The 1-jet Generalized Lagrange Geometry induced by the rheonomic Chernov metric

Vladimir Balan and Mircea Neagu

Abstract

The aim of this paper is to develop on the 1-jet space \( J^1(\mathbb{R}, M^4) \) the jet Generalized Lagrange Geometry (cf. [13, 12]) for the rheonomic Chernov metric

\[
F_{[y]}(t, y) = \sqrt{h^{11}(t)} \cdot \sqrt{y_1^1 y_2^1 y_1^2 + y_1^1 y_3^1 y_1^3 + y_2^1 y_3^1 y_1^3 + y_2^1 y_4^1 y_1^4}.
\]

The associated gravitational and electromagnetic field models based on the rheonomic Finsler Chernov metric tensor are developed and discussed.

Mathematics Subject Classification (2000): 53C60, 53C80, 83C22.

Key words and phrases: rheonomic Chernov metric of order three, canonical nonlinear connection, Cartan canonical connection, \( d \)-torsions and \( d \)-curvatures, geometrical Einstein equations.

1 Introduction

It is obvious that our natural physical intuition distinguishes four dimensions in a natural correspondence with material environment. Consequently, four-dimensionality plays a special role in almost all modern physical theories.

On the other hand, it is an well known fact that, in order to create the Relativity Theory, Einstein was forced to use the Riemannian geometry instead of the classical Euclidean geometry, the Riemannian geometry representing the natural mathematical model for the local isotropic space-time. But recent studies of physicists suggest a non-isotropic perspective of Space-Time - e.g., the concept of inertial body mass emphasizes the necessity of study of locally non-isotropic spaces ([7]). Among the possible models for the study of non-isotropic physical phenomena, Finsler geometry is an appropriate and effective mathematical framework.

The works of Russian scholars ([1] [10] [7]) emphasize the importance of the Finsler geometry which is characterized by the complete equivalence of all non-isotropic directions and promote in their works models based on special locally-Minkowski types of \( m \)-root metrics - e.g., Berwald-Moór or Chernov. Since any of the directions can be related to proper time, such spaces were generically called as having "multi-dimensional time" ([15]). In the framework of the 3- and 4-dimensional linear space with Berwald-Moór metric (i.e., having three-
and four-dimensional time), Pavlov and his co-workers (7 [14] [15]) provide new physical model-supporting evidence and geometrical interpretations, such as:

- physical events = points in the multi-dimensional time;
- straight lines = shortest curves;
- intervals = distances between the points along of a straight line;
- light pyramids ⇔ light cones in a pseudo-Euclidian space;
- surfaces of simultaneity = the surfaces of simultaneous physical events.

An important model of $m$—root type - the Chernov metric (5 [4]),

$$F : TM \rightarrow \mathbb{R}, \quad F(y) = \sqrt[3]{y^1 y^2 y^3} + y^1 y^2 y^4 + y^1 y^3 y^4 + y^2 y^3 y^4,$$

was recently shown to be relevant for Relativity. The larger class of Finsler metrics to which this metric belongs, the $m$—root metrics, have been previously studied by the Japanese geometers Matsumoto and Shimada (8 [9] [16]).

Considering the former geometrical and physical reasons, the present paper is devoted to the development on the 1-jet space $J^1(\mathbb{R}, M^4)$ of the Finsler-like geometry, applied to geometric gravitational and electromagnetic field theory associated to the natural 1-time rheonomic jet extension of the Chernov metric (1.1)

$$F_{[3]}(t, y) = \sqrt{h_{11}(t) \cdot \sqrt[3]{y^1 y^2 y^3} + y^1 y^2 y^4 + y^1 y^3 y^4 + y^2 y^3 y^4},$$

where $h_{11}(t)$ is a Riemannian metric on $\mathbb{R}$ and $(t, x^1, x^2, x^3, y^1, y^2, y^3, y^4)$ are the coordinates of the 1-jet space $J^1(\mathbb{R}, M^4)$.

The geometry that models gravitational and electromagnetic theories, relying on distinguished ($d$—)connections (and their $d$—torsions and $d$—curvatures), produced by a jet rheonomic Lagrangian function $L : J^1(\mathbb{R}, M^n) \rightarrow \mathbb{R}$, was extensively described in [13], where the geometrical ideas are similar, but exhibiting distinct features compared to the ones developed by Miron and Anastasiei in classical Generalized Lagrange Geometry (11). The geometrical jet distinguished framework from [13] - generically called as jet geometrical theory of the rheonomic Lagrange spaces, was initially stated by Asanov in [2] and developed further in the book [12].

In the sequel, we apply the general geometrical results from [13] to the rheonomic Chernov metric $F_{[3]}$.

