\section{ABSTRACT}

MicroRNAs (miRNAs) are non-coding RNAs that control many functions within the human cells by controlling protein levels through binding to messenger RNA (mRNA) translation process or mRNA abundance. Many pieces of evidence show that miRNAs affect the viral RNA replication and pathogenesis through direct binding to the RNA virus to mediate changes in the host transcriptome. Many previous studies have been studying the interaction between human cells’ miRNA and viral RNA to predict many targets along the viral genome. In this work, via the miRDB database, we determined the target scores of predicted human miRNA to bind with the ss-RNA of the severe acute respiratory syndrome coronavirus (SARS-CoV-2) in general and its spike gene in specific. Our predicted miRNA targets of the ss-RNA of SARS-CoV-2 might destabilize the ss-RNA translation of SARS-CoV-2 that has been established by more than 80% of asymptomatic infected cases in Jordan due to host miRNA interactions. In respiratory epithelial cells, the high prediction scoring for miRNAs covers the RNA from 5′ to 3′ that explains successful antiviral defenses against ss-RNA of SARS-CoV-2 and might lead to new nucleotide deletion mechanisms. The exciting findings here that the nucleotide substitution 1841A \textgreater\textgreater G at the viral genomic RNA level, which is an amino acid substitution D614G at the spike protein level showed a change in the predicted miRNA sequence from hsa-miR-4793-5p to hsa-miR-3620-3p with an increase in the target score from 91 to 92.

\section{1. Introduction}

Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) caused an outbreak in Wuhan city and characterized as a pandemic by the World Health Organization WHO [1]. The first case of SARS-CoV-2 was reported to the Jordanian Ministry of Health on March 2, 2020, for a Jordanian citizen who was in Italy. To the date of this report, there are 1218 confirmed cases, 1131 recovered and 11 deaths of COVID-19 in Jordan, according to the Jordanian Ministry of Health official web site which has been launched as a unified source of information about the preventive measurements and symptoms of corona virus-2019 (https://corona.moh.gov.jo/en).

In 2003, severe coronavirus acute breathing syndrome (SARS-CoV) appeared in China. It has spread to over 30 countries, infecting around 8000 people, killing young people with 10%, and aging with 50%. There are no approved coronavirus vaccines or antiviral treatments against, for example, such as the Middle East respiratory CoV (MERS-CoV) yet [2]. The molecular mechanisms of viral pathogenesis provide thoughtful help in the search for effective and secure therapeutic strategies against new human SARS-Cov-2.

MicroRNAs (miRNAs) are non-coding RNAs that control many functions within a cell by controlling protein levels through binding to mRNA translation process. Many shreds of evidence show that miRNAs affect the RNA viral replication and, consequently, pathogenesis through direct binding to the RNA virus-mediated changes in the host transcriptome. Host miRNAs can bind to a wide range of RNA viruses, straight adapt their pathogenesis through mimicking cellular mRNAs, and tolerating direct binding of the miRNA to the viral RNA. Theoretically, the abovementioned regulation is analogous to that of the host miRNAs [3,4].

Many miRNA sequences that targeted Influenza viral RNA segments were linked with the activity of host miRNA-induced antiviral defense. This link represents potential treatment with a combination of five miRNAs through Antagomirs delivery to suppress the viral replication and effectively improve protection against lethal challenge with PR8 influenza virus strain in mice [5].

Severe acute coronavirus syndrome (SARS-CoV) caused human fatal disease and reaction and extensive pulmonary disease. The significance...
of small non-coding RNAs for SARS-CoV pathologies, lung RNAs sequences of infected mice, and three (18–22 nt) small viral RNAs (svRNAs) were discovered. The three svRNAs originated from the SARS-CoV genomic regions nsp3 (svRNA-nsp3.1 and -nsp3.2), and N (svRNA-N). CoV svRNAs were characterized as independent from cell type and host species RNAse III, but the extent of the viral replication machinery was a dependent process. In vivo, lung pathology and pro-inflammatory cytokine release, antagonism-mediated inhibition of svRNA-N significantly decreased. This indicates that svRNAs contribute to the pathogenesis of SARS-CoV and demonstrates the potential for antagonists of svRNA-N as antivirals [6].

