**General Chemistry Procedures.** All chemical reagents were used as provided unless explicitly indicated otherwise. Tetrahydrofuran (THF) and dichloromethane (CH₂Cl₂) were purified via passage through alumina columns. All reactions were performed under anhydrous argon atmosphere using oven-dried (150 °C) glassware. Reaction mixtures were stirred magnetically using oven-dried magnetic stir bars. Compound purification via flash chromatography utilized silica gel (300–400 mesh) in the indicated solvent system. TLC was performed using 250 µm, F₂₅₄ silica gel plates and visualized UV and para-anisaldehyde stain. A Rudolph Autopol III polarimeter at the indicated temperature using the sodium D line (λ = 589 nm) unless otherwise specified and reported as follows: [α]                                          = rotation (c g/100 mL, solvent). ¹H and ¹³C NMR spectra were recorded on a Bruker 400 spectrometer at 400 Hz for ¹H NMR and at 100 Hz for ¹³C NMR. Chemical shifts are reported in ppm based on an internal standard of residual CHCl₃ (7.26 ppm in ¹H NMR and 77.16 in ¹³C NMR). Proton chemical data are reported in the following format: chemical shift (ppm) (multiplicity (s = singlet, d= doublet, t = triplet, q = quartet, quin = quintet, sextet = sextet, sept = septet, m = multiplet, br = broad peak), J = coupling constant (Hz), integration). High-resolution mass spectra (HRMS) were obtained on a Bruker BioTOF II ESI-TOF/MS using either PEG or PPG standards as high resolution calibrants.

(S)-3-((4S,5R,E)-5-hydroxy-2,4-dimethylhept-2-enoyl)-4-isopropylloxazolidin-2-one (12). An oven-dried round bottom flask (250 mL) equipped with magnetic stir bar charged with freshly distilled propionaldehyde¹ (4.93 mL, 68.3 mmol, 2 equiv.) in anhydrous dichloromethane (120 mL) was placed in dry ice-acetone bath (-78 °C) and allowed to equilibrate. To the cooled solution was added titanium(IV) chloride (3.77 mL, 34.2 mmol, 1 equiv.). To the resulting yellow reaction mixture was slowly added the vinylketene silyl N,O-acetal 11² (11.60 g, 34.2 mmol, 1 equiv.) as a solution in CH₂Cl₂ (45 mL, anhydrous). The reaction quickly adopted a dark red hue. Following completion of addition the reaction mixture was transferred to dry ice-acetonitrile bath (-40 °C) and stirred for 21 hours. The reaction mixture was quenched upon treatment with saturated Rochelle’s salt (aq.) followed by saturated sodium bicarbonate (aq.) solutions at -40 °C. The cloudy, white solution was allowed to warm to room temperature and stirred for 1 hour. The resulting biphasic solution was separated and the aqueous layer was extracted with dichloromethane (3 x 75 mL) and ethyl acetate (3 x 75 mL). The combined organic solutions were dried over anhydrous Na₂SO₄, filtered, and concentrated under vacuum. The resulting crude oil was dry-loaded onto silica column and purified via flash chromatography (30% EtOAc/hexanes) yielding the title compound (12) (8.76 g, 30.9 mmol, 90%) as a viscous, slightly yellow oil. Rf = 0.20 (20% EtOAc/hexanes); [α]²³ = 28.3 (c 1.00, CHCl₃); ¹H NMR (CDCl₃, 400 MHz) δ 5.82 (d, J = 10.4 Hz, 1H), 4.58 (dt, J = 8.8, 4.8 Hz, 1H), 4.34 (t, J = 8.8 Hz, 1H), 4.18 (dd, J = 7.2, 7.6 Hz, 1H), 3.32–3.25 (m, 1H), 3.08 (br, 1H), 2.63–2.52 (m, 1H), 2.38–2.28 (m, 1H), 1.94 (s, 3H), 1.76–1.64 (m, 1H), 1.44 (app sept, J = 7.6 Hz, 1H), 1.01 (t, J = 7.2 Hz, 3H), 0.98 (d, J = 7.2 Hz, 3H), 0.95–0.89 (m, 6H); ¹³C NMR (CDCl₃, 100 MHz) δ 171.7, 154.7, 142.5, 131.2, 76.7, 63.6, 58.3, 39.9, 28.6, 26.8,