2 Preliminary notations and formulas

Let $(\mathbb{R}, h_{11}(t))$ be a Riemannian manifold, where $\mathbb{R}$ is the set of real numbers. The Christoffel symbol of the Riemannian metric $h_{11}(t)$ is

$$\gamma^1_{11} = \frac{h^{11}}{2} \frac{dh_{11}}{dt}, \quad \text{where} \quad h^{11} = \frac{1}{h_{11}} > 0.$$
Let also $M^4$ be a manifold of dimension four, whose local coordinates are $(x^1, x^2, x^3, x^4)$. Let us consider the 1-jet space $J^1(\mathbb{R}, M^4)$, whose local coordinates are

$$(t, x^1, x^2, x^3, x^4, y_1^1, y_1^2, y_1^3, y_1^4).$$

These transform by the rules (the Einstein convention of summation is used throughout this work):

$$\tilde{t} = \tilde{t}(t), \quad \tilde{x}^p = \tilde{x}^p(x^q), \quad \tilde{y}_1^p = \frac{\partial \tilde{x}^p}{\partial x^q} \frac{dt}{dt}, \quad p, q = 1, 4, \quad (2.2)$$

where $d\tilde{t}/dt \neq 0$ and rank $(\partial \tilde{x}^p/\partial x^q) = 4$.

We further consider that the manifold $M^4$ is endowed with a tensor of kind $(0, 3)$, given by the local components $S_{ijl}(x)$, which is totally symmetric in the indices $p$, $q$ and $r$. We shall use the notations

$$S_{ij1} = 6S_{ijp} y_1^p, \quad S_{i11} = 3S_{ipq}(x) y_1^p y_1^q, \quad S_{i111} = S_{ipqr} y_1^p y_1^q y_1^r \quad (2.3)$$

We assume that the $d$–tensor $S_{ij1}$ is non-degenerate, i.e., there exists the $d$–tensor $S_{jkl}^1$ on $J^1(\mathbb{R}, M^4)$, such that $S_{ij1} S_{jkl}^1 = \delta^1_{kl}$. In this context, we can consider the third-root Finsler-like function $F(t, x, y)$, which is 1-positive homogenous in the variable $y$,

$$F(t, x, y) = \sqrt[3]{S_{pqr}(x) y_1^p y_1^q y_1^r} \cdot \sqrt[h_{111}(t)]{h_{111}(t)} = \sqrt[3]{S_{i111}(x, y)} \cdot \sqrt[h_{111}(t)]{h_{111}(t)}, \quad (2.4)$$

where the Finsler function $F$ has as domain of definition all values $(t, x, y)$ which satisfy the condition $S_{i111}(x, y) \neq 0$. Then the 3-positive homogeneity of the "$y$–function" $S_{i111}$ (which is a $d$–tensor on the 1-jet space $J^1(\mathbb{R}, M^4)$), leads to the equalities:

$$S_{i11} = \frac{\partial S_{i11}}{\partial y_1^i}, \quad S_{i11} y_1^i = 3S_{i11}, \quad S_{ij1} y_1^j = 2S_{i11}, \quad S_{ij1} = \frac{\partial S_{i11}}{\partial y_1^i}, \quad \frac{\partial^2 S_{i11}}{\partial y_1^i \partial y_1^j},$$

$$S_{ij1} y_1^j = 6S_{i11}, \quad \frac{\partial S_{ij1}}{\partial y_1^k} = 6S_{ijk}, \quad S_{ijp} y_1^p = \frac{1}{6} S_{ij1}.$$

The fundamental metrical $d$–tensor produced by $F$ is given by the formula

$$g_{ij}(t, x, y) = \frac{h_{111}(t)}{2} \frac{\partial^2 F^2}{\partial y_1^i \partial y_1^j}.$$ 

By direct computations, the fundamental metrical $d$–tensor takes the form

$$g_{ij}(x, y) = \frac{S_{i11}^{-1/3}}{3} \left[ S_{ij1} - \frac{1}{3 S_{i11}} S_{i11} S_{j11} \right]. \quad (2.5)$$

Moreover, since the $d$–tensor $S_{ij1}$ is non-degenerate, the matrix $g = (g_{ij})$ admits an inverse $g^{-1} = (g^{ij})$, whose entries are

$$g^{ik} = 3S_{i11}^{1/3} \left[ S_{j1k} + \frac{S_{i1j} S_{j1k}}{3 (S_{i11} - S_{j11})} \right]. \quad (2.6)$$
where $S^i_j = S^{p_1} S_{p_1 1}$ and $3 S^{s_1 1} = S^{p_1} S_{p_1 1} S_{q_1 1}$.

