3.3.4. Enrichment-based Clustering
Summary

Using SILAC labeling and affinity enrichment followed by high-resolution LC-MS/MS analysis, quantitative phosphorylome analysis was performed in pair of human cell lines. Altogether, 5,468 phosphorylation sites in 2,317 protein groups were identified, among which 5,338 sites in 2,263 proteins were quantified. When setting quantification ratio of >1.5 as up-regulated threshold and <0.67 as down-regulated threshold, 657 phosphorylation sites in 474 proteins were quantified as up-regulated targets and 404 phosphorylation sites in 307 proteins were quantified as down-regulated targets. Intensive bioinformatic analysis was then carried out to annotate those quantifiable targets, including protein annotation, functional classification, functional enrichment, functional enrichment-based cluster analysis, etc. Based on the results, further studies following the quantitative proteome analysis were suggested.

Technical Route

The aim of this project is to use integrated approach involving SILAC labeling, HPLC fractionation, affinity enrichment, mass spectrometry-based quantitative proteomics to quantify dynamic changes of the whole phosphorylome of human cell lines. The general technical route is indicated below:

- SILAC Labeling
- Protein Extraction
- Trypsin Digestion
- HPLC Fractionation
- Affinity Enrichment
- LC-MS/MS Analysis
- Database Search
- Bioinformatic Analysis
1. Results

1.1. Quantitative Overview

Altogether, 5,468 phosphorylation sites in 2,317 proteins were identified, among which 5,338 phosphorylation site in 2,263 proteins were quantified (Table 1). All the data was presented in the file of “5144SP_Pho/2-Basic_analysis/SILAC_modified_quantification.xlsx”

In this report, the quantitative ratio over 1.5 was considered as up-regulation while quantitative ratio below 1/1.5 (0.67) was considered as down-regulation (T test p-value <0.05). The number of differentially quantified sites and proteins were summarized in Table 2.

Table 1: Summary of identified and quantified sites and proteins

| Name | Identified | Quantified |
|------|-----------|------------|
| Sites | 5,468 | 5,338 |
| Proteins | 2,317 | 2,263 |

Table 2: Summary of differentially quantified sites and proteins (>1.5, or <0.67)

| Name | Up-regulated (>1.5) | Down-regulated (<0.67) |
|------|----------------------|------------------------|
| Sites | 657 | 404 |
| Proteins | 474 | 307 |

1.2. Protein Annotation

To further understand the function and feature of identified and quantified proteins, we annotated function or feature of protein from several different categories, including Gene Ontology, Protein Domain, Protein Complex, KEGG Pathway and Subcellular Localization. Firstly, all the identified proteins were annotated. Then, the quantifiable proteins were also annotated.

The results were presented in the folder: 5144SP_Pho/4-Protein_annotation
### 1.3. Motif Analysis

| Motif Logo | Motif | Motif Score | Foreground | Background | Fold Increase |

The results were presented in the folder: 5144SP_Pho9-Motif_analysis

1.4. Functional Classification of Differentially Quantified Proteins

1.4.1. GO Classification of Terms Level 2

According to GO annotation information of identified phosphorylation proteins, we calculated the number of quantifiable proteins in each GO term of level 2.

Table 3: The GO terms of level 2 distribution of up-regulated phosphorylation proteins (L/H)

| GO Terms Level 1 | GO Terms Level 2                                      | No. of Protein |
|------------------|-------------------------------------------------------|----------------|
| Biological Process | cell                                                  | 422            |
|                   | organelle                                             | 359            |

### Figure 3.

GO-based enrichment analysis of up-regulated (A) and down-regulated (B) proteins (L vs H). For detailed information of GO-based enrichment, please find the corresponding excel files in supplementary folder of “5144SP_Pho/6-Functional_enrichment”.

#### 1.5.2. KEGG Pathway Enrichment
**Figure 4.** The pathway obtained from KEGG pathway enrichment analysis (L vs H). The proteins in turquoise are down-regulated and the proteins in red are up-regulated. For detailed information of KEGG pathway, please find the supplementary folder of “5144SP_Pho/8-Enrichment_pathway_image”.

**Figure 5.** KEGG pathway-based enrichment analysis of up- and down-regulated proteins (L vs H). For detailed information of KEGG pathway, please find the corresponding excel files in supplementary folder of “5144SP_Pho/6-Functional_enrichment”.