(S)-3-((4S,5R,E)-2,4-dimethyl-5-((triisopropylsilyl)oxy)hept-2-enol)-4-isopropoxazolidin-2-one (13). A solution containing the aldol adduct 12 (889 mg, 3.14 mmol, 1 equiv.) in dichloromethane (24 mL, anhydrous) was cooled via ice-water bath. To the chilled, colorless solution was added diisopropylethylamine (0.655 mL, 3.76 mmol, 1.2 equiv.) followed by triisopropylsilyl trifluoromethylsulfonate (1.01 mL, 3.76 mmol, 1.2 equiv.). The resulting solution was stirred at 0° C (1 h) and allowed to warm to room temperature (20 min). The yellow, clear reaction solution was quenched upon addition of saturated sodium bicarbonate (aq.) at 0° C and allowed to warm to room temperature (20 min). The biphasic mixture was separated and the aqueous layer was extracted with dichloromethane (4 × 20 mL). The combined organic layers were dried over Na₂SO₄, filtered, and concentrated under vacuum. The product residue was purified by flash chromatography (10% EtOAc/hexanes) affording the silyl ether 13 (1.3805 g, 3.14 mmol, quant.) as a transparent, colorless oil. R₇ = 0.68 (20% EtOAc/hexanes); [α]₂⁰ D = 29.5 (c 1.00, CHCl₃);

¹H NMR (CDCl₃, 400 MHz) δ 6.19 (dd, J = 9.6, 1.2 Hz, 1H), 4.50 (ddd, J = 9.2, 5.6, 4.4, 1H), 4.29 (t, J = 8.8), 4.14 (dd, J = 6.0, 9.2 Hz, 1H), 3.73 (ddd, J = 5.2, 2.4, 7.6, 1H), 2.72 (ddq, 9.6, 6.8, 2.4 Hz, 1H), 2.42-2.30 (m, 1H), 1.92 (d, J = 1.2 Hz, 3H), 1.63-1.48 (m, 2H), 1.10-1.04 (m, 24H), 0.90 (t, J = 7.2 Hz, 6H), 0.86 (t, J = 7.6 Hz, 3H); ¹³C NMR (CDCl₃, 100 MHz) δ 172.4, 153.8, 141.1, 130.6, 77.8, 63.4, 58.4, 37.0, 28.3, 18.5, 18.4, 18.0, 16.7, 15.1, 13.7, 13.2, 10.5; HRMS (ESI-TOF) m/z: [M + Na]⁺ Calcd for C₂₄H₄₅NO₄Na 462.3010; Found 462.3019.

(4S,5R,E)-2,4-dimethyl-5-((triisopropylsilyl)oxy)hept-2-enal (14). A solution of imide 13 (3.185 g, 7.24 mmol, 1 equiv.) in anhydrous dichloromethane (229 mL) was equilibrated in dry-ice-acetone bath (-78 °C) under argon atmosphere. To the stirred solution was added diisobutylaluminum hydride (1.49 M in toluene, 9.73 mL, 14.5 mmol, 2 equiv.) in a dropwise fashion over two minutes. The reaction mixture was allowed to stir at -78 °C for 14 minutes then quenched upon successive addition of methanol (15 mL) and saturated, aqueous sodium potassium tartrate (15 mL). The resulting mixture was allowed to warm to room temperature and stirred vigorously overnight (14 h). The biphasic solution was separated and the aqueous layer was extracted with dichloromethane (3 × 100 mL). Combined organic extracts were dried over sodium sulfate, filtered and concentrated under vacuum. The resulting toluene solution was directly loaded onto flash silica column and purified (10% EtOAc/hexanes) furnishing enal 14 (1.983 g, 6.34 mmol, 88%) as a clear, colorless oil. R₇ = 0.52 (10% EtOAc/hexanes); [α]₂⁰ D = -4.3 (c 1.00, CHCl₃); ¹H NMR (CDCl₃, 400 MHz) δ 9.40 (s, 1H), 6.59 (d, J = 10.0 Hz, 1H), 3.78 (app. quin, J = 4 Hz, 1H), 2.89 (ddq, J = 10.0, 6.8, 3.2 Hz, 1H), 1.76 (s, 3H), 1.65-1.54 (m, 1H), 1.41 (app. sept, J = 7.6, 1H), 1.12 (d, J = 7.2 Hz, 3H), 1.08 (s, 21H), 0.86 (t, J = 7.6 Hz, 3H); ¹³C NMR (CDCl₃, 100 MHz) δ
(3S,6S,7R,E)-3-hydroxy-1-((R)-4-isopropyl-2-thioxothiazolidin-3-yl)-4,6-dimethyl-7-((triisopropylsilyl)oxy)non-4-en-1-one (16). A dichloromethane (anhydrous, 19.56 mL) solution of acetyl thiazolidinone 15 (1.07 g, 5.26 mmol, 1.7 equiv.) was cooled to -40 °C (dry ice-acetonitrile bath) under inert, argon atmosphere. To the chilled, yellow solution was added titanium (IV) chloride (0.611 mL, 5.57 mmol, 1.8 equiv.) resulting in a sudden color change to bright orange. The reaction mixture was stirred for 30 minutes. Slow addition of freshly distilled diisopropylethylamine (0.970 mL, 5.57 mmol, 1.8 equiv.) over three minutes caused a dramatic color change to blood red. The enolate solution was stirred for 2 h 12 m while maintaining an external temperature of -40 °C. The reaction was cooled to -78 °C and aldehyde 14 (0.967 g, 3.09 mmol, 1 equiv.) was slowly added over the course of one minute as a solution in dichloromethane (anhydrous, 3.87 mL) and stirred for 5 h. The resulting red-orange mixture was quenched via addition of saturated aqueous ammonium chloride (10 mL) at -78 °C. The biphasic solution was allowed to warm to room temperature and the layers were separated. The aqueous layer was extracted with dichloromethane (3 x 15 mL) and the combined organic layers were dried over sodium sulfate, filtered and concentrated under vacuum. The crude residue was purified by flash chromatography (30% EtOAc/hexanes) providing a slightly yellow, clear, viscous oil (155 mg, 0.372 mmol, 96%).

