ABSTRACT
In this paper, a numerical method is proposed for solving weakly singular Fredholm integral equations in Hilbert reproducing kernel space (RKHS). The Taylor series is used to remove singularity and reproducing kernel function are used as a basis. The effectiveness and stability of the numerical scheme is illustrated through two numerical examples.

Keyword:
Fredholm integral
Reproducing kernel
Taylor series
Weakly singular

1. INTRODUCTION
Weakly singular Fredholm integral equations (WSFIEs) have many applications in problems of applied sciences, mathematical physics, astrophysics and solid mechanics. The numerical solvability of these equations and other related equations have been pursued by several authors and solved by many numerical methods such as generalization of the Euler-Maclaurin summation formula [1], application of homotopy perturbation method [2], differential transform method [3], discrete Galerkin method [4], modified HPM method [5], SCW method [6], spectral methods [7], fractional linear multi-step methods [8], Jacobi spectral method [9] and other methods occurred in [10-14].

Recently, based on reproducing kernel theory, the reproducing kernel method (RKM) has been successfully applied to integral equations, Hilbert type singular integral equations of the second kind [15], Fredholm integral equation of the first kind [16], singular integral equation with cosecant kernel [17], the reproducing kernel method has been presented and developed in [18-25].

In this letter, a numerical scheme by using reproducing kernel space and Taylor series to solve the following weakly singular Fredholm integral equation is provided:

\[ u(x) = f(x) + \int_0^1 k(x,t)u(t)dt, \quad 0 \leq x \leq 1, \]  

(1)

where kernel \( k(x,t) = \frac{1}{(1-t)^\alpha} \) with the assumption \( 0 < \alpha < 1 \), is weakly singular and \( u(x) \) is the unknown function to be determined.
This paper is organized as five sections including the introduction. In the next section, the reproducing kernel spaces are presented in order to construct reproducing kernel functions in the space $W_2^m[0,1]$. Equation (1) is converted into an equivalent equation and the representation of approximate solution for Fredholm integral equations with a weakly singular kernel is obtained in Section 3. The numerical examples are presented to demonstrate the accuracy of the method in Section 4. The last section is a brief conclusion.

2. A REPRODUCING KERNEL HILBERT SPACE $W_2^m[0,1]$

The function space $W_2^m[0,1]$ is defined as follows:

**Definition 2.1.** $W_2^m[0,1] = \{u(x) | u^{(m-1)}(x) \text{ is an absolutely continuous real value function, } u^{(m)}(x) \in L^2[0,1]\}$. The inner product and norm in $W_2^m[0,1]$ are defined respectively by

$\langle u, v \rangle_{W_2^m} = \sum_{i=0}^{m-1} u^{(i)}(0)v^{(i)}(0) + \int_0^1 u^{(m)}(x)v^{(m)}(x) dx$,

and

$\| u \|_m = \sqrt{\langle u, u \rangle_m}, \quad u, v \in W_2^m[0,1]$.

In general, the function space $W_2^m[0,1]$ is a reproducing kernel space and its reproducing kernel $R_x(y)$ has the following reproducing property

$\langle u(y), R_x(y) \rangle = u(x), \quad \forall u \in W_2^m[0,1]$.

The reproducing kernel $R_x(y)$ can be denoted by

$R_x(y) = \begin{cases} \sum_{i=1}^{2m} c_i(y)x^{i-1}, & x \leq y, \\ \sum_{i=1}^{2m} d_i(y)x^{i-1}, & x > y, \end{cases}$

where coefficients $c_i(y), d_i(y), i = 1, 2, \cdots, 2m$, could be obtained by solving the following equations

$\frac{\partial^i R_x(x)}{\partial x^i} \bigg|_{x=y} = \frac{\partial^i R_x(y)}{\partial x^i} \bigg|_{x=y}, \quad i = 0, 1, 2, \cdots, 2m-2,$

$(-1)^m \frac{\partial^{2m-1} R_x(x)}{\partial x^{2m-1}} \bigg|_{x=y} - \frac{\partial^{2m-1} R_x(y)}{\partial x^{2m-1}} \bigg|_{x=y} = 1,$

for $i = 0, 1, 2, \cdots, 2m$. The details of solving these equations are provided in the next section.
\[
\frac{\partial^i R_i(0)}{\partial x^i} + \sum_{m=1}^{i} \frac{\partial^{2m-i+1} R_i(0)}{2^{2m-i+1} \partial x^{2m-i+1}} = 0, \quad i = 0, 1, \ldots, m-1,
\]
\[
\frac{\partial^{2m-i+1} R_i(1)}{\partial x^{2m-i+1}} = 0, \quad i = 0, 1, \ldots, m-1. \tag{7}
\]