To understand the early steps of COVID-19 infection, we predicted miRNAs sequences targeting the submitted 29903 bp of viral ss-RNA of the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2 complete genomic RNA sequence) from the isolate of Wuhan-Hu-1. A predicted miRNAs targeting region at 3822 bp ss-RNA of the spike glycoprotein of SARS-CoV-2 was revealed. Also, we predicted miRNAs targeting a variable region of the ss-RNA spike glycoprotein of SARS-CoV-2 sequences from 20 positive nasopharyngeal specimens form Jordan. These specimens were collected and sequenced by Biolab Diagnostic Laboratories (Jordan) & Andersen lab at Scripps Research (USA), who deposited the sequences in GISAID, a maintained global database based in Germany. The perception in this work might help scientists to understand the molecular mechanisms of viral pathogenesis. Besides, it might support the research for effective, safe therapeutic strategies against known human coronaviruses and new emergent strains with a focus on miRNA-induced antiviral human body defense, which could be a potential treatment developed for SARS-CoV-2.

2. Methods

The miRDB is an online http://mirdb.org/custom.html database for the target and working annotations of miRNA. All targets in miRDB were anticipated by MirTarget, a bioinformatics tool that was developed through the study of thousands of miRNA target interactions from high-performance research [7,8].

We have utilized the tool in the following link: http://biomodel.uah.es/en/lab/cybertory/analysis/trans.htm to convert submitted sequences from miRNA to DNA to demonstrate genome sequence alignment using ChromosPros Version 2.1.9. The Wuhan-Hu-1 full genome sequence (accession number: NC_045512.2) has been used as a reference sequence against miRNAs targeting the area of 3822 bp ss-RNA of the SARS-CoV-2 Spike gene. We predicted miRNA targets against the full length of 29903 bp ss-RNA (SARS-CoV-2 sequence) from the isolate of Wuhan-Hu-1. In addition, variable miRNAs were predicted to target regions on the SARS-CoV-2 sequences against the reference sequence ss-RNA spike glycoprotein (accession number: YP.009724390) from Jordanian positive nasopharyngeal specimens sequenced by Biolab Diagnostic Laboratories (Jordan) & Andersen lab at Scripps Research (USA) who published sequences retrieved from GISAID (https://corona.moh.gov.jo/en) (https://gisaid.org).

3. Results and discussion

We predicted top ten miRNAs targeting score between (98–99) against the submitted 29903 bp ss-RNA SARS-CoV-2 full length genome correspondingly, hsa-miR-4288, hsa-miR-195-5p, hsa-miR-16-5p, hsa-miR-15b-5p, hsa-miR-15a-5p, hsa-miR-6838-5p, hsa-miR-497-5p, hsa-miR-424-5p, hsa-miR-3133, hsa-miR-21-3p, hsa-miR-510-3p, hsa-miR-624-5p, and hsa-miR-497-5p) with targeting scores of (92, 90 and 84) respectively for the submitted 3822 bp of the ss-RNA spike glycoprotein of SARS-CoV-2 sequence of Wuhan-Hu-1 (from the complete genome NCBI reference sequence: NC_045512.2 Region: 21563–25384) as shown in Table 13 (Appendix). These miRNAs, as well as associated functional annotations, presented in miRDB present the expression profiles of hundreds of cell lines. To facilitate the prediction of miRNA functions, miRDB offers an integrative analysis of target prediction and Gene Ontology data found in Tables 14 and 15 (Appendix).

Moreover, in our study, we predicted the regions of miRNAs targeting score against many ss-RNA spike glycoprotein of SARS-CoV-2 sequences from Jordanian samples with amino acid substitutions (NCBI reference sequence: NC_045512.2 region: 21563–25384 and nomenclature sequence, Single Amino Acid Variant (SAV) and annotation used the accession number YP.009724390.1) showed in Tables 16–24 (Appendix). The original sequence of the del 432TTA, and the del Y144 have the same miRNA with a target score of 91. The original 1841A target miRNA scored (91, 64 and 56) for (hsa-miR-4793-5p, hsa-miR-143-5p and hsa-miR-3133) respectively. The interesting finding here that the 1841A > G, and D614G showed a change in the predicted miRNA and an increase in the target score from 91 to 92 (hsa-miR-4793-5p to hsa-miR-3620-3p). However, the original and 3415G > T D1139Y showed the same sequence of the miRNA (hsa-miR-548g-3p) and an increase in the target score from 80 to 81. The last substitution of 3499 G > A G1167S showed the same miRNA sequence of (hsa-miR-155-5p) and a decrease in the target score from 73 to 72.

