *C. setina rectidorsata* (6%) and *C. setina setina* (1%). A characteristic but scarce subspecies, *C. alta formosa*, is also present.
This cycle marks the base of the Upper Purbeck during which *C. setina* and *C. propunctata* become the most typical species.

Faunicycle 35, Mupes. 2773 specimens from CD, DB, Fa, Ki, Mo and Wa.
S-phase species represent 26% of the fauna, with darwinulids (10%), *R. jurassica* (7%), *B. striata* (6%) and a few specimens of *M. mediostricta*.
C-phase species are *C. setina* (20%), *C. propunctata* (12%), *C. alta* (11%) and *C. alta formosa* (6%). The first examples of *C. laevigata* and *C. ventrosa* are found in this faunicycle.

Faunicycle 36, Brede. 3146 specimens from CD, DB, Fa, Ki, Mo and Wa.
S-phase species represent 10% of the fauna, being mostly *D. leguminella* and *D. oblonga*.
C-phase species include *C. propunctata* (dominant, 32%), with *C. setina* (24%), *C. alta* (11%) and *C. wicheri* (8%).

Faunicycle 37, Tisbury. 2786 specimens from CD, DB, Mo, NP and Wa.
S-phase species represent 14% of the fauna and are mainly darwinulids (10%).
Of the C-phase species, *C. propunctata* is dominant (25%), with *C. setina* (18%), *C. alta* (17%) and other species.

Faunicycle 38, Durdle. 2391 specimens from CD, DB, Fa, Mo and Wa.
S-phase species represent 8% of the fauna. They are mainly darwinulids (5%) with *R. jurassica* (2%).
C-phase species are *C. setina* (dominant, 25%), with *C. wicheri* (23%) and *C. alta* (21%). *C. alta formosa* is now scarce.

Faunicycle 39, Tyneham. 1784 specimens from CD, DB, Fa, Gu, NP and Wa.
S-phase species represent 16% of the fauna, mainly darwinulids (11%) with *R. jurassica* and other species.
C-phase species include *C. setina* (dominant, 33%), *C. propunctata* (14%), *C. alta* (13%) and *C. wicheri* (7%).
ASSEMBLAGE 7

This fauna is essentially a continuation of Assemblage 6 but with some new elements such as the remarkable species Cypridea morula (Pl. 8, fig. 16). Cypridea dolabrata and C. wicheri both develop a number of sub-species and C. brevirostrata becomes abundant. In the upper part of this assemblage the typical Wealden form C. tuberculata becomes the dominant C-phase species. Although the Hastings Faunicycle (41) has been previously taken as the base of the Wealden, the transition from the Purbeck is gradual and it is only in the dolabrata faunas become firmly established. There is also a change in the ornament pattern of C. species and C. species but with some new elements such as the remarkable previously taken as the base of the Wealden, the transition R. a transition from Purbeck to Wealden faunas.

Faunicycle 40, Battle. 2237 specimens from CD, DB, Gu, NP and Wa.

S-phase species represent 18% of the fauna, mainly R. jurassica (9%) with darwinulids and other species.

Of the C-phase species, C. propunctata is the dominant form (35%), with C. aemulans (22%) and C. setina (11%).

Faunicycle 41, Hastings. 663 specimens from CD, Fa, Gl, He, Ki, Po and Wa.

S-phase species represent 10% of the fauna and include darwinulids (7%), with R. jurassica and Theriosynoecum alleni (first appearance).

Of the C-phase species, C. brevirostrata is the dominant form (41%), with C. wicheri (22%), C. setina (18%) and the scarce but characteristic C. tuberculata adjuncta.

Faunicycle 42, Bexhill. 1606 specimens from Ar, CD, He, Ki, Pe, Po and Wa.

S-phase species represent 13% of the fauna, mainly darwinulids (7%), with R. jurassica (4%) and T. alleni (2%).

C-phase species include C. laevigata (27%), C. brevirostrata (26%), C. morula (16%) and C. setina (9%).

C. morula is known only from this and the succeeding cycle. A form which may be C. melvillei appears for the first time in this cycle.

Faunicycle 43, Eastbourne. 3142 specimens from As, CD, He, Ki and Wa.

S-phase species represent 30% of the fauna. They are mainly R. jurassica (27%), with Timiriasevia punctata and darwinulids.

C-phase species include C. wicheri (19%), C. morula (14%), C. setina (13%) and C. dolabrata (12%).

Faunicycle 44, Nutfield. 1049 specimens from CD, Gl, He, Ki, Po and Wa.

S-phase species represent 4% of the fauna with darwinulids (3%) and T. alleni.

Of the C-phase species, C. dolabrata is dominant (55%), with C. tuberculata (11%), C. paulsgrovensis (10%), C. menevensis (7%), C. setina, C. aculeata and C. recta.

This fauna now has a typical early Wealden aspect.

Faunicycle 45, Maresfield. 160 specimens only, from CD, Fa, Gl, He, Ki, Pe, Po and We.

No S-phase species seen.

Of the C-phase species, C. tuberculata is dominant (56%), with C. menevensis (16%), C. paulsgrovensis (8%), C. aculeata (7%), C. bispinosa (6%) and C. recta.

Faunicycle 46, Hythe. 92 specimens only from He, a very sparse fauna.

No S-phase species seen.

C-phase species are C. tuberculata (dominant, 37%), with C. recta (18%), C. paulsgrovensis (16%) and C. menevensis (12%).

ASSEMBLAGE 8

This ostracod assemblage is found in the lower part of the Wadhurst Clay. The S-phases are dominated by Theriosynoecum alleni and Rhinocypris jurassica. The common C-phase species are C. laevigata and C. tuberculata.

Faunicycle 47, Rye. 2868 specimens from CD, Gl, Wa, We and WP.

S-phase species represent 40% of the fauna. T. alleni makes up 20%, and others present include a new form, Mantelliana phillipsiana, R. jurassica and darwinulids.

C-phase species include Cypridea blackbusensis (26%) a new arrival, C. paulsgrovensis (24%), C. westfieldensis another new form, C. menevensis and C. laevigata. C. melvillei was seen but was very scarce.

Faunicycle 48, Winchester. 2391 specimens from CD, Gl, Wa, We and WP.

S-phase species represent 15% of the fauna, mainly T. alleni (8%), with R. jurassica, M. phillipsiana and darwinulids.

Of the C-phase species, C. paulsgrovensis is dominant (72%) with C. tuberculata (8%), C. blackbusensis, C. westfieldensis, C. menevensis and a few C. melvillei.

Faunicycle 49, Lydd. 2604 specimens from CD, Gl, Ki, LM, Wa, We and WP.

S-phase species represent 31% of the fauna and include T. alleni (16%), with Damonella ellipsoidea, F. boloniensis and darwinulids.

Of the C-phase species, C. tuberculata is dominant (42%), with C. paulsgrovensis (26%), C. menevensis, C. laevigata and others.
Ostracod faunas in the Purbeck & Wealden of England

Faunicycle 50, Horsted. 1495 specimens from CD, Gl, LM, Wa, We and WP.
S-phase species represent 19% of the fauna and include T. alleni (13%) with R. jurassica, M. phillipsiana and darwinulids.
C-phase species are C. tuberculata (41%), C. paulsgrovensis (32%), C. laevigata, C. menevensis and C. melvillei.

Faunicycle 51, Kingsclere. 4488 specimens from Gl, LM, Wa, We and WP.
S-phase species represent 36% of the fauna, with T. alleni (26%), R. jurassica, darwinulids and other species.
C-phase species are C. laevigata (19%), C. melvillei (15%), C. paulsgrovensis (12%), C. tuberculata, C. menevensis and two new forms, Cypridea frithwaldi and C. lasius.

Faunicycle 52, St. Leonards. 4162 specimens from CD, Co, Gl, Ki, LM, Wa, We and WP.
S-phase species represent 41% of the fauna, including T. alleni (22%), R. jurassica (14%) and darwinulids.
C-phase species are C. paulsgrovensis (24%), C. laevigata (20%), C. menevensis and C. melvillei, with the new forms Cypridea helena, C. pendae, C. valdensis and C. vorucosa.

Faunicycle 53, Fairlight. 5202 specimens from CD, Co, Gl, Ki, LM, Wa, We and WP.
S-phase species represent 34% of the fauna; they include R. jurassica (12%), T. alleni (9%), darwinulids and a new form, Mantelliana mantelli.
C-phase species include C. paulsgrovensis (31%), C. laevigata (12%), C. menevensis, C. melvillei, C. pendae, and three new forms, Cypridea arenosa, C. giffordi and C. asseri.

ASSEMBLAGE 9
This assemblage is present in the upper part of the Wadhurst Clay. The S-phase species in this assemblage show little change, but in the C-phase, the previously common species C. paulsgrovensis, C. laevigata and C. tuberculata are replaced by C. melvillei, C. recta, C. aculeata and C. bispinosa. Cypridea arenosa, with some subspecies of C. laevigata and C. aculeata are characteristic.

Faunicycle 54, Lindfield. 3276 specimens from CD, Co, FL, Gl, Ki, LM, Wa, We and WP.
S-phase species represents 23% of the fauna, mainly darwinulids (11%), with T. alleni (7%) and R. jurassica (5%).
C-phase species are C. paulsgrovensis (19%), C. aculeata (12%), C. arenosa (9%), C. blackbushensis (8%), C. recta (7%), C. menevensis, C. pendae and a new form – Cypridea vericae.

Faunicycle 55, Wadhurst. 3076 specimens from CD, FL, Gl, Ki, LM, Wa and WP.
S-phase species represent 22% of the fauna, mainly darwinulids (8%) and R. jurassica (4%), with T. alleni, M. phillipsiana and others.
C-phase species include C. bispinosa (22%), C. aculeata (15%), C. recta (18%) and C. arenosa (8%).

Faunicycle 56, Crowhurst. 4381 specimens from CD, Co, FL, Gl, Ki, Wa, We and WP.
S-phase species represent 20% of the fauna, mainly darwinulids (15%), with R. jurassica, M. phillipsiana and T. alleni.
C-phase species include C. recta (29%) mostly the subspecies C. recta tilsldenensis, C. bispinosa (18%), C. melvillei (14%) and C. aculeata.

Faunicycle 57, Hawkhurst. 9376 specimens from Co, FL, Gl, Ki, Wa, We and WP.
S-phase species represent 17% of the fauna, mainly darwinulids (10%) and R. jurassica (6%), with T. alleni and M. phillipsiana.
C-phase species include C. melvillei (36%), C. aculeata (18%) and C. bispinosa (14%).

Faunicycle 58, Fletching. 1621 specimens from CD, FL, Ki and WP.
S-phase species represent 23% of the fauna with darwinulids (11%), R. jurassica (9%), T. alleni and Damanella pygmaea.
C-phase species include C. melvillei (30%), C. vorucosa (18%), C. bispinosa (13%) and C. aculeata.

Faunicycle 59, Chilcombe. 3978 specimens from CD, CL, Cu, Ki, PQ, Sh and Wa.
S-phase species represent 14% of the fauna with T. alleni (5%), M. phillipsiana (4%), darwinulids, R. jurassica and others.
C-phase species are C. recta (41%), with C. tuberculata, C. vorucosa, C. valdensis and C. bispinosa.

Faunicycle 60, Grinstead. 786 specimens from Cu, Hi, Ki, PQ and Wa.
S-phase species represent 22% of the fauna with darwinulids (12%), T. alleni (5%) and M. phillipsiana (5%).
C-phase species are C. bispinosa (48%), with C. tuberculata, C. recta and C. aculeata.

ASSEMBLAGE 10
The fauna is little changed. C-phase faunas consist largely of C. bispinosa, C. recta and C. tuberculata, and the S-phase faunas of T. alleni with darwinulids. The subspecies C. recta tilsldenensis is an important component of this assemblage. In the upper part of the assemblage, the faunas are sparse and known from very few localities so that details given for each Faunicycle are unreliable.
Faunicycle 61, Philpotts. 964 specimens from CL, Cu, Hi, PQ and Wa.
S-phase species represent 15% of the fauna with R. jurassica (7%), M. phillipsiana, T. alleni and darwinulids.
C-phase species include C. bispinosa (28%), C. tuberculata (21%), C. recta (20%) and C. verrucosa (13%).

Faunicycle 62, Copyhold. 215 specimens from Cu, PQ and Wa.
S-phase species represent 10% of the fauna. M. phillipsiana (9%) occurs with R. jurassica and darwinulids.
C-phase species are C. recta (mostly subspecies tillsdenensis) (71%), C. tuberculata, C. bispinosa and C. laevigata.

Faunicycle 63, Highbridge. 346 specimens from Ki.
S-phase species represent 2% of the fauna and are mostly darwinulids.
C-phase species include C. recta (mostly the subspecies tillsdenensis) (53%), C. melvillei (33%) and C. aculeata.

Faunicycle 64, Salehurst. 108 specimens from Cu.
S-phase species represent 9% of the fauna and all are darwinulids.
C-phase species are C. recta (mostly the subspecies tillsdenensis) (68%), C. valdensis (16%), C. aculeata, C. tuberculata and C. melvillei.

Faunicycle 65, Bathurst. 79 specimens from Cu and PQ.
S-phase species represent 8% of the fauna and are mostly darwinulids.
C-phase species are C. recta (mostly the subspecies tillsdenensis) (49%), C. bispinosa (28%) and C. valdensis (15%).

Faunicycle 66, Peasemarsh. 50 specimens from Cu and Sh.
S-phase species represent 34% of the fauna with M. wealdensis (18%) and darwinulids (16%).
C-phase species are C. recta (mainly the subspecies tillsdenensis) (40%), C. tuberculata (12%), C. valdensis (10%) and C. bispinosa (2%).

Faunicycle 67, Cuckfield. 151 specimens from Cu and Sh.
S-phase species represent 65% of the fauna. T. alleni (60%) occurs with M. phillipsiana and darwinulids.
C-phase species are C. bispinosa (20%), C. laevigata (10%), C. recta tillsdenensis (5%).

ASSEMBLAGE 11
The basal part of the Weald Clay (Horsham phase) contains a distinctive assemblage completely dominated by C. dorsispinata in the C-phase and with Miocytheridea henfieldensis and Theriosynoeicum fittoni as the S-phase forms. Whatever the reason for these impoverished faunas and the disappearance of most of the previously existing species, the base of the Weald Clay is marked by a profound faunal change. Although at first ostracods are scarce, they soon become abundant although relatively few species are present. In Anderson (1967) the terms Horsham Group and Henfield Group were used to refer to the ostracod assemblages in the Lower Weald Clay. In view of the lithological connotation now attributed to the word ‘Group’, these are re-named as ‘phases’.

Faunicycle 68, Sevenoaks. 6 specimens only, from He and Wd.
S-phase species are represented by five specimens. All are Darwinula oblonga.
C-phase species are represented by one specimen of C. dorsispinata.

Faunicycle 69, Egerton. 195 specimens from Ha and Wd.
S-phase species represent 20% of the fauna with darwinulids (10%), M. henfieldensis (7%), also T. fittoni and Mantelliana mantelli. M. mantelli and Miocytheridea henfieldensis are new arrivals.
C-phase species are C. dorsispinata (73%), C. clavata and C. tuberculata. Cypridea clavata is present for the first time.

Faunicycle 70, Redhill. 814 specimens from Wd.
S-phase species represent 17% of the fauna and include darwinulids (9%) with M. mantelli, T. fittoni and M. henfieldensis.
C-phase species are C. dorsispinata (50%), C. tuberculata (30%) and C. clavata.

