1. Introduction

There are so many chemical compounds in the field of chemistry. One of the most popular recent chemical compounds is metal-organic network (MON) which consists of metal ions and organic ligands. A new MON with zinc as the metal ion and benzene-1,3-dicarboxylic acid as the organic ligand (linker) has been synthesized with the help of hydrothermal method. This MON is also used as a selective nanoadsorbent for the preconcentration and extraction of trace amounts of cadmium with the help of solid-phase extraction method. A category of crystalline and porous materials is porous coordination polymers which are newly known as MONs [1]. One of the most important aspects which can be considered in the matter of MONs in bioapplications is their surface modification and control of their particle size distribution [2]. Zn-related MONs as chemical sensors could be converted into devices for luminescent characteristics [3]. The electron-rich T-conjugated fluorescent ligands are friendly to make Zn-MONs with nucleophilic properties in efficient luminescent sensors [4].

The low toxicity of zinc ions as the desirable character is considered to introduce Zn-related MONs into bio-application domains, especially drug carries. The antibiotic activity has been validated by combining different antibiotic drugs and metals [5]. In reality, Zn$^{2+}$ is an endogenous low-toxic transition metal cation which is widely used in dermatology as a cicatrizing agent and skin moisturizer with astringent, antidandruff, antibacterial, and anti-inflammatory agents [6]. In nonlinear optically active MONs, Zn$^{2+}$ is commonly used as a connecting point.
to prevail undesired d-d transitions in the visible region. Moreover, the toxicology, biomedical applications, and their biocompatibility are recently reported production procedures of zinc-related MONs. For more details, refer to [7].

Eddaoudi et al. [8] synchronized the isoreticular series (IRMOF-1 to IRMOF-16) of 16 highly crystalline materials. The free and fixed diameter of pores from IRMOF-1 to IRMOF-16 varies in the range of 3.8–19.1 and 12.8–28.8, respectively. The design of an IRMOF-10 series based on MON-5 was initiated by determining the reaction conditions necessary to produce the octahedral cluster with a ditopic linear carboxylate. Therefore, many IRMOF structures can be developed by using zinc oxide octahedral clusters \((\text{Zn}_4\text{O}(\text{CO})_4)\) as the metal corners linked via diverse organic dicarboxylate linkers and different three-dimensional cubic networks are formed. For more information, see [9]. All the IRMOFs have the expected topology of \(\text{CaB}_6\) [13] and happened through the prototype IRMOF-1 in which an oxide-centered \(\text{Zn}_4\text{O}\) tetrahedron is edge bridged. Some IRMOFs such as IRMOF-8, IRMOF-10, IRMOF-12, and IRMOF-16 have been seen in noncrystalline porous systems for \(\text{SiO}_2\) xerogels and aerogels [16]. For further investigation, see [7, 10–12].

MONs also predict the physicochemical properties such as grafting active groups [13], impregnating suitable active material [14], ion exchange [15], preparing composites with different substances [11], changing organic ligands and postsynthetic ligands [16], and biosensors enhancing sensitivity, response time, and selectivity [17]. Yap et al. [18] and Lin et al. [19] presented the recent progress in precursors on the preparation of several nanostructures and MON-related applications such as sensing, photocatalysis, electrocatalysis, supercapacitors, catalyst for production of fine chemicals, and lithium ion batteries. Graph theory provides useful tools in the field of modern chemistry which represent the chemical and physical properties of chemical compounds such as heat of formation, heat of evaporation, flash point, melting point, boiling point, temperature, pressure, density, retention in chromatography, and tension and partition coefficient [20–22]. First, distance-based topological index (TI) was discovered by Wiener to study the different properties of chemical compounds (boiling point of paraffin) in 1947 [23]. The very well-reputed first-degree-based TI was discovered by Gutman and Trinajstic to check the chemical physisorbed on the total pi-electron energy of the chemical compounds (alternant hydrocarbons) in 1972 [24].

Recently, Zhao et al. [25] introduced two connection number (number of vertices at distance two) based TIs to compute the general results for modified Zagreb connection indices of subdivision and semitotal point operations on graphs. Nowadays, these degree and connection number-based TIs are abundantly used in the topological properties of four-layered neural networks and MONs [26, 27]. Ali et al. [28] computed connection-based indices and coindices for the product of molecular networks. Gutman and Furtula discussed various topological properties of different molecular structures; see [29–31]. Ali and Trinajstic [32] and Javaid et al. [33] computed different connection-based TIs of graphs under different operations. Moreover, a variety of networks has been defined with the help of connection number-based TIs [34–37].

In this paper, we compute the connection-based Zagreb indices of two different zinc-related MONs such as zinc oxide (\(\text{ZNO}_X\) (n) = IRMOF-10) and zinc silicate (\(\text{ZNC}_L\) (n) = IRMOF-14) networks with respect to the increasing layers, \(n \geq 3\), taking both metal nodes and linkers together. The rest of the paper is organized as follows. Section 2 provides the preliminaries, definitions, and some important results which can be used in the main results. Sections 3 and 4 provides the main results for zinc oxide and zinc silicate networks, and Section 5 provides comparisons and conclusions.