To a bright yellow dichloromethane (anhydrous, 2 mL) solution of acyl thiazolidinone 16 (203 mg, 0.39 mmol, 1 equiv.) was added imidazole (133 mg, 1.95 mmol, 5 equiv.) followed by methylmethoxyamine hydrochloride (95.0 mg, 0.98 mmol, 2.50 equiv). A catalytic amount of 4-dimethylaminopyridine (one crystal) was added to the final mixture. The reaction was stirred 20 h at room temperature and quenched via addition of saturated aqueous ammonium chloride (2 mL). The biphasic mixture was separated and the aqueous layer was extracted with dichloromethane (4 x 10 mL). The combined organic layers were dried over sodium sulfate, filtered and concentrated under vacuum. The crude residue was purified by flash chromatography (30% EtOAc/hexanes) providing a slightly yellow, clear, viscous oil (155 mg, 0.372 mmol, 96%).

(3S,6S,7R,E)-N-methoxy-N,4,6-trimethyl-3-((triethylsilyl)oxy)-7-((triisopropylsilyl)oxy)non-4-enamide (18). To a reaction flask containing β-hydroxy amide 17 (345 mg, 0.829 mmol, 1.0 equiv.) dissolved in anhydrous dichloromethane (15 mL) in ice-water bath (0 °C) was added 2,6-lutidine (0.387 mL, 3.32 mmol, 4.0 equiv.). The resulting basic solution was supplemented with triethylsilyl trifluoromethanesulfonate (0.375 mL, 1.66 mmol, 2.0 equiv.) and stirred for 1.5 h. The reaction was terminated via the sequential addition of methanol (3 mL) followed by saturated aqueous sodium bicarbonate (5 mL) at 0 °C. The biphasic mixture was warmed to room temperature, separated, and the aqueous fractions were extracted with dichloromethane (4 x 10 mL). The combined organic fractions were dried over anhydrous sodium sulfate, filtered and concentrated under vacuum. The resulting crude oil was wet-loaded onto silica column and purified via flash chromatography (10% EtOAc/hexanes) affording a clear, slightly yellow oil (410.6 mg, 0.776 mmol, 94%). (5S,8S,9R,E)-6,8-dimethyl-5-((triethylsilyl)oxy)-9-((triisopropylsilyl)oxy)undeca-1,6-dien-3-one (19). A reaction vessel containing weinreb amide 18 (237 mg, 0.448 mmol, 1 equiv.) in anhydrous tetrahydrofuran (32 mL) was placed in ice-water bath (0 °C) and allowed to equilibrate. To the chilled, clear solution was added solution of vinylimagnesium bromide (1.0 M in THF, 1.44 mL, 1.44 mmol, 3.20 equiv.). The reaction mixture was stirred at 0 °C for 4 h. An additional aliquot of vinylimagnesium bromide (0.450 mL, 0.450 mmol, 1.00 equiv.) was added and the reaction mixture was stirred for 1 h prior to quenching with saturated, aqueous ammonium chloride (10 mL). The biphasic mixture was allowed to warm to room temperature, separated and the aqueous layer was extracted with dichloromethane (3 x 15 mL). The combined organic layers were dried over sodium sulfate, filtered and concentrated under vacuum. The resulting crude oil was wet-loaded onto silica column and purified via flash chromatography (5% EtOAc/hexanes) yielding the desired enone as a colorless oil (192 mg, 0.387 mmol, 86%). (5S,8S,9R,E)-5,9-dihydroxy-6,8-dimethylundeca-1,6-dien-3-one (20). To a polypropylene tube (15 mL, BD Falcon™) containing silyl ether 19 (29.8 mg, 0.0600 mmol, 1 equiv.) was added acetonitrile (3.0 mL) and magnetic stir bar. The mixture was stirred in