**ATIF/REFERENCE:** Arslan, B. & Uslu, K. (2021). Number of Subsets of the Set \([n]\) Including No Three Consecutive Even Integers. *European Journal of Science and Technology*, (28), 552-556.

**Abstract**

Consider an integer sequence counting the number of subsets of \(S\) of the set \(\{1, 2, \ldots, n\}\) containing no three consecutive even integers. The sequence is associated with the Tribonacci sequence. Furthermore, we investigate some basic properties of the sequence.

**Keywords:** Tribonacci numbers, recurrence relation, consecutive even integers, generating function, combinatorial representation.

\([n]\) Kümesinin Ardışık Üç Çift Tam Sayı İçermeyen Alt Kümelerinin Sayısı

**Öz**

\(\{1, 2, \ldots, n\}\) kümesinin ardışık üç çift tam sayı içermeyen \(S\) alt kümelerinin sayısı veren tam sayı dizisini alalım. Bu dizi Tribonacci sayı dizisi ile ilişkilendirildi. Ayrıca dizinin bazı temel özellikleri incelendi.

**Anahtar Kelimeler:** Tribonacci sayıları, rekürans bağıntı, ardışık çift sayılar, üreteç fonksiyon, combinatorial gösterim.

1. Introduction

Fibonacci sequence and similar integer sequences are used in many fields from engineering to art. The Tribonacci numbers are a generalization of the Fibonacci numbers. Some properties of Tribonacci numbers are given in [1, 3, 5, 6, 9, 10].

The Tribonacci sequence \( (T_n)_{n \geq 0} \) is defined by the third-order recurrence relation:
\[
T_n = T_{n-1} + T_{n-2} + T_{n-3},
\]
\[
T_0 = 0, T_1 = 1, T_2 = 1
\]
(1)

In [7] the Binet’s formula for the Tribonacci sequence is given by
\[
T_n = \frac{\alpha^{n+1} - \beta^{n+1} + \gamma^{n+1}}{(\alpha - \beta)(\alpha - \gamma) + (\beta - \alpha)(\beta - \gamma) + (\gamma - \alpha)(\gamma - \beta)}
\]
(2)
where \( \alpha, \beta \) and \( \gamma \) are roots of the cubic equation \( x^3 - x^2 - x - 1 = 0 \), i.e.,
\[
\alpha = \frac{1 + \sqrt[3]{19 + 3\sqrt{33}} + \sqrt[3]{19 - 3\sqrt{33}}}{3},
\]
\[
\beta = \frac{1 + \omega \sqrt[3]{19 + 3\sqrt{33}} + \omega^2 \sqrt[3]{19 - 3\sqrt{33}}}{3},
\]
\[
\gamma = \frac{1 + \omega^2 \sqrt[3]{19 + 3\sqrt{33}} + \omega \sqrt[3]{19 - 3\sqrt{33}}}{3},
\]
where \( \omega = \frac{-1+i\sqrt{3}}{2} \) is a primitive cube root of unity.

"The number of subsets \( S \) of the set \( \{1, 2, \ldots, n\} \) such that \( S \) contains no three consecutive integers." can be expressed in terms of the Tribonacci numbers. The answer is \( T_{n+2} \) by obtaining a recurrence by considering those subsets \( S \) which do or do not contain the first element ‘1’. By taking consecutive even integers instead of consecutive integers, we consider the following counting problem:

What is the number of subsets \( S \) of the set \( \{1, 2, \ldots, n\} \) such that \( S \) contains no three consecutive even integers? In this paper, we denote the sequence by \( (b_n)_{n \geq 0} \) corresponding to the counting problem.

After obtaining recursive definition of the sequence \( (a_n)_{n \geq 0} \), we give the generating function, the closed form formula, the combinatorial representation and limit of the ratios of consecutive terms of the sequence.

2. Main Results

2.1. Recursive definition of the sequence

Let’s write subsets \( S \) of the set \( \{1, 2, \ldots, n\} \) such that \( S \) contains no three consecutive even integers for some small \( n \) values:

It’s clear that for \( n < 6 \), \( b_n = 2^n \). Since there are no three consecutive even integers for \( n < 6 \). Hence, we get the initial conditions:
\[
b_0 = 1, b_1 = 2, b_2 = 4, b_3 = 8, b_4 = 16, b_5 = 32
\]
For \( n = 6 \), there are \( 2^6 - 2^3 = 56 \) subsets of the set \( \{1, 2, 3, 4, 5, 6\} \) such that \( S \) contains no three consecutive even integers. Hence, \( b_6 = 56 \).