2. Preliminaries

The vertex and edge sets are \(V(G)\) and \(E(G)\) for a simple and connected network \(G\). \(|V(G)|\) and \(|E(G)|\) are the cardinalities of vertex set and edge set which are equal to \(u\) and \(e\), respectively. In a connected network, there is a path between two vertices. The distance between two vertices \(p\) and \(q\) is the shortest path between them. It is denoted by \(d_G(p, q)\). In general [37], \(N_G(q,m) = \{p \in V(G); d_G(p, q) = m\}\) is the open \(m\)-neighborhood set of \(q\), where \(m\) represents a positive integer and \(|N_G(q,m)| = d_G(m,q)\) is called \(m\)-distance degree of a vertex \(q\). In particular,

(i) If \(m = 1\), \(d_G(q,1) = |N_G(q,1)| = d_G(q) = \text{degree of } q\) (number of vertices at distance one from \(q\))

(ii) If \(m = 2\), \(d_G(q,2) = |N_G(q,2)| = \tau_G(q) = \text{connection number of } q\) (number of vertices at distance two from \(q\))

For more terminologies and notations, see [36] and references therein.

Definition 1. For a (molecular) network \(G\), the first Zagreb index (\(M_1(G)\)), second Zagreb index (\(M_2(G)\)), and third Zagreb index (\(M_3(G)\)) are defined as follows:

\[
\begin{align*}
(a) \quad M_1(G) &= \sum_{q \in V(G)} [d_G(q)]^2 = \sum_{p \neq q \in E(G)} [d_G(p) + d_G(q)] \\
(b) \quad M_2(G) &= \sum_{p \neq q \in E(G)} [d_G(p) \times d_G(q)] \\
(c) \quad M_3(G) &= \sum_{q \in V(G)} [d_G(q)]^3 = \sum_{p \neq q \in E(G)} [d_G^2(p) + d_G^2(q)]
\end{align*}
\]

These degree-based TIs are defined by Gutman and Trinajstic [24]. These are abundantly used to predict better findings in molecular networks such as ZE isomerism, absolute value of correlation coefficient, entropy, acentric factor, and heat capacity.

Definition 2. For a (molecular) network \(G\), the first ZCI (\(ZC_1(G)\)), second ZCI (\(ZC_2(G)\)), and modified first ZCI (\(ZC_1^\ast(G)\)) are defined as follows:
(a) \( ZC_1 (G) = \sum_{q \in V(G)} [r_G (q)]^2 \)

(b) \( ZC_2 (G) = \sum_{pq \in E(G)} [r_G (p) \times r_G (q)] \)

(c) \( ZC_3 (G) = \sum_{pq \in E(G)} [r_G (p) + r_G (q)] \)

These connection-based TIs are defined by Ali and Trinajstic [32] (2018). They also reported that the modified first Zagreb connection index has better correlation coefficient value for the thirteen physicochemical properties of octane isomers than classical Zagreb indices.

**Definition 3.** For a (molecular) network \( G \), the modified second Zagreb connection index \((ZC_2^2 (G))\) and modified third Zagreb connection index \((ZC_3^2 (G))\) are defined as follows:

(a) \( ZC_2^2 (G) = \sum_{pq \in E(G)} [d_G (p) r_G (q) + d_G (q) r_G (p)] \)

(b) \( ZC_3^2 (G) = \sum_{pq \in E(G)} [d_G (p) r_G (q) + d_G (q) r_G (q)] \)

**Definition 4.** For a (molecular) network \( G \), the modified fourth Zagreb connection index \((ZC_4^2 (G))\) is defined as follows:

\[
ZC_4^2 (G) = \sum_{pq \in E(G)} [d_G (p) r_G (p) \times d_G (q) r_G (q)].
\]

These connection-based TIs are defined by Javadi et al. [35] to compute the exact solutions of several wheel-related graphs.

**Definition 5.** Zinc oxide network \((ZNOX (n))\): a chemical compound zinc oxide \((ZnO)\) is insoluble in water which is an inorganic compound of white powder shape with 5.61 g/cm\(^3\) density. The zinc oxide is heated with carbon (coke) that reduces to the metal vapor to condense the liquid from which the solid metal freezes.

\[
ZnO (s) + C (s) \rightarrow Zn (g) + CO (g)
\]

Zinc is a reactive metal to produce zinc ion \((Zn^{2+})\) and hydrogen gas. It also reduces those metal ions whose reduction potentials are higher than \(Zn^{2+}\). Zinc oxide is mostly used in making rubber, enamels, glazes, pigment in white paint, photoconductive surfaces, and protective coating for other metals. Zinc oxide-related MON is \(Zn_4O\)(BPDC)\(_3\), which is also known as IRMOF-10. IRMOF-9 is a catenated version of IRMOF-10. IRMOF-10 is three-dimensional cubic structures with a pore size diameter of 14.7/20.1 Å. In Figure 1, the zinc oxide-related MON of dimension 3 is presented. In general, the vertices and edges in ZNSL \((n)\) of dimension \(n\) are \(82n + 50\) and \(103n + 61\), respectively. For more understanding, see Figure 2.

![Figure 1: Zinc oxide network \((ZNOX (n) \cong H)\) for \(n = 3\).](image)

Now, we present some important results which are used in the main results.

**Lemma 1.** Let \( G \) be a connected network with \( u \) vertices and \( e \) edges. Then, \( r_G (p) + d_G (p) \leq \sum_{q \in V(G)} d_G (q) \), where equality holds if and only if \( G \) is a \([C_3, C_4]\)-free network.