Faunicycle 71, Hackhurst. 1041 specimens from Ha, So and Wd.
S-phase species represent 22% of the fauna including T. fittoni (9%), darwinulids (8%), with M. henfieldensis, M. mantelli and F. boloniensis.
C-phase species are C. dorsispinata (59%), with C. tuberculata and C. clavata.

Faunicycle 72, Marden. 2816 specimens from Ha, Re, Wa and Wd.
S-phase species represent 23% of the fauna with darwinulids (13%), T. fittoni (8%), M. henfieldensis and M. mantelli.
C-phase species are C. dorsispinata (42%), C. tuberculata (31%) and C. clavata.

Faunicycle 73, Hailsham. 2217 specimens from Ha, Re, Wa and Wd.
S-phase species represent 34% of the fauna with darwinulids (22%), M. henfieldensis (10%), T. fittoni and D. pygmaea.
C-phase species are C. dorsispinata (50%), with C. clavata, C. tuberculata, C. valdensis, and a new form Cypridea pumila.
Faunicycle 74, Langhurst. 1532 specimens from Ha and Re.

S-phase species represent 22% of the fauna with darwinulids (12%), *M. henfieldensis* (8%), *M. mantelli* and *D. pygmaea*.

C-phase species are *C. dorsispinata* (72%), with *C. tuberculata*, *C. clavata* and *C. valdensis*.

**ASSEMBLAGE 12**

At the base of the higher part of the Lower Weald Clay (Henfield phase), there is again a marked faunal change. Only one of the subspecies of *Cypridea dorsispinata* i.e. *roemeri* lingers on and is never very common. The dominant C-phase species is *C. tuberculata*, accompanied by *C. pumila*, *C. marina* and *C. valdensis*. In the S-phases, *M. henfieldensis* is the most abundant species. There appears to have been a steady decrease in salinity throughout this assemblage up to the Crawley Faunicycle.

Faunicycle 75, Henfield. 1226 specimens from Ha, Re, So, Wa, Wd and Wm.

S-phase species represent 80% of the fauna and include *M. henfieldensis* (42%), darwinulids (31%), *T. fittoni* and *D. pygmaea*.

C-phase species are *C. tuberculata* (10%), *C. pumila* (7%), *C. clavata* and *C. valdensis*.

Faunicycle 76, Rolvenden. 1935 specimens from Ha, Re, So, Wa and Wm.

S-phase species represent 52% of the fauna including *M. henfieldensis* (42%), with *T. fittoni*, *Damonella buchaniana*, *D. pygmaea*, *M. mantelli* and darwinulids.

C-phase species are *C. pumila* (38%), with *C. clavata*, *C. tuberculata*, *C. valdensis* and *C. dorsispinata roemeri*.

Faunicycle 77, Edenbridge. 2983 specimens from Ha, Re, So, Wa and Wm.

S-phase species represent 47% of the fauna with *M. henfieldensis* (26%), *T. fittoni*, *D. pygmaea*, *M. mantelli*, *D. buchaniana* and darwinulids.

C-phase species are *C. valdensis* (19%), *C. pumila* (11%), *C. tuberculata* and two species appear, *C. marina* and *C. brendae* sp. nov. (see later).

Faunicycle 78, Sandhurst. 4855 specimens from Cu, Ha, Re, So, Wa and Wm.

S-phase species represent 18% of the fauna and include *M. henfieldensis* (9%), with *T. fittoni*, *D. pygmaea*, *M. mantelli* and darwinulids.

C-phase species are *C. tuberculata* (36%), with *C. clavata*, *C. dorsispinata roemeri*, *C. valdensis* and *C. marina*.

Faunicycle 79, Crawley. 2548 specimens from Cu, Ha, Re, So, Wa and Wm.

S-phase species represent 8% of the fauna and include *M. henfieldensis* (8%) with *M. mantelli*, *D. pygmaea*, *T. fittoni* and darwinulids.

C-phase species include *C. tuberculata* (69%), with *C. clavata*, *C. valdensis*, *C. marina* and *C. brendae* sp. nov.

Faunicycle 80, Fernhurst. 1547 specimens from Cu, Ha, Re and Wa.

S-phase species represent 15% of the fauna and include *M. henfieldensis* (6%), with *M. mantelli*, *T. fittoni*, *D. pygmaea* and darwinulids.

C-phase species include *C. pumila* (37%), *C. tuberculata* (28%), *C. clavata*, *C. valdensis* and *C. brendae* sp. nov.

Faunicycle 81, Plumpton. 1396 specimens from CH, Cu, Ha, Re, Wa and Wm.

S-phase species represent 28% of the fauna including *M. henfieldensis* (18%), with *Cytheridea* (Haplocytheridea) *delicatula*, *M. mantelli* and darwinulids.

C-phase species are *C. pumila* (41%), *C. clavata* (20%), *C. tuberculata*, *C. valdensis* and *C. marina*.

**ASSEMBLAGE 13**

*Cypridea marina* replaces *C. pumila* as the dominant C-phase species during this period. The S-phase fauna is little changed except that *T. fittoni* becomes more abundant. Note that *Fabonella boloniensis* is present in the more saline Buxted, Ockley and Ewhurst Faunicycles.

Faunicycle 82, Buxted. 1945 specimens from CH, Cu, Ha, Re and Wa.

S-phase species represent 44% of the fauna, including *M. henfieldensis* (24%), *M. mantelli*, *D. pygmaea*, *F. boloniensis* and darwinulids.

C-phase species are *C. pumila* (40%), *C. valdensis* (13%), *C. marina*, *C. tuberculata* and *C. clavata*.

Faunicycle 83, Ockley. 1611 specimens from CH, Cu, Ha, Re and Wa.

S-phase species represent 49% of the fauna with *M. henfieldensis* (39%), *M. mantelli*, *F. boloniensis* and darwinulids.

C-phase species are *C. pumila* (45%), *C. tuberculata*, *C. valdensis*, *C. clavata* and *C. marina*.

Faunicycle 84, Horley. 2850 specimens from CH, Cu, Ha, Re and Wa.

S-phase species represent 27% of the fauna with *M. henfieldensis* (12%), *T. fittoni*, *M. mantelli* and darwinulids.

C-phase species are *C. marina* (58%), *C. tuberculata*, *C. pumila*, *C. valdensis* and *C. clavata*. *Cypridea hispida* sp. nov. (see later) appears in this Faunicycle.
Faunicycle 85, Slinfold. 4287 specimens from CH, Cu, Ha, Re and Wa.

S-phase species represent 14% of the fauna with T. fittoni (5%), M. henfieldensis (4%), M. mantelli, D. pygmaea and darwinulids.

C-phase species are C. marina (72%), C. hispida, C. tuberculata, C. pumila and C. valdensis.

Faunicycle 86, Newdigate. 1906 specimens from CH, Ha, Re and Wa.

S-phase species represent 14% of the fauna with T. fittoni (9%), M. henfieldensis, M. mantelli and darwinulids.

C-phase species are C. marina (39%), C. hispida (31%), C. tuberculata, C. pumila, C. clavata and C. valdensis.

Faunicycle 87, Romney. 485 specimens from CH, Ha and Wa.

S-phase species represent 50% of the fauna including M. henfieldensis (31%), M. mantelli and darwinulids.

C-phase species are C. tuberculata (27%), C. clavata (20%) and C. valdensis.

Faunicycle 88, Ewhurst. 1022 specimens from CH and Wa.

S-phase species represent 54% of the fauna with M. henfieldensis (22%), Cytheridea (H.) delicatula (22%), M. mantelli, Orthonotacythere diglypta and F. boloniensis.

C-phase species are C. clavata (39%), C. tuberculata and C. valdensis.

ASSEMBLAGE 14

In the Upper Weald Clay, the C-phase fauna is largely made up of C. clavata and its subspecies, with C. tuberculata and C. valdensis. Important species are C. bogdenensis which is typical of the Gillmans and Ditchling Faunicycles, and C. rotundata which is a common form in this assemblage. In the S-phases, T. fittoni eventually replaces M. henfieldensis as the dominant species. In the Atherfield and Woodhatch Faunicycles, there is a marked increase in salinity.

Faunicycle 89, Capel. 813 specimens from CH, Re and Wa.

S-phase species represent 66% of the fauna and include C. (H.) delicatula (62%), with M. henfieldensis and O. diglypta.

C-phase species are C. clavata (33%), C. tuberculata and C. valdensis.

Faunicycle 90, Bonnington. 94 specimens from CH and Wa.

S-phase species represent 37% of the fauna with M. henfieldensis (28%), M. mantelli, D. pygmaea and C. (H.) delicatula.

C-phase species are C. tuberculata (50%) and C. clavata (13%).

Faunicycle 91, Pluckley. 127 specimens from Wa.

S-phase species represent 37% of the fauna with Damoneula pygmaea (15%), Darwinula oblonga (14%), T. fittoni (7%) and M. henfieldensis.

C-phase species include C. tuberculata (37%). C. rotundata appears and makes up 17% of the fauna and C. valdensis (9%).

Faunicycle 92, Gillmans. 3273 specimens from Re and Wa.

S-phase species present 15% of the fauna and include T. fittoni (11%), D. pygmaea, M. henfieldensis, M. mantelli, R. jurassica and darwinulids.

C-phase species are C. clavata (32%), C. bogdenensis (22%), C. valdensis (16%), C. rotundata (14%), C. fasciata and C. tenuis. Cypridea bogdenensis, C. fasciata and C. tenuis are all forms first seen in this Faunicycle.

Faunicycle 93, Ditchling. 1696 specimens from Re and Wa.

S-phase species represent 17% of the fauna with T. fittoni (16%), M. mantelli, M. henfieldensis and darwinulids.

C-phase species are C. clavata (27%), C. rotundata (21%), C. bogdenensis (18%), C. valdensis (16%), C. fasciata, C. hamata and C. spinigera. The last two species are first seen in this Faunicycle.

Faunicycle 94, Atherfield. 569 specimens from Re and Wa.

S-phase species represent 62% of the fauna with T. fittoni (58%), M. mantelli, M. henfieldensis and darwinulids.

C-phase species are C. valdensis (28%), C. hamata (9%), and the first occurrence of C. insulae, C. caudata and C. comptonensis.

Faunicycle 95, Woodhatch. 1030 specimens from Re and Wa.

S-phase species represent 80% of the fauna with T. fittoni, M. mantelli and Darwinula jonesi.

C-phase species are C. valdensis (10%), C. comptonensis, C. tenuis and three new first occurrences, C. cuckmerensis, C. vectae and C. warlinghamensis.

ASSEMBLAGE 15

In the highest part of the Weald Clay and the transition beds to the Lower Greensand, the salinity was high throughout. Cypridea spinigera is a typical C-phase species and Theriosynoeum fittoni is by far the most abundant ostracod.

Faunicycle 96, Sandown. 720 specimens from At, Re and Wa.

S-phase species represent 75% of the fauna and include T. fittoni (74%), with M. mantelli and Sternbergella cornigera (a new form).

C-phase species are C. spinigera (14%), C. fasciata, C. hamata, C. valdensis, C. tenuis, C. warlinghamensis, C. rotundata, C. caudata and C. cuckmerensis.
Faunicycle 97, Cuckmere. 774 specimens from At, Re and Wa.

S-phase species represent 75% of the fauna with T. fittoni (74%), D. leguminella, S. cornigera and M. mantelli.

C-phase species are C. valdensis (18%), C. warlinghamensis, C. hamata, C. spinigera, C. insulae, C. tenuis, C. clavata, C. rotundata and C. cuckmerensis.

Faunicycle 98, Earlswood. 906 specimens from At and Re.

S-phase species represent 95% of the fauna with T. fittoni (83%), M. mantelli, D. oblonga and S. cornigera.

C-phase species are C. tenuis (4%), C. fasciata, C. rotundata, C. warlinghamensis, C. cuckmerensis and C. spinigera.

NOTES ON THE SPECIES

Stratigraphically important species are marked, on the following pages, with an asterisk (*, see Fig. 5). The percentages given are of the total number of specimens of the species that have been collected. The occurrences of species of Cypridea are shown on Fig. 3 and of the other genera on Fig. 4. Notes on the other genera follow those on Cypridea on p. 33.

Suborder Podocopina Sars, 1866  
Family Ilyocyprididae Kaufman, 1900  
Genus Cypridea Bosquet, 1852

*Cypridea aculeata* Jones, 1885

**Material.** 3076 specimens from Co, FL, Gl, Gu, He, Ki, LM, NP, Po, PQ, Sh, Wa, We, WP.

**Range.** Kingsclere to Grinstead Faunicycles, Wadhurst Clay. A few similar forms (C. aff. aculeata) which are found in the lower part of the Wadhurst Clay and in the Upper Tunbridge Wells Sand may belong to this species – giving a total range of Winchester to Salehurst Faunicycles.

**Maximum.** Hawkhurst Faunicycle, 56%. The species first becomes important in the Fairlight Faunicycle and is abundant in the Lindfield, Wadhurst, Crowhurst, Hawkhurst and Fletching Faunicycles.

Subspecies *aculeata* Jones, 1885  
Hawkhurst to Grinstead Faunicycles (Pl. 6, fig. 9)

Subspecies *antiqua* Anderson, 1967  
Wadhurst to Crowhurst Faunicycles (Pl. 6, fig. 8)

Subspecies *elgivae* Anderson, 1967  
Fairlight to Lindfield Faunicycles (Pl. 6, fig. 11)

Subspecies *eppili* Anderson, 1967  
Crowhurst to Chilcombe Faunicycles (Pl. 6, fig. 3)

Subspecies *eustactii* Anderson, 1967  
St. Leonards to Linfield Faunicycles (Pl. 6, fig. 5)

Subspecies *holmani* Anderson, 1967  
Hawkhurst to Chilcombe Faunicycles (Pl. 7, fig. 1)

Subspecies *plautii* Anderson, 1967  
St. Leonards to Fairlight Faunicycles (Pl. 7, fig. 2)

Subspecies *regni* Anderson, 1967  
Hawkhurst to Chilcombe Faunicycles (Pl. 7, fig. 4)

Subspecies *subaculeata* Anderson, 1967  
Hawkhurst to Chilcombe Faunicycles (Pl. 7, fig. 7)

Cypridea aemulans, new name for C. acuta Anderson (1971b; p. 50, pl. xvi, fig. 5) preoccupied by C. acuta Moos (1959 p. 46). (An inverse species).

(Pl. 4, fig. 2)

**Material.** 1333 specimens from Bg, Br, CD, DB, Fa, GS, Cu, He, Ki, Mo, MW, NP, Pe, Po, Wa.

**Range.** Corfe to Nutfield Faunicycles. Fairly common in the Middle and Upper Purbeck. A similar form is occasionally seen in the Netherfield to Royal Faunicycles and may be this species.

**Maximum.** Battle Faunicycle 37%.

*Cypridea alta* Wolburg, 1959

**Material.** 1992 specimens from Bg, Br, CD, DB, Fa, Cu, Hd, Mo, NP, Wa.

**Range.** Greenwood to Battle Faunicycles (Upper Purbeck) but there are similar forms in the Scallop, Bacon, Bexhill and Eastbourne Faunicycles.