3. SOLVING EQUATION (1) IN THE REPRODUCING KERNEL SPACE

3.1. An Equivalent Transformation of Equation (1)

In this section, for solving Equation (1) an equivalent transformation of Equation (1) is proposed. Consider the integral equation with the given conditions in relation (1). With the Taylor series expansion of \( u(t) \) based on expanding about the given point \( x \) belonging to the interval \([0,1)\), we have the Taylor series approximation of \( u(t) \) in the following form

\[
u(t) = u(x) + (t-x)u'(x) + \frac{(t-x)^2}{2}u''(x) + \cdots + \frac{(t-x)^n}{n!}u^{(n)}(x) + \frac{(t-x)^{n+1}}{(n+1)!}u^{(n+1)}(\zeta_x), \tag{8}\]

where \( \zeta_x \) is between \( x \) and \( t \). By substituting relation (8) into Equation (1), we have

\[
u(x) - \int_0^1 (1-t)^{\alpha} \frac{1}{k!} u^{(k)}(x) dt + E_n(x) = f(x), \tag{9}\]

where \( u^{(0)}(x) = u(x) \) and \( E_n(x) = \frac{1}{(n+1)!} \int_0^1 (1-t)^{\alpha} (t-x)^n u^{(n+1)}(\zeta_x) dt \). Alternatively, we use the truncated Taylor series of \( u(t) \) and solve the following equation

\[
u(x) - \sum_{k=0}^{n} \frac{u^{(k)}(x)}{k!} \int_0^1 (1-t)^{\alpha} (t-x)^k dt = f(x), \tag{10}\]

when \( 0 < \alpha < 1 \). \( \int_0^1 (1-t)^{\alpha} (t-x)^k dt \) is computable for \( k = 0, 1, \ldots, n \). Hence, Equation (10) can be written as following

\[
\sum_{k=0}^{n} a_k(x) u^{(k)}(x) = f(x). \tag{11}\]

3.2. The Exact and Approximate Solution

The solution of Equation (11) is given in the reproducing kernel Hilbert space \( W_m^m[0,1] \), parameter \( n \) is related to the number of terms Taylor series that are chosen. We define the operator \( \mathbb{L} : W_m^m[0,1] \to W^m_m[0,1] \) as

\[
\mathbb{L} u(x) = \sum_{k=0}^{n} a_k(x) u^{(k)}(x), \tag{12}\]

then Equation (11) can be written as

---

The Combined Reproducing Kernel Method and Taylor Series for Solving Weakly ... (Azizallah Alvandi)
\[ L(u) = f(x). \] (13)

It is clear that \( L \) is a bounded linear operator and \( L^* \) is the adjoint operator of \( L \). In order to obtain the representation of the solution of Equation (11), let

\[ \phi_i(x) = R_{x_i}(x), \quad \psi_i(x) = L^* \phi_i(x) = [L_y R_y(y)](x_i), \quad (i = 1, 2, \ldots), \] (14)

where \( \{x_i\}_{i=1}^\infty \) is dense in the interval \([0, 1]\). Hence, one gets

\[ \psi_i(x) = \sum_{k=0}^{n} a_k(x_i) \frac{\partial^k R(x, y)}{\partial y^k} \bigg|_{y=x_i}. \] (15)

**Theorem 3.2.1.** If \( \{x_i\}_{i=1}^\infty \) is dense in \([0, 1]\), then \( \{\psi_i(x)\}_{i=1}^\infty \) is complete system in \( W^m_2[0, 1] \). \textit{Proof.} If for any \( u(x) \in W^m_2[0, 1] \), it has \( \langle u(x), \psi_i(x) \rangle = 0 \quad i = 1, 2, \ldots \), namely

\[ \langle u(x), \psi_i(x) \rangle = \langle u(x), (L_y R_y(y))(x_i) \rangle = 0, \] (16)

