ABSTRACT

Introduction: Complementary and Alternative Medicines is a group of diverse medical and healthcare systems, practices, and products that are not considered to be part of conventional medicine. Alternative medicine has been used to treat various illnesses, including viral infections. COVID-19, a new strain of Coronavirus 2019 (SARS-CoV-2) causes mild to moderate respiratory illness in humans. There is a high risk among the elderly and those people with heart and lung disease, asthma, low CD4 counts, or diabetes. These Chinese medicines were used in similar conditions in 2003 during the SARS outbreak with documented clinical successes. The AYUSH ministry in India has suggested alternative medicines such as Ayurveda, Homeopathy, and Unani practice that could act as an immunity booster against the deadly novel coronavirus. Many people are seeking alternative medicine as these have been used to treat many viral diseases. But there is no scientific evidence that these alternative medicines can prevent or cure the illness COVID-19.

Aim: This review is done to find whether alternative medicines help us to fight against COVID-19.

Materials and Method: In this review, data were collected related to COVID-19, herbal medicine, and alternative medicine from Google Scholar, PubMed, SciFinder, and ScienceDirect using keywords. Nearly 48 articles related to the topic had been reviewed and interpreted.

Result: This review demonstrates the usage of alternative medicines against COVID19. As there is no specific treatment or vaccine available for COVID 19 at present, many people are seeking alternative medicine to boost immunity to fight against the deadly virus. But there is no scientific evidence that these alternative medicines can prevent or cure the illness COVID-19. It is important to be safe by staying at home, maintaining social distance, and proper hygiene. It is also important to boost the immune system and follow a proper diet during this pandemic.

Key Words: Ayurveda, COVID 19, Immunity, Treatment, Traditional, CAM

INTRODUCTION

Complementary and Alternative Medicines is a group of diverse medical and healthcare systems, practices, and products that are not considered to be part of conventional medicine. Alternative medicine aims in achieving the healing effects of the medicine that lacks biological plausibility and is often unproven. Complementary medicine (CM), complementary and alternative medicines (CAM), Integrative medicines (IM), and holistic medicine are of the same phenomenon. Alternative therapies rely on pseudoscience rather than medical science. Traditional practices are “alternative” as it is used outside their original setting and are without any proper scientific explanation or evidence. They are also called new-age medicine, pseudomedicine, unconventional medicine, or unorthodox medicine. The traditional alternative medicine may include Acupuncture, Ayurveda, Homeopathy, Naturopathy, and Chinese medicines. The most commonly used complementary modalities are massage, acupuncture, naprapathy, reflexology, osteopathy, cupping, and spiritual healing. Complementary medicines are usually used along with standard medical treatments. For example, acupuncture helps to lessen some side effects of cancer treatments. CAM can be broadly classified based on five major domains as alternative medical systems, mind-body interventions, biologically-based treatments, manipulative and body-based methods, and energy therapies. More than 80% of the world’s population uses Complementary and Alternative Medicines.
(CAMs). In the U.S, CAM was used by about 38% of adults and 12% of the children \(^1\). According to the World Health Organization has estimated over 100 million users of CAM in Europe \(^2\). Many people from different cultures are following their alternative medicines \(^3\) and strategies in order to sustain their immune power against COVID-19.

Alternative medicine has been used to treat various illnesses, including viral infections. Herbal, dietary, complementary, and natural therapies have been used widely for the prevention and treatment of viral infections. The traditional Chinese herbal medicines were used for treating novel coronavirus (COVID 19) pneumonia \(^4\). These Chinese medicines were used in similar conditions in 2003 during the SARS outbreak with documented clinical successes \(^5\). The National Administration of Traditional Chinese Medicine (NATCM) has formulated a herbal formula through which there was a 90% response rate out of 214 clinical cases of COVID 19 related pneumonia \(^6\). Despite initial clinical successes and promising research, the cure rate for COVID-19 remains difficult to achieve and, even with integrative medicine available, remains an extremely dangerous contagion.

The AYUSH ministry suggested alternative medicines such as Ayurveda, Homeopathy, and Unani practice that could act as an immunity booster against the deadly novel coronavirus. TN Kabasurakudineer against COVID 19 was implemented by the government in many stores and is used by the public. But Medical experts criticized that there is no proven scientific evidence. The aim of the study is to find whether alternative medicines help us to fight against COVID 19.

**COVID-19**

COVID-19, a new strain of Coronavirus 2019 (SARS-CoV-2) is a zoonotic virus and the incubation period is about 2-14 days and it may vary. The symptoms are respiratory disorders, coughing, fever, shortness of breath, pain or pressure in the chest, confusion, bluish lips, and difficulty breathing, some can be even asymptomatic. The fatal complications are pneumonia, severe acute respiratory syndrome, kidney failure, and sepsis. There is a high risk among the elderly and those people with heart and lung disease, asthma, low CD4 counts (including some HIV patients), or diabetics. The outbreak of the coronavirus disease 2019 (COVID 19) emerged in Wuhan City, China, in late 2019 and has now reached pandemic status \(^7\). The novel coronavirus has been named severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), whereas the disease associated with it is referred to as COVID 19. Club-shaped glycoprotein spikes in the envelope give the virus a crown-like or coronal appearance. During the initial days, the risk factors were travel history and viral exposure. It spreads via respiratory droplet, aerosol, and thorough super spreaders \(^8\). Clinical severity of COVID-19 was higher among adults aged greater 65 years old \(^9\). People with pre-existing conditions like diabetes and heart diseases are at higher risk \(^10\). High prevalence of co-morbidities with confirmed cases was about 26% and those who died from COVID-19 had a higher prevalence of about 67.2% \(^11\). Asymptomatic carriers play an important role in the transmission of the disease \(^12\).