One of the record genomic changes observed in the severe acute respiratory syndrome coronavirus (SARS-CoV-1) isolated from humans after human to human transmission was the acquisition of a specific 29-nucleotide deletion occurred in open reading frame 8 (ORF8). Three top target scores of miRNAs prediction (hsa-miR-497-5p, hsa-miR-195-5p and hsa-miR-21-3p) showed in Table 12, 16 and 24 (Appendix). They had an expression in the respiratory epithelial cells, and effective antiviral defenses against the ss-RNA of SARS-CoV-2 might lead to a new mechanism of binding miRNA to cause nucleotide deletion in SARS-CoV-2 in reflection to previous reports [5,6,9].

4. Conclusion

Over the past few years, some articles reported the target prediction of miRNA and viral RNA interaction. In our forecasts, more than asymptomatic 80% of the COVID-19 diseased persons raised due to the host miRNA interactions, which have identified the target where the genome replication of the ss-RNA of SARS-CoV-2 has changed to probably inhibit the translation of the ss-RNA and hence possible preventing viral replication and stabilization by subsequent generations. The top target scores of miRNAs prediction cover from 5’ to 3’ in the human respiratory epithelial cells that might be the reason for an effective antiviral defense against the ss-RNA of SARS-CoV-2 and lead to a new mechanism of nucleotide deletion in the coding region of a protein. The miRNAs found in all tissues have targeted gene functions, which lead to an identification of novel cellular pathways to block viral RNA replication or even host cell-specific targeting the regulation for the ss-RNA of SARS-CoV-2.

| 1           | 100          | hsa-miR-497-5p | PAPPA       | pappalysin 1     |
| 2           | 100          | hsa-miR-497-5p | FASN        | fatty acid synthase |
| 3           | 100          | hsa-miR-497-5p | UNC80       | unc-80 homolog, NALCN channel complex subunit |
| 4           | 100          | hsa-miR-497-5p | PGP2        | fibroblast growth factor 2 |
| 5           | 100          | hsa-miR-497-5p | TNRC6B      | trinucleotide repeat containing 6B |
| 6           | 100          | hsa-miR-497-5p | PTPN4       | protein tyrosine phosphatase, non-receptor type 4 |
| 7           | 100          | hsa-miR-497-5p | PHF19       | PHD finger protein 19 |
| 8           | 99           | hsa-miR-497-5p | UBE2Q1      | ubiquitin conjugating enzyme E2 Q1 |
| 9           | 99           | hsa-miR-497-5p | LSM11       | LSM11, U7 small nuclear RNA associated |
| 10          | 99           | hsa-miR-497-5p | ANKUB1      | ankyrin repeat and ubiquitin domain containing 1 |

Table 9  
Predicted targets function for hsa-miR-424-5p on 29903 bp ss-RNA SARS-COV-2 genome.

| Target Rank | Target Score | miRNA Name   | Gene Symbol | Gene Description |
|-------------|--------------|--------------|-------------|------------------|
| 1           | 100          | hsa-miR-424-5p | PAPPA       | pappalysin 1     |
| 2           | 100          | hsa-miR-424-5p | FASN        | fatty acid synthase |
| 3           | 100          | hsa-miR-424-5p | UNC80       | unc-80 homolog, NALCN channel complex subunit |
| 4           | 100          | hsa-miR-424-5p | PGP2        | fibroblast growth factor 2 |
| 5           | 100          | hsa-miR-424-5p | TNRC6B      | trinucleotide repeat containing 6B |
| 6           | 100          | hsa-miR-424-5p | PTPN4       | protein tyrosine phosphatase, non-receptor type 4 |
| 7           | 100          | hsa-miR-424-5p | PHF19       | PHD finger protein 19 |
| 8           | 99           | hsa-miR-424-5p | UBE2Q1      | ubiquitin-conjugating enzyme E2 Q1 |
| 9           | 99           | hsa-miR-424-5p | LSM11       | LSM11, U7 small nuclear RNA associated |
| 10          | 99           | hsa-miR-424-5p | ANKUB1      | ankyrin repeat and ubiquitin domain containing 1 |