**Lemma 2** (see [35]). Let \( G \) be a connected and \([C_3, C_4]\)-free network with \( u \) vertices and \( e \) edges. Then,

(i) \( \sum_{q \in V(G)} d_G (q) = 2e \)

(ii) \( \sum_{q \in V(G)} r_G (q) = M_1 (G) - 2e \)

**Lemma 3** (see [25]). Let \( G \) be a connected and \([C_3, C_4]\)-free network with \( u \) vertices and \( e \) edges. Also, \( G \cong P_\mu \). Then

(i) \( ZC_2^2 (G) = 8u - 22 \) if \( u \geq 4 \)

(ii) \( ZC_3^2 (G) = 8u - 22 \) if \( u \geq 3 \)
3. Main Results Based on Zinc Oxide Network (ZNOX (n))

In this section, we compute the main results for first Zagreb connection index (ZCI), second ZCI, modified first ZCI, modified second ZCI, and modified fourth ZCI of zinc oxide-related MON (ZNOX (n)). Let \( H \) be ZNOX (n) be the zinc oxide network of dimension \( n \) in the plane, see Figure 1. The partitions of \( H \) with respect to the vertex set and edge set are \( V(H) \) and \( E(H) \). We can easily see each vertex of degrees 2, 3, and 4. We have

\[
V_1 = \{ v \in V(H) \vert d_v = 2 \}, \quad V_2 = \{ v \in V(H) \vert d_v = 3 \}, \quad \text{and} \quad V_3 = \{ v \in V(H) \vert d_v = 4 \}, \quad \text{where} \quad |V_1| = 42n + 30, \quad |V_2| = 26n + 14, \quad \text{and} \quad |V_3| = 2n + 2.
\]

So, \( |V(H)| = |V_1| + |V_2| + |V_3| = 70n + 46 \). Now, the partitions of vertices according to connection number are

\[
V_1 = \{ v \in V(H) \vert r_v = 2 \}, \quad V_2 = \{ v \in V(H) \vert r_v = 3 \}, \quad V_3 = \{ v \in V(H) \vert r_v = 4 \}, \quad V_4 = \{ v \in V(H) \vert r_v = 5 \}, \quad \text{and} \quad V_5 = \{ v \in V(H) \vert r_v = 8 \}, \quad \text{where} \quad |V_1| = 2n + 6, \quad |V_2| = 28n + 20, \quad |V_3| = 30n + 10, \quad |V_4| = 8n + 8, \quad \text{and} \quad |V_5| = 2n + 2.
\]

There are four types of partitions of edge sets of \( H \) according to the degree. We have

\[
|E(H)| = |E_{d=2}^l| + |E_{d=3}^l| + |E_{d=4}^l| + |E_{d=5}^l| + |E_{d=8}^l| = 85n + 55.
\]

And there are seven types of partitions of edge sets of \( H \) according to the connection number of vertices as

\[
|E(H)| = |E_{c=2}^l| + |E_{c=3}^l| + |E_{c=4}^l| + |E_{c=5}^l| + |E_{c=8}^l| + |E_{c=10}^l| + |E_{c=16}^l| = 85n + 55.
\]

These edge partitions are shown in Tables 1 and 2.

There are four types of partitions of edge sets of \( H \) according to the degree as

\[
|E(H)| = |E_{d=2}^l| + |E_{d=3}^l| + |E_{d=4}^l| + |E_{d=5}^l| + |E_{d=8}^l| = 85n + 55.
\]

And there are seven types of partitions of edge sets of \( H \) according to the connection number of vertices as

\[
|E(H)| = |E_{c=2}^l| + |E_{c=3}^l| + |E_{c=4}^l| + |E_{c=5}^l| + |E_{c=8}^l| + |E_{c=10}^l| + |E_{c=16}^l| = 85n + 55.
\]

These edge partitions are shown in Tables 3 and 4.

**Theorem 1.** Let \( H \) be ZNOX (n) be a zinc oxide network of dimensions \( n \geq 3 \). Then, the first Zagreb connection index is

\[
ZC_1(H) = 1068n + 692.
\]

**Proof.** By definition,

\[
ZC_1(G) = \sum_{q \in V(G)} [\tau_G(q)]^2
\]

\[
= (2n + 6)^2 + (28n + 20)^2 + (30n + 10)^2 + (8n + 8)^2 + (2n + 2)^2
\]

\[
= 8n + 24 + 252n + 180 + 480n + 160 + 200n + 200 + 128n + 128
\]

\[
= 1068n + 692.
\]

**Theorem 2.** Let \( H \) be ZNOX (n) be a zinc oxide network of dimensions \( n \geq 3 \). Then, the second Zagreb connection index is

\[
ZC_2(H) = 1376n + 896.
\]
Table 4: Partition of $H$'s edges according to the connection number.

| $E'_{r(p),r(q)}$ | $E'_{3,3}$ | $E'_{3,5}$ | $E'_{3,4}$ | $E'_{3,5}$ | $E'_{4,4}$ | $E'_{4,5}$ | $E'_{5,8}$ |
|------------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| $|E'_{r(p),r(q)}|$ | $4n + 12$   | $4n + 12$   | $24n + 12$  | $4n + 12$   | $21n + 7$   | $12n + 4$   | $8n + 8$    |