Consider subsets counted by \( b_n \). Let’s find a recurrence for the sequence \( (b_n)_{n \geq 0} \). For \( n > 5 \) there are the following cases for the subsets:

1) The number of subsets not containing 2 as an element is \( 2b_{n-2} \).
2) The number of subsets which contain 2, but don’t contain 4, is \( 4b_{n-4} \).
3) The number of subsets which contain 2 and 4, but don’t contain 6, is \( 8b_{n-6} \).

This gives a recurrence
\[
b_n = 2b_{n-2} + 4b_{n-4} + 8b_{n-6}
\]
(3)

2.2. Generating function and the Binet formula of the sequence

Let the generating function associated to the sequence \( (b_n)_{n \geq 0} \) be the formal power series
\[
F(x) = \sum_{n \geq 0} b_n x^n.
\]
To find \( F(x) \), multiply both sides of the recurrence relation (3) by \( x^n \) and sum over the values of \( n \) for which the recurrence is valid, namely, over \( n \geq 6 \). We get,
\[
\sum_{n \geq 6} b_n x^n = 2 \sum_{n \geq 6} b_{n-2} x^n + 4 \sum_{n \geq 6} b_{n-4} x^n + 8 \sum_{n \geq 6} b_{n-6} x^n
\]
(4)

Then try to relate these sums to the unknown generating function \( F(x) \). We have,
\[
\sum_{n \geq 6} b_n x^n = F(x) - b_0 - b_1 x - b_2 x^2 - b_3 x^3 - b_4 x^4 - b_5 x^5
\]
\[
= F(x) - 1 - 2x - 4x^2 - 8x^3 - 16x^4 - 32x^5
\]
\[
\sum_{n \geq 6} 2 b_{n-2} x^n = 2x^2 \sum_{n \geq 0} b_{n-2} x^{n-2} = 2x^2(F(x) - b_0 - b_1 x - b_2 x^2 - b_3 x^3) = 2x^2(F(x) - 1 - 2x - 4x^2 - 8x^3)
\]
\[
\sum_{n=0}^{\infty} 4b_{n-4}x^n = 4x^4 \sum_{n=0}^{\infty} b_{n-4}x^{n-4} = 4x^4(F(x) - b_3 - b_4x)
\]
\[
= 4x^4(F(x) - 1 - 2x)
\]
\[
\sum_{n=0}^{\infty} 8b_{n-6}x^n = 8x^6 \sum_{n=0}^{\infty} b_{n-6}x^{n-6} = 8x^6F(x)
\]

If we write these results on the two sides of (4), we find
\[
F(x) - 1 - 2x - 4x^2 - 8x^3 - 16x^4 - 32x^5
\]
\[= 2x^2(F(x) - 1 - 2x - 4x^2 - 8x^3) + 4x^4(F(x) - 1 - 2x) + 8x^6F(x).
\]

Which is trivial to solve for the unknown generating function \(F(x)\) in the form
\[
F(x) = \frac{1 + 2x + 2x^2 + 4x^3 + 4x^4 + 8x^5}{1 - 2x^2 - 4x^4 - 8x^6}.
\]

**Theorem 1.** For \(n \in \mathbb{N}\), let \(b_n\) be the number of subsets of \(S\) of the set \([n] = \{1, 2, \ldots, n\}\) containing no three consecutive even integers. Then we have the following formulas for the subsequences of \((b_n)_{n \geq 0}\)
\[
b_{2n} = 2^n T_{n+3},
\]
\[
b_{2n+1} = 2^{n+1} T_{n+2}.
\]

where \(T_n\) is the \(n\)th Tribonacci number defined by (1).

**Proof.** If \(A(x)\) is the generating function for even terms of the sequence \((b_n)_{n \geq 0}\), then it is clear that \(A(x) = \frac{1}{2}(F(x) + F(-x))\). Substituting (5) we get,
\[
A(x) = \frac{1 + 2x^2 + 4x^4}{1 - 2x^2 - 4x^4 - 8x^6} \tag{8}
\]
Substituting \(u = 2x^2\) in (8) we have,
\[
A(u) = \frac{1 + u + u^2}{1 - u - u^2 - u^3}.
\]
The generation function of the Tribonacci sequence with initial conditions \(T_0 = 1, T_1 = 1, T_2 = 2\) is
\[
\frac{1}{1 - x - x^2 - x^3}.
\]
\[\left(1, 1, 2, 4, 7, 13, 24, \ldots \right) \leftrightarrow \frac{1}{1 - x - x^2 - x^3} \tag{9}
\]
Now let’s right-shift the sequence (9) by adding 1 and 2 leading zeros respectively:
\[
\left(0, 1, 1, 2, 4, 7, 13, 24, \ldots \right) \leftrightarrow \frac{x}{1 - x - x^2 - x^3}
\]
\[
\left(0, 0, 1, 1, 2, 4, 7, 13, 24, \ldots \right) \leftrightarrow \frac{x^2}{1 - x - x^2 - x^3}
\]