**Maximum.** Tisbury Faunicycle, 26%.

Subspecies *alta* Wolburg, 1959  
Maximum in Durdle Faunicycle (Pl. 5, fig. 14)

Subspecies *formosa* Wolburg, 1959  
Maximum in Tisbury Faunicycle (Pl. 5, fig. 13)

*Cypridea altissima* Martin, 1940

(Pl. 5, fig. 18)

**Material.** 404 specimens from As, Bg, Br, Bs, CD, DB, Fa, Gu, Hd, Mo, NP, Wa.

**Range.** Cinder Beds to Greenwood Faunicycles (Middle and Upper Purbeck).

**Maximum.** Langton Faunicycle, 22%. It is possible that this form may be an unornamented subspecies of C. granulosa.

*Cypridea amisia* Wolburg, 1959

(Pl. 5, fig. 10)

**Material.** 1326 specimens from Bg, Br, CD, DB, Fa, Gu, Hd, Mo, MW, Pe, Po, Pt, Wa.

**Range.** Nothe to Bacon Faunicycles (Middle Purbeck).

**Maximum.** Scallop Faunicycle, 36%.

*Cypridea andersoni* Wolburg, 1959

(Pl. 5, fig. 7)

**Material.** 145 specimens from Br, CD, Fa, Mo, Wa.

**Range.** Langton to Tisbury Faunicycles (Upper Purbeck).

**Maximum.** Tisbury Faunicycle, 50%.
Cypridea arenosa Anderson, 1967  
**Material.** 764 specimens from CD, Co, FL, Gl, LM, Wa, We, WP.  
**Range.** Fairlight to Hawkhurst Faunicycles (Wadhurst Clay).  
**Maximum.** Lindfield Faunicycle, 41%.  
Subspecies *arenosa* Anderson, 1967  
Fairlight and Linfield Faunicycles  
(Pl. 8, fig. 14)  
Subspecies *hengisti* Anderson, 1967  
Fairlight and Hawkhurst Faunicycles  
(Pl. 9, fig. 1)  
Subspecies *marshalli* Anderson, 1967  
Fairlight and Lindfield Faunicycles  
(Pl. 9, fig. 2)  
*Cypridea asseri* Anderson, 1967  
(An inverse species)  
(Pl. 9, fig. 4)  
**Material.** 362 specimens from Co, FL, Gl, Ki, Wa, We, WP.  
**Range.** Fairlight to Hawkhurst Faunicycles (Wadhurst Clay).  
**Maximum.** Hawkhurst Faunicycle, 64%.  
*Cypridea bimammata* Harbort, 1907  
(An inverse species)  
**Material.** 155 specimens from Br, CD, Fa, Gu, Ki, Mo, MW, Wa.  
**Range.** Scallop to Hastings Faunicycles. (Middle and Upper Purbeck).  
**Maximum.** Mupes Faunicycle, 43%.  
Subspecies *bimammata* Harbort, 1907  
Range as for species (not figured)  
Subspecies *prolifera* Anderson, 1971  
Range as for species  
(Pl. 6, fig. 15)  
* Cypridea bispinosa * Jones, 1878  
(An inverse species)  
**Material.** 3628 specimens from Ba, CD, Co, CL, EG, FL, Gl, HC, HP, JL, Ki, LM, PQ, Sb, Se, SF, Sh, Wa, We, WP.  
**Range.** Kingsclere to Cuckfield Faunicycles (Wadhurst Clay-Tunbridge Wells Sand).  
**Maximum.** Hawkhurst Faunicycle, 36%.  
Subspecies *birini* Anderson, 1967  
Middle Wadhurst Clay  
(Pl. 7, fig. 13)  
Subspecies *bispinosa* Jones, 1878  
Upper Wadhurst Clay to Tunbridge Wells Sand  
(Pl. 7, fig. 17)  
Subspecies *suthrigensis* Anderson, 1967  
Middle Wadhurst Clay  
(Pl. 7, fig. 10)  
* Cypridea blackbushensis * Anderson, 1967  
(An inverse species)  
(Pl. 8, fig. 2)  
**Material.** 1214 specimens from Bl, CD, Gl, Ki, LM, Wa, We, WP.  
**Range.** Rye to Hawkhurst Faunicycles (Wadhurst Clay).  
**Maximum.** Rye Faunicycle, 62%.  

* Cypridea bogdenensis * Anderson, 1967  
(An inverse species)  
(Pl. 10, fig. 10)  
**Material.** 1023 specimens from Bo, GP, Re, Wa.  
**Range.** Limited, Gillmans to Ditchling Faunicycles (Upper Weald Clay).  
**Maximum.** Gillmans Faunicycle, 71%.  

* Cypridea brenda* sp. nov.  
(Pl. 10, fig. 5)  
**Derivation of name.** After Brenda Coleman (ex B.G.S) who took the SEM photographs for this paper.  
**Holotype.** B.G.S. Mik (M) 4485.  
**Dimensions.** Holotype length 0.85 mm, height 0.51 mm.  
**Locality and horizon.** Cuckfield No. 2 Borehole, Sussex, at 89-90ft (27.12-27.43 m). Crawley Faunicycle, Henfield phase of the Lower Weald Clay, *Cypridea tuberculata* Zone.  
**Diagnosis.** A medium sized carapace, triangular ovate in lateral view. Rostrum large, alveolus long and deep, cyathus lunate. Surface covered with fine punctations. Ornament consisting of 2-4, generally 3, large spines in the furcal area and a number of very small auxiliary tubercles in the anterodorsal area and a few in the posterodorsal area. The left valve is the larger.  
**Description.** This species is probably related to *Cypridea marina* with which it is usually associated, but the spinose ornament is much sparser and quite distinctive. Notably the polar and ocular tubercles seen in *C. marina* are always absent.  
**Distribution.** This is a stratigraphically important species so far known only from the Edenbridge to Fernhurst Faunicycles of the Lower Weald Clay. It has been found in the Cuckfield No. 2 Borehole (Cu), the Hailsham Borehole (Ha), the Pevensey No. 2 Borehole (Py), the Ripe Borehole (Re), the Warlingham Borehole (Wa) and Warnham Brick Pit (Wm).  

* Cypridea brevirostrata * Martin, 1940  
(An inverse species)  
(Pl. 5, fig. 16)  
**Material.** 594 specimens from Bg, Br, CD, DB, Fa, He, Ki, Mo, OM, Po, Wa, WB.  
**Range.** Scallop to Eastbourne Faunicycles (Middle Purbeck and Ashdown Beds).  
**Maximum.** Bexhill Faunicycle, 38%.  

* Cypridea caudata * Anderson, 1967  
(Pl. 10, fig. 15)  
**Remarks.** A rare species in the Upper Weald Clay (Atherfield to Sandown Faunicycles) found at Atherfield, Bletchingly Tunnel and possibly in the Punfield Beds, but the range is not well known.
Ostracod faunas in the Purbeck & Wealden of England

*Cypridea clavata* Anderson, 1939 (An inverse species)

Material. 4192 specimens from BM, CH, Cu, EF, Ha, He, PS, Py, Re, So, ST, Wa, Wd, Wm, Ya.

Range. Egerton to Cuckmere Faunicycles (Weald Clay).

Maximum. Gillmans Faunicycle, 25%.

Subspecies *bardana* Anderson, 1967
Maximum in Gillmans Faunicycle (Pl. 9, fig. 17)
Subspecies *beltana* Anderson, 1967
Maximum in Ditchling Faunicycle (Pl. 9, fig. 18)
Subspecies *clavata* Anderson, 1939
Mainly Lower Weald Clay (Pl. 9, fig. 15)
Subspecies *gordana* Anderson, 1967
Maximum in Gillmans Faunicycle (Pl. 10, fig. 16)
Subspecies *maleta* Anderson, 1967
Maximum in Gillmans Faunicycle (Pl. 10, fig. 2)
Subspecies *talaria* Anderson, 1967
Maximum in Gillmans Faunicycle (Pl. 10, fig. 3)

*Cypridea delicatula* Anderson, 1971 (An inverse species)

Material. 624 specimens from Br, CR, DB, Fa, GD, Gu, He, Ki, Mo, MW, NP, NW, Wa.

Range. Goldspur to Peveril Faunicycles (Middle Purbeck).

Maximum. Ashdown Faunicycle, 50%.

Subspecies *angulata* Martin, 1940
Brede to Tyneham Faunicycles (Pl. 4, figs. 14, 18)
Subspecies *dolabrata* (Anderson, 1939)
Eastbourne Faunicycle (Pl. 4, fig. 16)
Subspecies *kingsclerensis* Anderson, 1971
Tisbury to Bexhill Faunicycles (Pl. 12, fig. 19)

*Cypridea dorisispinata* (Anderson, 1939)

Material. 5281 specimens from CH, Cu, Ha, He, Re, So, Wa, Wd, Wm.

Range. Sevenoaks to Sandhurst Faunicycles (Lower Weald Clay).

Maximum. Hailsham Faunicycle, 40%.

An important species nearly limited to the basal beds of the Weald Clay (Assemblage 11) in which it is the dominant form, only the subspecies *roemeri* continues upwards into the Henfield phase — into Assemblage 12.

Subspecies *dorisispinata* (Anderson, 1939)
Maximum in Redhill Faunicycle (Pl. 9, fig. 7)
Subspecies *duplicata* Anderson, 1967
A rare form (Pl. 9, fig. 8)
Subspecies *gemella* Anderson, 1967
A rare form (Pl. 9, fig. 9)
Subspecies *quinquecornis* Anderson, 1967
A very rare form (Pl. 9, fig. 10)
Subspecies *roemeri* (Anderson, 1939)
Maximum in Hailsham Faunicycle (Pl. 9, fig. 16)
Subspecies *tricornis* Anderson, 1967
A common subspecies in the Horsham phase (Pl. 9, fig. 11)

*Cypridea comptonensis* Anderson, 1967

Material. 47 specimens from CC, Rd, Re, SC.

Range. Atherfield to Woodhatch Faunicycles (Upper Weald Clay).

Maximum. Atherfield Faunicycle. This is a rare but important species of very limited range.

*Cypridea cuckmerensis* Anderson, 1967

(An inverse species)

Material. 265 specimens known from Bg, Br, CD, DB, Fa, He, Mo, Wa.

Range. Worth to Mupes Faunicycles (Middle and Upper Purbeck).

Maximum. Bacon Faunicycle, 41%.

§In Anderson, 1967, pp. 240-241 and 262, the figure numbers were inadvertently transposed so that fig. 31 should be *C. clavata talaria* and fig. 32 *C. clavata mistrata*. H.I.C.
*Cypridea granulosa* (J. de C. Sowerby, 1836)

Material. 16,169 specimens from As, Bg, Br, CD, DB, Fa, GD, Gu, He, Ki, MB, Mo, NP, Pe, Po, Ri, VW, Wa.

Range. Lower Soft Cockle to Langton Faunicycles (Lower and Middle Purbeck).

Maximum. Peveril Faunicycle, 18%.

This is the most important and typical species in the Middle Purbeck.

Subspecies *fasciculata* (Forbes, 1855)

Ranges from Netherfield to Langton Faunicycles. Maximum in Peveril Faunicycle.

(Pl. 3, fig. 18 with footnote H.1-C)

Subspecies *granulosa* (J. de C. Sowerby, 1836)

Ranges from Burwash to Corfe Faunicycles. Maximum in Netherfield Faunicycle.

(Pl. 3, fig. 8)

Subspecies *protoplanulosa* Anderson, 1971

Ranges from the Lower Soft Cockle to the Nothe Faunicycles. Maximum in the Goldspur Faunicycle.

(Pl. 3, fig. 12)

*Cypridea granulosa* J. de C. Sowerby, 1836

Material. 16,169 specimens from As, Bg, Br, CD, DB, Fa, GD, Gu, He, Ki, MB, Mo, NP, Pe, Po, Ri, VW, Wa.

Range. Lower Soft Cockle to Langton Faunicycles (Lower and Middle Purbeck).

Maximum. Peveril Faunicycle, 18%.

This is the most important and typical species in the Middle Purbeck.

Subspecies *fasciculata* (Forbes, 1855)

Ranges from Netherfield to Langton Faunicycles. Maximum in Peveril Faunicycle.

(Pl. 3, fig. 18 with footnote H.1-C)

Subspecies *granulosa* (J. de C. Sowerby, 1836)

Ranges from Burwash to Corfe Faunicycles. Maximum in Netherfield Faunicycle.

(Pl. 3, fig. 8)

Subspecies *protoplanulosa* Anderson, 1971

Ranges from the Lower Soft Cockle to the Nothe Faunicycles. Maximum in the Goldspur Faunicycle.

(Pl. 3, fig. 12)

*Cypridea hispida* sp. nov.

(Pl. 10, fig. 6)

Derivation of name. Latin *hispidus*, -a, -um; prickly.

Holotype. B.G.S. Mik (M) 4486.

Dimensions. Holotype length 0.72 mm, height 0.43 mm.

Locality and horizon. Hailsham Borehole, Sussex, at 19.00-19.50 m. Slindfold Faunicycle, Henfield phase of the Lower Weald Clay, *C. marina* Zone.

Diagnosis. A medium sized carapace with a large rostrum and alveolus. Cyathus narrow, lunate. Surface rather coarsely punctate in the centre becoming finer towards the margins. The ornament consists of generally 2 or 3 large tubercles in the furcal area and a large ocular. A lumbar tubercle may be present at the dorsal end of the furcal row. The left valve is the larger.

Description. This appears to be related to *Cypridea marina*, but with much reduced ornament and a more limited stratigraphical distribution. There are usually a number of small auxiliary tubercles particularly near the anterior end but sometimes also in the lumbar area.

Distribution. *C. hispida* has been found in the Horley, Slindfold and Newdigate Faunicycles of the Lower Weald Clay (Henfield phase) in the Horley Brick Pit (CH), the Hailsham Borehole (Ha), the Pevensey No. 8 Borehole (Py), the Ripe Borehole (Re) and the Warlingham Borehole (Wa).

Because of its limited vertical range this species is a useful stratigraphical index.
**Cypridea inaequalis** Wolburg, 1959
(Pl. 4, fig. 11)

**Material.** 107 specimens from As, Br, CD, Fa, GS, Ki, Mo, Pe, Pt.

**Range.** Corfe to Tisbury Faunicycles (Middle and Upper Purbeck).

**Maximum.** Tisbury Faunicycle, 66%.

**Cypridea insulae** Anderson, 1967
(Pl. 10, fig. 14)

**Material.** A few specimens only from SB, SC.

**Remarks.** This is a rare species known only from the Upper Weald Clay at Sandown and Shepherd's Chine in the Isle of Wight.

**Cypridea laevigata** (Dunker, 1846)

**Material.** 3155 specimens from CD, Co, DB, FL, GI, He, Ki, LM, PQ, St, Ti, Wa, We, WP.

**Range.** Mupes to Cuckfield Faunicycles (Upper Purbeck-Tunbridge Wells Sand).

**Maximum.** Kingsclere Faunicycle, 31%. 77% of all specimens were found in the Kingsclere, St. Leonards and Fairlight Faunicycles (Nos. 51-53).

A few specimens of *C. laevigata* are found in the Upper Purbeck but the species first becomes important at the base of the Wadhurst Clay (Rye Faunicycle) as the subspecies *laevigata*. It becomes the dominant species in the Kingsclere Faunicycle (*leonardi* subspecies). The subspecies *subquadrata* and *fairlightensis* are typical forms in the St. Leonards and Fairlight Faunicycles. The species is not very common in the Lindfield, Wadhurst and Crowhurst Faunicycles where *wadhurstensis* is the characteristic subspecies, but becomes abundant again in the Hawkhurst Faunicycle (subspecies *hawkhurstensis*). At higher levels, mainly in the Grinstead Faunicycle, the subspecies is *philpottsi* but this is never very common. Specimens of *C. aff. laevigata* occur rarely in Assemblage 10.