Following the ideas from [3], the energy action functional

$$ E(t, x(t)) = \int_a^b \int_{\mathbb{R}^4} F^2(t, x(t), y(t)) \sqrt{h_{11}(t)} dt = \int_a^b S^{2/3}_{111} \cdot h_{11} \sqrt{h_{11}} dt, $$

where $y(t) = dx/dt$, produces on the 1-jet space $J^1(\mathbb{R}, \mathbb{R}^4)$, via the Euler-Lagrange equations, the canonical time dependent spray

$$ S = \left( H^{(i)}_{(1)1}, G^{(i)}_{(1)1} \right), $$

where, using the notations (2.1) and (2.3), we have

$$ H^{(i)}_{(1)1} = -\frac{\gamma^{11}_{11} y^i_1}{2} $$

and

$$ G^{(i)}_{(1)1} = \frac{g^{1m}_{11}}{6 \sqrt{S_{111}}} \left[ \frac{\partial S_{s_1 11}}{\partial x^p} y^p - (1 - \gamma^{11}_{11}) \frac{\partial S_{111}}{\partial x^m} \right] - \frac{S^1_{11}}{6 (S_{111} - S_{111})} \left( \frac{\partial S_{111}}{\partial x^p} y^p + 3 \gamma^{11}_{11} S_{111} \right). $$

**Remark 2.1.** In the particular case when the components $G_{pqr}$ are independent on the variable $x$, the expression of (2.8) simplifies as

$$ G^{(i)}_{(1)1} = -\frac{\gamma^{11}_{11} S_{111}}{2 (S_{111} - S_{111})} S^i_{11}. $$

Note that, in this case, the Finsler-like function (2.4) is of locally-Minkowski type.

It is known (3) that the canonical time dependent spray $S$ given by (2.7) determines on the 1-jet space $J^1(\mathbb{R}, \mathbb{R}^4)$ a canonical nonlinear connection given by

$$ \Gamma = \left( M^{(i)}_{(1)1} = 2 H^{(i)}_{(1)1} = -\gamma^{11}_{11} y^i_1, \ N^{(i)}_{(1)j} = \frac{G_{(1)1}^{(i)}}{\partial y^j_1} \right). $$

**3 The rheonomic Chernov metric**

Beginning with this Section we will focus only on the rheonomic Chernov metric, which is the Finsler-like metric (2.4) for the particular case

$$ S_{pqr} := S_{[3]}^{pqr} = \begin{cases} \frac{1}{3!}, & \{p, q, r\} \text{ - distinct indices} \\ 0, & \text{otherwise.} \end{cases} $$
Consequently, the rheonomic Chernov metric is given by
\[ F_{[3]}(t, y) = \sqrt{h^{11}(t) \cdot \left( y_1^4 y^1_1 y_1^3 + y_1^4 y^1_1 y_1^4 + y_1^5 y_1^1 y_1^4 + y_1^5 y_1^1 y_1^4 \right)}. \] (3.1)

Moreover, using the preceding notations and formulas, we obtain the following relations:
\[ S_{111} := S_{[3]111} = y_1^1 y_1^2 y_1^3 + y_1^1 y_1^2 y_1^4 + y_1^1 y_1^3 y_1^4 + y_1^2 y_1^3 y_1^4, \]
\[ S_{i11} := S_{[3]i11} = \frac{\partial S_{[3]111}}{\partial y_1^i} = \frac{S_{[3]111} y_1^i - S_{[4]1111}}{(y_1^i)^2}, \]
\[ S_{ij1} := S_{[3]ij1} = \frac{\partial^2 S_{[3]111}}{\partial y_1^i \partial y_1^j} = \begin{cases} S_{[1]1} - y_1^i - y_1^j, & i \neq j \\ 0, & i = j, \end{cases} \]

where \( S_{[4]1111} = y_1^1 y_1^2 y_1^3 y_1^4 \) and \( S_{[1]1} = y_1^1 + y_1^2 + y_1^3 + y_1^4 \). Note that, for \( i \neq j \), the following equality holds true as well:
\[ S_{[3]111} \cdot S_{[3]j11} = S_{[3]111} \left( S_{[1]1} - y_1^i - y_1^j \right) + \frac{S_{[3]1111}^2}{(y_1^i)^2 (y_1^j)^2}. \]

Because we have
\[ 0 \neq \det (S_{[1]1})_{i,j=1,4} = 4 \left[ 4 S_{[4]1111} - S_{[3]1} S_{[3]111} \right] := D_{1111}, \]
we find
\[ S^{j1} := S_{[3]}^{j1} = \begin{cases} -2 \frac{D_{1111}}{D_{1111}} \left( y_1^j + y_1^i \right) \left[ y_1^j y_1^k + S_{[4]1111} y_1^k \right], & j \neq k \\ \frac{1}{D_{1111}} \cdot \frac{1}{y_1^j} \left[ \prod_{i=1}^4 \left( y_1^j + y_1^i \right) \right], & j = k. \end{cases} \]

Further, laborious computations lead to:
\[ S_{1} := S_{[3]}^{j1} = S_{[3]}^{p1} S_{[3]p11} = \frac{1}{2} y_1^i, \]
\[ S_{111} := S_{[3]111} = S_{[3]}^{p1} S_{[3]p11} S_{[3]q11} = \frac{1}{2} S_{[3]111}. \] (3.2)