ice-water bath (0 °C) until a homogenous solution was obtained. A solution of 48% aqueous hydrofluoric acid and acetonitrile (11:89, 8.36 mL) was slowly added to the reaction vessel. The resulting clear solution was stirred vigorously for 1 h and placed in a refrigerator (4 °C) for 15 h. The reaction was quenched at 0 °C via dropwise addition of a saturated aqueous sodium bicarbonate solution until the pH was 7. The neutralized solution was extracted with ethyl acetate (4 x 15 mL). All organic fractions were combined, dried over sodium sulfate, filtered and concentrated under vacuum. The crude residue was wet-loaded onto silica column and purified via flash column chromatography (5% MeOH/dichloromethane) affording the diol as a colorless oil (13.3 mg, 0.586 mmol, 98%). A reaction flask containing vinyl ketone 20 (3.9 mg) in anhydrous tetrahydrofuran (5 mL) was supplemented with N-acetyl cysteine (2.0 μL, 0.019 mmol, 1.1 equiv.). To the resulting clear solution was added a catalytic amount of cesium carbonate and the resulting reaction mixture was stirred for 5 h at ambient temperature under argon atmosphere and quenched upon addition of a saturated, aqueous ammonium chloride solution (5 mL). The combined organic fractions were dried over sodium sulfate, filtered and concentrated under vacuum. The crude residue was wet-loaded onto silica flash column with a small copper(II) sulfate-impregnated silica gel plug (2 cm thick) and purified (eluent = 10% MeOH/dichloromethane) furnishing the desired thioether as a colorless, translucent oil (5.9 mg, 0.017 mmol, quant.). Scheme S2. Chemical synthesis of thioether substrate 7a. Aldol adduct S1 was sequentially converted to the corresponding weinreb amide (S3) followed by protection with triethylsilyl trifluromethanesulfonate providing disilylether S4. Grignard addition and deprotection followed by Michael addition afforded thioether 7a.

(3R,6S,7R,E)-3-hydroxy-N-methoxy-N,4,6-trimethyl-7-((triisopropylsilyloxy)non-4-enamide (S3).

To a reaction vessel containing acyl thiazolidinethione S1 (0.298 g, 0.578 mmol) in anhydrous dichloromethane (3 mL) was sequentially added imidazole (0.197 g, 2.89 mmol, 5.00 equiv.) and N,O-dimethylhydroxylamine hydrochloride (0.141 g, 1.45 mmol, 2.50 equiv.). The reaction mixture was stirred at ambient temperature under argon atmosphere for 16 h and quenched upon addition of a saturated, aqueous ammonium chloride solution (4 mL). The biphasic solution was separated and the aqueous layer was extracted with dichloromethane. Combined organic fractions were dried over anhydro us sodium sulfate, filtered, concentrated under vacuum and purified via silica flash column chromatography (40% EtOAc/hexanes) yielding the desired amide as a slightly yellow, clear oil (0.208 g, 0.501 mmol, 87%).

Scheme S3. Synthesis of TylDH3 substrate 6c. The outlined route closely parallels that of thioester 6b (Schemes 1 and 2 in manuscript). Notable differences include the use of the enantiomer of 11 (ent-11), the syn-selective vinylogous aldol promoted by excess titanium(IV) chloride, and the production of dehydration product S12 due to an increased sensitivity of diastereomer S11 to prolonged aldol conditions.