Table 10  
Predicted targets function for hsa-miR-3133 on 29903 bp ss-RNA SARS-COV-2 genome.

| Target Rank | Target Score | miRNA Name   | Gene Symbol | Gene Description |
|-------------|--------------|--------------|-------------|------------------|
| 1           | 100          | hsa-miR-3133 | HOOK3       | hook microtubule tethering protein 3 |
| 2           | 100          | hsa-miR-3133 | RN52        | regulating synaptic membrane exocytosis 2 |
| 3           | 100          | hsa-miR-3133 | TGFBRAP1    | transforming growth factor-beta receptor-associated protein 1 |
| 4           | 99           | hsa-miR-3133 | RPRD1A      | regulation of nuclear pre-mRNA domain-containing 1A |
| 5           | 99           | hsa-miR-3133 | TFAP2B      | transcription factor AP-2 beta |
| 6           | 99           | hsa-miR-3133 | PTPRK       | protein tyrosine phosphatase, receptor type K |
| 7           | 99           | hsa-miR-3133 | MAP2        | microtubule-associated protein 2 |
| 8           | 99           | hsa-miR-3133 | NRF1        | nuclear respiratory factor 1 |
| 9           | 99           | hsa-miR-3133 | KAT6A       | lysine acetyltransferase 6A |
| 10          | 99           | hsa-miR-3133 | URI1        | URI1, prefoldin like chaperone |

Table 11  
Predicted targets function for hsa-miR-21-3p on 29903 bp ss-RNA SARS-COV-2 genome.

| Target Rank | Target Score | miRNA Name   | Gene Symbol | Gene Description |
|-------------|--------------|--------------|-------------|------------------|
| 1           | 99           | hsa-miR-21-3p | STK38L      | serine/threonine kinase 38 like |
| 2           | 98           | hsa-miR-21-3p | PCDH19      | protocadherin 19 |
| 3           | 96           | hsa-miR-21-3p | LAMP1       | lysosomal associated membrane protein 1 |
| 4           | 96           | hsa-miR-21-3p | GRIA2       | glutamate ionotropic receptor AMPA type subunit 2 |
| 5           | 96           | hsa-miR-21-3p | TOGAR1M1    | TOG array regulator of axonemal microtubules 1 |
| 6           | 96           | hsa-miR-21-3p | ATP1B1      | ATPase Na+:+K+:+transporting subunit beta 1 |
| 7           | 96           | hsa-miR-21-3p | TSC22D2     | TSC22 domain family member 2 |
| 8           | 96           | hsa-miR-21-3p | NAP1L5      | Nucleosome assembly protein 1 like 5 |
| 9           | 95           | hsa-miR-21-3p | UBE4B       | ubiquitination factor 4B |
| 10          | 95           | hsa-miR-21-3p | ZNF236      | zinc finger protein 326 |
Table 12
Predicted miRNAs targeting region on 29903 nt SARS-COV-2 complete genome.

| miRNA Name          | Previous Name | miRNA Sequence | Length |
|---------------------|---------------|----------------|--------|
| hsa-miR-15b-5p      | hsa-miR-15b   | 5′- uagcagcacaucaugguuaacc - 3′ | 22     |
| hsa-miR-497-5p      | hsa-miR-497   | 5′- cagcagcagacuacggguuu - 3′ | 21     |
| hsa-miR-16-5p       | hsa-miR-16    | 5′- uagcagcagcuauauaggugu - 3′ | 22     |
| hsa-miR-6838-5p     |               | 5′- aagcagcagucucacagucucu - 3′ | 22     |
| hsa-miR-4288        |               | 5′- uugucugcugaguuucc - 3′ | 17     |
| hsa-miR-15a-5p      | hsa-miR-15a   | 5′- uagcagcagcuauuaugggug - 3′ | 22     |
| hsa-miR-3133        |               | 5′- uaaagaacucuuaaaccuaau - 3′ | 22     |
| Hsa-miR-424-5p      | Hsa-miR-424   | 5′- cagcagcagacuacggguuu - 3′ | 22     |
| Hsa-miR-497-5p      | Hsa-miR-497   | 5′- cagcagcagacuacggguuu - 3′ | 21     |