**Proof.** By definition,

$$ZC_2(G) = \sum_{pq \in E(G)} [\tau_G(p) \times \tau_G(q)]$$

$$= \sum_{pq \in E_{1,3}} [\tau_H(p) \times \tau_H(q)] + \sum_{pq \in E_{1,5}} [\tau_H(p) \times \tau_H(q)] + \sum_{pq \in E_{1,4}} [\tau_H(p) \times \tau_H(q)]$$

$$+ \sum_{pq \in E_{1,3}} [\tau_H(p) \times \tau_H(q)] + \sum_{pq \in E_{1,5}} [\tau_H(p) \times \tau_H(q)] + \sum_{pq \in E_{1,4}} [\tau_H(p) \times \tau_H(q)]$$

$$= |E_{(2,3)}(H)| (2 \times 3) + |E_{(3,3)}(H)| (3 \times 3) + |E_{(3,5)}(H)| (3 \times 5) + |E_{(4,5)}(H)| (4 \times 5)$$

$$+ |E_{(4,4)}(H)| (4 \times 4) + |E_{(3,4)}(H)| (3 \times 4) + |E_{(4,4)}(H)| (4 \times 4) + |E_{(5,8)}(H)| (5 \times 8)$$

$$= (4n + 12)(2 \times 3) + (12n + 4)(3 \times 3) + (4n + 12)(3 \times 5) + (12n + 4)(4 \times 5)$$

$$+ (12n + 4)(4 \times 4) + (24n + 8)(3 \times 4) + (9n + 3)(4 \times 4) + (8n + 8)(5 \times 8)$$

$$= 24n + 72 + 108n + 36 + 60n + 180 + 240n + 80 + 192n + 64$$

$$+ 288n + 96 + 144n + 48 + 320n + 320$$

$$= 1376n + 896.$$

\(\square\)

**Theorem 3.** Let $H \cong \text{ZNOX}(n)$ be a zinc oxide network of dimensions $n \geq 3$. Then, the modified first Zagreb connection index is

$$ZC'_1(H) = 672n + 432.$$

**Proof.** By definition,

$$ZC'_1(G) = \sum_{pq \in E(G)} [\tau_G(p) + \tau_G(q)]$$

$$= \sum_{pq \in E_{1,3}} [\tau_H(p) + \tau_H(q)] + \sum_{pq \in E_{1,5}} [\tau_H(p) \times \tau_H(q)] + \sum_{pq \in E_{1,4}} [\tau_H(p) \times \tau_H(q)]$$

$$+ \sum_{pq \in E_{1,3}} [\tau_H(p) \times \tau_H(q)] + \sum_{pq \in E_{1,5}} [\tau_H(p) \times \tau_H(q)] + \sum_{pq \in E_{1,4}} [\tau_H(p) \times \tau_H(q)]$$

$$= |E_{(2,3)}(H)| (2 + 3) + |E_{(3,3)}(H)| (3 + 3) + |E_{(3,5)}(H)| (3 + 5) + |E_{(4,5)}(H)| (4 + 5)$$

$$+ |E_{(4,4)}(H)| (4 + 4) + |E_{(3,4)}(H)| (3 + 4) + |E_{(4,4)}(H)| (4 + 4) + |E_{(5,8)}(H)| (5 + 8)$$

$$= (4n + 12)(5 + 12n + 4)(6) + (4n + 12)(8) + (12n + 4)(9) + (12n + 4)(8)$$

$$+ (24n + 8)(7)(8) + (8n + 8)(13)$$

$$= 20n + 60 + 72n + 24 + 32n + 96 + 108n + 36 + 96n + 32 + 168n + 56$$

$$+ 72n + 24 + 104n + 104$$

$$= 672n + 432.$$
Theorem 4. Let $H \equiv \text{ZNOX}(n)$ be a zinc oxide network of dimensions $n \geq 3$. Then, the modified second Zagreb connection index is

$$\text{ZC}^*_2 (H) = 1740n + 1124. \quad (9)$$

Proof. By definition,

$$\text{ZC}^*_2 (G) = \sum_{pq \in E(G)} [d_G(p)\tau_G(q) + d_G(q)\tau_G(p)]$$

$$= \sum_{pq \in E_{Z,3}} [d_H(p)\tau_H(q) + d_H(q)\tau_H(p)] + \sum_{pq \in E_{Z,4}} [d_H(p)\tau_H(q) + d_H(q)\tau_H(p)]$$

$$+ \sum_{pq \in E_{Z,5}} [d_H(p)\tau_H(q) + d_H(q)\tau_H(p)] + \sum_{pq \in E_{Z,6}} [d_H(p)\tau_H(q) + d_H(q)\tau_H(p)]$$

$$+ \sum_{pq \in E_{Z,7}} [d_H(p)\tau_H(q) + d_H(q)\tau_H(p)] + \sum_{pq \in E_{Z,8}} [d_H(p)\tau_H(q) + d_H(q)\tau_H(p)]$$

$$= |E_{Z,3}^c (2 \times 3 + 2 \times 3) + E_{Z,4}^c (2 \times 3 + 2 \times 3) + E_{Z,5}^c (2 \times 5 + 3 \times 3) + E_{Z,6}^c (2 \times 5 + 3 \times 4)$$

$$+ E_{Z,7}^c (2 \times 4 + 3 \times 4) + E_{Z,8}^c (2 \times 4 + 3 \times 4) + E_{Z,9}^c (3 \times 4 + 3 \times 4) + E_{Z,10}^c (3 \times 5 + 4 \times 5)$$

$$= (4n + 12)(10) + (12n + 4)(12) + (4n + 12)(19) + (12n + 4)(22) + (12n + 4)(20) + (24n + 8)(17) + (9n + 3)(24) + (8n + 8)(44)$$

$$= 1740n + 1124. \quad \square$$

Theorem 5. Let $H \equiv \text{ZNOX}(n)$ be a zinc oxide network of dimensions $n \geq 3$. Then, the modified third Zagreb connection index is