**Subspecies fairlightensis** Anderson, 1967
Fairlight Faunicycle only
(Pl. 7, fig. 9)

**Subspecies hawkhurstensis** Anderson, 1967
Crowhurst to Fletching Faunicycles, maximum in the Hawkhurst Faunicycle
(Pl. 7, fig. 12)

**Subspecies laevigata** (Dunker, 1846)
Mupes to Lydd Faunicycles, maximum in the Rye Faunicycle
(Pl. 7, fig. 3)

**Subspecies leonardi** Anderson, 1967
Kingsclere to St. Leonards Faunicycles, maximum in the Kingsclere Faunicycle
(Pl. 7, fig. 8)

**Subspecies philpottsi** Anderson, 1967
Grinstead Faunicycle
(Pl. 7, fig. 5)

**Subspecies subquadrata** Anderson, 1967
St. Leonards Faunicycle
(Pl. 7, fig. 16)

**Cypridea lasius** Anderson, 1967
(Pl. 8, fig. 10)

**Material.** 152 specimens from CD, Co, Gl, We, WP.

**Range.** Kingsclere to Highbridge Faunicycles (Wadhurst Clay).

**Maximum.** St. Leonards Faunicycle, 50%.

*Cypridea lata* Martin, 1940

**Material.** 2900 specimens from As, Bg, Br, BW, CD, DB, DM, Fa, GD, GS, Gu, He, HW, Ki, Mo, MW, NP, NW, Pe, Po, Py, Wa.

**Range.** Mountfield to Brede Faunicycles (Upper Purbeck-Tunbridge Wells Sand).

**Maximum.** Durlston Faunicycle, 19%.

An important and widespread species particularly in the Middle Purbeck.

**Subspecies lata** Martin, 1940
Netherfield to Cinder Beds Faunicycles, maximum in the Durlston Faunicycle
(Pl. 3, fig. 14)

**Subspecies latissima** Anderson, 1971
Poxwell to Brede Faunicycles, maximum in the Mupes Faunicycle
(Pl. 3, fig. 15)

**Subspecies senilis** Anderson, 1971
Royal to Poxwell Faunicycles, maximum in the Scallop Faunicycle
(Pl. 3, fig. 17)

*Cypridea marina* Anderson, 1967
(Pl. 10, fig. 17)

**Material.** 6619 specimens from BG, CH, Cu, FF, Ha, Py, Re, Ru, So, TB, Wa, Wm.

**Range.** Edenbridge to Newdigate Faunicycles (Lower Weald Clay).

**Maximum.** Slinfold Faunicycle, 47%.

This is a species characteristic of the Henfield phase of the Lower Weald Clay.

**Cypridea martini** Wolburg, 1959
(Pl. 11, fig. 14)

**Material.** 37 specimens from Br, Fa, Hd, MW, Wa.

**Range.** Langton to Bacon Faunicycles (Middle Purbeck).

**Maximum.** Scallop Faunicycle, a rare species.

*Cypridea melvillei* Anderson, 1967
(Pl. 8, fig. 8)

**Material.** 5334 specimens from CD, CL, Co, FL, Ge, HC, HP, Ki, LM, PQ, Wa, We, WP.

**Range.** Bexhill to Salehurst Faunicycles (Ashdown Sand to Upper Tunbridge Wells Sand).

**Maximum.** Hawkhurst Faunicycle, 64%.
**Cypridea menevensis** (Anderson, 1939)  
(An inverse species)  
(Pl. 7, fig. 11)  
**Material.** 1104 specimens from CD, Co, Gl, He, Ki, LM, Po, Wa, We, WP.  
**Range.** Hastings to Wadhurst Faunicycles (Ashdown Sand and Wadhurst Clay).  
**Maxima.** St. Leonards and Fairlight Faunicycles, 62%.  
A species typical of the Wadhurst Clay but not easily distinguished from the Purbeck species *C. penshurstensis.*

**Cypridea morula** Anderson, 1971  
(Pl. 8, fig. 16)  
**Material.** Specimens from CD.  
**Remarks.** This is a rare but distinctive species so far known only from the Bexhill and Eastbourne Faunicycles in the Chilcomb Down Borehole, Hampshire.

**Cypridea obliqua** Wolburg, 1959  
(Pl. 5, fig. 15)  
**Material.** 32 specimens from As, Bg, CD, DB, Cu, Ki, MW, Pe, Po, Pt, Wa.  
**Range.** Langton to Bacon Faunicycles (Middle and Upper Purbeck).  
**Maximum.** Scallop Faunicycle, 78%.

**Cypridea paralela** Martin, 1940  
(Pl. 11, fig. 15)  
**Materials.** Specimens from CD, He, Mo, Po, Wa.  
**Remarks.** A rare species only seen in the Mupes and Brede Faunicycles of the Upper Purbeck.

**Cypridea paulsgrovensis** (Anderson, 1939)  
(An inverse species)  
(Pl. 7, fig. 14)  
**Material.** 7678 specimens from CD, Co, Gl, Ki, LM, Po, Wa, We, WP.  
**Range.** Hastings to Fletching Faunicycles (Ashdown Sand-Wadhurst Clay).  
**Maximum.** Winchester Faunicycle, 22%.  
This is a typical and abundant Wadhurst Clay species, closely resembling *C. aemulans* of the Middle and Upper Purbeck Beds and Ashdown Sand.

**Cypridea pendae** Anderson, 1967  
(Pl. 8, fig. 13)  
**Material.** 673 specimens from Co, FL, Gl, JL, Ki, LM, PQ, Wa, We, WP.  
**Range.** St. Leonards to Chilcombe Faunicycles (mainly Upper Wadhurst Clay).  
**Maximum.** Hawkhurst Faunicycle, 42%.  
This species could possibly be an unornamented form of *C. aculeata.*

**Cypridea penshurstensis** Anderson, 1971  
(An inverse species)  
(Pl. 4, fig. 13)  
**Material.** 3093 specimens from Bg, Br, BW, CD, DB, Fa, GS, Gu, He, Ki, Mo, NP, Pe, Po, Wa.  
**Range.** Netherfield to Battle Faunicycles (Middle and Upper Purbeck).  
**Maximum.** Lulworth Faunicycle, 27%.  
This species is rare until the Langton Faunicycle, is common in the Greenwood and Lulworth Faunicycles.  
**Remarks.** *C. penshurstensis* is very like *C. menevensis* and may be an ancestor of that species.

**Cypridea posticalis** Jones, 1885  
(Pl. 4, fig. 10)  
**Material.** 690 specimens from Ar, Br, CD, DB, Fa, GD, Hd, He, Ki, Mo, MW, NP, PC, Pe, Ri, VW, Wa.  
**Range.** Netherfield and Durlston Faunicycles, possible specimens in Swanage Faunicycle.  
**Maximum.** Durlston Faunicycle, 78%.  
Though not very abundant, this is a stratigraphically important species. It is widely distributed and short ranging.

**Cypridea primaeva** Anderson, 1941  
(Pl. 2, fig. 12)  
**Material.** 617 specimens from As, Ay, Bg, CD, DB, Fa, GD, Gu, He, Ki, Mo, MW, PC, Pe, SW, Wa.  
**Range.** Warren to Corfe Faunicycles.  
**Maximum.** Mountfield Faunicycle, 23%.

**Cypridea pseudomarina** Anderson, 1967  
(Pl. 10, fig. 7)  
**Material.** Specimens from At, HB, Rd.  
**Range.** Ditchling to Atherfield Faunicycles. A rare form in the Upper Weald Clay.
*Cypridea pumila* Anderson, 1967
(Pl. 10, fig. 4)

**Material.** 3416 specimens from CH, Cu, DS, Ha, He, Ki, Po, Py, Re, So, Wa, Wm.

**Range.** Hailsham to Newdigate Faunicycles (Lower Weald Clay).

**Maximum.** Buxted Faunicycle, 23%.

This is a characteristic species of the Lower Weald Clay. It is closely associated with *C. marina*.

*Cypridea recta* Wolburg, 1959

**Material.** 2357 specimens from CD, Co, FL, Gl, Ki, LM, St, Wa, We, WP.

**Range.** Hastings to Cuckfield Faunicycles (Ashdown Sand, Wadhurst Clay and Tunbridge Wells Sand).

**Maximum.** Crowhurst Faunicycle, 56%.

Subspecies *edithae* Anderson, 1967
(Pl. 8, fig. 5)

Subspecies *inflata* Wolburg, 1959

Grinstead Clay only

Subspecies *recta* Wolburg, 1959

Hastings to Grinstead Faunicycles

(Pl. 8, fig. 4)

Subspecies *tillsdenensis* Anderson, 1967

Lindfield to Cuckfield Faunicycles,
characteristic of the Tunbridge Wells Sand

(Pl. 8, fig. 1)

*Cypridea rotundata* Anderson, 1967
(Pl. 10, fig. 9)

**Material.** 825 specimens from At, BM, CF, Do, GP, HB, Re, SB, Wa.

**Range.** Pluckley to Earlswood Faunicycles (Upper Weald Clay).

**Maximum.** Gillmans and Ditchling Faunicycles, 97%. This is a characteristic form in the Petworth Marble.

*Cypridea sagena* Anderson, 1971
(Pl. 3, fig. 13)

**Material.** 1430 specimens from Br, CD, Fa, GD, Hd, Ki, Mo, MW, NP, NW, Pe, Wa.

**Range.** Burwash to Nothe Faunicycles (Middle Purbeck).

**Maximum.** Mountfield Faunicycle, 44%.

*Cypridea setina* (Anderson, 1939)

**Material.** 3438 specimens from Br, CD, DB, Fa, Gu, He, Ki, Mo, NP, OM, Pe, Po, Pt, Wa.

**Range.** Studland to Rye Faunicycles (mainly Upper Purbeck).

**Maximum.** Brede Faunicycle, 25%.

*C. setina rectidorsata* and *C. setina setina* are by far the commonest subspecies. Both are characteristic of and abundant in the Upper Purbeck.

Subspecies *acerata* Anderson, 1962

Upper Purbeck and Ashdown Sand

(Pl. 5, fig. 12)

Subspecies *bellatula* Anderson, 1971

Eastbourne Faunicycle

(Pl. 5, fig. 6)

Subspecies *camelodes* Anderson, 1962

Tynemouth Faunicycle

(Pl. 6, fig. 18)

Subspecies *deburghi* Anderson, 1971

Hastings to Bexhill Faunicycles

(Pl. 6, fig. 7)

Subspecies *dorica* Anderson, 1962

Tisbury to Durdle Faunicycles

(Pl. 6, fig. 12)

Subspecies *erumna* Anderson, 1962

Mupes to Battle Faunicycles

(Pl. 6, fig. 6)

Subspecies *florida* Anderson, 1971

Bexhill to Eastbourne Faunicycles

(Pl. 6, fig. 17)

Subspecies *rectidorsata* Sylvester-Bradley, 1949

Studland to Battle Faunicycles

(Pl. 6, fig. 14)

Subspecies *setina* (Anderson, 1939)

Lulworth to Battle Faunicycles

(Pl. 5, fig. 9)

Subspecies *pelota* nov.

(Pl. 11, fig. 10)

**Derivation of name.** Spanish, *pelota* (f), a ball.

**Holotype.** B.G.S. Mik (M) 2154.

**Dimensions.** Holotype length 0.89mm, height 0.61 mm.

**Locality and horizon.** Kingsclere No. 1 Borehole, Hampshire, at 1141 ft. (347.8 m). Rye Faunicycle, Wadhurst Clay, Wealden.

**Diagnosis.** Carapace rounded, subquadrate in lateral view, outline oval from above. Rostrum very small, alveolus obsolete, cyathus narrow lunate. Length/height ratio 1.46. Left valve the larger.

**Description.** This subspecies is the last of the *C. setina* stock. In outline it is nearest to the subspecies *rectidorsata*, but is relatively shorter and higher and the beak and notch are barely visible.

**Distribution.** *Cypridea setina pelota* has been recognised with certainty only from the Kingsclere Borehole not far above the base of the Wadhurst Clay, but a few ostracods from this horizon in the Chilcomb Down Borehole may also be of the subspecies.

*Cypridea simplissima*, new name for *C. simplex* Anderson, 1971, preoccupied by Galeeva, 1955

(Pl. 11, fig. 5)

**Material.** 2240 specimens from As, Bg, Br, BW, CD, DB, Fa, GD, Gu, Hd, He, Ki, Mo, MW, NP, NW, Pe, Wa.

**Range.** Upper Soft Cockle to Hythe Faunicycles.

**Maximum.** Scallop Faunicycle, 10%; Durdle Faunicycle, 10%. This is a small, simple carapace not easily distinguishable from the juveniles of some other species.
Cypridea spinigera (J. de C. Sowerby, 1836)  
(Pl. 10, fig. 13)  
Material. 176 specimens from At, BT, CB, Ch, Ea, Ki, Rd, Re, SB, Wa.  
Range. Ditchling to Earlswood Faunicycles (Upper Weald Clay).  
Maxima. Sandown and Cuckmere Faunicycles. A rare species.

*Cypridea swanagensis Anderson, 1971  
Material. 835 specimens from Br, Cd, Fa, GD, He, Hd, Mo, MW, NP, NW, PC.  
Range. Netherfield to Peveril Faunicycles (Middle Purbeck).  
Maxima. Netherfield and Durlston Faunicycles, 97%.  
Subspecies ornata Anderson, 1971  
Durlston Faunicycle only  
(Pl. 4, fig. 1)  
Subspecies swanagensis Anderson, 1971  
Netherfield to Peveril Faunicycles  
(Pl. 4, fig. 12)

Cypridea tenuis Anderson, 1967  
(Pl. 10, fig. 11)  
Material. 100 specimens from At, CB, Hy, Rd, Re, SB, SC, Wa.  
Range. Gillmans to Earlswood Faunicycles (Upper Weald Clay).  
Maxima. Woodhatch Faunicycle, 34%. This is a rare species, probably the last of the C. setina-laevigata-dolabrata group.