Replacing now the above computed entities into the formulas (2.3a) and (2.0), we get \( g_{ij} := g_{[3]ij} = \)
\[ = \begin{cases} \frac{S_{[3]111}^{-1/3}}{9} \left[ 2 \left( S_{[1]1} - y_1^i - y_1^j \right) - \frac{S_{[4]1111}^2}{S_{[3]111}} \cdot \frac{1}{(y_1^i)^2 (y_1^j)^2} \right], & i \neq j \\ -\frac{S_{[3]111}^{-4/3}}{9} \cdot S_{[3]111}^2, & i = j \end{cases} \] (3.3)
and
\[ g^{jk} := g^{jk}_{[3]} = 3S^{1/3}_{[3]111} \left[ S^{j11} + \frac{1}{6S^{111}} y_1^j y_1^k \right]. \] (3.4)

Consequently, using the formulas (2.9) and (3.2), we find the following geometrical result:

**Proposition 3.1.** For the rheonomic Chernov metric (3.1), the energy action functional
\[ E_{[3]}(t, x(t)) = \int_a^b \sqrt{y_1^1 y_2^1 y_3^1 + y_1^1 y_2^1 y_4^1 + y_1^1 y_3^1 y_4^1 + y_1^1 y_1^1 y_4^1 + y_1^2 y_1^2 y_3^1 + y_1^2 y_1^2 y_4^1} : h^{11} \sqrt{h^{11}} dt \]
produces on the 1-jet space \( J^1(\mathbb{R}, M^4) \) the canonical time dependent spray
\[ S_{[3]} = \left( H^{(i)}_{(1)11} = -\frac{\kappa_{11}^1}{2} y_1^i, G^{(i)}_{(1)1} = -\frac{\kappa_{11}^1}{2} y_1^i \right). \] (3.5)

Moreover, the formulas (2.10) and (3.5) imply

**Corollary 3.2.** The canonical nonlinear connection on the 1-jet space \( J^1(\mathbb{R}, M^4) \) produced by the rheonomic Chernov metric (3.1) is
\[ \Gamma_{[3]} = \left( M^{(i)}_{(1)11} = -\kappa_{11}^1 y_1^i, N^{(i)}_{(1)j} = -\frac{\kappa_{11}^1}{2} \delta_{ij} \right), \] (3.6)
where \( \delta_{ij} \) is the Kronecker symbol.

### 4 Cartan canonical connection.

**Distinguished torsions and curvatures**

The importance of the nonlinear connection (3.6) is coming from the possibility of construction of the dual *local adapted bases*: of \( d^- \)-vector fields
\[ \left\{ \frac{\delta}{\delta t}, \frac{\delta}{\delta x^i}; \frac{\delta}{\delta y_1^i} = \frac{\partial}{\partial y_1^i} + \frac{\kappa_{11}^1}{2} \frac{\partial}{\partial y_1^1}; \frac{\partial}{\partial y_1^1} \right\} \subset \mathcal{X}(E) \] (4.1)
and of \( d^- \)-covector fields
\[ \left\{ dt; \delta x^i; \delta y_1^i = dy_1^i - \kappa_{11}^1 y_1^i dt - \frac{\kappa_{11}^1}{2} dx^1 \right\} \subset \mathcal{X}^*(E), \] (4.2)
where \( E = J^1(\mathbb{R}, M^4) \). Note that, under a change of coordinates (2.2), the elements of the adapted bases (4.1) and (4.2) transform as classical tensors. Consequently, all subsequent geometrical objects on the 1-jet space \( J^1(\mathbb{R}, M^4) \) (as Cartan canonical connection, torsion, curvature etc.) will be described in local adapted components. We emphasize that the definition of local components of connections, torsion and curvature, obey the formalism used in the works [11, 12, 13, 8].

Using a general result from [13], by direct computations, we can give the following important geometrical result:
Theorem 4.1. The Cartan canonical $\Gamma_3$-linear connection, produced by the rheonomic Chernov metric (3.1), has the following adapted local components:

$$CT_3 = \left( \kappa_{11}, \ G_{j1}^k = 0, \ L^i_{jk} = \frac{\kappa_{11}^1}{2} C_{j(k)}^{i(1)}, \ C_{j(k)}^{i(1)} \right),$$

where

$$C_{j(k)}^{i(1)} = 3S_{[3]}^m S_{[3]jkm} - \frac{1}{6} S_{[3]111} \left[ S_{[3]j1k1} \frac{y_1^i}{2} + \delta_j^i S_{[3]j1k1} + \delta_k^i S_{[3]j11} \right] + \frac{1}{9} S_{[3]111} S_{[3]j11} y_1^i.$$  \hspace{1cm} (4.3)

