Abstract: *Petiveria alliacea* (Phytolaccaceae) is a small shrub which grows in Africa and tropical America, where it is popularly known as “tipim”, “tipi” and “guinê”. The leaves are used in folk medicine as diuretic, sedative or analgesic. Phytochemical investigation led to the identification of eight compounds, six of which are being described for the first time in this species: stigmasterol, stigmastenol, stigmastanol, loliolide, 3-hydroxy-5,6-epoxy-β-ionone and benzyl-β-glucopyranoside. The hexane and dichloromethane fractions presented good antitumor activity besides low toxicity. The compounds isolated from the above mentioned fractions were also tested and showed good antitumor activity, which confirms a significant potential of steroids as antitumor agents. These results indicate the potential of *P. alliacea* as source of antitumor agents.

INTRODUCTION

*Petiveria alliacea* (Phytolaccaceae) is an herbaceous plant with a typical height of about 1m found in Africa and tropical America. In Brazil, this species occurs in north, south and southeast regions, being popularly known as “tipim”, “tipi”, “guinê” and “erva-de-alho” (Zoghi et al. 2002; Neves et al. 2006; Camargo 2007).

Previous ethnopharmacological studies evince the utilization of this plant as diuretic, sedative, analgesic, abortive, in the treatment of rheumatism, diabetes, headaches, allergies and furunculosis (Ruffa et al. 2002; Duarte and Lopes 2005; Camargo 2007; Oliveira; De Oliveira; Andrade 2010; Almeida 2011; Fletes-Arjona et al. 2013).

Other studies also report inhibitory effect against *Trypanosoma cruzi*, insecticidal activity, acaricide activity, besides antimicrobial activity against some strains, such as: *Escherichia coli*, *Staphylococcus aureus*, *Enterococcus faecalis*, *Pseudomonas aeruginosa*, *Bacillus subtilis*, *Streptococcus mutans*, *Sphingobacterium epidermidis*, *Candida parapsilosis*, *Candida kefyr*, *Candida albicans*, *Cladosporium cladosporioides* and *Cladosporium sphaerospermum*. Pharmacological studies for this species show significant antiulcerative, antitumor and anticonvulsant activity (Johnson; Williams; Roberts 1997; Benevides et al. 2001; Kubec and Musah 2001; Ruffa et al. 2002; Duarte and Lopes 2005; Camargo, 2007; Webster et al. 2008; Guedes et al. 2009; Oliveira; De Oliveira; Andrade, 2010; Almeida, 2011; Pacheco et al. 2013).

The chemical profile of *P. alliacea* is characterized by the presence of sulfur containing compounds such as sulfides, polysulfides, and sulfoxides, in addition to flavonoids, steroids and triterpenes (Anwar et al. 2008; Almeida 2011; Hernández et al. 2014).

Pharmacological investigations of the ethyl acetate extract of *P. alliacea* demonstrated antitumor activity against melanoma (A375; IC₅₀ 35.2 μg/mL ± 1.35), erythroleukemia (K562; IC₅₀ 32.0 μg/mL ± 1.64), myeloid leukemia (NB-4; IC₅₀ 45 μg/mL ± 2.0) and breast adenocarcinoma (4T1; IC₅₀ 29.3 μg/mL) (Urueña et al. 2008; Cifuentes et al. 2009; Hernández et al. 2014).

This paper presents the identification of eight compounds, six of which are described for the first time occurring in this species: stigmastanol, stigmastenol, looliolide, 3-hydroxy-5,6-epoxy-β-ionone and benzyl β-glucopyranoside. Moreover, antitumor activity of the extracts and substances against histiocytic lymphoma (U937) were evaluated, besides cytotoxicity on peripheral blood mononuclear cells (PMBC).

**MATERIAL AND METHODS**

**GENERAL EXPERIMENTAL PROCEDURE**

High performance countercurrent chromatographs (HPCCCC) were acquired using a Dynamic Spectrum HPCCC apparatus (Berkshire, United Kingdom) equipped with a pair of preparative columns with 142 mL capacity and a pair of analytical columns with 27.5 mL capacity. The β-value ranges from 0.52 to 0.86 and the revolution speed was set up to 1600 rpm. The system comprises two Knauer Smartline 100 V5010 pumps (Berlin, Germany), a Buchi C-660 fraction collector and a 5 mL manual injection valve (Hichrom – Bellefonte, USA). The solvent system was chosen by the shake-flask method as described by Berthold and Carda-Broch (2004).