*Cypridea tuberculata (J. de C. Sowerby, 1836)  
Material. 9430 specimens from Br, CD, CH, Co, Cu, DB, Fa, Gl, Gu, Ha, Hd, Ki, LM, MB, Po, Re, So, Wa, Wd, We, Wm, WP.  
Range. Worth to Pluckley Faunicycles (Purbeck and Wealden).  
Maxima. Lydd Faunicycle.  
This is a typical Wealden species, especially characteristic of the Wadhurst Clay and the Henfield phase of the Weald Clay.  
Subspecies adjuncta Jones, 1885  
Upper Purbeck and Ashdown Sand  
(Pl. 5, fig. 4)  
Subspecies indigens Anderson, 1939  
Lower Weald Clay  
(Pl. 11, fig. 11)  
Subspecies langtonensis Anderson, 1971  
Worth, Langton and Scallop Faunicycles (Middle Purbeck). Maximum in the Worth Faunicycle  
(Pl. 5, fig. 5)  
Subspecies tuberculata (J. de C. Sowerby, 1836)  
Lower Wadhurst Clay.  
Maxima in the Lydd and Horsted Faunicycles  
(Pl. 5, fig. 2)

Cypridea tumescens (Anderson, 1939)  
Material. 2496 specimens from As, Ay, Bg, Br, CD, DB, Fa, FW, GD, Gu, Hd, He, Ki, Mo, Nd, NP, Py, Ri, Sw, Wa.  
Range. Quainton to Worth Faunicycles (Lower and Middle Purbeck).  
Subspecies acrobeles Anderson, 1971  
Quainton to Robertsbridge Faunicycles. Maximum in the Hard Cockle Faunicycle  
(Pl. 1, fig. 14)  
Subspecies praecursor Oertli, 1963  
Burwash to Ashdown Faunicycles. Maximum in the Goldspur Faunicycle  
(Pl. 1, fig. 16)  
Subspecies tumescens (Anderson, 1939)  
Swanage to Croydon Faunicycles. Maximum in the Durlston Faunicycle  
(Pl. 1, fig. 13)

*Cypridea valdensis (J. de C. Sowerby, 1836)  
Material. 3216 specimens from BP, CH, Cu, Ha, Hy, Ki, Re, So, Wa, Wm.  
Range. St. Leonards to Cuckmere Faunicycles.  
Maxima. Edenbridge Faunicycle, 17%; Gillmans Faunicycle, 17%.
Ostracod faunas in the Purbeck & Wealden of England

Subspecies *clareae* Anderson, 1967
Distribution as for the species but rare.
(Pl. 8, fig. 15)

Subspecies *claudii* Anderson, 1967
Distribution as for the species but rare.
(Pl. 8, fig. 12)

Subspecies *valdensis* (J. de C. Sowerby, 1836)
The usual form of the species; common in the Weald Clay of all areas.
(Pl. 8, fig. 18)

*Cypridea varians* Anderson, 1971
(Pl. 11, fig. 12)

Material. 254 specimens from Br, CD, DB, Fa, GD, Gu, Ki, Mo, MW, NP, NW, Wa, WB.

Range. Mountfield to Hastings Faunicycles.

Maximum. Battle Faunicycle.

*Cypridea vectae* Anderson, 1967
(Pl. 11, fig. 1)

Remarks. A rare species known only from the Woodhatch Faunicycle of the Weald Clay at CB, Rd, Re, SC.

*Cypridea ventrosa* Jones, 1885
(Pl. 7, fig. 18)

Remarks. A rare species in the Upper Purbeck of Dorset, Mupes to Hastings Faunicycles at DB and Ki. Not recorded from the Weald.

*Cypridea vericae* Anderson, 1967
(Pl. 9, fig. 6)

Material. 105 specimens from Co, FL, GI, St, We, WP.

Range. Lindfield to Fletching Faunicycles (Wadhurst Clay).

Maximum. Hawkhurst Faunicycle, 59%, a rare species.

*Cypridea verrucosa* Jones, 1878
(Pl. 8, fig. 17)

Material. 292 specimens from CD, FL, Ki, Sh, Wa.

Range. St. Leonards to Grinstead Faunicycles.

Maximum. Fletching Faunicycle.

*Cypridea vidrana* Wolburg, 1959
(Pl. 5, fig. 17)

Material. 970 specimens from As, Bg, Br, BW, CD, DB, Fa, GS, Gu, Hd, He, Mo, MW, Py, Wa.

Range. Langton to Greenwood Faunicycles (upper Middle Purbeck).

Maximum. Bacon Faunicycle, 53%.

This species succeeds *C. amisia* as the dominant form in the upper part of the Middle Purbeck.

*Cypridea warlinghamensis* Anderson, 1967
(Pl. 11, fig. 2)

Material. 50 specimens from Rd, Re, SB, SC, Wa.

Range. Woodhatch to Earlswood Faunicycles (Upper Weald Clay).

Maximum. Cuckmere Faunicycle. A rare species.

*Cypridea wicheri* Wolburg, 1959
Material. 1644 specimens from CD, DB, Fa, Gu, He, Ki, Mo, Pe, Po, Wa.

Range. Bacon to Bexhill Faunicycles (Middle Purbeck-Ashdown Sand).

Maximum. Durdle Faunicycle, 43%.

Subspecies *croesi* Anderson, 1971
Lulworth to Bexhill Faunicycles, maximum in Bexhill Faunicycle
(Pl. 6, fig. 13)

Subspecies *isabellae* Anderson, 1971
Lulworth to Bexhill Faunicycle
(Pl. 6, fig. 1)

Subspecies *torosa* Anderson, 1971
Lulworth to Bexhill Faunicycles
(Pl. 6, fig. 2)

Subspecies *veronae* Anderson, 1971
Mupes to Bexhill Faunicycles, maximum in Brede Faunicycle
(Pl. 6, fig. 4)

Subspecies *wicheri* Wolburg, 1959
Bexhill Faunicycle only
(Pl. 6, fig. 10)

Subspecies *wicki* Wolburg, 1959
Bacon to Tyneham Faunicycles, maximum in Lulworth Faunicycle; Upper Purbeck
(Pl. 6, fig. 16)

*Cypridea wolburgi* Anderson, 1971
(An inverse species)
(Pl. 11, fig. 13)

Material. 363 specimens from CD, He, Wa.

Range. Greenwood to Mupes Faunicycles.

Maximum. Lulworth Faunicycle.

OTHER GENERA

Genus *Bisulcocypris* Pinto & Sanguinetti, 1962

*Bisulcocypris dilatata* Anderson, 1971
(Pl. 3, fig. 10)

Material. 158 specimens from Ay, DB, FW, He, Mo, MW, NW, PC.

Range. Swindon to Corfe Faunicycles (Lower and Middle Purbeck).

Maximum. Swanage Faunicycle, 37%.

*Bisulcocypris striata* (Martin, 1940)

Material. 1507 specimens from As, CD, DB, GD, Gu, He, Ki, Mo, MW, NP, NW, OM, Pe, Wa.

Range. Upwey to Rye Faunicycles (Purbeck to basal Wadhurst Clay).

Maximum. Netherfield Faunicycle, 14%.

Subspecies *montuberculata* Anderson, 1971
Studland to Mupes Faunicycles
(Pl. 3, fig. 2)

Subspecies *striata* (Martin, 1940)
Upway to Rye Faunicycles
(Pl. 3, fig. 1)
Genus Cytheridea Bosquet, 1852
  Subgenus Haplocytheridea Stephenson, 1936
  Cytheridea (Haplocytheridea) delicatula Martin, 1961
  (Pl. 8, fig. 9)

**Material.** Specimens from CH, Re, Wa.
**Range.** Rye to Hawkhurst Faunicycles (Wadhurst Clay);
Plumpton to Bonnington Faunicycles (Weald Clay).
**Maximum.** Capel Faunicycle, 60%.

Genus Damonella Anderson, 1966
  Damonella buchaniana Anderson, 1966
  (Pl. 2, fig. 13)

**Material.** 504 specimens from BT, DB, Mo, Po.
**Range.** Upwey to Newdigate Faunicycles (mainly Purbeck, rare in the Wealden).
**Maximum.** Durlston Faunicycle, 27%.

Damonella denticulata Anderson, 1966
  (Pl. 11, fig. 16)
**Remarks.** A rare form in the upper part of Weald Clay at GP, Wa.

Damonella ellipsoidea (Wolburg, 1962)
  (Pl. 2, fig. 4)
**Material.** 676 specimens from DB, He, Ki, Mo, VW.
**Range.** Warren to Sandhurst Faunicycles (mainly Lower and Middle Purbeck).
**Maximum.** Corfe Faunicycle, 20%.

Damonella punctatula Anderson, 1966
  (Pl. 11, fig. 17)
**Remarks.** A rare species known only from the Hawkhurst Faunicycle of the Wadhurst Clay at WP.

Damonella pygmaea (Anderson, 1941)
  (Pl. 2, fig. 7)
**Material.** 1333 specimens from DB, Ki, Mo, SW.
**Range.** Warren to Gillmans Faunicycles (Purbeck and Wealden).
**Maximum.** Hailsham Faunicycle, 17%.

Genus Darwinula Brady & Robertson, 1885
  Darwinula jonesi Anderson, 1971
  (Pl. 11, fig. 7)

**Material.** 104 specimens from At, Bg, Ha, Mo, Wa, Wy.
**Range.** Durlston to Grinstead Faunicycles (mainly Wadhurst Clay).
**Maximum.** Rye Faunicycle, 63%.

Darwinula leguminella (Forbes, 1855)
  (Pl. 11, fig. 8)
**Material.** 9112 specimens from almost all localities.
**Range.** Warren to Cuckmere Faunicycles (Purbeck and Wealden).
**Maximum.** Hawkhurst Faunicycle, 10%.

Darwinula oblonga (Roemer, 1839)
  (Pl. 11, fig. 9)
**Material.** 4819 specimens. A ubiquitous species in the Purbeck and Wealden. Usually occurs with D. leguminella.
**Range.** Upwey to Cuckmere Faunicycles.
**Maximum.** Mountfield Faunicycle, 10%.

Genus Eocytheridea Bate, 1963
  Eocytheridea eusarca (Anderson, 1941)
  (Pl. 1, fig. 15)
**Material.** 304 specimens from Ay, Sw.
**Range.** Quainton to Stair Faunicycles (Lower Purbeck).
**Maximum.** Warren Faunicycle, 88%.

Eocytheridea oleroni (Donze, 1960)
  (Pl. 12, fig. 20)
**Material.** 38 specimens from Ay, Sw.
**Range.** Quainton to Langton Faunicycles (Purbeck).
**Maximum.** Langton Faunicycle, 79%.

Genus Eoparacypris Anderson, 1971
  Eoparacypris abbreviata Anderson, 1971
  (Pl. 11, fig. 6)
**Material.** 17 specimens from CD.
**Range.** Worth to Langton Faunicycles (Purbeck).
**Maximum.** Langton Faunicycle, 89%.

Eoparacypris attenuata Anderson, 1971
  (Pl. 12, fig. 1)
**Material.** 32 specimens from CD, He, MW, Wa.
**Range.** Goldspur to Poxwell Faunicycles (Purbeck).
**Maximum.** Bacon Faunicycle, 63%.

Eoparacypris edmundsi sp. nov.
  (Pl. 12, fig. 4)
**Derivation of name.** For F. H. Edmunds for his contributions to the geology of the Weald.
**Holotype.** B.G.S. Mik (M) 3279.
**Dimensions.** Holotype length 0.370mm, height 0.185mm.
**Locality and horizon.** Warlingham Borehole, Surrey, depth 1070ft. 10in. (326.41 m), Weald Clay, Sandown Faunicycle.
**Diagnosis.** Carapace small. In lateral view elongate-triangular. Anterior margin evenly rounded and with a broad flange. Dorsal margin almost straight, backward sloping. Posterior acutely triangular. Ventral margin slightly sinuous. Shell surface smooth, glossy.
**Description.** This small species is found rarely in the more saline phases of the upper part of the Weald Clay. Though similar to E. edwardi in size, it is easily distinguished by having a more acute posterior to the shell. E. parallela, though similar in shape to E. edmundsi, is longer, lower, and more acute posteriorly.
**Distribution.** A rare species from the Sandown Faunicycle (Upper Weald Clay) of the Warlingham Borehole (Wa).
Ostracod faunas in the Purbeck & Wealden of England

Eoparacypris edwardi Anderson, 1971  
(Pl. 12, fig. 11)  
**Material.** A rare species from Wa, WP.  
**Range.** Wadhurst Clay to Lower Weald Clay.  
**Maximum.** Fairlight and Lindfield Faunicycles.

Eoparacypris macroselina Anderson, 1971  
(Pl. 3, fig. 6)  
**Material.** 60 specimens from CD, Gu, NP, Pe, Wa.  
**Range.** Lower Soft Cockle to Tyneham Faunicycles (Purbeck).  
**Maximum.** Goldspur Faunicycle, 32%.

Eoparacypris parullela (Neale, 1962)  
(Pl. 12, fig. 3)  
**Material.** 24 specimens from CD, Gu, MW, NP, Wa.  
**Range.** Scallop to Hythe Faunicycles (Purbeck and Wealden).  
**Maximum.** Tyneham Faunicycle, 33%.

Eoparacypris surriensis Anderson, 1971  
(Pl. 12, fig. 2)  
**Remarks.** A rare species ranging from the Mountfield to the Grinstead Faunicycles at CD, Gu, PQ, Wa.

Genus Fabanella Martin, 1961  
*Fabanella ansata* (Jones, 1885)  
(Pl. 1, fig. 12)  
**Material.** 1654 specimens from Ay, Bg, DB, GD, He, Ki, Mo, PC, Pe, Po, SO, Sw, Wa.  
**Range.** Quainton to Netherfield Faunicycles (mainly Lower Purbeck).  
**Maximum.** Warren Faunicycle, 62%.

*Fabanella boloniensis* (Jones, 1882)  
(Pl. 1, fig. 6)  
**Material.** 14642 specimens from Ay, Bg, Br, Bu, CD, DB, Fa, GD, Gu, He, Ki, Mo, NP, OM, Fy, Wa.  
**Range.** Quainton to Ewhurst Faunicycles (mainly Lower Purbeck but with possible specimens to top of Wealden).  
**Maximum.** Burwash Faunicycle, 12%. 40% of the specimens seen were found in the Robertsbridge to Goldspur Faunicycles (high Lower Purbeck to base Middle Purbeck).

Fabanella dimorpha Anderson, 1971  
(Pl. 12, fig. 12)  
**Remarks.** A rare species known only from the Upper Purbeck at Ki.

Genus Galliaecytheridea Oertli, 1957  
*Galliaecytheridea postsinuata* Wolburg, 1962  
(Pl. 4, figs. 3, 9)  
**Material.** 6344 specimens from Ar, As, CD, GD, He, LR, Mo, MW, NW, Po, VW, Wa.  
**Range.** Durlston to Corfe Faunicycles (possibly also in the Swanage Faunicycle).  
**Maximum.** Cinder Beds Faunicycle, 94%. An important species indicating a higher than normal salinity. Characteristic of the Cinder Beds everywhere.

Genus Klieana Martin, 1940  
*Klieana alata* Martin, 1940  
(Pl. 2, figs. 1, 2)  
**Material.** 1864 specimens from As, Ay, Bg, DB, GD, Gu, Ki, Mo, NP, Sw, Wa.  
**Range.** Quainton to Langton Faunicycles (mainly Lower Purbeck).  
**Maximum.** Warren Faunicycle, 35% (66% of all known specimens are from the Warren and Ridgeway Faunicycles).

*Klieana dictyota* Anderson, 1971  
(Pl. 3, fig. 11)  
**Material.** 374 specimens from As, GD, Gu, LR, Mo, MW, NP, NW, Pe, Wa.  
**Range.** Swindon to Nothe Faunicycles (Lower Purbeck).  
**Maximum.** Cinder Beds Faunicycle, 97% (a characteristic high salinity species associated with *G. postsinuata*).

Klieana thoracina Anderson, 1971  
(Pl. 12, fig. 14)  
**Remarks.** Specimens from As, DB, GD, Ki, Mo. A rare form in the Mountfield and Worth Faunicycles.

Genus Macrodentina Martin, 1940  
*Macrodentina mediostricta* (Sylvester-Bradley, 1941)  
(Pl. 5, fig. 3)  
**Material.** 1800 specimens from As, Ay, Bg, DB, GD, He, Ki, Mo, MW, PC, Wa.  
**Range.** Corfe to Mupes Faunicycles (a typical form in the upper Middle Purbeck).  
**Maximum.** Scallop Faunicycle, 42%.