Proof. Using the Chernov derivative operators (4.1) and (4.2), together with the relations (3.3) and (3.4), we apply the general formulas which give the adapted components of the Cartan canonical connection, namely \[13\]

$$G_{j1}^k = \frac{g_{km}^j}{2} \frac{\delta g_{[3]mj}}{\delta t}, \quad L^i_{jk} = \frac{g_{im}^j}{2} \left( \frac{\delta g_{[3]jm}}{\delta x^k} + \frac{\delta g_{[3]km}}{\delta x^j} - \frac{\delta g_{[3]jk}}{\delta x^m} \right),$$

$$C_{j(k)}^{i(1)} = \frac{g_{im}^j}{2} \left( \frac{\partial g_{[3]jm}}{\partial y_1^k} + \frac{\partial g_{[3]km}}{\partial y_1^j} - \frac{\partial g_{[3]jk}}{\partial y_1^m} \right) = \frac{g_{im}^j}{2} \frac{\partial g_{[3]jk}}{\partial y_1^m},$$

where, by computations, we have

$$\frac{\partial g_{[3]jk}}{\partial y_1^m} = 2S_{[3]111}^{-1/3} S_{[3]jkm} - \frac{1}{9} S_{[3]111}^{-4/3} \left( S_{[3]j1k1} S_{[3]m11} + S_{[3]km1} S_{[3]j11} + S_{[3]mj1} S_{[3]k11} \right) + \frac{4}{27} S_{[3]111}^{-7/3} S_{[3]j11} S_{[3]k11} S_{[3]m11}. $$

For details, we refer to [16] and [3]. \hspace{1cm} \Box

Remark 4.2. The following properties of the $d$–tensor $C_{j(k)}^{i(1)}$ hold true:

$$C_{j(k)}^{i(1)} = C_{k(j)}^{i(1)}, \quad C_{j(m)}^{i(1)} y_1^m = 0.$$

Theorem 4.3. The Cartan canonical connection $CT_3$ of the rheonomic Chernov metric (3.1) has three effective local torsion $d$-tensors:

$$P_{1(1)j}^{(1)} = -\frac{1}{2} \kappa_{11} C_{i(j)}^{k(1)}, \quad P_{i(j)}^{(1)} = C_{i(j)}^{k(1)}, \quad R_{1(1)j}^{(k)} = \frac{1}{2} \left( \frac{d\kappa_{11}^1}{dt} - \kappa_{11}^1 \kappa_{11}^1 \right) \delta_j^i.$$
Proof. A general $h$-normal $\Gamma$-linear connection on the 1-jet space $J^1(\mathbb{R}, M^4)$ is characterized by eight effective $d-$tensors of torsion (cf. [13]). For our Cartan canonical connection $CT[3]$ these reduce to the following three (the other five cancel):

\[ P^{(k)}_{i(j)} = \frac{\partial N^{(k)}_{(i)j}}{\partial y^1} - L^k_{ji}, \quad R^{(k)}_{i(1)j} = \frac{\delta M^{(k)}_{(1)j}}{\delta x^j} - \frac{\delta N^{(k)}_{(1)j}}{\delta t}, \quad P^{k(1)}_{i(j)} = C^{k(1)}_{i(j)}. \]

\[ \square \]

Theorem 4.4. The Cartan canonical connection $CT[3]$ of the rheonomic Chernov metric (5.1) has three effective local curvature $d-$tensors:

\[ R^{(1)}_{ij(k)} = \frac{1}{4} \partial_{x^k}^1 \partial_{x^i}^1 \partial_{x^j}^1 S^{(1)(1)}_{i(j)(k)}, \quad P^{(1)}_{ij(k)} = \frac{1}{2} \partial_{x^k}^1 \partial_{y^1}^1 S^{(1)(1)}_{i(j)(k)}, \]

\[ S^{(1)(1)}_{i(j)(k)} = \frac{\partial C^{(1)}_{i(k)j}}{\partial y^1} + \frac{\partial C^{(1)}_{i(k)} y^1}{\partial y^1} + C^{m(1)}_{i(j)} C^{(1)}_{m(k)} - C^{(1)}_{i(k)} C^{(1)}_{j(m)}. \]

Proof. A general $h$-normal $\Gamma$-linear connection on the 1-jet space $J^1(\mathbb{R}, M^4)$ is characterized by five effective $d-$tensors of curvature (cf. [13]). For our Cartan canonical connection $CT[3]$ these reduce to the following three (the other two cancel):

\[ R_{ijk} = \frac{\delta L^i_{jk}}{\delta x^k} - \frac{\delta L^j_{ik}}{\delta x^k} + L^m_{ij} L^l_{mk} - L^m_{ik} L^l_{mj}, \]

\[ P^{(1)}_{ij(k)} = \frac{\partial L^i_{jk}}{\partial y^1} - C^{(1)}_{i(k)j} + C^{m(1)}_{i(k)} P^{(1)}_{(m)(1)(j)k}, \]

\[ S^{(1)(1)}_{i(j)(k)} = \frac{\partial C^{(1)}_{i(k)j}}{\partial y^1} + \frac{\partial C^{(1)}_{i(k)} y^1}{\partial y^1} + C^{m(1)}_{i(j)} C^{(1)}_{m(k)} - C^{(1)}_{i(k)} C^{(1)}_{j(m)}, \]

where

\[ C^{(1)}_{i(k)j} = \frac{\partial C^{(1)}_{i(k)j}}{\delta x^j} + C^{m(1)}_{i(k)} L^l_{mj} - C^{(1)}_{i(m)} L^l_{mj} - C^{(1)}_{i(m)} L^l_{mj}. \]

\[ \square \]

Remark 4.5. We have denoted by $/1$, $i$ and $\|^{(1)}_{(i)}$ the Cartan covariant derivatives with respect to the corresponding $\mathbb{R}-$horizontal (temporal), $M-$horizontal and vertical vector fields of the basis [4.1].

