Notification List of Bacterial Strains Made Available by the United Kingdom National Collection of Type Cultures in 2021

Jake David Turnbull, Jo Dicks, Sunita Gurung, Hannah McGregor, The NCTC 2021 Depositors Cohort, Sarah Alexander

The National Collection of Type Cultures, Culture Collections, UK Health Security Agency, Colindale, London, United Kingdom

ABSTRACT Here, we report on the 47 bacterial strains made available by the National Collection of Type Cultures in 2021, alongside a commentary on these strains and their significance.

The National Collection of Type Cultures (NCTC) is composed of approximately 6,000 bacterial reference and type strains, of which many are of medical and veterinary importance. The NCTC is currently in its 103rd year of operation and is hosted by the recently formed UK Health Security Agency (UKHSA).

Each year, bacterial strains are added to the collection for many reasons. These reasons include but are not limited to individuals who wish to share strains of diagnostic or industrial utility, veterinary and public health establishments who wish to share strains that carry emergent or important virulence factors or antibiotic resistance determinants, and researchers who deposit proposed type strains of novel taxa into the collection in order to validly describe them. Here, we describe the strains made available from the NCTC to the scientific community in 2021.

Forty-seven bacterial strains were made available to the scientific community by the NCTC in 2021, which are all listed in Table 1. Of these 47 strains, 17 strains constitute novel prokaryotic taxa, with the remaining 30 strains comprised of historic strains (n = 4), antimicrobial resistant (AMR) reference strains (n = 6), contemporary clinical and veterinary reference strains (n = 17), type strains not previously held by the NCTC (n = 2), and a laboratory reference strain (n = 1). The full details for each strain (e.g., citations for the full taxon descriptions, strain provenance, and validated growth conditions) can be obtained from the NCTC online catalogue.

The novel taxa listed in Table 1 were all isolated from humans and animals, except for NCTC 14075 Paraburkholderia agricolaris, which was isolated originally from leaf litter in the United States. NCTC 14318 Eikenella exigua, NCTC 14180 Eikenella halliae, NCTC 14179 Eikenella longinqua, NCTC 14393 Enemella dayhoffiae, NCTC 14394 Enemella evansiae, NCTC 14359 Escherichia ruysiae, and NCTC 14396 Pseudoxanthomonas winnipegensis are all of human provenance. The remaining nine strains are of animal provenance, including isolates of horse, bat, sheep, alpaca, raccoon, Northern elephant seal, and California sea lion origin.

The descriptions of all strains were published in 2019 (n = 1), 2020 (n = 11), and 2021 (n = 5). The valid publication and description of NCTC 14393 Enemella dayhoffiae and NCTC 14394 Enemella evansiae (1) include the description of the novel genus Enemella. The publication of the valid description of NCTC 14359 Escherichia ruysiae constitutes the first novel species to be assigned to the genus since 2015 upon the valid publication of the description of Escherichia marmotae (2).

The four Shigella strains were all accessioned into the NCTC from the 1917 to 1954 Murray Collection of pre-antibiotic-era Enterobacteriaceae (3). NCTC 14120, NCTC 14146, and NCTC 14154 were all isolated before 1919, with NCTC 14123 dating from before 1938.

Four of the five AMR-associated Escherichia coli (NCTC 14376 to NCTC 14381) accessions are MC1000 strains genetically modified to harbor variants of functional
isopropyl-β-D-thiogalactopyranoside (IPTG)-inducible mcr genes that confer resistance to the antibiotic colistin. In 2018, they were used to demonstrate the detection of mcr-mediated resistance to polymyxins using matrix-assisted laser desorption ionization–time of flight mass spectrometry (MALDI-TOF MS) (4). NCTC 14376 is an unmodified strain and does not carry an mcr gene. The Clostridioides difficile strain NCTC 14385 harbors a 7-kb plasmid, named pCD-METRO, which contributes to phenotypic metronidazole resistance to the strain (5), further elucidating the role of plasmids in metronidazole resistance in Clostridioides difficile.