**Clinical Manifestation**

Common symptoms reported in adults with COVID-19 are fever, dry cough, and fatigue; severe cases have been associated with dyspnoea and bilateral ground-glass opacities on chest CT. Symptoms in children include flu-like syndrome, fluctuating fever, pneumonia, and upper respiratory signs like cough, sore throat, stuffy nose, sneezing, and rhinorrhea. COVID 19 patients showed respiratory as well as gastrointestinal symptoms \(^13\). A decreased sense of taste and smell may occur \(^14\). The loss of smell symptom was observed in 30% of confirmed cases in China. Sepsis was frequently observed complications. Computed tomography was used for diagnosis \(^15\). The gold standard for diagnosis is by real-time reverse transcription-polymerase chain reaction (rRT-PCR) from a nasopharyngeal swab. The time delay between the incident of infection and the time taken for him or her to develop symptoms is called incubation. 95% of them would develop symptoms within 13 days of infection \(^16\). The basic reproduction number of SARS-CoV-2 in the early outbreak in China was estimated to be 2 \(^17\).

**Potential Treatment Options**

There is presently no vaccine \(^18\) or specific antiviral drug regime which is used for the treatment of critically ill patients. The management of patients mainly focuses on the provision of supportive care with oxygenation, ventilation, and fluid management, treatment of symptoms, isolation, and experimental measures \(^19\). Combination treatment of low-dose of systemic corticosteroids and anti-virals and atomization inhalation of interferon has been encouraged as part of critical COVID 19 management \(^20\). Antiviral agents, including oseltamivir (75 mg every 12h orally), ganciclovir (0.25 g every 12h intravenously), and lopinavir/ritonavir tablets (400/100 mg twice daily). Remdesivir is currently under trials and has been known to prevent MERS-CoV. An old anti-malarial, chloroquine phosphate, has been effective in inhibiting the exacerbation of pneumonia due to its antiviral and anti-inflammatory activities \(^21\). Cell plasma-based therapy and the role of mesenchymal stem cells are emerging \(^22\).

**Chinese Traditional Medicines**

Traditional Chinese medicines were used in treating COVID 19 patients. There was widespread use of Traditional Chinese Medicine during the last SARS-COV outbreak. The five most commonly used herbs were *Astragali radix* (Huangqi),
Glycyrrhiza radix Et Rhizoma (Gancao), Saposhnikoviae radix (Fangfeng), Atractylodis macrocephalae Rhizoma (Baizhu), and Lonicerae japonicae Flo. Chinese medicines have a positive role in fighting against COVID-19. But this cannot be used to treat patients with lethal lung injury and in cases of uncontrolled immune responses of COVID 19 in elderly. 85% of COVID-19 patients received combined treatment with regular medication and traditional remedies in China.

Alternative Medicines
Alternative Medicines are common amongst people with chronic ailments such as rheumatologic conditions, breast cancer, asthma, inflammatory bowel disease, headache, back problems, and chronic pain, as well as degenerative conditions like multiple sclerosis. There has been the usage of alternative medicines in other viral diseases. Chinese medicines used in the management of viral myocarditis. The herbal complementary therapies used in the treatment of influenza. Complementary and alternative medicines are used among persons living with HIV. The perceived effect of an alternative practice arises from the belief that it will be effective (placebo effect).

Usage of CAM
The usage of Complementary Alternative Medicines is showing a remarkable increase in support. The poor compliance and long-term side effects of conventional medicines brings the large CAM users. Homeopathy was frequently used in Far East countries, Pakistan, and UAE. The usage of CAM is based on past experiences. In Africa traditional medicine is used for about 80% primary healthcare due to the lack of access to conventional medicines. In a study of alternative medicine usage in India, 79% of CAM users indicated that they had positive outcomes with their treatments.

Advantages and Disadvantages
There are both advantages and disadvantages in using CAM. The disadvantage is that a physician is unaware to alternative medicines usage and their side effects on drug interactions. The advantages are its natural, no side effects, easy availability, rapid symptomatic, and instant relief for mild ailments.

CONCLUSION
This review demonstrates the usage of alternative medicines against COVID-19. As there is no specific treatment available for COVID-19, many people are seeking alternative medicine as alternative medicines have been used to treat many viral diseases. But there is no scientific evidence that these alternative medicines can prevent or cure the illness COVID-19. The usage of certain alternative medicines may not be safe. Some help in boosting the immune system but not a complete cure. It is important to be safe by staying at home, maintaining social distance, and proper hygiene. It is also important to boost the immune system and follow a proper diet during this pandemic.

ACKNOWLEDGEMENTS
We thank Saveetha Dental College for the support to carry out this study.