Note that \( \{x_i\}_{i=1}^\infty \) is a dense set, hence \( L_y u(x) \equiv 0 \). It follows that \( u(x) \equiv 0 \). So the proof of theorem is complete. By Gram-Schmidt process, we obtain an orthogonal basis \( \{\overline{\psi}_i(x)\}_{i=1}^\infty \) of \( W^m_2[0, 1] \), such that

\[ \overline{\psi}_i(x) = \sum_{k=1}^{i} \beta_{ik} \psi_k(x), \] (17)

where \( \beta_{ik} \) are orthogonal coefficients. In order to obtain \( \beta_{ij} \), let

\[ \psi_j(x) = \sum_{k=1}^{i} B_{ij} \overline{\psi}_i(x). \]

\[ \langle \psi_j(x), \psi_i(x) \rangle = \sum_{k=1}^{i-1} B_{ik} B_{jk} + B_{ij}^2, \]

\[ B_{ij} = \sqrt{\langle \psi_j(x), \psi_j(x) \rangle - \sum_{k=1}^{i-1} B_{ik}^2}. \]

\[ \beta_{ij} = \frac{1}{\sqrt{\langle \psi_j(x), \psi_j(x) \rangle - \sum_{k=1}^{i-1} B_{ik}^2}} \left( - \sum_{k=1}^{i-1} B_{ik} \beta_{ij} \right). \] (18)

**Theorem 3.2.2** If \( u(x) \) is the solution of Equation (1), then

\[ u(x) = \sum_{i=1}^{\infty} \sum_{k=1}^{i} \beta_{ik} f(x_k) \overline{\psi}_i(x). \] (19)

\textit{Proof.} \( u(x) \) can be expanded to Fourier series in term of normal orthogonal basis \( \overline{\psi}_i(x) \) in \( W^m_2[0, 1] \),

\[ \text{ISSN: 2252-8814} \]

IJAAS Vol. 5, No. 3, September 2016 : 109 – 117
\[ u(x) = \sum_{i=1}^{\infty} \langle u(x), \psi_i(x) \rangle \psi_i(x) = \sum_{i=1}^{\infty} \sum_{k=1}^{\infty} \beta_{i,k} \langle u(x), \varphi_k(x) \rangle \psi_i(x) \]

\[ = \sum_{i=1}^{\infty} \sum_{k=1}^{\infty} \beta_{i,k} \langle u(x), \nabla \varphi_k(x) \rangle \psi_i(x) = \sum_{i=1}^{\infty} \sum_{k=1}^{\infty} \beta_{i,k} f(x_k) \psi_i(x). \] (20)

The proof is complete.

By truncating the series of the left-hand side of (19), we obtain the approximate solution of (1)

\[ u_N(x) = \sum_{i=1}^{N} \sum_{k=1}^{\infty} \beta_{i,k} f(x_k) \psi_i(x). \] (21)

\[ u_N(x) \] in (21) is the \( N \)-term intercept of \( u(x) \) in (19), so \( u_N(x) \to u(x) \) in \( W^m_2[0,1] \) as \( N \to \infty \).

**Lemma 3.2.1.** If \( u(x) \in W^m_2[0,1] \), then there exists a constant \( c \) such that \( |u(x)| \leq c\|u(x)\|_{P_m}. \)

**Proof.**

There exists a constant \( c \) such that

\[ |u(x)| \leq c\|u\|_{m}. \]

The proof of the lemma is complete.

**Theorem 3.2.3.** Suppose the following conditions are satisfied

(i) \( \|u_N(x)\|_{W^m_2} \) is bounded;

(ii) \( \{x_i\}_{i=1}^{\infty} \) is dense in \( [0,1] \).

Then \( N \)-term approximate solution \( u_N(x) \) converges to the exact solution \( u(x) \) of Equation (1) and the exact solution is expressed as

\[ u(x) = \sum_{i=1}^{\infty} B_i \psi_i(x), \] (22)

where \( B_i = \sum_{k=1}^{\infty} \beta_{i,k} f(x_k) \).