### 1.5.3. Domain Enrichment

| Domain                                    | -log10(Fisher' exact test p value) |
|-------------------------------------------|-----------------------------------|
| Protein kinase-like domain                 |                                   |
| Serine/threonine/tyrosine-protein kinase catalytic domain | 2.69                              |
| Protein kinase domain                      |                                   |
| AGC-kinase, C-terminal                      |                                   |
| Tyrosine-protein kinase, catalytic domain   | 2.09                              |
| SH3 domain                                 |                                   |
| Serine/threonine-/dual specificity protein kinase, catalytic domain | 2.02 |
| Homeodomain-like                          |                                   |
| Protein kinase, C-terminal                 |                                   |
| Histone deacetylase domain                 |                                   |
| Diacylglycerol/pherbol-ester binding       | 1.4                               |
| SANT/Myb domain                           |                                   |
| UBA-like                                   |                                   |

Figure 6. Protein domain enrichment analysis of up-regulated (A) and down-regulated (B) proteins (L vs H). For detailed information of protein domain, please find the corresponding excel files in supplementary folder of “5144SP_Pho/6-Functional_enrichment”.

1.5.4. Complex Enrichment

Figure 7. Protein complex enrichment analysis of up-regulated (A) and down-regulated (B) proteins (L vs H). For detailed information of protein complex, please find the corresponding excel files in supplementary folder of “5144SP_Pho/6-Functional_enrichment”.
The results were presented in the folder: 5144SP_Pho/6-Functional_enrichment

1.6. Cluster Analysis

1.6.1. Quantiles-based Clustering for Protein Groups

Firstly, the quantified proteins in this study were divided into four quantiles according to the quantification ratio to generated four quantiles: Q1 (0~1/1.5), Q2 (1/1.5~1/1.3), Q3 (1.3~1.5) and Q4 (>1.5). Then, the quantiles-based clustering was performed.

Figure 8. Distribution of quantification results.
Figure 9. GO enrichment-based cluster analysis.

Figure 10. Protein domain, Protein complex and KEGG pathway-based clustering analysis.
2. Suggestions for Further Studies

Based on the results of the current project, the following studies are recommended by PTM Biolabs:

- **To investigate the crosstalk between ubiquitination and phosphorylation**
  Ubiquitination and phosphorylation are well known to have intensive crosstalk with vital biological functions. PTM Biolabs has reagents and stable technologies for the quantification of both ubiquitination and phosphorylation. The bioinformatic analysis of the crosstalk between ubiquitination and phosphorylation could also be deeply performed by the advanced bioinformatics team in PTM Biolabs.

- **To investigate other PTMs and their crosstalks**
  PTM Biolabs also has reagents and technologies for determining dynamic changes of other PTM substrates and the crosstalk between them, using in-house established methodologies, including Phosphorylation (phosphorylation), lysine succinylation (Ksucc), lysine glutarylation (Kglu), lysine butyrylation (Kbuty), lysine propionylation (Kprop), lysine crotonylation (Kcr), O-GlcNAcylatio, N-glycosylation and phosphoryltion.

PTM Biolabs is able to deliver high quality service in the projects proposed above. We are proudly providing our technical expertise and knowledge in epigenetics and proteomics towards the client’s success.

3. Materials and Methods

3.1. Sample Preparation

3.1.1. Materials and Reagents

| Name            | Company | CAT#      |
|-----------------|---------|-----------|
| DMEM Medium     | Pierce  | DMEM Medium|
| DMEM-L          | Gibco   | DMEM-L    |
3.1.2. SILAC Labeling

The cells were grown to 80% confluence in high glucose (4.5 g/liter) Dulbecco’s modified Eagle’s medium (with glutamine and sodium pyruvate) containing 10% fetal bovine serum and 1% penicillin-streptomycin at 37°C with 95% air and 5% CO₂. The cells were labeled with either “heavy isotopic lysine” (13C-Lysine) or “light isotopic lysine” (12C-Lysine) using a SILAC Protein Quantitation Kit (Pierce, Thermo) according to manufacturer’s instructions. Briefly, the cell line was grown in Dulbecco’s modified Eagle’s medium supplemented with 10% fetal bovine serum and either the “heavy” form of [U-13C₆]-L-lysine or “light” [U-12C₆]-L-lysine for more than six generations before being harvested, to achieve more than 97% labeling efficiency. After that, the cells were further expanded in SILAC media to desired cell number (~5×10⁸) in fifteen 150 cm² flasks.