A reaction vessel containing acyl thiazolidinethione 16 (0.126 g, 0.620 mmol, 1.70 equiv.) in anhydrous dichloromethane (2.3 mL) under argon atmosphere was cooled to -40 °C (dry ice-acetonitrile bath). The equilibrated solution was supplemented by titanium(IV) chloride (72.0 µL, 0.657 mmol, 1.80 equiv.) and stirred for 30 min. To the reaction was slowly added freshly distilled diisopropylethylamine$^1$ (0.114 mL, 0.657 mmol, 1.80 equiv.). The blood red reaction mixture was stirred for 2 h and transferred to dry ice-acetone bath (-78 °C). A dichloromethane (1.3 mL) solution of aldehyde S9 (0.114 g, 0.365 mmol, 1.00 equiv.) was slowly added to the cooled solution over 12 min. After stirring for 4 h at -78 °C the reaction was quenched via addition of ammonium chloride (5 mL). The biphasic mixture was warmed to ambient temperature and separated. The aqueous layer was extracted with dichloromethane (3 x 10 mL). Combined organic layers were dried over anhydrous sodium sulfate, filtered and concentrated under vacuum. **General biology procedures.** All chemical reagents were purchased from Sigma-Aldrich and were used directly without further purification. E. coli BL21–AI cells were from Life Technologies. IPTG was acquired through Gold Biotechnology. L- (+)-Arabinose (≥99%) was purchased through Sigma Aldrich. His60 Ni Superflow resin was purchased from Clontech Laboratories, Inc. OD600 was measured on an Eppendorf BioPhotometer. Sonication was carried out by Branson Sonifier 450. Gel filtration purification was performed on HiLoad 16/600 Superdex 200 pg column (GE). Protein mass spectrometry was carried out using an Agilent 6250 QTOF LC/MS. Kinetic LC–MS/MS was conducted with AB Sciex QTRAP 5500 mass spectrometer and Shimadzu LC system.

The TylKR3-DH3 didomain was ordered as codon-optimized synthetic DNA from Life Technologies. The synthetic DNA encoded the region 957-1682 from the tylactone synthase module 3 polypeptide. The insert was cloned into pMCSG7 using ligation independent cloning (LIC). TylKr3-DH3 synthetic forward primer: 5’-TACTTCCAAT-CCAATGCCCCATCGCTGCGACG-3’; TylKr3-DH3 synthetic reverse primer: 5’-TTATCCACTTCCAATGGTTAGTTGGTGATCTTCCGCTGTCACCAGCCG-3’ (LIC-overhangs in **bold**; inserted stop codon **underlined**). The insert was confirmed via sequencing.

**Cloning and Expression of TylDH3-KR3 Construct**

Initial efforts to recombinantly express the mono-domain TylKR3 were hampered by with poor expression levels and protein aggregation. Strategies to alleviate these issues included an increase of rare tRNA codons (Rosetta cell line), optimization of codon selection (synthetic TylKR3 gene), toxic protein-compatible expression hosts (pLysS cell line), appending a fusion protein (attempted with SUMO, mOCR, and GST), chaperone coexpression (GroEL-GroES) and truncations of both N- and C-termini. Disappointingly, these techniques failed to improve expression of soluble non-aggregated TylKR3 and forced us to abandon the expression of the mono-domain construct.

The tylGII region encoding TylDH3-KR3 didomain comprising residues 957-1682 was cloned into a pMCSG7 vector and transformed into E. coli BL21-AI cells containing the pRARE plasmid. A large TB media culture (0.5 L in 2.8 L Fernbach flask) was
inoculated with as small amount of overnight culture (5 mL) and incubated at 37 °C, shaking at 250 RPM until OD600 = 1.00–1.20. The culture was cooled to 20 °C and incubated with shaking (250 RPM) for 1 h. Cells were induced upon addition of IPTG (0.100 mM) and D-araabinose (1.00 g) and allowed to shake (250 RPM) at 20 °C for 19 h. The cell pellet was collected after centrifugation (4 °C, 5,000 x G, 30 min) and resuspended in lysis buffer (50 mM tricine, 50 mM ammonium sulfate, 100 mM urea, pH 8.5, 4 mL/g of pellet). The cells were lysed (3 x 2 min, 50% duty cycle, 40 % power, 4 °C) and centrifuged (4 °C, 28,600 x G, 45 min). The soluble protein was purified by sequential metal-immobilized affinity chromatography and size exclusion chromatography to afford approximately 9 mg of purified protein (18 mg / L) that was greater than 90% pure as judged by SDS-PAGE (Figure S1) and to be near the predicted calculated mass by mass spectrometry (Figure S2).