$$\text{ZC}^*_3 (H) = 1808n + 1184. \quad (11)$$

Proof. By definition,

$$\text{ZC}^*_3 (G) = \sum_{pq \in E(G)} [d_G(p)\tau_G(p) + d_G(q)\tau_G(q)]$$

$$= \sum_{pq \in E_{Z,3}} [d_H(p)\tau_H(p) + d_H(q)\tau_H(q)] + \sum_{pq \in E_{Z,4}} [d_H(p)\tau_H(q) + d_H(q)\tau_H(p)]$$

$$+ \sum_{pq \in E_{Z,5}} [d_H(p)\tau_H(p) + d_H(q)\tau_H(q)] + \sum_{pq \in E_{Z,6}} [d_H(p)\tau_H(q) + d_H(q)\tau_H(p)]$$

$$+ \sum_{pq \in E_{Z,7}} [d_H(p)\tau_H(p) + d_H(q)\tau_H(q)] + \sum_{pq \in E_{Z,8}} [d_H(p)\tau_H(p) + d_H(q)\tau_H(q)]$$

$$= |E_{Z,3}^c (2 \times 2 + 2 \times 3) + E_{Z,4}^c (2 \times 3 + 2 \times 3) + E_{Z,5}^c (2 \times 3 + 3 \times 3) + E_{Z,6}^c (2 \times 4 + 3 \times 3) + E_{Z,7}^c (2 \times 3 + 3 \times 4)$$

$$+ E_{Z,8}^c (2 \times 4 + 3 \times 4) + E_{Z,9}^c (2 \times 3 + 3 \times 4) + E_{Z,10}^c (3 \times 4 + 3 \times 4) + E_{Z,11}^c (3 \times 5 + 4 \times 8)$$

$$= (4n + 12)(10) + (12n + 4)(12) + (4n + 12)(21) + (12n + 4)(23) + (12n + 4)(20) + (24n + 8)(18) + (9n + 3)(24) + (8n + 8)(47)$$

$$= 1808n + 1184. \quad \square$$
Theorem 6. Let $H \cong ZNOX(n)$ be a zinc oxide network of dimensions $n \geq 3$. Then, the modified fourth Zagreb connection index is
\[
ZC_4^* (H) = 10344n + 7224.
\] (13)

Proof. By definition,
\[
ZC_4^* (G) = \sum_{pq \in E(G)} \left[ d_G(p)r_G(q) \times d_G(q)r_G(p) \right]
= \sum_{pq \in E_{1,3}} \left[ d_H(p)r_H(q) \times d_H(q)r_H(p) \right] + \sum_{pq \in E_{1,4}} \left[ d_H(p)r_H(q) \times d_H(q)r_H(p) \right] + \sum_{pq \in E_{1,5}} \left[ d_H(p)r_H(q) \times d_H(q)r_H(p) \right] + \sum_{pq \in E_{1,6}} \left[ d_H(p)r_H(q) \times d_H(q)r_H(p) \right] + \sum_{pq \in E_{1,7}} \left[ d_H(p)r_H(q) \times d_H(q)r_H(p) \right] + \sum_{pq \in E_{1,8}} \left[ d_H(p)r_H(q) \times d_H(q)r_H(p) \right]
= |E_{2,3}^c| (2 \times 3 \times 2 \times 3) + |E_{3,4}^c| (2 \times 3 \times 3 \times 3) + |E_{3,5}^c| (2 \times 5 \times 3 \times 4) + |E_{4,4}^c| (2 \times 4 \times 3 \times 4) + |E_{3,5}^c| (2 \times 4 \times 3 \times 3) + |E_{4,6}^c| (3 \times 4 \times 3 \times 4) + |E_{5,8}^c| (3 \times 8 \times 4 \times 5)
= (4n + 12)(24) + (12n + 4)(36) + (4n + 12)(90) + (12n + 4)(120) + (12n + 4)(96)
= 1728n + 432n + 144 + 1296n + 1080 + 1440n + 480 + 1152n + 384
= 10344n + 7224.
\]

4. Main Results Based on Zinc Silicate Network (ZNSL (n))

In this section, we compute the main results for first Zagreb connection index (ZCI), second ZCI, modified first ZCI, modified second ZCI, modified third ZCI, and modified fourth ZCI of zinc silicate-related MON (ZNSL (n)). Let $K \cong ZNSL(n)$ be the zinc silicate network of dimension $n$ in the plane, see Figure 2. The partitions of $K$ with respect to the vertex set and edge set are $V(K)$ and $E(K)$. We can easily see each vertex of degrees 2, 3, and 4. We have $V_1 = \{ v \in V(K)|d_v = 2 \}$, $V_2 = \{ v \in V(K)|d_v = 3 \}$, and $V_3 = \{ v \in V(K)|d_v = 4 \}$, where $|V_1| = 42n + 30$, $|V_2| = 38n + 18$, and $|V_3| = 2n + 2$. So, $|V(K)| = |V_1| + |V_2| + |V_3| = 82n + 50$. Now, the partitions of vertices according to connection number are $V_4 = \{ v \in V(K)|r_v = 2 \}$, $V_5 = \{ v \in V(K)|r_v = 3 \}$, $V_6 = \{ v \in V(K)|r_v = 4 \}$, $V_7 = \{ v \in V(K)|r_v = 5 \}$, $V_8 = \{ v \in V(K)|r_v = 6 \}$, and $V_9 = \{ v \in V(K)|r_v = 8 \}$, where $|V_4| = 2n + 6$, $|V_5| = 16n + 16$, $|V_6| = 48n + 16$, $|V_7| = 8n + 8$, $|V_8| = 6n + 2$, and $|V_9| = 2n + 2$. So, $|V(K)| = |V_1| + |V_2| + |V_3| + |V_4| + |V_5| + |V_6| + |V_7| + |V_8| + |V_9| = 103n + 61$. These vertex partitions are shown in Tables 5 and 6.