(continued on next page)
### Table 12 (continued)

| Previous Name | miRNA Name | miRNA Sequence | Target Score |
|---------------|------------|----------------|--------------|
| hsa-miR-21*   | 5′- caacaccugaguggu - 3′ (length = 21) |                |              |

### Table 13
Predicted miRNAs targeting the submitted 3822 bp ss-RNA spike glycoprotein of SARS-COV-2 sequence, accession number NC_045512.2 REGION: 21563–25384.

| Target Rank | miRNA Name | Target Score |
|-------------|------------|--------------|
| 1           | hsa-miR-510-3p | 92           |
| 2           | hsa-miR-624-5p | 90           |
| 14          | hsa-miR-497-5p | 84           |

### Table 14
Predicted targets function for hsa-miR-510-3p on 3822 bp ss-RNA spike glycoprotein of SARS-COV-2 sequence, accession number NC_045512.2 REGION: 21563–25384.

| Target Rank | miRNA Name | Target Score | Gene Symbol | Gene Description |
|-------------|------------|--------------|-------------|------------------|
| 1           | hsa-miR-510-3p | 100         | CNOT6       | CCR4-NOT transcription complex subunit 6 |
| 2           | hsa-miR-510-3p | 99          | NEXMIF      | neurite extension and migration factor |
| 3           | hsa-miR-510-3p | 99          | RBMS3       | RNA binding motif single stranded interacting protein 3 |
| 4           | hsa-miR-510-3p | 99          | DENND6A     | DENN domain containing 6A |
| 5           | hsa-miR-510-3p | 99          | SNAP91      | Synaptosome associated protein 91 |
| 6           | hsa-miR-510-3p | 99          | BCLAF1      | BCL2 associated transcription factor 1 |
| 7           | hsa-miR-510-3p | 99          | LATS2       | large tumor suppressor kinase 2 |
| 8           | hsa-miR-510-3p | 99          | ELOVL7      | ELOVL fatty acid elongase 7 |
| 9           | hsa-miR-510-3p | 98          | ZFHX3       | zinc finger homeobox 3 |
| 10          | hsa-miR-510-3p | 98          | FMR1        | fragile X mental retardation 1 |

### Table 15
Predicted targets function for hsa-miR-624-5p on 3822 bp ss-RNA spike glycoprotein of SARS-COV-2 sequence, accession number NC_045512.2 REGION: 21563–25384.

| Target Rank | miRNA Name | Target Score | Gene Symbol | Gene Description |
|-------------|------------|--------------|-------------|------------------|
| 1           | hsa-miR-624-5p | 96          | ARL4A       | ADP ribosylation factor like GTase 4A |
| 2           | hsa-miR-624-5p | 96          | SOWAH      | sosondowah ankiny repeat domain family member C |
| 3           | hsa-miR-624-5p | 95          | SYT1       | synaptotagmin 1 |
| 4           | hsa-miR-624-5p | 95          | CLOCK      | clock circadian regulator |
| 5           | hsa-miR-624-5p | 95          | STK38      | serine/threonine kinase 38 |
| 6           | hsa-miR-624-5p | 95          | LCPI       | lymphocyte cytosolic protein 1 |
| 7           | hsa-miR-624-5p | 95          | ZNF800     | zinc finger protein 800 |
| 8           | hsa-miR-624-5p | 95          | DOCK11     | dedicator of cytokinesis 11 |
| 9           | hsa-miR-624-5p | 94          | UAP1       | UDP-N-acetylglucosamine pyrophosphorylase 1 |
| 10          | hsa-miR-624-5p | 94          | NFKBIA     | NFKB inhibitor alpha |