### TABLE 1 The 47 strains made available by the National Collection of Type Cultures in 2021

| NCTC accession identifier | Species name | Primary reference | Available whole-genome sequence data | Taxon rank |
|---------------------------|--------------|------------------|-------------------------------------|------------|
| NCTC 14351                | Acholeplasma equirhinis | 14 | GCF_017052655.1 | sp. nov.  |
| NCTC 14318                | Eikenella exigua | 6 | GCF_008805035.1 |
| NCTC 14180                | Eikenella halliae | 15 | GCF_001648475.1 |
| NCTC 14179                | Eikenella longingua | 15 | GCF_001648355.1 |
| NCTC 14359                | Escherichia rhusiae | 16 | GCF_002498915.1 |
| NCTC 14309                | Mycoplasma procyoni | 14 | GCF_017052595.1 |
| NCTC 14411                | Oceanirvga mirounga | 17 | GCF_002505095.1 |
| NCTC 14075                | Paraburkholderia agricultaris | 18 | GCF_009455635.1 |
| NCTC 14396                | Pseudoxanthomonas winnipegensis | 19 | GCF_004283755.1 |
| NCTC 14454                | Staphylococcus durrelli | 20 | GCF_015594545.1 |
| NCTC 14453                | Staphylococcus lloydii | 20 | GCF_015775975.1 |
| NCTC 14363                | Streptococcus caledonicus | 21 | PRJEB33418 |
| NCTC 14455                | Streptococcus pacificus | 22 | GCF_016481305.1 |
| NCTC 14341                | Streptococcus vicugnae | 22 | GCF_016461705.1 |
| NCTC 14410                | Streptococcus zalophi | 22 | GCF_016481285.1 |
| NCTC 14393                | Enemella dayhoffiae | 1 | GCF_002250625.1 | gen. nov., sp. nov. |
| NCTC 14394                | Enemella evansi | 1 | GCF_002250705.1 |
| NCTC 14120                | Shigella flexneri | 3 | ERS179715 | Historic strain |
| NCTC 14123                | Shigella sonnei | 3 | ERS222760 |
| NCTC 14146                | Shigella flexneri | 3 | ERS179747 |
| NCTC 14154                | Shigella sonnei | 3 | ERS179739 |
| NCTC 14376                | Escherichia coli | 4 | AMR reference strain |
| NCTC 14377                | Escherichia coli | 4 |
| NCTC 14378                | Escherichia coli | 4 |
| NCTC 14379                | Escherichia coli | 4 |
| NCTC 14381                | Escherichia coli | 4 |
| NCTC 14385                | Clostridioides difficile | 5 | GCF_000696735.1 |
| NCTC 14169                | Clostridioides difficile | 5 |
| NCTC 14174                | Clostridioides difficile | 5 |
| NCTC 14178                | Auritidibacter ignavus | 7 | GCF_003185985.1 |
| NCTC 14181                | Eikenella exigua | 15 | GCF_001648495.1 |
| NCTC 14457                | Staphylococcus aureus | 8 |
| NCTC 14458                | Staphylococcus aureus | 8 |
| NCTC 14459                | Staphylococcus aureus | 8 |
| NCTC 14460                | Staphylococcus aureus | 8 |
| NCTC 14461                | Staphylococcus aureus | 8 |
| NCTC 14462                | Staphylococcus aureus | 8 |
| NCTC 14464                | Staphylococcus aureus | 8 |
| NCTC 14465                | Staphylococcus aureus | 8 |
| NCTC 14481                | Legionella wadsworthii |
| NCTC 14405                | Neisseria animaloris | 10 |
| NCTC 14406                | Neisseria animaloris | 10 |
| NCTC 14407                | Neisseria animaloris | 10 |
| NCTC 14408                | Neisseria animaloris | 10 |
| NCTC 14201                | Ideonella sakaiensis | 11 | GCF_001293525.1 | Type strain |
| NCTC 14293                | Varibaculum cambricen | 12 |
| NCTC 14582                | Escherichia coli | |

*The 47 strains include type strains of 17 novel taxa and 30 additional reference and type strains from established taxa. The whole-genome sequence data are listed as publicly available whole-genome assemblies in NCBI RefSeq, with the exception of NCTC 14363 for which several contig-level assemblies exist at time of writing, and NCTC 14120, NCTC 14123, NCTC 14146, and NCTC 14154 for which Illumina short-read data exist at the time of writing. All whole-genome sequence data were provided by the depositors of each strain and are accessible via the NCBI using the above identifiers (https://www.ncbi.nlm.nih.gov/).
NCTC 14169 and NCTC 14174 are *Clostridioides difficile* reference strains of PCR ribotypes 017 and 015, respectively. NCTC 14174 is the first PCR ribotype 015 isolate of *Clostridioides difficile* to be accessioned into the NCTC.

NCTC 14181 is an additional reference strain for *Eikenella exigua* (6), and NCTC 14178 is an additional reference strain for *Auritidibacter ignavus* (7). NCTC 14481 *Legionella wadsworthii* was isolated originally from a recent instance of human infection, reflecting the role of this species as a known but infrequent cause of legionellosis.