There are four types of partitions of edge sets of $K$ according to the degree as $|E(K)| = |E_{2,3}^c| + |E_{3,4}^c| + |E_{3,5}^c| + |E_{4,6}^c| + |E_{5,8}^c| + |E_{6,9}^c| = 103n + 61$. and there are seven types of partitions of edge sets of $K$ according to the connection number of vertices as $|E(K)| = |E_{2,3}^c| + |E_{3,4}^c| + |E_{3,5}^c| + |E_{4,6}^c| + |E_{5,8}^c| + |E_{6,9}^c| = 103n + 61$. These edge partitions are shown in Tables 7 and 8.

Theorem 7. Let $K \cong ZNSL(n)$ be a zinc silicate network of dimensions $n \geq 3$. Then, the first Zagreb connection index is
\[
ZC_1(K) = 1464n + 824.
\] (15)

Proof. By definition,
\[
ZC_1(G) = \sum_{q \in V(G)} r_G(q)^2
= (2n + 6)(2)^2 + (16n + 16)(3)^2 + (48n + 16)(4)^2 + (8n + 8)(5)^2 + (6n + 2)(6)^2 + (2n + 2)(8)^2
= 8n + 24 + 144n + 144 + 768n + 256 + 200n + 200 + 216n + 72 + 128n + 128
= 1464n + 824.
\]
Theorem 8. Let $K \equiv ZNSL(n)$ be a zinc silicate network of dimensions $n \geq 3$. Then, the second Zagreb connection index is

$$ZC_2(K) = 1910n + 1074.$$  (17)

Proof. By definition,

$$ZC_2(G) = \sum_{p \in V(G)} \tau_G(p) \times \tau_G(q)$$

$$= \sum_{p \in E_2} \tau_K(p) \times \tau_K(q) + \sum_{p \in E_3} \tau_K(p) \times \tau_K(q) + \sum_{p \in E_4} \tau_K(p) \times \tau_K(q)$$

$$+ \sum_{p \in E_5} \tau_K(p) \times \tau_K(q) + \sum_{p \in E_6} \tau_K(p) \times \tau_K(q) + \sum_{p \in E_7} \tau_K(p) \times \tau_K(q)$$

$$+ \sum_{p \in E_8} \tau_K(p) \times \tau_K(q)$$

$$= |E_{(2,3)}(K)| (2 \times 3) + |E_{(3,3)}(K)| (3 \times 3) + |E_{(3,5)}(K)| (3 \times 5) + |E_{(4,5)}(K)| (4 \times 5)$$

$$+ |E_{(4,4)}(K)| (4 \times 4) + |E_{(3,4)}(K)| (3 \times 4) + |E_{(4,3)}(K)| (4 \times 4) + |E_{(4,6)}(K)| (4 \times 6)$$

$$+ |E_{(6,6)}(K)| (6 \times 6) + |E_{(5,8)}(K)| (5 \times 8)$$

$$= (4n + 12)(2 \times 3) + (6n + 2)(3 \times 3) + (4n + 12)(3 \times 5) + (12n + 4)(4 \times 5)$$

$$+ (36n + 12)(4 \times 4) + (12n + 4)(3 \times 4) + (6n + 2)(4 \times 4) + (12n + 4)(4 \times 6)$$

$$+ (3n + 1)(6 \times 6) + (8n + 8)(5 \times 8)$$

$$= 24n + 72 + 54n + 18 + 60n + 180 + 240n + 80 + 576n + 192$$

$$+ 144n + 48 + 96n + 32 + 288n + 96 + 108n + 36 + 320n + 320$$

$$= 1910n + 1074.$$  (18)
Theorem 9. Let \( K \equiv ZNSL(n) \) be a zinc silicate network of dimensions \( n \geq 3 \). Then, the modified first Zagreb connection index is

\[
ZC_1^*(K) = 876n + 500.
\]  

(19)

Proof. By definition,

\[
ZC_1^*(G) = \sum_{pq \in E(G)} [\tau_G(p) + \tau_G(q)]
\]

\[
= \sum_{pq \in E_{1,3}} [\tau_K(p) + \tau_K(q)] + \sum_{pq \in E_{3,5}} [\tau_K(p) + \tau_K(q)] + \sum_{pq \in E_{5,3}} [\tau_K(p) + \tau_K(q)]
\]

\[
+ \sum_{pq \in E_{4,5}} [\tau_K(p) + \tau_K(q)] + \sum_{pq \in E_{6,4}} [\tau_K(p) + \tau_K(q)] + \sum_{pq \in E_{4,6}} [\tau_K(p) + \tau_K(q)]
\]

\[
+ \sum_{pq \in E_{2,3}} [\tau_K(p) + \tau_K(q)]
\]

\[
= |E_{(2,3)}(K)| \binom{2}{3} + |E_{(3,3)}(K)| \binom{3}{3} + |E_{(3,5)}(K)| \binom{3}{5} + |E_{(4,5)}(K)| \binom{4}{5} + |E_{(4,4)}(K)| \binom{4}{4} + |E_{(5,6)}(K)| \binom{5}{6} + |E_{(5,8)}(K)| \binom{5}{8}
\]

\[
= (4n + 12)(2 + 3) + (6n + 2)(3 + 3) + (4n + 12)(3 + 5) + (12n + 4)(4 + 5) + (36n + 12)(4 + 4) + (12n + 4)(3 + 4) + (6n + 2)(4 + 4) + (12n + 4)(4 + 6) + (3n + 1)(6 + 6) + (8n + 8)(5 + 8)
\]

\[
= 20n + 60 + 36n + 12 + 32n + 96 + 108n + 36 + 288n + 96 + 84n + 28 + 48n + 16 + 120n + 40 + 36n + 12 + 104n + 104
\]

\[
= 876n + 500.
\]