5 Applications of the rheonomic Chernov metric

5.1 Geometrical gravitational theory

From a physical point of view, on the 1-jet space $J^1(\mathbb{R}, M^4)$, the rheonomic Chernov metric (5.1) produces the adapted metrical $d-$tensor

\[ G_{[3]} = h_{11} dt \otimes dt + g_{[i]j} dx^i \otimes dx^j + h^{11} g_{[i]j} \delta y^1_i \otimes \delta y^1_j, \]

(5.1)
where $g_{[3]ij}$ is given by (3.3). This may be regarded as a "non-isotropic gravitational potential". In such a physical context, the nonlinear connection $\Gamma_{[3]}$ (used in the construction of the distinguished 1-forms $\delta y_1^r$) prescribes, most likely, a sort of "interaction" between $(t)$-, $(x)$- and $(y)$-fields.

We postulate that the non-isotropic gravitational potential $G_{[3]}$ is governed by the geometrical Einstein equations

$$ \text{Ric} (C\Gamma_{[3]}) - \frac{\text{Sc} (C\Gamma_{[3]})}{2} G_{[3]} = \mathcal{K} T, $$

(5.2)

where $\text{Ric} (C\Gamma_{[3]})$ is the Ricci $d$-tensor associated to the Cartan canonical connection $C\Gamma_{[3]}$ (in Riemannian sense and using adapted bases), $\text{Sc} (C\Gamma_{[3]})$ is the scalar curvature, $\mathcal{K}$ is the Einstein constant and $T$ is the intrinsic stress-energy $d$-tensor of matter.

In this way, working with the adapted basis of vector fields (1.1), we can find the local geometrical Einstein equations for the rheonomic Chernov metric (3.1). Firstly, by direct computations, we find:

**Theorem 5.1.** The Ricci $d$-tensor of the Cartan canonical connection $C\Gamma_{[3]}$ of the rheonomic Chernov metric (3.1) has the following effective local Ricci $d$-tensor components:

\[
R_{ij} := R^r_{ijr} = \frac{1}{4} S_{[3]}^{i(r)} (\mathcal{K} T)^{1)}_{(i)(j)};
\]

\[
P_{(i)}^{(1)}_{(j)} = P_{(i)(j)}^{(1)} = \frac{1}{2} S_{[3]}^{i(1)} (\mathcal{K} T)^{1)}_{(i)(j)};
\]

\[
S_{(i)(j)}^{1)} = -9 S_{[3]}^{rql} S_{[3]}^{rm1} \left( S_{[3]}^{ijpq} S_{[3]}^{qr1} - S_{[3]}^{i1pq} S_{[3]}^{j1rq} + \frac{1}{12} S_{[3]}^{i111} S_{[3]}^{j11} - \frac{1}{18} S_{[3]}^{i111} S_{[3]}^{j11},
\]

where $S_{(i)(j)}^{1)} = S_{r(1)(r)}^{(1)}$ is the vertical Ricci $d$-tensor field.

**Proof.** Using the equality (1.3), by laborious direct computations, we obtain the following equalities (we assume implicit summation by $r$ and $m$):

\[
\frac{\partial C_{i(r)}^{r(1)}}{\partial y^1_k} = 3 \frac{\partial S_{[3]}^{rml}}{\partial y^1_k} S_{[3]}^{ijm} - \frac{1}{2} S_{[3]}^{ij1} S_{[3]}^{j11} + \frac{5}{9} S_{[3]}^{i11} S_{[3]}^{j11},
\]

\[
\frac{\partial C_{i(k)}^{r(1)}}{\partial y^1_k} = 3 \frac{\partial S_{[3]}^{rml}}{\partial y^1_k} S_{[3]}^{irm} - \frac{2}{3} S_{[3]}^{i11} S_{[3]}^{j11} + \frac{2}{3} S_{[3]}^{i11} S_{[3]}^{j11},
\]

\[
C_{m(k)}^{r(1)} C_{(l)}^{m(l)} = 9 S_{[3]}^{rql} S_{[3]}^{rm1} S_{[3]}^{ijp} S_{[3]}^{jrq} - \left( \frac{1}{2} S_{[3]}^{i11} S_{[3]}^{j11} S_{[3]}^{j11} + \frac{1}{6} S_{[3]}^{i11} S_{[3]}^{j11} + \frac{1}{9} S_{[3]}^{i11} S_{[3]}^{j11} S_{[3]}^{j11},
\]

9
Finally, taking into account that we have
\[
\frac{\partial C^{r(1)}}{\partial y_{i(1)(j)}} = \frac{\partial C^{r(1)}}{\partial y_{1}} - C_{i(1)(j)}^{m(1)} C_{m(1)}^{r(1)} - C_{m(1)}^{r(1)} C_{m(1)(j)}^{i(1)},
\]
and using the equalities
\[
\frac{\partial S_{r(1)(j)}}{\partial y_{1}} S_{11}^{1} = -6 S_{r(1)(j)}^{1} S_{11}^{1},
\]
we obtain the required result. \(\square\)