Let’s try to obtain the generating function \(A(x)\) using the generating functions of the Tribonacci sequences given in terms of initial conditions:
\[
A(u) = (1 + u + 2u^2 + 4u^3 + \ldots + 3^n u^n + \ldots)
\]
\[
+ (0 + u + 2u^2 + 6u^3 + \ldots + 3^n u^n + \ldots)
\]
\[
+ (0 + 0u + u^2 + u^3 + \ldots + 3^n u^n + \ldots)
\]
\[
A(u) = (1 + 2u + 4u^2 + 7u^3 + \ldots + T_{n+2}u^n + \ldots)
\]
\[
A(x) = (1 + 2(2x^2) + 4(2x^2)^2 + 7(2x^2)^3 + \ldots + T_{n+2}(2x^2)^n + \ldots)
\]
\[
A(x) = 1 + 2.2x^2 + 4.2^2x^4 + 7.2^3x^6 + \ldots + T_{n+2}.2^n x^{2n} + \ldots
\]

Since \(A(x)\) is the generating function for even terms of the sequence \((b_n)_{n \geq 0}\), we have
\[
b_{2n} = 2^n T_{n+3}
\]
where \(T_n\) is the Tribonacci numbers with initial conditions;
\[
T_0 = 0, T_1 = 1, T_2 = 2.
\]

If \(B(x)\) is the generating function for odd terms of the sequence \((b_n)_{n \geq 0}\), then it is clear that \(B(x) = \frac{1}{2}(F(x) - F(-x))\). Similarly using (5) and generating function method, for \(n \geq 0\) we have
\[
b_{2n+1} = 2^{n+1} T_{n+2}.
\]
The proof is completed.

**Corollary 1.** For \(n \in \mathbb{N}\), let \(a_n\) be the number of subsets of \(S\) of the set \([n] = \{1, 2, \ldots, n\}\) including no three consecutive even integers. Then we have the following closed form formula
\[
b_n = \left\lfloor \frac{n+1}{2} \right\rfloor T_{\left\lfloor \frac{n+1}{2} \right\rfloor}.
\]

where \(T_n\) is the \(n\)th Tribonacci number, \([n]\) is the floor of \(n\).

**Proof.** Using Theorem 1, we can write piecewise defined sequence \((b_n)_{n \geq 0}\) as follows:
\[
b_n = \begin{cases} 
2^n T_{n+3}, & \text{if } n \text{ is even} \\
2^{n+1} T_{n+2}, & \text{if } n \text{ is odd}
\end{cases}
\]

Then it is easy to see that
\[
b_n = 2^{\left\lfloor \frac{n+1}{2} \right\rfloor} T_{\left\lfloor \frac{n+1}{2} \right\rfloor}.
\]

**2.3. Obtaining Binet formula of the sequence with combinatorial approach**

Let’s try to find formulas respectively for the subsequences \((b_{2n})_{n \geq 0}\) and \((b_{2n-1})_{n \geq 1}\) of the sequence \((b_n)_{n \geq 0}\). Let’s consider the set \(M = \{1, 2, 3, \ldots, 2n\}\). For every \(n \in \mathbb{N}\), let \(d_{2n}\) be the number of subsets of \(S\) of the set \(M = \{1, 2, 3, \ldots, 2n\}\)

\[554\]
containing no three consecutive even integers. First, we separate the set $M$ into two disjoint subset $S_1 = \{1, 3, 5, \ldots, 2n-1\}$ and $S_2 = \{2, 4, 6, \ldots, 2n\}$. First notice that, counting subsets from $S_2$ including no three consecutive even integers is equivalent to counting subsets from $\{1, 2, \ldots, n\}$ including no three consecutive integers. Hence there are $T_{n+2}$ subsets where $T_n$ is the Tribonacci numbers defined by (1). The number of subsets of $S_1$ include no three consecutive even integers is equal to $2^3$ since all elements of $S_1$ are odd integers. Using multiplication principle, the total number of subsets of $M$ containing no three consecutive even integers is $2^nT_{n+2}$. Hence, we have

$$b_{2n} = 2^nT_{n+2}.$$ 

Considering the set, $M = \{1, 2, 3, \ldots, 2n+1\}$ and using the same counting technique we have

$$a_{2n+1} = 2^{n+1}T_{n+2}.$$ 

### 2.4. The combinatorial representation of the sequence

The explicit formula of Tribonacci sequence is given in [4] by the formula

$$T_n = \sum_{i=0}^{\left \lfloor \frac{n-1}{2} \right \rfloor} \sum_{j=0}^{i} \binom{i}{j} \binom{n-1-i-j}{i}.$$ 