Theorem 10. Let \( K \equiv ZNSL(n) \) be a zinc silicate network of dimensions \( n \geq 3 \). Then, the modified second Zagreb connection index is

\[
ZC_2^*(K) = 2340n + 1324.
\]  

(20)

Proof. By definition,
\[ ZC_2^*(G) = \sum_{p \neq E(G)} [d_G(p)r_G(q) + d_G(q)r_G(p)] \]
\[ = \sum_{p \neq E_3} [d_K(p)r_K(q) + d_K(q)r_K(p)] + \sum_{p \neq E_3} [d_K(p)r_K(q) + d_K(q)r_K(p)] \]
\[ + \sum_{p \neq E_3} [d_K(p)r_K(q) + d_K(q)r_K(p)] + \sum_{p \neq E_3} [d_K(p)r_K(q) + d_K(q)r_K(p)] \]
\[ + \sum_{p \neq E_3} [d_K(p)r_K(q) + d_K(q)r_K(p)] + \sum_{p \neq E_3} [d_K(p)r_K(q) + d_K(q)r_K(p)] \]
\[ + \sum_{p \neq E_4} [d_K(p)r_K(q) + d_K(q)r_K(p)] + \sum_{p \neq E_4} [d_K(p)r_K(q) + d_K(q)r_K(p)] \]
\[ + \sum_{p \neq E_4} [d_K(p)r_K(q) + d_K(q)r_K(p)] + \sum_{p \neq E_4} [d_K(p)r_K(q) + d_K(q)r_K(p)] \]
\[ + \sum_{p \neq E_4} [d_K(p)r_K(q) + d_K(q)r_K(p)] + \sum_{p \neq E_4} [d_K(p)r_K(q) + d_K(q)r_K(p)] \]
\[ = |E_{3,2}^*| (2 \times 3 + 2 \times 2) + |E_{3,3}^*| (2 \times 3 + 2 \times 3) + |E_{3,4}^*| (2 \times 3 + 3 \times 3) + |E_{4,2}^*| (2 \times 3 + 3 \times 4) + |E_{4,3}^*| (2 \times 4 + 3 \times 4) \]
\[ + |E_{4,4}^*| (2 \times 4 + 3 \times 4) + |E_{5,5}^*| (3 \times 4 + 3 \times 4) + |E_{5,6}^*| (3 \times 4 + 3 \times 6) + |E_{6,4}^*| (3 \times 5 + 4 \times 4) \]
\[ = (4n + 12) (10) + (6n + 2) (12) + (4n + 12) (21) + (12n + 4) (23) + (36n + 12) (20) + (12n + 4) (18) \]
\[ + (6n + 2) (24) + (12n + 4) (30) + (3n + 1) (36) + (8n + 8) (47) \]
\[ = 40n + 120 + 72n + 24 + 84n + 252 + 276n + 92 + 720n + 240 + 216n + 72 + 144n + 48 + 360n \]
\[ + 120 + 108n + 36 + 376n + 376 \]
\[ = 2340n + 1324. \quad (22) \]

**Theorem 11.** Let \( K \equiv ZNSL(n) \) be a zinc silicate network of dimensions \( n \geq 3 \). Then, the modified third Zagreb connection index is

\[ ZC_3^*(K) = 2396n + 1380. \quad (23) \]

**Proof.** By definition,

\[ ZC_3^*(G) = \sum_{p \neq E(G)} [d_G(p)r_G(q) + d_G(q)r_G(p)] \]
\[ = \sum_{p \neq E_3} [d_K(p)r_K(q) + d_K(q)r_K(p)] + \sum_{p \neq E_3} [d_K(p)r_K(q) + d_K(q)r_K(p)] \]
\[ + \sum_{p \neq E_3} [d_K(p)r_K(q) + d_K(q)r_K(p)] + \sum_{p \neq E_3} [d_K(p)r_K(q) + d_K(q)r_K(p)] \]
\[ + \sum_{p \neq E_4} [d_K(p)r_K(q) + d_K(q)r_K(p)] + \sum_{p \neq E_4} [d_K(p)r_K(q) + d_K(q)r_K(p)] \]
\[ + \sum_{p \neq E_4} [d_K(p)r_K(q) + d_K(q)r_K(p)] + \sum_{p \neq E_4} [d_K(p)r_K(q) + d_K(q)r_K(p)] \]
\[ + \sum_{p \neq E_4} [d_K(p)r_K(q) + d_K(q)r_K(p)] + \sum_{p \neq E_4} [d_K(p)r_K(q) + d_K(q)r_K(p)] \]
\[ = |E_{3,2}^*| (2 \times 2 + 2 \times 3) + |E_{3,3}^*| (2 \times 3 + 2 \times 3) + |E_{3,4}^*| (2 \times 3 + 3 \times 3) + |E_{4,2}^*| (2 \times 4 + 3 \times 5) + |E_{4,3}^*| (2 \times 4 + 3 \times 4) \]
\[ + |E_{4,4}^*| (2 \times 4 + 3 \times 4) + |E_{5,5}^*| (3 \times 4 + 3 \times 4) + |E_{5,6}^*| (3 \times 4 + 3 \times 6) + |E_{6,4}^*| (3 \times 5 + 4 \times 4) \]
\[ = (4n + 12) (10) + (6n + 2) (12) + (4n + 12) (21) + (12n + 4) (23) + (36n + 12) (20) + (12n + 4) (18) \]
\[ + (6n + 2) (24) + (12n + 4) (30) + (3n + 1) (36) + (8n + 8) (47) \]
\[ = 40n + 120 + 72n + 24 + 84n + 252 + 276n + 92 + 720n + 240 + 216n + 72 + 144n + 48 + 360n \]
\[ + 120 + 108n + 36 + 376n + 376 \]
\[ = 2340n + 1324. \quad (24) \]
Theorem 12. Let $K \equiv ZNSL(n)$ be a zinc silicate network of dimensions $n \geq 3$. Then, the modified fourth Zagreb connection index is