*Macrodentina retirugata* (Jones, 1885)  
(Pl. 1, fig. 4)  
**Material.** 896 specimens from the basal Purbeck Beds at Swindon and in the Aylesbury area.  
**Range.** Quainton to Warren Faunicycles.  
**Maximum.** Quainton Faunicycle, 98%.

*Macrodentina rugulata* (Jones, 1885)  
(Pl. 1, fig. 2)  
**Material.** 1553 specimens from the basal Purbeck Beds at Swindon and in the Aylesbury area.  
**Range.** Quainton to Stair Faunicycles.  
**Maximum.** Quainton Faunicycle, 69%.
**Macrodentina transiens** (Jones, 1885)  
(Pl. 1, fig. 3)  
*Remarks.* In 1974, Bassiouni erected a new genus *Paranotacythere* for the Upper Jurassic-Lower Cretaceous species of *Orthonotacythere* with *O. diglypta* Triebel as type.  

**Orthonotacythere auricula** Martin, 1961  
(Pl. 12, fig. 21)  
*Remarks.* A very rare species so far seen only in the Mupes Faunicycle.  

**Orthonotacythere cineraria** Anderson, 1971  
(Pl. 4, fig. 6)  
*Remarks.* A very rare species in the Upper Weald Clay.  

**Orthonotacythere favulata** Martin, 1940  
(Pl. 3, figs. 5, 7)  
*Remarks.* A very rare species in the Upper Weald Clay.  

**Orthonotacythere inversa** (Cornuel, 1848)  
(Pl. 12, fig. 5)  
*Remarks.* A very rare species in the Upper Weald Clay at Atherfield.  

**Orthonotacythere nodosaria** Anderson, 1971  
(Pl. 4, figs. 4, 5)  
*Remarks.* A rare form from the Grinstead Faunicycle at O. P. Q. Of the two syntypes of *Candona pellucida* (Jones, 1848) selected as lectotype; it now has the number Mik (M) 526 in the B.G.S. Collection. *GSM* 06074 (now Mik (M) 527) is in poor condition.
Ostracod faunas in the Purbeck & Wealden of England

Genus *Paraschuleridea* Swartz & Swain, 1946

*Paraschuleridea buglensis* Barker, 1966

(Pl. 1, fig. 5)

**Material.** 308 specimens from localities in the Aylesbury area.

**Range.** Quainton to Robertsbridge Faunicycles (Lower Purbeck).

**Maximum.** Warren Faunicycle, 70%.

Genus *Procytheropteron* Ljubimova, 1955

*Procytheropteron barkeri* Anderson, 1971

(Pl. 2, fig. 3)

**Material.** 366 specimens from Ay.

**Range.** Quainton to Wardour Faunicycles (Lower Purbeck).

**Maximum.** Quainton Faunicycle, 32%.

*Procytheropteron brodiei* (Jones, 1894)

(Pl. 5, fig. 1)

**Material.** 17 specimens from As, GD, MW, NW, Wa, VW.

**Range.** Peveril to Nothe Faunicycles (Middle Purbeck).

**Maximum.** Cinder Beds Faunicycle.

Genus *Protocythere* Triebel, 1938

*Protocythere serpentina* (Anderson, 1941)

(Pl. 1, fig. 7)

**Material.** 555 specimens from Ay and Sw.

**Range.** Quainton to Stair Faunicycles (Lower Purbeck).

**Maximum.** Quainton Faunicycle, 79%.

Genus *Pseudoparacypridopsis* Anderson, 1971

*Pseudoparacypridopsis mountfieldensis* Anderson, 1971

(Pl. 3, fig. 3)

**Material.** 987 specimens from Bg, CD, GD, Gu, He, Mo, MW, NP, Wa.

**Range.** Lower Soft Cockle to Battle Faunicycles (Purbeck).

**Maximum.** Mountfield Faunicycle, 44%.

Genus *Scabriculocypris* Anderson, 1941

*Scabriculocypris erastes* Anderson, 1941

(Pl. 12, fig. 18)

**Remarks.** A rare species in the Warren and Ringstead Faunicycles at Swindon. Appears occasionally in the Middle and Upper Purbeck in the Mountfield and Warlingham boreholes.

*Scabriculocypris durstonensis* Anderson, 1971

(Pl. 4, figs. 15, 17)

**Material.** 145 specimens from CD, DB.

**Range.** Mountfield to Bacon Faunicycles (Purbeck).

**Maximum.** Corfe Faunicycle, 62%.

*Scabriculocypris trapezoides* Anderson, 1941

(Pl. 2, fig. 14)

**Material.** 1704 specimens from As, Ay, Bg, CD, GD, Gu, He, Ki, Mo, NP, PC, Pe, Po, Sw, Wa.

**Range.** Quainton to Fletching Faunicycles (mainly Lower and Middle Purbeck).

**Maximum.** Goldspur Faunicycle, 27%.

Genus *Scabriculocypris* Anderson, 1941

*Scabriculocypris cerastes* Anderson, 1941

(Pl. 12, fig. 18)

**Remarks.** A rare species found mainly in the Lower Purbeck at Swindon, but a few specimens were also obtained from the Mountfield and Tisbury Faunicycles in the Ashdown Borehole.

*Scabriculocypris durlstonensis* Anderson, 1971

(Pl. 4, figs. 15, 17)

**Material.** 145 specimens from Bg, CD, GD, Gu, He, Mo, MW, NP, Wa.

**Range.** Mountfield to Bacon Faunicycles (Purbeck).

**Maximum.** Corfe Faunicycle, 62%.

Genus *Stenestroemia* Christensen, 1968

*Stenestroemia cressida* Anderson, 1971

(Pl. 12, fig. 13)

**Remarks.** A rare form seen only in the Grinstead Faunicycle of the Kingsclere Borehole.

*Stenestroemia decipiens* Anderson, 1941

(Pl. 12, fig. 8)

**Remarks.** A rare species ranging from the Warren to the Hard Cockle Faunicycle (Lower Purbeck) at Ay, DR, Sw.

*Stenestroemia fragilis* (Martin, 1940)

(Pl. 2, fig. 6)

**Material.** 361 specimens from As, Ay, Bg, BW, DB, GD, Gu, Mo, MW, NP, NW, Pe, Wa.

**Range.** Ridgeway to Crowhurst Faunicycles (Purbeck and Wealden).

**Maximum.** Goldspur Faunicycle, 16%.

Genus *Stenestroemia* Christensen, 1968

*Stenestroemia cornigera* (Jones, 1888)

(Pl. 11, fig. 3)

**Remarks.** A rare species found in the Weald Shales of Atherfield Point in the Isle of Wight (At).

Genus *Stillina* Laurencich, 1957

*Stillina arkelli* Anderson, 1971

(Pl. 12, fig. 13)

**Remarks.** A rare species, 31 specimens found in the Cinder Beds Faunicycle at MW and Wa.

**Genus Theriosynoecum** Branson, 1936

*Theriosynoecum alleni* (Pinto & Sanguinetti, 1962)

(Pl. 7, fig. 15)

**Material.** 4365 specimens. A species common in the Wadhurst Clay.

**Range.** Hastings to Philpotts Faunicycles.

**Maximum.** Kingsclere Faunicycle, 26%.
**Theriosynoecum fittoni** (Mantell, 1844)  
(Pl. 9, figs. 12, 13)

**Material.** 4903 specimens. A species common in the Upper Weald Clay.

**Range.** Sevenoaks to Earlswood Faunicycles.

**Maximum.** Woodhatch Faunicycle, 17%.

*Theriosynoecum forbesi* (Jones, 1885)

**Material.** 604 specimens from Ay, Bt, CD, DB, FW, GD, Gu, He, MB, Mo, NP, NW, OM, PC, Po, Ri, Up, Wa.

**Range.** Warren to Eastbourne Faunicycles (mainly Purbeck).

**Maximum.** Netherfield Faunicycle, 31%.

**Remarks.** Only 76 specimens known, mainly from the Upper Portland Beds at Bugle Pit, Aylesbury. A few individuals continued into the basal Purbeck Beds (Quainton and Warren Faunicycles) at Bugle Pit and Warren Park, both near Aylesbury.

**Genus** Timiriasevia Mandelstam, 1947

**Timiriasevia punctata** Clements, 1973  
(Pl. 3, fig. 4)

**Material.** 106 specimens from Bg, DB, Gu, Ki, Mo, MW, Wa, WB.

**Range.** Wardour to Hawkhurst Faunicycles (Purbeck and Wealden).

**Maximum.** Eastbourne Faunicycle, 38%.

**Remarks.** A rare species from the Lower Purbeck (Upway to Hard Cockle Faunicycle) in the Mountfield Boreholes.

*Wolburgia* Anderson, 1966

**Wolburgia otherfieldensis** Anderson, 1966  
(Pl. 12, fig. 10)

**Remarks.** A very rare species known only from the Upper Purbeck (Lulworth Faunicycle) in the Chilcomb Down Borehole.

**Wolburgia tavola** Anderson, 1966  
(Pl. 12, fig. 9)

**Remarks.** A very rare species found in the Upper Weald Clay at Atherfield and in the Chilcomb Down Borehole.

**Wolburgia visceralis** (Anderson, 1941)  
(Pl. 1, fig. 1)

**Remarks.** A rare species found in the Upper Weald Clay at Atherfield and in the Chilcomb Down Borehole.

**Genus** Wolburgia Anderson, 1966

**Wolburgia atherfieldensis** Anderson, 1966  
(Pl. 12, fig. 10)

**Remarks.** A rare species found in the Upper Weald Clay at Atherfield and in the Chilcomb Down Borehole.

**Wolburgia polyphema** Anderson, 1966  
(Pl. 12, fig. 7)

**Remarks.** A rare species found in the Upper Weald Clay at Atherfield and in the Chilcomb Down Borehole.

**Wolburgia tavola** Anderson, 1966  
(Pl. 12, fig. 9)

**Remarks.** A very rare species known only from the Upper Purbeck (Lulworth Faunicycle) in the Chilcomb Down Borehole.

**Wolburgia visceralis** (Anderson, 1941)  
(Pl. 1, fig. 1)

**Remarks.** Only 76 specimens known, mainly from the Upper Portland Beds at Bugle Pit, Aylesbury. A few individuals continued into the basal Purbeck Beds (Quainton and Warren Faunicycles) at Bugle Pit and Warren Park, both near Aylesbury.

**LOCALITIES QUOTED IN THE TEXT**

Important sites are marked with an asterisk (*) and 1″

Sheet numbers are of the Geological Survey maps. Detailed localities and horizons are not available for some of these records.

*Ar* Arreton No. 1 Borehole, Isle of Wight, SZ/5307 8564, 1″ 331, Wealden-Purbeck, 210-2563 ft, (64-781 m).

*As* Ashdown No. 1 Borehole, 1954, Sussex, TQ/5006 3035, 1″ 303, Wealden (Ashdown Beds)-Purbeck to 1099 ft, (335 m).

*At* Atherfield Point, Isle of Wight, SZ/450 790, 1″ 344, Weald shales.

*Ay* Aylesbury area, Buckinghamshire (see also Bugle Pit), 1″ 237, Portland-Purbeck junction.

**BG** Buck’s Green, Sussex, TQ/076 328, TQ/082 327, 1″ 302, Lower Weald Clay.

**Bg** Brightling No. 27 Borehole, 1961, Sussex, TQ/687 198, 1″ 320, Partly cored, Purbeck 484-966 ft 8 in, (147.5-294.6 m).

**BH** Black Horse Quarry, near Battle, TQ/769 142, 1″ 320, Wadhurst Clay.

**Bl** Blackbush Wood, Kent, TQ/738 357, 1″ 304, Wadhurst Clay.

**BM** Barham Mill, Kent, TQ/875 466, 1″ 288, Upper Weald Clay.

**Bo** Bogden, Kent, TQ/77 46, 1″ 288, Weald Clay.

**BP** Bookhurst Pottery Brick Pit, near Cranleigh, Surrey, TQ/076 394, 1″ 301, Weald Clay.

**Br** Broadoak Borehole, Sussex, 1974, TQ/61950 22142, 1″ 303, Middle and Lower Purbeck, 2.50-133.65 m.

**BT** Brown’s Pit, near Earlswood, Surrey, TQ/2640 4905, 1″ 286, Weald Clay.

**Bu** Bugle Pit, Hartwell, near Aylesbury, Buckinghamshire, SP/793 121, 1″ 237, Portland-Purbeck junction.

**BW** Binglett’s Wood, Sussex, TQ/6227 2145, 1″ 319, Purbeck.

**CB** Cuckmere Brick Pits, Berwick, Sussex, TQ/5265 0765 & TQ/5255 0700, 1″ 319, Upper Weald Clay.

**CC** Compton Chine, Isle of Wight, SZ/366 852, 1″ 330, Weald Shales.

**CD** Chilcomb Down (Winchester) Borehole, Hampshire, 1960, Purbeck and Wealden 0-2015 ft, (to 614 m).

**CF** Coldharbour Farm, near Maidstone, Kent, TQ/884 461, 1″ 288, Weald Clay.

**CH** Clock House Brick Pit, Capel, Surrey, TQ/174 384, 1″ 302, Weald Clay.

**CL** Copyhold Lane, Sussex, 1″ 302, Grinstead Clay.

**CN** Chaldon Borehole, Chaldon Down, Dorset, 1″ 342, Lower Purbeck.
Ostracod faunas in the Purbeck & Wealden of England

**APPENDIX**

The primary reason for the preparation of this and previous studies of Purbeck and Wealden ostracods has been the need to find a method of correlation of these variable sequences, not only within the Wealden area, but also into Hampshire, Dorset and beyond. To this end, numerous surface exposures and boreholes have been examined in Purbeck and Wealden strata across southern England. Parts of these correlations have been published (e.g. Anderson, 1971, pl. VI), but the large format and complexity of the diagrams has meant that they are not easily reproduced for publication. They do, however, illustrate the primary evidence for the correlations derived from the identification of the ostracods whose identity and distribution are summarised above.

A number of the diagrams drafted by Dr. Anderson have been presented to the Geological Survey and can be consulted by reference to the Biostratigraphy Research Group, British Geological Survey, Keyworth, Nottingham. Amongst these are diagrams showing:-

A. Sequence of Faunicycles in the Purbeck Beds (a), Portland to Cinder Beds.

Nineteen complete sequences spanning the Purbeck Beds in Dorset, Hampshire and the Weald are illustrated and correlated by Faunicycles. The sections are to scale and show some lithological detail. Difficulties in the nomenclature of the finer sediments (i.e. shales, mudstones, marls, siltstones and clays) are not resolved and these are all shown by one ornament. The 'limestones' range from calcareous mudstones to fragmental shell beds. Gypsum and/or anhydrite, though mainly found in the Ridgeway and Stair Faunicycles, also occur sporadically at higher levels. The 'Broken Beds' of the Dorset
coast are here equated with the main Gypsum Beds of Sussex and are found in boreholes in Hampshire.
B. Sequence of Faunicycles in the Purbeck (b), above the Cinder Beds.
The Purbeck Beds above the Cinder Beds in the same 19 sequences are treated in a similar fashion. Except near Ridgeway, sandstones are rare in the western part of the basin unlike in the east where coarser sediments are common, particularly in the Upper Purbeck.
C. The Portland-Purbeck Transition.
Details of the lithostratigraphy, ostracods and bivalves of sections at Bugle Pit, N. Whitechurch and Warren Farm, near Aylesbury; Swindon (Wilts.) and Portesham, Dorset.
These beds are only seen near the western shore. There is a lower sequence of mainly Portland-type sediments with *Myophorella, Liostrea* and ostracods belonging to the genus *Macrodentina* but including some less saline episodes with species of *Fabanella* and even, though rarely, with *Cypridea* spp. This is followed by more typical Lower Purbeck sediments with *Fabanella* as the dominant ostracod genus and with species of *Cypridea* rather more common.
D. The stratigraphical distribution of ostracod species in the Purbeck and Wealden of England.