**Proof.** (i) The convergence of \( u_N(x) \) will be proved. From (21), one gets

\[ u_N(x) = u_{N-1}(x) + B_N \psi_N(x). \] (23)

From the orthogonality of \( \{\psi_i(x)\}_{i=1}^{\infty} \), it follows that

\[ \|u_N(x)\|_{W^m_2}^2 = \|u_{N-1}(x)\|_{W^m_2}^2 + \|B_N\|_{2}^2. \]

The sequence \( \|u_N(x)\|_{W^m_2} \) is monotone increasing. Due to \( \|u_N(x)\|_{W^m_2} \) being bounded, \( \|u_N(x)\|_{W^m_2} \) is convergent as soon as \( N \to \infty \). Then there exists a constant \( c \) such that

\[ \|u_N(x)\|_{W^m_2} \leq c\|u(x)\|_{P_m}. \]
\[
\sum_{i=1}^{\infty} B_i^2 = c. \quad (24)
\]

Let \( m > N \), in view of \((u_m - u_{m-1}) \perp \ldots \perp (u_N - u_N)\), it follows that
\[
\|u_m - u_N\|_{W_2^m}^2 = \|u_m - u_{m-1} + u_m - u_{m-2} + \ldots + u_{N+1} - u_N\|_{W_2^m}^2 \\
= \|u_m - u_{m-1}\|_{W_2^m}^2 + \|u_{m-1} - u_{m-2}\|_{W_2^m}^2 + \ldots + \|u_{N+1} - u_N\|_{W_2^m}^2 \\
= \sum_{i=N+1}^{m} (B_i)^2 \to 0, \ (N \to \infty). \quad (25)
\]

Considering the completeness of \( W_2^m[0,1] \), it has
\[
W_2^m \ni u_N(x) \to u(x), \quad N \to \infty.
\]

(ii) It is proved that \( u(x) \) is the solution of Equation (11).

From (22), it follows
\[
(Lu)(x_j) = \sum_{i=1}^{\infty} B_i \langle L \bar{\varphi}_i(x), \varphi_j(x) \rangle \\
= \sum_{i=1}^{\infty} B_i \langle \bar{\varphi}_i(x), L \varphi_j(x) \rangle \\
= \sum_{i=1}^{\infty} B_i \langle \bar{\varphi}_i(x), \varphi_j(x) \rangle.
\]

it follows that
\[
\sum_{j=1}^{N} \beta_{Nj} (Lu)(x_j) = \sum_{i=1}^{\infty} B_i \sum_{j=1}^{N} \beta_{Nj} \bar{\varphi}_j(x)_{W_2^m} = B_N.
\]

If \( N = 1 \), then \((Lu)(x_j) = f(x_j)\).

If \( N = 2 \) then \( \beta_{21}(Lu)(x_1) + \beta_{22}(Lu)(x_2) = \beta_{21}f(x_1) + \beta_{22}f(x_2)\).

It is clear that \((Lu)(x_2) = f(x_2)\).

Moreover, it is easy to see by induction that \((Lu)(x_j) = f(x_j)\). Since \( \{x_j\}_{j=1}^{\infty} \) is dense on \([0,1] \), for any \( x \in [0,1] \)
\[
(Lu)(x) = f(x). \quad (26)
\]

That is, \( u(x) \) is the solution of Equation (11) and
\[
u(x) = \sum_{i=1}^{\infty} B_i \bar{\varphi}_i(x). \quad (27)
\]

The proof is complete.
4. NUMERICAL EXAMPLES

In this section, two examples with exact solutions are given. We take $N = 10$, that $N$ is the number of terms of the Fourier series of the unknown function $u(x)$. Parameter $n$ is the number of terms of the Taylor series and we choose $m > n$ for solving these examples.

**Example 4.1.** We consider the following weakly singular Fredholm integral Equation [1]:

$$u(x) = x^2 - \frac{16}{15} \int_0^x \frac{u(t)}{\sqrt{1-t}} \, dt, \quad 0 \leq x \leq 1,$$

(28)

with the exact solution $u(x) = x^2$.

Let $n = 3$ and applying the reproducing kernel method. The comparison between the exact solution and the approximate solution and the absolute errors in spaces $W^7_2[0,1], W^8_2[0,1]$ are graphically shown in Figure 1, respectively. The absolute errors between $u(x)$ and $u_{10}(x)$ in spaces $W^7_2[0,1], W^8_2[0,1]$ are shown in Table 1. By increasing $m$, the behavior improves. This is an indication of stability on the reproducing Kernel. It is obviously our presented method is more accurate than the Euler-Maclaurin summation formula method [1].

5. CONCLUSION

In this paper, we established a method to find numerical solutions of the Fredholm integral equations with a weakly singular kernel. We used the Taylor series to remove singularity and solved some examples with our proposed method. According to the examples solved in two different spaces, by increasing \( m \), the behavior improves. This is an indication of stability on the reproducing Kernel. The results from the numerical examples show that the present method is accurate and reliable for solving these equations.