GC-MS analysis was performed on a Shimadzu GCMS-QP5050A (Kyoto, Japan) equipped with a DB5 column (30 m x 0.25 mm, 0.25 μm film thickness); a flow of 1.3 mL/min; 280°C injector initial temperature; ion source temperature equal to 280°C and 70 eV EI ionization. Sample injections were 1μL.

NMR spectra were acquired on a Bruker DPX-500 model operating at 500 MHz for ¹H and 125 MHz for ¹³C, using deuterated solvents.

Column chromatography (CC) was conducted with silica-gel 60 (0063-0200 mm Merck, Germany) in glass columns with various lengths and widths. TLC analyses were performed using GF254 silica-gel 60 (Merck, Germany) revealed by different chemical and physical methods.

**PLANT MATERIAL**

*P. alliacea* leaves were collected at Campos dos Goytacazes (Rio de Janeiro, Brazil) in May 2013. A voucher specimen (H8389) was deposited in the herbarium of the Northern Rio de Janeiro State University.

**EXTRACTION AND ISOLATION**

Dried and ground leaves (1735.89 g) were submitted to Soxhlet extraction with methanol for 24h. The methanolic extract (70 g) was fractionated by liquid-liquid partition with different organic solvents yielding four fractions: *n*-hexane (32.71 g), dichloromethane (7.53 g), ethyl acetate (6.67 g) and *n*-butanol (9.29 g).

The hexane fraction (3 g) was chromatographed on silica gel with *n*-hexane:ethyl acetate gradients. TLC analysis of fraction 7 revealed the presence of impurities that were removed by solubilization in ethyl acetate yielding a white solid 1 (46.4 mg). Fraction 10 also revealed the presence of impurities that were removed by solubilization in methanol yielding a white solid 2 (37.6 mg).

The dichloromethane fraction (3 g) was submitted to silica gel chromatography eluted using *n*-hexane:ethyl acetate gradients, yielding fractions 7 (3 - 33.2 mg) and 14 (64.7 mg). Fraction 14 was submitted to HPCCC using a solvent system comprising *n*-hexane:ethyl acetate: MeOH: H₂O (5:6:5:6; v/v). The upper mobile phase was eluted by flow 1.5 mL/min from the tail-to-head, bloodletting of 16 mL and sample elution time 0.23 min. Compound 4 (10.6 mg) was isolated as a yellow oil.

The ethyl acetate fraction (1 g) was partitioned using a two-phase solvent system comprising *n*-hexane:ethyl acetate: MeOH: H₂O (1.2:5:1:2.5; v/v), resulting in two fractions: an organic upper phase (607 mg) and an aqueous lower phase (393 mg).

The aqueous lower phase (143.1 mg) was submitted to HPCCC using a solvent system comprising acetonitrile: ethyl acetate: iso-butanol: H₂O (0.5:3:2.5: v/v). The lower mobile phase was eluted by flow 1.5 mL/min from the head-to-tail, bloodletting of 24 mL and sample elution time 0.30 min. Compound 5 (8.3 mg) was obtained as a yellow solid.

3β-isoorborinol (1)

Compound 1: ¹H NMR (500 MHz, CDCl₃): 3.23 (d, J = 4.6 Hz, H-3), 5.25 (d, J = 5.5 Hz, H-11), 1.62 (d, J = 6.5 Hz, H-18); ¹³C NMR (125 MHz, CDCl₃): 35.9 (C-1), 27.7 (C-2), 78.9 (C-3), 39.0 (C-4), 52.3 (C-5), 21.4 (C-6), 26.6 (C-7), 40.9 (C-8), 148.8 (C-9), 39.6 (C-10), 114.3 (C-11), 36.0 (C-12), 36.7 (C-13), 38.1 (C-14), 29.7 (C-15), 35.9 (C-16), 42.8 (C-17), 52.0 (C-18), 20.1 (C-19), 28.2 (C-20), 59.6 (C-21), 30.7 (C-22), 28.2 (C-23), 15.6 (C-24), 22.1 (C-25), 17.0 (C-26), 15.2 (C-27), 13.9 (C-28), 22.1 (C-29) e 23.0

(C-30). GC-MS - retention time 30.04 min, M+ 426, C30H38O, m/z 411, 393, 273, 259, 241, 191, 163.