### Table 16
Predicted miRNAs targeting region on 3822 bp ss-RNA spike glycoprotein of SARS-COV-2 sequence.

| Target Rank | miRNA Name | miRNA Sequence | Gene Symbol | Gene Description |
|-------------|------------|----------------|-------------|------------------|
| 1           | hsa-miR-624-5p | 5′- uaguaccaguaccuugugu - 3′ (length = 22) |               |                  |

(continued on next page)
| miRNA Name       | Previous Name | miRNA Sequence | Target Score | miRNA Name |
|------------------|---------------|----------------|--------------|------------|
| hsa-miR-497-5p   | hsa-miR-497   | 5’ - cagcagcacacugugguuugu - 3’ (length = 21) | 91           | hsa-miR-196a-1-3p |
| hsa-miR-624-5p   | hsa-miR-624; hsa-miR-624* | 5’ - uaguaccaguaccuuguguca - 3’ (length = 22) | 91           | hsa-miR-4793-5p |
| hsa-miR-143-5p   |               |                | 64           | hsa-miR-143-5p |
| hsa-miR-3133     |               |                | 56           | hsa-miR-3133 |

Table 19
1841A > G D614G showed a change in the sequence of the miRNA and increased in the target score from 90 to 91 on variable ss-RNA spike glycoprotein of SARS-COV-2 sequence from Jordanian samples.

| Target Rank | Target Score | miRNA Name |
|-------------|--------------|------------|
| 1           | 92           | hsa-miR-3620-3p |
| 2           | 55           | hsa-miR-3133 |
| 3           | 54           | hsa-miR-21-3p |

Table 20
Original 3415G target miRNA score.

| Target Rank | Target Score | miRNA Name |
|-------------|--------------|------------|
| 1           | 80           | hsa-miR-548g-3p |
| 2           | 72           | hsa-miR-627-5p |
| 3           | 61           | hsa-miR-506-5p |

Table 21
3415G > T D1139Y showed the same the miRNA and increased the target score from 80 to 81 on variable ss-RNA spike glycoprotein of SARS-COV-2 sequence from Jordanian samples.

| Target Rank | Target Score | miRNA Name |
|-------------|--------------|------------|
| 1           | 81           | hsa-miR-548g-3p |
| 2           | 72           | hsa-miR-627-5p |
| 3           | 61           | hsa-miR-506-5p |
S. Peng, J. Wang, S. Wei, C. Li, K. Zhou, J. Hu, et al., Endogenous cellular microRNAs targeting the submitted variation ss-RNA spike glycoprotein of SARS-COV-2 sequence from Jordanian samples.

| Target Rank | Target Score | miRNA Name |
|-------------|--------------|-------------|
| 1           | 73           | hsa-miR-155-5p |
| 2           | 62           | hsa-miR-6765-5p |
| 3           | 53           | hsa-miR-551b-5p |

Table 23

3499 G > A G1167S showed the same the miRNA and decreased the target score from 73 to 72 on the variable ss-RNA spike glycoprotein of SARS-COV-2 sequence from Jordanian samples.

| Target Rank | Target Score | miRNA Name |
|-------------|--------------|-------------|
| 1           | 72           | hsa-miR-155-5p |
| 2           | 62           | hsa-miR-6765-5p |
| 3           | 51           | hsa-miR-668-3p |

Table 24

Predicted miRNAs targeting region on variable ss-RNA spike glycoprotein of SARS-COV-2 sequence from Jordanian samples.

| Sample number with accession on GISAID | NCBI Reference Sequence: NC_045512.2 | Sample 23: hCoV-19/Jordan/SR-042/2020/EP-I_JISL_430000/2020-03-30 | Sample 3,5,7,8,10,11,12,13,15,18,20 and21 Example: hCoV-19/Jordan/SR-036/2020/EP-I_JISL_429996/2020-03-23 | Sample 21: hCoV-19/Jordan/SR-033/2020/EP-I_JISL_429993/2020-03-16 | Sample 16: hCoV-19/Jordan/SR-039/2020/EP-I_JISL_429998/2020-03-28 |