Using (6), (7) and (10) we have the combinatorial representation of the sequence $(b_n)_{n \geq 0}$

$$b_{2n} = 2^n \sum_{i=0}^{\left \lfloor \frac{n+1}{2} \right \rfloor} \sum_{j=0}^{i} \binom{i}{j} \binom{n+1-i-j}{i}, \quad n \geq 0$$

$$b_{2n+1} = 2^{n+1} \sum_{i=0}^{\left \lfloor \frac{n+1}{2} \right \rfloor} \sum_{j=0}^{i} \binom{i}{j} \binom{n+1-i-j}{i}, \quad n \geq 0.$$ 

Writing combinatorial identity for $2^n$ and using (11) and (12) we have,

$$b_{2n} = \sum_{k=0}^{n} \binom{n}{k} \sum_{i=0}^{\left \lfloor \frac{n+1}{2} \right \rfloor} \sum_{j=0}^{i} \binom{i}{j} \binom{n+1-i-j}{i}, \quad n \geq 0$$

$$b_{2n+1} = \sum_{k=0}^{n+1} \binom{n+1}{k} \sum_{i=0}^{\left \lfloor \frac{n+1}{2} \right \rfloor} \sum_{j=0}^{i} \binom{i}{j} \binom{n+1-i-j}{i}, \quad n \geq 0.$$ 

### 2.5. Limit of the ratios of consecutive terms of the sequence

It’s well known that the limit of the ratio of two consecutive Fibonacci numbers is the Golden Ratio. A similar relationship occurs for the Tribonacci numbers.

Define the sequence $x_n = \frac{T_{n+1}}{T_n}$ for $n \geq 1$ and $\lim_{n \to \infty} x_n = L$ exist. Using (1) for $n \geq 3$ we have

$$x_n = \frac{T_{n-2} + T_{n-1} + T_n}{T_n} = \frac{T_{n-2} + T_{n-1} + 1}{T_n},$$

$$x_n = \frac{T_{n-1} + T_{n-2} + T_n}{T_{n-1}} = \frac{T_{n-1} + T_{n-2} + 1}{T_{n-1}}.$$ 

$$x_n = \frac{1}{r_{n-2} r_{n-1} r_{n-2}} + \frac{1}{r_{n-1}} + 1,$$

$$x_n = \frac{1}{x_{n-2} x_{n-1}} + 1 + 1.$$ 

Taking the limit of both sides of (1), we obtain $L = \frac{1}{12} + \frac{1}{L} + 1$. Then $L^2 - L^2 + L - 1 = 0$. We know that the terms of values of $T_n$ are real-valued and positive. From (13) we know that $L = \frac{1 + \sqrt{19 + 3\sqrt{33} + \sqrt{19 - 3\sqrt{33}}}}{3}$ is the only real-valued root of the equation $L^2 - L^2 + L - 1 = 0$. Therefore,

$$\lim_{n \to \infty} \frac{T_{n+1}}{T_n} = \frac{1 + \sqrt{19 + 3\sqrt{33} + \sqrt{19 - 3\sqrt{33}}}}{3} \approx 1.839286755.$$ 

For any positive integer $k$ and $\alpha = \frac{1 + \sqrt{19 + 3\sqrt{33} + \sqrt{19 - 3\sqrt{33}}}}{3}$ the following limit is obtained in [1].

$$\lim_{n \to \infty} \frac{T_{n+k}}{T_n} = \alpha^k$$

**Corollary 2.** For $n \in \mathbb{N}$, let $b_n$ be the number of subsets of the set $[n] = \{1, 2, \ldots, n\}$ including no three consecutive even integers. Then we have the following results:

$$\lim_{n \to \infty} \frac{b_{2n+1}}{b_{2n}} = 2$$

$$\lim_{n \to \infty} \frac{b_{2n+2k}}{b_{2n+1}} = 2^{k-1} \alpha^k$$

**Proof.** (16) is an immediate consequence of (6) and (7). (17) is implied by (6), (7) and (14).

**Corollary 3.** For $n \in \mathbb{N}$, let $b_n$ be the number of subsets of the set $[n] = \{1, 2, \ldots, n\}$ including no three consecutive even integers. Then we have the following limit:

$$\lim_{n \to \infty} \frac{b_{2n+2k}}{b_{2n+1}} = 2^{k-1} \alpha^k$$

**Proof.** (18) is an immediate consequence of (6), (7) and (15).
3. Conclusions

In this paper, we first obtained recursive formula of the sequence \((b_n)_{n\geq 0}\) which counts the number of subsets of \(S\) of the set \([n] = \{1, 2, \ldots, n\}\) including no three consecutive even integers. Then we had the closed form formula of the sequence \((b_n)_{n\geq 0}\) using the generating function method and combinatorial approach. The combinatorial representation and limit of the ratio of consecutive terms of the sequence are obtained.