The “light” labeled cells were then treated with 5×10¹⁰ PFU/mL ad-girdin shRNA and the “heavy” labeled cells were treated with same amount of ad-GFP. After treatment, the cells were maintained in SILAC media for another 48 hours. The cells were then harvested and washed twice with ice-cold PBS. After snap freezing in liquid nitrogen, cell pellets were stored in -80 ℃ freezer for future use.

| Groups       | Labeling information                              |
|--------------|---------------------------------------------------|
| ad-GFP       | Heavy (lysine 13C₆ and arginine 13C₆,15N₄)         |

Table 2. Labeling information
3.1.3. **Protein Extraction**

The harvested “heavy” and “light” labeled cells were lysed with lysis buffer (100 mM Tris-Cl, 2mM EDTA, pH 7.2) supplemented with Phosphatase Inhibitor Cocktail Set III and Protease Inhibitor Cocktail Set V on ice using a high intensity ultrasonic processor (Scientz) for 30 min, respectively. The supernatants were saved after centrifuge at 20,000 g for 10 min at 4 °C. The protein concentration was determined with 2-D Quant kit according to the manufacturer’s instructions.

3.1.4. **Trypsin Digestion**

For digestion, the protein solution was reduced with 10 mM DTT for 1 h at 37 °C and alkylated with 20 mM IAA for 45 min at room temperature in darkness. Finally, trypsin was added at 1:50 trypsin-to-protein mass ratio for the first digestion overnight and 1:100 trypsin-to-protein mass ratio for a second 4 h-digestion.

3.1.5. **HPLC Fractionation**

The sample was then fractionated into fractions by high pH reverse-phase HPLC using Agilent 300Extend C18 column (5 μm particles, 4.6 mm ID, 250 mm length). Briefly, peptides were first separated with a gradient of 2% to 60% acetonitrile in 10 mM ammonium bicarbonate pH 10 over 80 min into 80 fractions, Then, the peptides were combined into 8 fractions and dried by vacuum centrifuging.

3.1.6. **Affinity Enrichment**

Peptide mixtures were first incubated with IMAC microspheres suspension with vibration. The IMAC microspheres with enriched phosphopeptides were collected by centrifugation, and the supernatant was removed. To remove nonspecifically adsorbed peptides, the IMAC microspheres were washed with 50% ACN/6% TFA and 30% ACN/0.1% TFA, sequentially. To elute the enriched phosphopeptides from the IMAC microspheres, elution buffer containing 10% NH4OH
was added and the enriched phosphopeptides were eluted with vibration. The supernatant containing phosphopeptides was collected and lyophilized for LC-MS/MS analysis.

3.2. Quantitative Proteomic Analysis by LC-MS/MS

3.2.1. Materials and Reagents

| Name               | Company         |
|--------------------|-----------------|
| H₂O                | Thermo          |
| ACN (acetonitrile) | Fisher Chemical |
| FA (formic acid)   | Fluka           |

3.2.2. Mass Spectrometer

Thermo Scientific™ Q Exactive™ Plus

3.2.3. LC-MS/MS Analysis

Peptides were dissolved in solvent A (0.1% FA in 2% ACN), directly loaded onto a reversed-phase pre-column (Acclaim PepMap 100, Thermo Scientific). Peptide separation was performed using a reversed-phase analytical column (Acclaim PepMap RSLC, Thermo Scientific) with a linear gradient of 2-24% solvent B (0.1% FA in 98% ACN) for 50 min, 24-36% solvent B for 12 min and 35-80% solvent B for 4 min then holding at 80% for the last 4 min, all at a constant flow rate of 300 nL/min on an EASY-nLC 1000 UPLC system. The resulting peptides were analyzed by Q Exactive™ Plus hybrid quadrupole-Orbitrap mass spectrometer (ThermoFisher Scientific).

The peptides were subjected to NSI source followed by tandem mass spectrometry (MS/MS) in Q Exactive™ Plus (Thermo) coupled online to the UPLC. Intact peptides were detected in the Orbitrap at a resolution of 70,000. Peptides were selected for MS/MS using NCE setting as 28; ion fragments were detected in the Orbitrap at a resolution of 17,500. A data-dependent procedure that alternated between one MS scan followed by 20 MS/MS scans was applied for the top 20 precursor ions above a threshold ion count of 5E3 in the MS survey scan with 15.0s dynamic exclusion. The electrospray voltage applied was 2.0 kV. Automatic gain control (AGC)
was used to prevent overfilling of the ion trap; 5E4 ions were accumulated for generation of MS/MS spectra. For MS scans, the m/z scan range was 350 to 1800.

3.2.4. Database Search

The resulting MS/MS data was processed using MaxQuant with integrated Andromeda search engine (v.1.4.1.2). Tandem mass spectra were searched against SwissProt_Human (20,203 sequences) database concatenated with reverse decoy database. Trypsin/P was specified as cleavage enzyme allowing up to 2 missing cleavages, 5 modifications per peptide and 5 charges. Mass error was set to 10 ppm for precursor ions and 0.02 Da for fragment ions. Carbamidomethylation on Cys was specified as fixed modification and oxidation on Met, phosphorylation on Ser, Thr, Tyr and acetylation on protein N-terminal were specified as variable modifications. False discovery rate (FDR) thresholds for protein, peptide and modification site were specified at 1%. Minimum peptide length was set at 7. All the other parameters in MaxQuant were set to default values. The site localization probability was set as > 0.75.