This shows the ostracod species as a percentage of the total ostracod fauna. C-phase and S-phase species are both shown (unlike Figs. 3 and 4 in this paper). The predominance of S-phase species in both the early parts of the Purbeck and latest Wealden is clearly seen.
E. Sequence of ostracod faunas in the Wadhurst Clay of Sussex and Surrey.
A detailed correlation between the Wadhurst Park, Westfield, Cooden, Little Maxfield, Freshfield Lane and Warlingham boreholes showing graphically the percentage of S-phase species as a percentage of the total ostracods, and the C-phase species as a percentage of total C-phase ostracods.
Note the marked faunal change between the Fairlight and Lindfield Faunicycles.
F. Sequence of ostracod faunas in the Lower Weald Clay (Henfield phase) of Sussex and Surrey.
A detailed correlation between the Ripe, Hailsham, Warlingham and Cuckfield boreholes and Clock House and Warnham pits showing graphically the percentage of S-phase species as a percentage of the total ostracods and the C-phase species as a percentage of the C-phase ostracods. This shows the successive replacement of *C. dorsispinata* and *C. tuberculata* of the basal Wealden by *C. pumila* and *C. marina* and these by *C. clavata* in the highest parts of the Weald Clay.
Explanation of Plate 1

All the specimens figured within each plate are in the collection of the British Geological Survey, at Keyworth, Nottinghamshire. Earlier citations of Mik(M) numbers often include the three number suffix 001. This is here omitted as all these specimens are alone on single cell slides.

Plates, but not the figures within each plate, are ordered by first appearance of species.

Fig. 1. *Wolburgia visceralis* (Anderson), Mik(M) 722; **holotype**; length 0.67 mm, height 0.36 mm; Town Gardens Quarry, Swindon, Wiltshire. p. 38

Fig. 2. *Macrodentina rugulata* (Jones), Mik(M) 3290; length 0.77 mm, height 0.46 mm; Warren House Farm, Stewkley, Buckinghamshire. p. 35

Fig. 3. *Macrodentina transiens* (Jones), Mik(M) 3291; length 0.63 mm, height 0.365 mm; Warren House Farm, Stewkley, Buckinghamshire. p. 36

Fig. 4. *Macrodentina retirugata* (Jones), Mik(M) 720) length 0.88 mm, height 0.50 mm; Town Gardens Quarry, Swindon, Wiltshire. p. 35

Fig. 5. *Paraschuleridea buglesis* Barker, Mik(M) 724; **holotype**; length 0.75 mm, height 0.40 mm; Town Gardens Quarry, Swindon, Wiltshire. p. 37

Fig. 6. *Fabanella boloniensis* (Jones), Mik(M) 4489; length 1.10 mm, height 0.56 mm; White Nothe, Dorset. p. 35

Fig. 7. *Protocythe serpentina* (Anderson), Mik(M) 723; **holotype**; length 0.70 mm, height 0.40 mm; Town Gardens Quarry, Swindon, Wiltshire. p. 37

Fig. 9. *Theriosynoecum forbesi forbesi* (Jones), Mik(M) 3294; length 0.78 mm, height 0.495 mm; Ridgeway, Dorset. p. 38

Fig. 10. *Mantelliana wealdensis* (Wolburg), male, Mik(M) 3220; length 1.14 mm, height 0.665 mm; Guestling No. 1 Borehole, Sussex. p. 36

Fig. 11. *Cypridea peltoides peltoides* Anderson (angular form, 1971, pl. 7, fig. 7), Mik(M) 3318; length 0.985 mm, height 0.66 mm; Mountfield No. 5 Borehole, Sussex. p. 30

Fig. 12. *Cypridea primaeva* Anderson, Mik(M) 736; holotype; length 0.85 mm, height 0.55 mm; Town Gardens Quarry, Swindon, Wiltshire. p. 30

Fig. 13. *Damonella buchaniana* Anderson, Mik(M) 2483; holotype; length 0.46 mm, height 0.3 mm; Portsdown No. 1 Borehole, Hampshire. p. 34

Fig. 14. *Scabriculocypris trapezoides* Anderson, Mik(M) 727; holotype; length 0.565 mm, height 0.37 mm; Town Gardens Quarry, Swindon, Wiltshire. p. 37

Fig. 15. *Mantelliana purbeckensis* (Forbes), Mik(M) 2682; length 1.125 mm, height 0.755 mm; Kingsclere Borehole, Hampshire. p. 36

Fig. 16. *Cypridea peltoides eurygaster* Anderson, Mik(M) 3033; holotype; length 1.18 mm, height 0.88 mm; Mountfield No. 4 Borehole, Sussex. p. 30

Fig. 17. *Mantelliana cyrtus* Anderson, Mik(M) 3217; holotype; length 1.35 mm, height 1.07 mm; Mountfield No. 4 Borehole, Sussex. p. 36

Fig. 18. *Mantelliana wealdensis* (Wolburg), female, Mik(M) 3219; length 1.17 mm, height 0.82 mm; Netherfield Place No. 5 Borehole, Sussex. p. 36
Explanation of Plate 3

Fig. 1. *Bisulcocypris striata striata* (Martin), Mik (M) 3298; length 0.615 mm, height 0.35 mm; Chilcomb Down No. 1 Borehole, Hampshire. p. 33

Fig. 2. *Bisulcocypris striata monotuberculata* Anderson, Mik (M) 3297; **holotype**; length 0.735 mm, height 0.44 mm; Kingsclere No. 1 Borehole, Hampshire. p. 33

Fig. 3. *Pseudoparacypridopsis mountfieldensis* Anderson, Mik (M) 3282; **holotype**; length 1.155 mm, height 0.63 mm; Chilcomb Down Borehole, Hampshire. p. 37

Fig. 4. *Timriasevia punctata* Clements, Mik (M) 3232; length 0.52 mm, height 0.31 mm; Mountfield No. 4 Borehole, Sussex. p. 38

Fig. 5. *Orthonotacythere favulata* Martin, male, Mik (M) 3273; length 0.54 mm, height 0.31 mm; Netherfield Place No. 5 Borehole, Sussex. p. 36

Fig. 6. *Eoparacypris macroselina* Anderson, male, Mik (M) 3288; length 1.385 mm, height 0.635 mm; Netherfield Place No. 3 Borehole, Sussex. p. 35

Fig. 7. *Orthonotacythere favulata* Martin, female, Mik (M) 3264; length 0.59 mm, height 0.31 mm; Netherfield Place No. 5 Borehole, Sussex. p. 36

Fig. 8. *Cypridea granulosa granulosa* (J. de C. Sowerby), Mik (M) 517; **lectotype**; length 1.15 mm, height 0.78 mm; Vale of Wardour, Wiltshire. p. 28

Fig. 9. *Eoparacypris macroselina* Anderson, female, Mik (M) 3281; **holotype**; length 2.02 mm, height 1.04 mm; Penshurst (1899) Borehole, Sussex. p. 35

Fig. 10. *Bisulcocypris dilatata* Anderson, Mik (M) 3300; **holotype**; length 0.54 mm, height 0.345 mm; Mountfield No. 4 Borehole, Sussex. p. 33

Fig. 11. *Kleesana dictyota* Anderson, Mik (M) 3274; **holotype**; length 0.54 mm, height 0.365 mm; Penshurst (1938) Borehole, Sussex. p. 35

Fig. 12. *Cypridea granulosa protogranulosa* Anderson, Mik (M) 3155; **topotype**; length 1.065 mm, height 0.69 mm; Netherfield Place No. 5 Borehole, Sussex. p. 28

Fig. 13. *Cypridea sagena* Anderson, Mik (M) 3169; **holotype**; length 1.03 mm, height 0.665 mm; Milkhurst Wood, Sussex. p. 31

Fig. 14. *Cypridea lata lata* Martin, Mik (M) 3172; length 1.04 mm, height 0.68 mm; Nine Acre Wood, Sussex. p. 29

Fig. 15. *Cypridea lata latissima* Anderson, Mik (M) 3177; **holotype**; length 1.055 mm, height 0.74 mm; Kingsclere No. 1 Borehole, Hampshire. p. 29

Fig. 16. *Mantelliana cyrtion* Anderson, Mik (M) 3218; **topotype**; length 1.28 mm, height 0.915 mm; Mountfield No. 4 Borehole, Sussex. p. 36

†Fig. 17. *Cypridea lata senilis* Anderson, Mik (M) 3176; length 1.16 mm, height 0.825 mm; Guestling No. 3 Borehole, Sussex. p. 29

Fig. 18. *Cypridea granulosa fasciculata* (Forbes), Mik (M) 390; †**neotype**; length 1.15 mm, height 0.75 mm; Vale of Wardour, Wiltshire. p. 28

†This neotype was proposed by Anderson in 1971 (p. 67), using a syntype of the original material of *Cypridea granulosa*. Although it is possible that this specimen was studied by Forbes there is no evidence that it is a syntype of his *C. fasciculata*. However, since 1971, definite syntypes determined by Forbes as *C. fasciculata* have been recognized in the B.G.S. collections. They are on a slab with numerous *Cypridea* (GSM 60264) recorded as from the Middle Purbeck Beds of Durlstone Bay, Dorset.
Explanation of Plate 4

Fig. 6. *Cypridea laevigata wadhurstensis* Anderson, Mik(M) 2147; holotype; length 1·05 mm, height 0·60 mm; Chilcomb Down Borehole, Hampshire.

Fig. 7. *Cypridea aculeata subaculeata* Anderson, Mik(M) 2951; holotype; length 0·97 mm, height 0·62 mm; Warlingham Borehole, Surrey.

Fig. 8. *Cypridea laevigata leonardi* Anderson, Mik(M) 2149; holotype; length 1·17 mm, height 0·71 mm; Warlingham Borehole, Surrey.

Fig. 9. *Cypridea laevigata fairlightensis* Anderson, Mik(M) 2151; holotype; length 1·16 mm, height 0·75 mm; Warlingham Borehole, Surrey.

Fig. 10. *Cypridea bispinosa suthrigensis* Anderson, Mik(M) 2142; holotype; length 0·88 mm, height 0·53 mm; Warlingham Borehole, Surrey.

Fig. 11. *Cypridea menveensis* (Anderson), Mik(M) 4499; length 0·90 mm, height 0·52 mm; Portsdown No. 1 Borehole, Sussex.

Fig. 12. *Cypridea laevigata hawkhurstensis* Anderson, Mik(M) 2148; holotype; length 1·07 mm, height 0·64 mm; Warlingham Borehole, Surrey.

Fig. 13. *Cypridea bispinosa birini* Anderson, Mik(M) 2143; holotype; length 0·94 mm, height 0·60 mm; Warlingham Borehole, Surrey.

Fig. 14. *Cypridea paulsgrovensis* (Anderson), Mik(M) 2155; length 0·97 mm, height 0·615 mm; Warlingham Borehole, Surrey.

Fig. 15. *Theriosynoecum allenii* (Pinto & Sanguinetti), female; Mik(M) 2958; length 0·87 mm, height 0·55 mm; Chilcomb Down Borehole, Hampshire.

Fig. 16. *Cypridea laevigata subquadrata* Anderson, Mik(M) 2150; holotype; length 1·09 mm, height 0·83 mm; Chilcomb Down Borehole, Hampshire.

Fig. 17. *Cypridea bispinosa bispinosa* Jones, Mik(M) 2957; length 1·015 mm, height 0·685 mm; Warlingham Borehole, Surrey.

Fig. 18. *Cypridea ventrosa* Jones, Mik(M) 3205; length 1·04 mm, height 0·77 mm; Swanage, Dorset.
Explanation of Plate 8

Fig. 1. *Cypridea recta tillsdenensis* Anderson, Mik(M) 2180; **holotype**; length 0·79 mm, height 0·46 mm; Warlingham Borehole, Surrey. p. 31

Fig. 2. *Cypridea blackbushensis* Anderson, Mik(M) 2170; **holotype**; length 0·66 mm, height 0·38 mm; Blackbush Wood, Kent. p. 26

Fig. 3. *Cypridea frithwaldi* Anderson, Mik(M) 2962; **holotype**; length 0·61 mm, height 0·36 mm; Warlingham Borehole, Surrey. p. 28

Fig. 4. *Cypridea recta recta* Wolburg, Mik(M) 2178; length 0·79 mm, height 0·48 mm; Kingsclere No. 1 Borehole, Hampshire. p. 31

Fig. 5. *Cypridea recta edithae* Anderson, Mik(M) 2181; **holotype**; length 0·86 mm, height 0·51 mm; Kingsclere No. 1 Borehole, Hampshire. p. 31

Fig. 6. *Mantelliana phillipsiana* (Jones), female, Mik(M) 2960; length 1·96 mm, height 1·20 mm; Black Horse Quarry, Binfield, Sussex. p. 36

Fig. 7. *Cypridea recta inflata* Wolburg, Mik(M) 2179; length 0·77 mm, height 0·50 mm; Kingsclere No. 1 Borehole, Hampshire. p. 31

Fig. 8. *Cypridea melvillei* Anderson, Mik(M) 2173; **holotype**; length 0·35 mm, height 0·20 mm; Kingsclere No. 1 Borehole, Hampshire. p. 29

Fig. 9. *Cytheridea (Haplocytheridea) delicula* Martin, Mik(M) 4495; length 0·56 mm, height 0·345 mm; Warlingham Borehole, Surrey. p. 34

Fig. 10. *Cypridea lasius* Anderson, Mik(M) 2406; **holotype**; length 0·92 mm, height 0·58 mm; Wadhurst Park No. 1 Borehole, Sussex. p. 29

Fig. 11. *Cypridea helenaes* Anderson, Mik(M) 2157; **holotype**; length 0·97 mm, height 0·60 mm; Warlingham Borehole, Surrey. p. 28

Fig. 12. *Cypridea valdensis claudi* Anderson, Mik(M) 2183; **holotype**; length 1·31 mm, height 0·83 mm; Warlingham Borehole, Surrey. p. 33

Fig. 13. *Cypridea pendae* Anderson, Mik(M) 2141; **holotype**; length 1·00 mm, height 0·66 mm; Warlingham Borehole; Surrey. p. 33

Fig. 14. *Cypridea arenosa arenosa* Anderson, Mik(M) 2138; **holotype**; length 0·94 mm, height 0·62 mm; Wadhurst Park N. 3 Borehole, Sussex. p. 26

Fig. 15. *Cypridea valdensis clareae* Anderson, Mik(M) 2184; **holotype**; length 1·265 mm, height 0·75 mm; Warlingham Borehole, Surrey. p. 33

Fig. 16. *Cypridea morula* Anderson, Mik(M) 2169; **holotype**; length 1·215 mm, height 0·90 mm; Chilcomb Down Borehole, Hampshire. p. 30