Figure S1. SDS-PAGE image of TylDH3-KR3 purification. The ladder, cell lysate, insoluble pellet, soluble protein and serial nickel elution fractions are shown in lanes 1-9, respectively. The band corresponding to TylDH3-KR3 is boxed.
Figure S2 - Mass spectrometry analysis of TylDH3-KR3. The convoluted (raw) spectrum and deconvoluted are both displayed. TylDH3-KR3 was found to have a mass of 76,264 Da. The spectrum was obtained using 0.5 mg/mL of recombinant TylDH3-KR3 in 25% formic acid.

Determination of TylDH3-KR3 Ketoreductase Activity
A small eppendorf tube (1.5 mL, 100 μL total volume) containing substrate 4 or 5 (1 mM), heterologously expressed TylDH3-KR3 (5 μM), NADPH (2 mM), Tris (50 mM), NaCl (150 mM) at pH 8.0 was incubated at ambient temperature for 15 h. 60 μL of the diluted reaction solution was added to a HPLC vial and analyzed by LC-MS/MS (Table S4) employing a Kinetix reverse-phase C_{18} column (50 mm × 2.1 mm, 2.6 μm, Phenomenex) operated at 0.4 mL min\(^{-1}\) with a gradient between mobile phase A (H\(_2\)O) and mobile phase B (MeCN). The gradient program was 0 min, 5% B; 2 min, 5% B; 7 min, 55% B; 8 min, 70% B; 9 min, 70% B; 10.5 min, 5% B; 12 min, 5% B. Co-injection of standards 6a, 6b, and 8 for substrate 4 confirmed the identity of product traces. The standards 7a, 7b, and 9 were used for the analysis of the incubation of substrate 5.

Analysis of TylDH3-KR3 Dehydratase Activity

Steady-State Analysis.
The enzymatic reactions were carried out in a total volume of 50 μL under initial velocity conditions containing TylDH3-KR3 (1 μM), reaction buffer (50 mM Tris, 150 mM NaCl,
pH 8.0) and substrates 6b or 7b at variable concentrations (0.5, 1, 2, 3, 4, 6, 8 mM). The final DMSO concentration was held constant at 4%. After incubation at 25 °C for 8 min (the reaction found to be linear up to 10 min), 5 µL of the reaction mixture was added to 495 µL of 1:1 MeCN–reaction buffer (100-fold dilution). The resulting solution was vortexed, centrifuged and analyzed by 60 µL of the diluted reaction solution was added to a HPLC vial with 10 µL of internal standard 3 (320 nM) and analyzed by LC-MS/MS (Table S4) employing a Kinetix reverse-phase C₁₈ column (50 mm × 2.1 mm, 2.6 µm, Phenomenex) operated at 0.4 mL min⁻¹ with a gradient between mobile phase A (H₂O) and mobile phase B (MeCN). The gradient program was 0 min, 5% B; 2 min, 5% B; 7 min, 55% B; 8 min, 70% B; 9 min, 70% B; 10.5 min, 5% B; 12 min, 5% B. Standard curves of enzymatic products 8 and 9 were generated by injecting the authentic standard at varying concentrations with a fixed concentration of an internal standard (8 for the standard curve of 9 and 9 for the standard curve of 8). The amount of enzymatic product formation at each time point was calculated by plotting the area ratio (analyte/internal standard) into the standard curve. Control reactions for each concentration of substrate were performed without the addition of enzyme. Each reaction was performed in duplicate. The specificity constants (Kₘ/k_cat) were determined by fitting the normalized v₀ vs [S] plots to linear equations (Figure S3 panels A and B).

Substrates 6c and 6d were analyzed in an analogous way using synthetic S14 as the product standard (Figure S3 panels C and D). The LC-MS/MS trace of S14 is provided in Figure S4.
Figure S3. Linear regression analysis of TyLDH3KR3 kinetic data with substrates 6b, 7b, 6c, and 6d. The kinetic plots of thioester 6b, thioether 7b, thioester 6c and thioester 6d are shown in panels A, B, C and D, respectively. Represented data is the result of duplicate LC-MS/MS data normalized with controls lacking enzyme. Specificity constants ($k_{cat}/K_M$) for each substrate are displayed below the corresponding plot.

Figure S4. LC-MS/MS trace of dienethiolate S14. The synthetic compound S14 was used to confirm the identity of the dehydration products arising from thioesters 6c and 6d. A standard curve for quantitative determination of specificity constants was generated from the synthetic compound.