3.2.5. QC Validation of MS Data

The MS data validation was shown in Figure 11. Firstly, we checked the mass error of all the identified peptides. The distribution of mass error is near zero and most of them are less than 0.02 Da which means the mass accuracy of the MS data fit the requirement (Figure 11A). Secondly, the length of most peptides distributed between 8 and 20, which agree with the property of tryptic peptides (Figure 11B), that means sample preparation reach the standard.
Figure 11. QC validation of MS data. (A) Mass error distribution of all identified peptides, (B) Peptide length distribution.
3.3. Bioinformatics Methods

3.3.1. Annotation Methods

GO Annotation

The Gene Ontology, or GO, is a major bioinformatics initiative to unify the representation of gene and gene product attributes across all species. More specifically, the project aims to:

1. Maintain and develop its controlled vocabulary of gene and gene product attributes;
2. Annotate genes and gene products, and assimilate and disseminate annotation data;
3. Provide tools for easy access to all aspects of the data provided by the project.

The ontology covers three domains:

1. Cellular component: A cellular component is just that, a component of a cell, but with the proviso that it is part of some larger object; this may be an anatomical structure (e.g. rough endoplasmic reticulum or nucleus) or a gene product group (e.g. ribosome, proteasome or a protein dimer).
2. Molecular function: Molecular function describes activities, such as catalytic or binding activities, that occur at the molecular level. GO molecular function terms represent activities rather than the entities (molecules or complexes) that perform the actions, and do not specify where or when, or in what context, the action takes place.
3. Biological process: A biological process is series of events accomplished by one or more ordered assemblies of molecular functions. It can be difficult to distinguish between a biological process and a molecular function, but the general rule is that a process must have more than one distinct steps.

Gene Ontology (GO) annotation proteome was derived from the UniProt-GOA database (www.ebi.ac.uk/GOA/). Firstly, Converting identified protein ID to UniProt ID and then mapping to GO IDs by protein ID. If some identified proteins were not annotated by UniProt-GOA database, the InterProScan soft would be used to annotated protein’s GO functional based on protein sequence alignment method. Then proteins were classified by Gene Ontology annotation based on three categories: biological process, cellular component and molecular function.

Domain Annotation
A protein domain is a conserved part of a given protein sequence and structure that can evolve, function and exist independently of the rest of the protein chain. Each domain forms a compact three-dimensional structure and often can be independently stable and folded. Many proteins consist of several structural domains. One domain may appear in a variety of different proteins. Molecular evolution uses domains as building blocks and these may be recombined in different arrangements to create proteins with different functions. Domains vary in length from between about 25 amino acids up to 500 amino acids in length. The shortest domains such as zinc fingers are stabilized by metal ions or disulfide bridges. Domains often form functional units, such as the calcium-binding EF hand domain of calmodulin. Because they are independently stable, domains can be "swapped" by genetic engineering between one protein and another to make chimeric proteins.

Identified proteins domain functional description were annotated by InterProScan (a sequence analysis application) based on protein sequence alignment method, and the InterPro domain database was used. InterPro (http://www.ebi.ac.uk/interpro/) is a database that integrates diverse information about protein families, domains and functional sites, and makes it freely available to the public via Web-based interfaces and services. Central to the database are diagnostic models, known as signatures, against which protein sequences can be searched to determine their potential function. InterPro has utility in the large-scale analysis of whole genomes and metagenomes, as well as in characterizing individual protein sequences.

**KEGG Pathway Annotation**

KEGG connects known information on molecular interaction networks, such as pathways and complexes (the "Pathway" database), information about genes and proteins generated by genome projects (including the gene database) and information about biochemical compounds and reactions (including compound and reaction databases). These databases are different networks, known as the "protein network", and the "chemical universe" respectively. There are efforts in progress to add to the knowledge of KEGG, including information regarding ortholog clusters in the KEGG Orthology database. KEGG Pathways mainly including: Metabolism, Genetic Information Processing, Environmental Information Processing, Cellular Processes, Rat Diseases, Drug development. *Kyoto Encyclopedia of Genes and Genomes (KEGG)* database was used to annotate protein pathway. Firstly, using KEGG online service tools KAAS to annotated protein’s
KEGG database description. Then mapping the annotation result on the KEGG pathway database using KEGG online service tools KEGG mapper.