Fig. 17. *Cypridea verrucosa* Jones, Mik(M) 2159; length 0·97 mm, height 0·67 mm; Kingsclere No. 1 Borehole, Hampshire. p. 33

Fig. 18. *Cypridea valdensis valdensis* (J. de C. Sowerby), Mik(M) 1027; **lectotype**; length 1·28 mm, height 0·90 mm; near Hythe, Kent. p. 32
Explanation of Plate 9

Fig. 1. *Cypridea arenosa hengisti* Anderson, Mik(M) 2139; holotype; length 0.89 mm, height 0.60 mm; Wadhurst Park No. 3 Borehole, Sussex. p. 26

Fig. 2. *Cypridea arenosa marshalli* Anderson, Mik(M) 2140; holotype; length 0.98 mm, height 0.62 mm; Wadhurst Park No. 3 Borehole, Sussex. p. 26

Fig. 3. *Cypridea giffordi* Anderson, Mik(M) 2171; holotype; length 0.4 mm, height 0.25 mm; Wadhurst Park No. 3 Borehole, Sussex. p. 28

Fig. 4. *Cypridea asseri* Anderson, Mik (M) 2145; holotype; length 0.81 mm, height 0.47 mm; Warlingham Borehole, Surrey. p. 26

Fig. 5. *Mantelliana mantelli* (Jones), Mik(M) 1004; lectotype; length 1.425 mm, height 0.76 mm; Atherfield, Isle of Wight. p. 36

Fig. 6. *Cypridea vericae* Anderson, Mik(M) 2158; holotype; length 0.92 mm, height 0.55 mm; Wadhurst Park No. 3 Borehole, Sussex. p. 33

Fig. 7. *Cypridea dorsispinata dorsispinata* (Anderson), Mik(M) 538; length 0.90 mm, height 0.575 mm; Henfield No. 1 Borehole, Sussex. p. 27

Fig. 8. *Cypridea dorsispinata duplicata* Anderson, Mik(M) 2131; holotype; length 0.87 mm, height 0.51 mm; Henfield No. 1 Borehole, Sussex. p. 27

Fig. 9. *Cypridea dorsispinata gemella* Anderson, Mik(M) 2129; holotype; length 0.93 mm, height 0.605 mm; Henfield No. 1 Borehole, Sussex. p. 27

Fig. 10. *Cypridea dorsispinata quinquecornis* Anderson, Mik(M) 2130; holotype; length 0.82 mm, height 0.51 mm; Henfield No. 1 Borehole, Sussex. p. 27

Fig. 11. *Cypridea dorsispinata tricornis* Anderson, Mik(M) 2132; holotype; length 1.07 mm, height 0.575 mm; Henfield No. 1 Borehole, Sussex. p. 27

Fig. 12. *Theriosynoecum fittoni* (Mantell), female, Mik(M) 1905; lectotype; length 0.95 mm, height 0.58 mm; Punfield Cove, Dorset. p. 38

Fig. 13. *Theriosynoecum fittoni* (Mantell), male, Mik(M) 4498; length 1.0 mm, height 0.6 mm; Ringwould Borehole, Kent. p. 38

Fig. 14. *Miocytheridea henfieldensis* (Anderson), Mik(M) 3001; length 0.83 mm, height 0.45 mm; Henfield No. 1 Borehole, Sussex. p. 36

Fig. 15. *Cypridea clavata clavata* (Anderson), Mik(M) 2379; length 0.805 mm, height 0.48 mm; Warlingham Borehole, Surrey. p. 27

Fig. 16. *Cypridea dorsispinata roemeri* (Anderson), Mik(M) 524; syntype; length 0.86 mm, height 0.54 mm; Henfield No. 1 Borehole, Sussex. p. 27

Fig. 17. *Cypridea clavata bardana* Anderson, Mik(M) 2383; holotype; length 1.04 mm, height 0.655 mm; Coldharbour Farm, Kent. p. 27

Fig. 18. *Cypridea clavata beltana* Anderson, Mik(M) 2382; holotype; length 1.0 mm, height 0.62 mm; Barham Mill, Kent. p. 27
Ostracod faunas in the Purbeck & Wealden of England

Plate 9
Explanantion of Plate 10

Fig. 1. *Cypridea clavata maleta* Anderson, Mik(M) 2385; **holotype**; length 0.835 mm, height 0.54 mm; Warlingham Borehole, Surrey. p. 27

Fig. 2. *Cypridea clavata mistrata* Anderson, Mik(M) 2381; **holotype**; length 0.96 mm, height 0.575 mm; Warlingham Borehole, Surrey. p. 27

Fig. 3. *Cypridea clavata talaria* Anderson, Mik(M) 2380; **holotype**; length 0.90 mm, height 0.52 mm; Warlingham Borehole, Surrey. p. 27

Fig. 4. *Cypridea pumila* Anderson, Mik(M) 2120; **holotype**; length 0.99 mm, height 0.61 mm; Portsdown No. 1 Borehole, Hampshire. p. 31

Fig. 5. *Cypridea brendae* sp. nov., Mik(M) 4485; **holotype**; length 0.85 mm, height 0.51 mm; Cuckfield No. 2 Borehole, Sussex. p. 26

Fig. 6. *Cypridea hispida* sp. nov., Mik(M) 4486; **holotype**; length 0.72 mm, height 0.43 mm; Hailsham Borehole, Sussex. p. 28

Fig. 7. *Cypridea pseudomarina* Anderson, Mik(M) 2119; **holotype**; length 0.925 mm, height 0.575 mm; Atherfield, Isle of Wight. p. 30

Fig. 8. *Cypridea fasciata* Anderson, Mik(M) 2116; **holotype**; length 0.825 mm, height 0.52 mm; Atherfield, Isle of Wight. p. 28

Fig. 9. *Cypridea rotundata* Anderson, Mik(M) 2121; **holotype**; length 0.79 mm, height 0.51 mm; Brookhurst Pottery Brick Pit, Surrey. p. 31

Fig. 10. *Cypridea bogdenensis* Anderson, Mik(M) 2113; **holotype**; length 0.91 mm, height 0.55 mm; Bogden, Kent. p. 26

Fig. 11. *Cypridea tenuis* Anderson, Mik(M) 2122; **holotype**; length 0.905 mm, height 0.49 mm; Hythe, Kent. p. 32

Fig. 12. *Cypridea hamata* Anderson, Mik(M) 2117; **holotype**; length 0.705 mm, height 0.48 mm; Warlingham Borehole, Surrey. p. 28

Fig. 13. *Cypridea spinigera* (J. de C. Sowerby), Mik(M) 2175; **lectotype**; length 0.93 mm, height 0.56 mm; Sandown Bay, Isle of Wight. p. 32

†Fig. 14. *Cypridea insulae* Anderson, Mik(M) 2400; **holotype**; length 0.495 mm, height 0.29 mm; Shepherd’s Chine, Isle of Wight. p. 29

Fig. 15. *Cypridea caudata* Anderson, Mik(M) 2114; **holotype**; length 0.71 mm, height 0.485 mm; Atherfield, Isle of Wight. p. 26

Fig. 16. *Cypridea clavata gordana* Anderson, Mik(M) 2384; **holotype**; length 1.04 mm, height 0.65 mm; Coldharbour Farm, Kent. p. 27

Fig. 17. *Cypridea marina* Anderson, Mik(M) 2118; **holotype**; length 0.88 mm, height 0.57 mm; Tongham Borehole, Sussex. p. 29

Fig. 18. *Cypridea comptonensis* Anderson, Mik(M) 2395; **holotype**; length 1.159 mm, height 0.725 mm; Shepherd’s Chine, Isle of Wight. p. 27

†In explanation of Plate XVI, figs. 10-14, Anderson, 1967, p. 262 quotes the holotype of *C. insulae* as Mik(M) 2499; the number is correctly given in the description (p. 246) as Mik(M) 2400.

H.I-C
Explanation of Plate 11

Fig. 1. *Cypridea vectae* Anderson, Mik(M) 2399; **holotype**; length 0·79 mm, height 0·48 mm; Shepherd's Chine, Isle of Wight. p. 33

Fig. 2. *Cypridea warlinghamensis* Anderson, Mik(M) 2401; **holotype**; length 0·765 mm, height 0·46 mm; Shepherd's Chine, Isle of Wight. p. 33

Fig. 3. *Sternbergella cornigera* (Jones), Mik(M) 1013; **lectotype**; length 0·92 mm, height 0·51 mm; Atherfield, Isle of Wight. p. 37

Fig. 4. *Cypridea cuckmerensis* Anderson, Mik(M) 2115; **holotype**; length 0·81 mm, height 0·475 mm; Berwick, Sussex. p. 27

The following figures illustrate species of less stratigraphical significance than those preceding either because of their rarity or of their long range.

Fig. 5. *Cypridea simplissima* nom. nov. for *C. simplex* Anderson (non Galeeva), Mik(M) 3209; **holotype**; length 0·72 mm, height 0·46 mm; Chilcomb Down Borehole, Hampshire. p. 31

Fig. 6. *Eoparacypris abbreviata* Anderson, Mik(M) 3278; **holotype**; length 0·665 mm, height 0·39 mm; Chilcomb Down Borehole, Hampshire. p. 34

Fig. 7. *Darwinula jonesi* Anderson, Mik(M) 3326; **holotype**; length 0·935 mm, height 0·385 mm; Wateringbury, Kent. p. 34

Fig. 8. *Darwinula leguminella* (Forbes), Mik(M) 3323; length 0·62 mm, height 0·26 mm; Mountfield No. 3 Borehole, Sussex. p. 34

Fig. 9. *Darwinula oblonga* (Roemer), Mik(M) 3324; length 1·15 mm, height 0·525 mm; Warlingham Borehole, Sussex. p. 34

Fig. 10. *Cypridea setina pelota* sub. sp. nov., Mik(M) 2154; **holotype**; length 0·89 mm, height 0·61 mm; Kingsclere No. 1 Borehole, Hampshire. p. 31

Fig. 11. *Cypridea tuberculata indigens* Anderson, Mik(M) 4494; length 0·88 mm, height 0·5 mm; Warlingham Borehole, Surrey. p. 32

Fig. 12. *Cypridea varians* Anderson, Mik(M) 3210; **holotype**; length 0·77 mm, height 0·54 mm; Chilcomb Down Borehole, Hampshire. p. 33

Fig. 13. *Cypridea wolburgi* Anderson, Mik(M) 3206; **holotype**; length 1·0 mm, height 0·705 mm; Warlingham Borehole, Surrey. p. 33

Fig. 14. *Cypridea cf. martini* Wolburg, Mik(M) 3194; length 0·83 mm, height 0·53 mm; Warlingham Borehole, Surrey. p. 29

Fig. 15. *Cypridea parallela* Martin, Mik(M) 2174; length 1·01 mm, height 0·63 mm; Chilcomb Down Borehole, Hampshire. p. 30

Fig. 16. *Damonella denticulata* Anderson, Mik(M) 2485; **holotype**; length 0·57 mm, height 0·34 mm; Gillmans Brick Pit, Billingshurst, Sussex. p. 34

Fig. 17. *Damonella punctatula* Anderson, Mik(M) 2486; **holotype**; length 0·45 mm, height 0·31 mm; Wadhurst No. 3 Borehole, Sussex. p. 34

Fig. 18. *Cypridea tuberculata dorsiclavata* sub. sp. nov., Mik(M) 4488; **holotype**; length 0·915 mm, height 0·655 mm; Warlinglid Borehole, Sussex. p. 32

64
Explanation of Plate 12

Fig. 1. *Eoparacypris attenuata* Anderson, Mik(M) 3277; holotype; length 0.8 mm, height 0.315 mm; Henfield No. 1 Borehole, Sussex.  

Fig. 2. *Eoparacypris surriensis* Anderson, Mik(M) 3284; holotype; length 1.32 mm, height 0.62 mm; Warlingham Borehole, Surrey.  

Fig. 3. *Eoparacypris parallela* (Neale), Mik(M) 3283; length 0.88 mm, height 0.385 mm; Chilcomb Down Borehole, Hampshire.  

Fig. 4. *Eoparacypris edmundsi* sp. nov., Mik(M) 3279; holotype; length 0.37 mm, height 0.185 mm; Warlingham Borehole, Surrey.  

Fig. 5. *Orthonotacythere inversa* (Cornuel), Mik(M) 2412; length 0.5 mm, height 0.275 mm; Atherfield, Isle of Wight.  

Fig. 6. *Orthonotacythere diglypta* Triebel, female, Mik(M) 3271; length 0.61 mm, height 0.325 mm; Chilcomb Down Borehole, Hampshire.  

Fig. 7. *Wolburgia polyphema* Anderson, Mik(M) 2488; holotype; length 0.46 mm, height 0.27 mm; Mountfield No. 4 Borehole, Sussex.  

Fig. 8. *Stenestroemia decipiens* (Anderson), Mik(M) 735; length 0.47 mm, height 0.25 mm; Town Gardens Quarry, Swindon, Wiltshire.  

Fig. 9. *Wolburgia tavola* Anderson, Mik(M) 2487; holotype; length 0.41 mm, height 0.215 mm; Chilcomb Down Borehole, Hampshire.  

Fig. 10. *Wolburgia atherfieldensis* Anderson, Mik(M) 673; holotype; length 0.29 mm, height 0.17 mm; Atherfield, Isle of Wight.  

Fig. 11. *Eoparacypris edwardi* Anderson, Mik(M) 3280; holotype; length 0.42 mm, height 0.265 mm; Warlingham Borehole, Surrey.  

Fig. 12. *Fabanella dimorpha* Anderson, Mik(M) 3214; holotype; length 1.09 mm, height 0.62 mm; Kingsclere No. 1 Borehole, Hampshire.  

Fig. 13. *Stenestroemia cressida* Anderson, Mik(M) 2402; holotype; length 0.555 mm, height 0.29 mm; Kingsclere No. 1 Borehole, Hampshire.  

Fig. 14. *Klieana thoracina* Anderson, Mik(M) 3286; holotype; length 0.46 mm, height 0.28 mm; Mountfield No. 3 Borehole, Sussex.  

Fig. 15. *Stillina arkeffi* Anderson, Mik(M) 3267; holotype; length 0.765 mm, height 0.39 mm; Warlingham Borehole, Surrey.  

Fig. 16. *Palaeocytheridea pellucida* Anderson, Mik(M) 526; lectotype; length 0.94 mm, height 0.60 mm; Henfield No. 1 Borehole, Sussex.  

Fig. 17. *Scabriculocypris acanthes* Anderson, Mik(M) 728; holotype; length 0.68 mm, height 0.44 mm; Town Gardens Quarry, Swindon, Wiltshire.  

Fig. 18. *Scabriculocypris cerastes* Anderson, Mik(M) 729; holotype; length 0.68 mm, height 0.43 mm; Town Gardens Quarry, Swindon, Wiltshire.  

Fig. 19. *Cypridea dolabrata kingsclerensis* Anderson, Mik (M) 2125; holotype; length 1.10 mm, height 0.78 mm; Kingsclere No. 1 Borehole, Hampshire.  

Fig. 20. *Eocytheridea cf. oleroni* (Donze), Mik (M) 3307, length 0.57 mm, height 0.33 mm; Warren House Farm, Stewkley, Buckinghamshire.  

Fig. 21. *Orthonotacythere auricula* Martin, Mik (M) 3269, length 0.61 mm, height 0.33 mm; Warlingham Borehole, Surrey.