**loilolide (4a) and 3-hydroxy-5,6-epoxy-β-ionone (4b)**

Compound 4a: 1H NMR (500 MHz, CDCl3): 4.34 (m, H-3), 5.70 (s, H-7), 2.00 (dd, J = 17.0 Hz e 3.5 Hz, H2-2), 1.55 (dd, J = 14 Hz e 3.5 Hz, H-2), 2.49 (dd, J = 14.0 Hz e 2.5 Hz, H4-4), 1.80 (s, H4-4); 13C NMR (125 MHz, CDCl3); 35.9 (C-1), 47.3 (C-2), 66.8 (C-3), 45.6 (C-4), 86.7 (C-5), 182.5 (C-6), 112.9 (C-7), 171.9 (C-8), 26.5 (C-9), 30.6 (C-10), 19.8 (C-11); CG-MS – 4a, 28.27%, retention time 6.36 min, M+ 197, C11H10O3, m/z 191, 123, 109, 95 e 79.

Compound 4b: 1H NMR (500 MHz, CDCl3): 3.92 (m, H-3), 7.05 (d, J = 15.9 Hz, H-7), 6.31 (d, J = 15.9 Hz, H-8), 1.65 (s, H2-2), 1.26 (s, H6-6), 2.40 (dd, J = 6.5 Hz e 1.5 Hz, H4-4), 1.68 (s, H4-4); 13C NMR (125 MHz, CDCl3): 35.1 (C-1), 46.6 (C-2), 64.0 (C-3), 40.5 (C-4), 67.2 (C-5), 69.4 (C-6), 142.4 (C-7), 132.6 (C-8), 197.5 (C-9), 28.2 (C-10), 24.9 (C-11), 27.0 (C-12), 29.3 (C-13); CG-MS – 4b, 71.63%, retention time 7.03 min, M+ 255, C15H20O5, m/z 196, 178, 163, 140, 124, 111 e 95.

**Benzyl-β-glucopyranoside (5)**

Compound 5: 1H NMR (500 MHz, MeOD): 7.36 (m, H-2 e 6), 7.41 (m, H-3 e 5), 7.29 (m, H-4), 4.37 (d, J = 8.3 Hz, H-1”), 3.27 (m, H-2”), 3.28 (m, H-3”), 3.38 (m, H-4”), 3.41 (m, H-5”), 4.95 (d, J = 11.9 Hz, H4-4”), 4.69 (d, J = 11.9 Hz, H4-1”), 3.71 (s, H6-6”), 3.91 (s, H6-6”), 13C NMR (125 MHz, MeOD): 137.68 (C-1), 127.80 (C-2 e 6), 127.88 (C-3 e 5), 127.29 (C-4), 70.35 (C-1”), 101.89 (C-1”), 73.75 (C-2”), 76.64 (C-3”), 70.31 (C-4”), 76.71 (C-5”), 61.43 (C-6”).

**CYTOTOXICITY AGAINST TUMOR CELL LINES**

The MTT assay used to evaluate the antitumor potential of the leaves extracts (Mosmann, 1983) against human cancer cell line U937 (histiocytic lymphoma) was purchased from American Type Culture Collection (ATCC, Rockville, MD, USA) and that against human normal cell line (PBMC) peripheral blood mononuclear cells was obtained from the venous blood of healthy volunteers (Bennett and Brd, 1994). Cytotoxicity analysis of the fractions and compounds were quantified by assessing the ability of living cells to reduce the yellow dye 3-(4,5-dimethyl-2-thiazolyl)-2,5-diphenyl-2H-tetrazolium bromide (MTT) to a purple formazan product. All cell lines were maintained in DMEM-F12 medium (Gibco®) supplemented with 10% fetal bovine serum and 20 μg/mL gentamicin (Gibco®) at 37°C with 5% CO2 and controlled humidity. Cells were plated in 96-well plates 100 μL/well (1x10^4 cells/mL) and incubated with various concentrations of fractions and compounds. After 48 h of incubation, 20 μL of MTT (10 mg/mL) was added to each well plate. Plates were maintained at 37°C with 5% CO2 and controlled humidity for 4 h. After this period, 150 μL of the supernatant were removed from each well and 100 μL of a 0.0014% solution of HCl in isopropanol, was added and homogenize until complete dissolution of the purple formazan. After centrifugation for 10 min, at 1500 rpm, 100 μL of the supernatant was transferred to another 96-well culture plate in order to measure absorbance at 570 nm (Epoch™, BioTek® Instruments, Inc.). Doxorubicin (Sigma Aldrich) was used as positive control for the tested cell lines.