**Remark 5.2.** The vertical Ricci \(d\)-tensor \(S^{(1)(1)}_{(i)(j)}\) has the following property of symmetry:
\[
S^{(1)(1)}_{(i)(j)} = S^{(1)(1)}_{(j)(i)}.
\]

**Proposition 5.3.** The scalar curvature of the Cartan canonical connection \(C_{[3]}^{\Gamma} \) of the rheonomic Chernov metric \((3.1)\) is given by
\[
S_{c} \left( C_{[3]}^{\Gamma} \right) = 4 h_{11}^{11} + \frac{\chi_{11}^{1} \chi_{11}^{1}}{4} \cdot S_{11}^{1}, \quad \text{where} \quad S_{11}^{1} = g_{[3]}^{pq} S_{(p)(q)}^{(1)(1)}.
\]

**Proof.** The general formula for the scalar curvature of a Cartan connection is (cf. \[13\])
\[
S_{c} \left( C_{[3]}^{\Gamma} \right) = g_{[3]}^{pq} R_{pq} + h_{11}^{11} g_{[3]}^{pq} S_{(p)(q)}^{(1)(1)}.
\]

Describing the global geometrical Einstein equations \((5.2)\) in the adapted basis of vector fields \((4.1)\), it is known the following important geometrical and physical result (cf. \[13\]):

**Theorem 5.4.** The local geometrical Einstein equations that govern the non-isotropic gravitational potential \((5.1)\) (produced by the rheonomic Chernov metric \((3.1)\)) are given by:
\[
\begin{align*}
\xi_{11} S_{11}^{1} h_{11} &= T_{11} \\
\frac{\chi_{11}^{1} \chi_{11}^{1}}{4 \kappa} S_{(i)(j)}^{(1)(1)} + \xi_{11} S_{11}^{1} g_{ij} &= T_{ij} \\
\frac{1}{\kappa} S_{(i)(j)}^{(1)(1)} + \xi_{11} S_{11}^{1} g_{ij} &= T_{(i)(j)}^{(1)(1)}.
\end{align*}
\]
\[
\begin{cases}
0 = T_{1i}, & 0 = T_{1i}, & 0 = T_{(1)i1}, \\
0 = T_{1(i)}^{(1)}, & \frac{\kappa_{11}}{2K} S_{(i)(j)}^{(1)} = T_{i(j)}^{(1)}, & \frac{\kappa_{11}}{2K} S_{(i)(j)}^{(1)} = T_{(i)j}^{(1)},
\end{cases}
\] (5.4)

where

\[\xi_{11} = -\frac{4h_{11} + \kappa_{11}}{8K} \kappa_{11}.\]

**Remark 5.5.** The local geometrical Einstein equations (5.3) and (5.4) impose as the stress-energy \( d-T \)ensor of matter \( T \) to be symmetrical. In other words, the stress-energy \( d-T \)ensor of matter \( T \) must satisfy the local symmetry conditions

\[T_{AB} = T_{BA}, \quad \forall A, B \in \left\{ 1, \ i, \ (1) \right\}. \]

### 5.2 Geometrical electromagnetic theory

In the paper [13], using only a given Lagrangian function \( L \) on the 1-jet space \( J^1(\mathbb{R}, M^4) \), a geometrical theory for electromagnetism was also constructed. In this background of jet relativistic rheonomic Lagrange geometry, we work with an electromagnetic distinguished 2-form

\[F = F_{(i)j}^((1)) dy_1^i \wedge dx^j,\]

where

\[F_{(i)j}^((1)) = \frac{h_{11}}{2} \left[ g_{jm} N_{(1)i}^m - g_{im} N_{(1)j}^m + \left( g_{ir} L_{jm}^r - g_{jr} L_{im}^r \right) y_1^m \right],\]

which is characterized by the following geometrical Maxwell equations [13]

\[
\begin{cases}
F_{(i)j}^{(1)} & = \frac{1}{2} A_{(i)j} \left\{ D_{(1)i}^{(1)} - D_{(i)m}^{(1)} C_{(i)j}^m + \left( d_{(1)(1)}^{(1)} R_{(1)(1)j}^{(1)} - \left( g_{(1)(1)j} - g_{(1)(1)i} \right) h_{11}^1 g_{pq} y_1^q \right) \right\}, \\
\sum_{\{i,j,k\}} F_{(i)j}^{(1)} & = -\frac{1}{8} \sum_{\{i,j,k\}} \frac{\partial^3 L}{\partial y_1^i \partial y_1^j \partial y_1^m} \left[ \frac{\delta N_{(1)i}^m}{\delta x^k} - \frac{\delta N_{(1)k}^m}{\delta x^i} \right] y_1^p, \\
\sum_{\{i,j,k\}} F_{(i)j}^{(1)} & = 0,
\end{cases}
\]