NCTC 14457 to NCTC 14465 are eight strains of *Staphylococcus aureus* that carry the methicillin resistance gene *mecC* isolated from human clinical sources (8). These strains were isolated originally in a six-hospital surveillance study in the United Kingdom and date from a little over a year after the *mecC* gene was first discovered in an isolate recovered from a milk bulk tank and consequently described (9).

NCTC 14405 to NCTC 14408 are four strains of *Neisseria animaloris* isolated from the wounds of stranded porpoises. They are described in a study elucidating the role of *Neisseria animaloris* infection following traumatic injuries by gray seals and the potential of *Neisseria animaloris* as a zoonotic pathogen from both animal species (10). They are the first known strains of *Neisseria animaloris* that were not isolated from cats, dogs, or humans (H. Malnick, personal communication).

The NCTC 14201 *Ideonella sakaiensis* type strain was isolated originally from a microbial consortium obtained from a poly(ethylene terephthalate) (PET; a humanmade plastic) bottle recycling site in Sakai, Japan, and can degrade and utilize PET as a carbon source (11). NCTC 14293 *Varibaculum cambriense* is also the type strain of its species, and its addition to the NCTC fortifies the variety of clinically relevant anaerobic species held by the collection (12). NCTC 14582 *Escherichia coli* is an additional strain of K-12 added to the NCTC, with the precedingly held K-12 strain being NCTC 10538 *Escherichia coli*.

In conclusion, the UK National Collection of Type Cultures is a dynamic collection, and the accessioning of additional bacterial strains ensures the collection’s continuing relevancy to the work and activities of the scientific community. The collection enjoys collaboration and interaction with researchers worldwide, which is reflected in the newly accessioned bacterial strains described above.

The 47 strains described here represent modest growth in the holdings of the NCTC, and growth slowed in part due to the coronavirus disease 19 (COVID-19) pandemic. It is a requirement that in order to validly describe new bacterial taxa that the type culture is deposited in two recognized culture collections in two different countries (13), and the approximate third of the strains described above that serve as the type strains of novel taxa highlight the role of the NCTC in the description of novel bacterial taxa.

More information on depositing bacterial strains into the NCTC, a free service provided globally, is available on the NCTC/UKHSA Culture Collections website at https://www.culturecollections.org.uk.

Data availability. The full details for each strain (e.g., citations for the full taxon descriptions, strain provenance, and validated growth conditions) can be obtained from the NCTC online catalogue. Links to the catalogue entry for each strain can be found in Table 1, as can the links to the requisite genomic data wherever they are available.

ACKNOWLEDGMENTS

The NCTC 2021 Depositors Cohort are as follows: Kathryn Bernard (National Microbiology Laboratory-CSHCAH, Public Health Agency of Canada, Winnipeg, Manitoba, Canada), Jessica Day (Respiratory and Vaccine Preventable Bacteria Reference Unit, UK Health Security Agency, Colindale, London, UK), Geoffrey Foster (Scottish Marine Animal Stranding Scheme, SRUC Veterinary Services, An Lochran, Inverness, Scotland, UK), Kay Fountain (Department of Biology and Biochemistry, University of Bath, Claverton Down, Bath, UK), Øyvind Kommedal (Department of Microbiology, Haukeland University Hospital, Bergen, Norway), Henry Malnick (formally of the Laboratory of Health Care Associated Infection, Public Health England, Colindale, London, UK), Despoina Mavridou (MRC Centre for Molecular Bacteriology and Infection, Department of Life Sciences, Faculty of Natural Sciences, Imperial College London,
London, UK, Boas van der Putten (Department of Medical Microbiology, Amsterdam UMC, University of Amsterdam, Amsterdam, the Netherlands), and Wip Klaas Smits (Department of Medical Microbiology, Leiden University Medical Center, Leiden, Netherlands).

We wish to express our thanks to the NCTC 2021 Depositors Cohort and additional depositors of the strains discussed above, who are as follows: Debra Brock (Department of Biology, Washington University in St. Louis, St Louis, MO), Mark Holmes (Department of Veterinary Medicine, University of Cambridge, Cambridge, UK), Nitin Kumar (Wellcome Sanger Institute, Wellcome Genome Campus, Hinxton, UK), Yuki Muramatsu (Biological Resource Center, National Institute of Technology and Evaluation, Kisasazu, Chiba, Japan), Dmitry Volokhov (Center for Biologics Evaluation and Research, U.S. Food and Drug Administration, Silver Spring, MD).

Select strains were accessioned as part of a strain exchange with the Culture Collection at the University of Goteborg and the DSMZ-German Collection of Microorganisms and Cell Cultures GmbH.

We also express our thanks to all of the past members of the NCTC for their work in maintaining and developing the collection over the past 102 years.