**STATISTICAL ANALYSIS**

Cell viability was evaluated by two-way ANOVA (analysis of variance). The means and respective standard errors were analyzed using the Graph Pad software Prism version 5.0 (GraphPad Software Incorporated, San Diego, USA). Significant difference was p < 0.5, <0.01 and <0.001.

**RESULTS AND DISCUSSION**

Phytochemical analysis afforded the identification of one triterpene: 3β-isoorborinol (1); four steroids: stigmastanol (3a), stigmastenol (3b), β-sitosterol (3c) stigmasterol (3d), which were isolated both from the hexane and dichloromethane fractions; two norsequitrenoids: loliolide (4a) and 3-hydroxy-5,6-epoxy-β-ionone (4b) and one phenolic glycoside benzyl-β-glucopyranoside (5) (Figure 1).

Structures were identified based on NMR spectral results and comparison with published data: triterpene 1 (Flagg 200), steroids mixture 3 (Itoh et al. 1981; Kojima et al. 1990) (TABLE 1), norsequitrenoids 4a and 4b (Chávez et al. 1997) and phenolic glycosides 5 (Yoneda et al. 2008). Triterpene, mixture of steroids and mixture of norsequitrenoids were also analyzed by GC-MS.
Phytochemical analysis and cytotoxic activity of *Petiveria alliacea* (Phytolaccaceae)

Figure 1 - Structures of identified compounds from *P. alliacea* leaves.

GC-MS analysis of the steroidal fractions allowed the identification of: stigmasterol (3a – 15.9%) – Retention time 20.9 min., M+ 412, fragmented ions m/z 394, 351, 300, 273 and 255, molecular formula C_{29}H_{48}O; stigmastenol (3b – 21.4%) – Retention time 21:2 min., M+ 414, fragmented ions m/z 399, 371, 353, 316, 302, 287 and 273, molecular formula C_{29}H_{50}O; β-sitosterol (3c – 12.87%) – Retention time 22:5 min., M+ 414, fragmented ions m/z 396, 329, 303, 273, 255, 231 and 213, molecular formula C_{29}H_{50}O and stigmastanol (3d – 49.83%) - Retention time 22:8 min., M+ 416, fragmented ions m/z 401, 383, 233 and 215, molecular formula C_{29}H_{52}O.

The 1H NMR spectrum of compound 5 spectrum presented signals between δH 7.2 - 7.4 ppm which are characteristic of aromatic protons. Aromatic carbons were also detected in 13C NMR spectrum: δC 137.68 and 127.29 ppm. Glycosidic signals between δH 3.6 - 3.9 ppm were also observed in 1H NMR, and a doublet at δH 4.37 (d, 8.3 Hz, H-1”) was assigned as the anomeric proton. An anomeric carbon was also observed in 13C NMR at δC 101.89 (C-1”) in addition to five signals between δC 61.0 - 77.0 ppm which suggest the presence of a glycoside moiety. The analysis of the spectral data compared with literature data confirmed benzyl-β-glucopyranoside structure (Yoneda et al. 2008).

Phytochemical analysis and cytotoxic activity of *Petiveria alliacea* (Phytolaccaceae)

The methanol extract and fractions of this extract were tested for cytotoxicity activity front cell lines U937 and PBMC (Table 2).