11
where $A_{i,j}$ denotes an alternate sum, $\sum_{i,j,k}$ means a cyclic sum and we have

$$\begin{align*}
\mathcal{D}^{(1)}_{i1} & = \frac{h^{11}}{2} \frac{\delta g_{ip}}{\delta x^p} y^i_1, \\
D^{(1)}_{i1} & = h^{11} g_{ip} \left[ -N^{(p)}_{(1)j} + L^m_{2jm} y^m_1 \right], \\
D^{(1)}_{i1} & = h^{11} \left[ g_{ij} + g_{ip} C^{(1)}_{m(j)} y^m_1 \right], \\
D^{(1)}_{i1} & = \frac{\delta \mathcal{D}^{(1)}_{i1}}{\delta x^j} - \mathcal{D}^{(1)}_{i1} L^m_{ij}, \\
G^{k}_{ij} & = \frac{\delta G^k_{i1}}{\delta x^j} + G^m_{i1} L^k_{mj} - G^k_{m1} L^m_{ij}, \\
F^{(1)}_{(i)j}/1 & = \frac{\delta F^{(1)}_{(i)j}}{\delta t} + F^{(1)}_{(i)j} x^1_{11} - F^{(1)}_{(m)j} G^m_{i1} - F^{(1)}_{(i)m} G^m_{j1}, \\
F^{(1)}_{(i)j}/k & = \frac{\delta F^{(1)}_{(i)j}}{\delta x^k} - F^{(1)}_{(m)j} L^m_{ik} - F^{(1)}_{(i)m} L^m_{jk}, \\
F^{(1)}_{(i)j}/(k) & = \frac{\partial F^{(1)}_{(i)j}}{\partial y^k_i} - F^{(1)}_{(m)j} C^{(1)}_{i(k)} - F^{(1)}_{(i)m} C^{(1)}_{j(k)}. 
\end{align*}$$

For the rheonomic Chern metric (6.1) we have $L = F^2_{[3]}$ and, consequently, we obtain the electromagnetic 2-form

$$\mathcal{F} := \mathcal{F}_{[3]} = 0.$$ 

In conclusion, the locally-Minkowski rheonomic Chern geometrical electromagnetic theory is trivial. In our opinion, this fact suggests that the metric (6.1) has rather gravitational connotations than electromagnetic ones in its $h$–flat ($x$–independent) version, which leads to the need of considering $x$–dependent conformal deformations of the structure (as, e.g., recently proposed by Garas'ko in [6]).

6 Conclusion

In recent physical and geometrical studies ([11, 14, 13]), an important role is played by the Finslerian metric

$$F_{[2]}(t, y) = \sqrt{h^{11}(t)} \cdot \sqrt{y^1_1 y^2_1 + y^1_1 y^3_1 + y^1_1 y^4_1 + y^2_1 y^3_1 + y^2_1 y^4_1 + y^3_1 y^4_1}, \quad (6.1)$$

which produces the fundamental metrical $d$–tensor

$$g_{ij} := g_{[2]ij} = \frac{h^{11}(t)}{2} \frac{\partial^2 F^2_{[2]}}{\partial y^i_1 \partial y^j_1} = \frac{1}{2} (1 - \delta_{ij}) \Rightarrow g^{jk} := g^{i=k} = \frac{2}{3} (1 - 3 \delta^{jk}).$$

The Finslerian metric (6.1) generates the jet canonical nonlinear connection

$$\Gamma_{[2]} = \left( M^{(i)}_{(1)1} = -\kappa_{11} y^j_1, \quad N^{(i)}_{(1)j} = -\frac{\kappa_{11}}{2} \delta^i_j \right).$$

12
and the Cartan $\Gamma^{[2]}$-linear connection

$$CT^{[2]} = \left( x^{1}_{11}, C^{k}_{j1} = 0, L^{i}_{jk} = 0, C^{(1)}_{j(k)} = 0 \right).$$

For the Cartan connection $CT^{[2]}$ all torsion $d-$tensors vanish, except

$$R^{(k)}_{(1)1j} = \frac{1}{2} \left[ \frac{dx^{1}_{11}}{dt} - x^{1}_{11} x^{1}_{11} \right] \delta^{k}_{j},$$

and all curvature $d-$tensors are zero. Consequently, all Ricci $d-$tensors vanish and the scalar curvature cancels. The geometrical Einstein equations (5.2) produced by the Finslerian metric (6.1) become trivial, namely

$$0 = T_{AB}, \quad \forall A, B \in \left\{ 1, i, (1) \right\}.$$  

At the same time, the electromagnetic 2-form associated to the Finslerian metric (6.1) has the trivial form

$$F := F^{[2]} = 0.$$  

In conclusion, both the metric-tensor based geometrical (gravitational and electromagnetic) theories are shown to be trivial for the case of the rheonomic locally Finslerian Chernov metric (6.1). Hence, for developing a non-trivial $h-$model, one may need to consider other closely related alternatives offered by $h-$conformally-deformed models or by $x-$dependent rheonomic Finsler metrics of $m-$root type.