$$ZC^*_4(K) = 14700n + 8676. \tag{25}$$

Proof. By definition,

$$ZC^*_4(G) = \sum_{pq \in E(G)} [d_G(p)\tau_G(q) \times d_G(q)\tau_G(p)]$$

$$= \sum_{pq \in E_{1,3}} [d_K(p)\tau_K(q) \times d_K(q)\tau_K(p)] + \sum_{pq \in E_{1,3}} [d_K(p)\tau_K(q) \times d_K(q)\tau_K(p)]$$

$$+ \sum_{pq \in E_{1,4}} [d_K(p)\tau_K(q) \times d_K(q)\tau_K(p)] + \sum_{pq \in E_{1,4}} [d_K(p)\tau_K(q) \times d_K(q)\tau_K(p)]$$

$$+ \sum_{pq \in E_{1,4}} [d_K(p)\tau_K(q) \times d_K(q)\tau_K(p)] + \sum_{pq \in E_{1,4}} [d_K(p)\tau_K(q) \times d_K(q)\tau_K(p)]$$

$$= |E_{2,3}^c| (2 \times 3 \times 2 \times 2) + |E_{3,3}^c| (2 \times 3 \times 2 \times 3) + |E_{3,5}^c| (2 \times 5 \times 3 \times 3) + |E_{4,5}^c| (2 \times 5 \times 3 \times 5) + |E_{4,4}^c| (2 \times 4 \times 3 \times 4)$$

$$+ |E_{4,5}^c| (2 \times 4 \times 3 \times 3) + |E_{5,4}^c| (3 \times 4 \times 3 \times 4) + |E_{4,6}^c| (3 \times 6 \times 3 \times 4) + |E_{6,6}^c| (3 \times 6 \times 3 \times 6) + |E_{5,5}^c| (3 \times 8 \times 4 \times 5)$$

$$= (4n + 12)(24) + (6n + 2)(36) + (4n + 12)(90) + (12n + 4)(120) + (36n + 12)(96) + (12n + 4)(72)$$

$$+ (6n + 2)(144) + (12n + 4)(216) + (3n + 1)(324) + (8n + 8)(480)$$

$$= 96n + 288 + 216n + 72 + 360n + 1080 + 1440n + 480 + 3456n + 1152$$

$$+ 864n + 288 + 864n + 288 + 2592n + 864 + 972n + 324 + 3840n + 3840$$

$$= 14700n + 8676. \tag{26}$$

5. Comparisons and Conclusions

In this section, we compare zinc oxide (H) and zinc silicate (K) related MONs via some Zagreb connection indices (ZCIs) such as first ZCI, second ZCI, modified first ZCI, modified second ZCI, modified third ZCI, and modified fourth ZCI with the help of Tables 9–14 that have been constructed by using numerical values of the aforementioned ZCIs. The graphical presentations for ZCIs of MONs are presented in Figures 3–10.

The comparative study of zinc-related MONs is highlighted by the following conclusions:

(i) From Tables 9–14 and Figures 3–8, we see that the behaviors for all the ZCIs of zinc silicate MONs have more values and upper lines than zinc oxide MONs with the following order:

$$ZC_1(K) \geq ZC_1(H), ZC_2(K) \geq ZC_2(H), ZC'_1(K) \geq ZC'_1(H), ZC'_2(K) \geq ZC'_2(H), ZC_3(K) \geq ZC_3(H),$$

and

$$ZC'_3(K) \geq ZC'_3(H).$$

(ii) From Tables 15 and 16 and Figures 9 and 10, we see that modified fourth ZCI (ZC'_4) attains more values and upper lines than other ZCIs for both zinc-related MONs.

(iii) The modified first Zagreb connection index ($ZC'_1$) attained better values of correlation coefficient for the thirteen physicochemical properties of octane isomers than other classical Zagreb indices. In this paper, novel connection-based Zagreb index $ZC'_4$ attains better values of correlation coefficient for increasing order in both the cases of zinc-related MONs.

(iv) Table 17 shows that zinc silicate-related MON of dimension $n$ for the aforesaid ZCIs has attained upward position than zinc oxide-related MON.

(v) Moreover, these general relations (Tables 15–17) indicate that the chemical capability of zinc silicate-related MON is better than zinc oxide-related MON for all values of $n$.

Now, the problem is still open for prism, product, subdivision, and their compliment networks with the help of connection-based Zagreb indices.