**Subcellular Localization**

The cells of eukaryotic organisms are elaborately subdivided into functionally distinct membrane bound compartments. Some major constituents of eukaryotic cells are: extracellular space, cytoplasm, nucleus, mitochondria, Golgi apparatus, endoplasmic reticulum (ER), peroxisome, vacuoles, cytoskeleton, nucleoplasm, nucleolus, nuclear matrix and ribosomes. Bacteria also have subcellular localizations that can be separated when the cell is fractionated. The most common localizations referred to include the cytoplasm, the cytoplasmic membrane (also referred to as the inner membrane in Gram-negative bacteria), the cell wall (which is usually thicker in Gram-positive bacteria) and the extracellular environment. Most Gram-negative bacteria also contain an outer membrane and periplasmic space. Unlike eukaryotes, most bacteria contain no membrane-bound organelles, however there are some exceptions.

There, we used wolfpsort a subcellular localization predication soft to predict subcellular localization. Wolfpsort an updated version of PSORT/PSORT II for the prediction of eukaryotic sequences.

**Protein Complex**

Protein complexes are key molecular entities that integrate multiple gene products to perform cellular functions. CORUM is a database that provides a manually curated repository of experimentally characterized protein complexes from mammalian organisms, mainly human (64%), mouse (16%) and rat (12%). The new CORUM 2.0 release encompasses 2837 protein complexes offering the largest and most comprehensive publicly available dataset of mammalian protein complexes. The CORUM dataset is built from 3198 different genes, representing approximately 16% of the protein coding genes in humans. Each protein complex is described by a protein complex name, subunit composition, function as well as the literature reference that characterizes the respective protein complex. Recent developments include mapping of functional annotation to Gene Ontology terms as well as cross-references to Entrez Gene identifiers.
3.3.2. Motif Analysis

Soft motif-x was used to analysis the model of sequences constituted with amino acids in specific positions of modifier-21-mers (10 amino acids upstream and downstream of the site) in all protein sequences. And all the database protein sequences were used as background database parameter, other parameters with default.

3.3.3. Functional Enrichment

Enrichment of Gene Ontology analysis

Proteins were classified by GO annotation into three categories: biological process, cellular compartment and molecular function. For each category, we used Functional Annotation Tool of DAVID Bioinformatics Resources 6.7 to identify enriched GO against the background of Homo sapiens. A two-tailed Fisher’s exact test was employed to test the enrichment of the protein-containing IPI entries against all IPI proteins. Correction for multiple hypothesis testing was carried out using standard false discovery rate control methods. The GO with a corrected p-value < 0.05 is considered significant.

Enrichment of pathway analysis

Encyclopedia of Genes and Genomes (KEGG) database was used to identify enriched pathways by Functional Annotation Tool of DAVID against the background of Homo sapiens. A two-tailed Fisher’s exact test was employed to test the enrichment of the protein-containing IPI entries against all IPI proteins. Correction for multiple hypothesis testing was carried out using standard false discovery rate control methods. The pathway with a corrected p-value < 0.05 was considered significant. These pathways were classified into hierarchical categories according to the KEGG website.

Enrichment of protein domain analysis

For each category proteins, InterPro (a resource that provides functional analysis of protein sequences by classifying them into families and predicting the presence of domains and important sites) database was researched using Functional Annotation Tool of DAVID against the background of Homo sapiens. A two-tailed Fisher’s exact test was employed to test the enrichment of the protein-containing IPI entries against all IPI proteins. Correction for multiple
hypothesis testing was carried out using standard false discovery rate control methods and domains with a corrected p-value < 0.05 were considered significant.

**Enrichment of complex analysis**

Manually curated CORUM protein complex database for human was used for protein complex analysis. Overrepresented complexes were identified using hypergeometric test for each category proteins. A two-tailed Fisher’s exact test was employed to test the enrichment of the protein-containing SwissProt entries against all SwissPort human proteins. Correction for multiple hypothesis testing was carried out using standard false discovery rate control methods and complexes with a corrected p-value < 0.05 were considered significant.

**3.3.4. Enrichment-based Clustering**

All the protein categories obtained after enrichment were collated along with their P values, and then filtered for those categories which were at least enriched in one of the clusters with P value<0.05. This filtered P value matrix was transformed by the function \( x = -\log_{10}(P \text{ value}) \). Finally these x values were z-transformed for each category. These z scores were then clustered by one-way hierarchical clustering (Euclidean distance, average linkage clustering) in Genesis. Cluster membership was visualized by a heat map using the “heatmap.2” function from the “gplots” R-package.