According to the American National Cancer Institute, IC$_{50}$ of 30 µg.mL$^{-1}$ is the upper limit for an crude extract or fraction there of to be considered a potential antitumor drug (Suffness and Pezzuto 1990). The best antitumor activity was found on the achieved by hexane and dichloromethane fractions, IC$_{50}$ 29.91 µg/mL ± 1.09 and 24.89 µg/mL ± 1.16, respectively. These fractions also showed low cytotoxicity in PBMC, 94.61 ± 1.22 µg/mL and IC$_{50}$ 117.2 ± 1.24 µg/mL. Thus, the phytochemical investigation was focused on these fractions and the isolated compounds were also evaluated against U937 and PBMC (Table 3).

The pure compound isolated from the hexane fraction (1 - 3β-isoborinol) did not show any antitumor activity, where as the steroid mixture (3) demonstrated significant activity against U937 (IC$_{50}$ 26.10 ± 1.07 µg/mL) with low cytotoxicity for peripheral blood mononuclear cells (IC$_{50}$ with 211.3 ± 1.04 µg/mL).

This steroid mixture is formed by unique skeleton type with different unsaturation standard. The literature records that steroids exhibit activity against leukemia breast, prostate, colon, lung, stomach and ovarian cancer with low cytotoxicity for the normal cells (Sayeed and Ameen 2015). The anticancer activity of *P. alliacea* described by Urueña, Cifuentes and Hernández may be as cribbed to the presence of steroids as described previously.

**Table 2** - IC$_{50}$ values extract / fractions of the species *P. alliacea* in neoplastic and normal cells after incubation for 48 hours.

| Extract and fractions | U937 (µg/mL) | PBMC (µg/mL) |
|-----------------------|--------------|--------------|
| PAM                   | 98.97 ± 1.19 | 253.3 ± 1.07 |
| PAMH                  | 29.91 ± 1.09 | 94.61 ± 1.22 |
| PAMD                  | 24.89 ± 1.16 | 117.2 ± 1.24 |
| PAMA                  | 81.46 ± 1.16 | 161.4 ± 1.16 |
| PAMB                  | >400         | >400         |

* The data are presented as IC$_{50}$ values. The experiments were performed in triplicate.

**Table 3** - IC$_{50}$ values of the substances identified in the species *P. alliacea* in neoplastic and normal cells after incubation for 48 hours.

| Substances identified | U937 (µg/mL) | PBMC (µg/mL) |
|-----------------------|--------------|--------------|
| 1                     | >200         | >200         |
| 3                     | 26.10 ± 1.07 | 211.3 ± 1.04 |
| Doxorubicin (positive control) | 2.25 ± 1.03 µM | 26.92 ± 1.21 µM |

*The data are presented as IC$_{50}$ values. Doxorubicin was used as positive control. The experiments were performed in triplicate.
CONCLUSION

Eight compounds were identified in this study, namely, one triterpene, four steroids, two nor-esquiterpenoids and one phenolic glycoside. Six of the eight substances are described here for the first time in the species *P. alliacea* (stigmasterol, stigmastenol, stigmasterol, loliolide, 3-hydroxy-5,6-epoxy-β-ionone and benzyl-β-glucopyranoside). In the cytotoxicity assay we found that the hexane and dichloromethane fractions presented excellent antineoplastic activity and low toxicity. The tests performed with the compounds obtained by these fractions confirm the antineoplastic potential of the steroid class.

RESUMO

*Petiveria alliacea* (Phytolaccaceae) é um arbusto pequeno que ocorre na África e na América tropical e é popularmente conhecido como tipim, tipi e guiné. Suas folhas são usadas pela medicina popular como diurético, sedativo, analgésico, entre outras utilizações. A investigação fitoquímica levou à identificação de oito substâncias, das quais seis estão sendo descritas pela primeira vez nessa espécie: estigmasterol, estigmastenol, estigmasterol, loliolide, 3-hidroxi-5,6-epoxi-β-lonona e benzil-β-glucopyranoside. As frações hexânica e diclorometânica apresentaram boa atividade antitumoral, além de baixa toxicidade. As substâncias obtidas a partir das frações acima mencionadas, também foram testadas e mostraram boa atividade antitumoral, o que confirma o grande potencial dos esteróides como agentes antitumorais. Estes resultados indicam o potencial de *P. alliacea* como fonte de agentes antitumorais.

Palavras-chave: Phytolaccaceae, Petiveria alliacea, esteroides, atividade antitumoral.
