We present an analytic method to compute the one-loop magnetic correction to the gluon polarization tensor starting from the Landau-level representation of the quark propagator in the presence of an external magnetic field. We show that the general expression contains the vacuum contribution that can be isolated from the zero-field limit for finite gluon momentum. The general tensor structure for the gluon polarization also contains two spurious terms that do not satisfy the transversality properties. However, we also show that the coefficients of this structures vanish and thus do not contribute to the polarization tensor, as expected. In order to check the validity of the expressions we study the strong and weak field limits and show that well established results are reproduced. The findings can be used to study the conditions for gluons to equilibrate with the magnetic field produced during the early stages of a relativistic heavy-ion collision.

Keywords: Gluon polarization tensor; Magnetic fields; Landau levels

I. INTRODUCTION

The production of hot and dense strongly interacting matter in heavy-ion reactions at high energies, constitutes a driving force for the formulation of novel approaches to study QCD subject to extreme conditions. For semi-central collisions, these conditions include the presence of strong, albeit short-lived, magnetic fields. Many theoretical efforts concentrate on describing these conditions considering that the temperature is the largest of the energy scales [1–4]. However, it has also been realized that the imprints of these strong fields [5–9], if any, should be searched for studying probes produced during the very early stages of the collision, where the system is not yet equilibrated and the largest of the energy scales is instead the magnetic field itself. Possible imprints include an enhanced prompt photon production and/or the chiral magnetic effect [7–12].

The early stages of a heavy-ion reaction are also characterized by the presence of a large number of low momentum gluons which are thought to give rise to the saturation phenomenon described by the Glasma [13]. When a magnetic field is present, gluon dynamics can also be affected. A deeper understanding of gluon properties within a magnetized medium is crucial to describe the evolution of observables coming from these early stages. The gluon dispersive properties in a magnetized medium are encoded in the gluon polarization tensor $\Pi^{\mu\nu}$. In a perturbative approach, deviations from its vacuum properties come from the coupling of the magnetic field to virtual quarks. The quark propagator can be represented in terms of a sum over Landau levels. When the field is strong, calculations often resort to the approximation where these quarks occupy the lowest Landau level (LLL), which simplifies considerably the treatment [14–16]. Nevertheless, when the field is not as intense, it is important to perform a sum over Landau levels to capture effects that may be missing from expressions restricted to the LLL, in particular, the emergence of tensor polarization structures other than the parallel one that make up the full polarization tensor. This kind of calculations have been performed at one-loop level for the photon polarization tensor [17] in the context of the vacuum birefringence in strong magnetic fields, where the authors resort to a numerical treatment for the infinite sum over Landau levels. However, in order to gain a deeper insight, an analytical approach for the infinite sum over Landau levels is desirable. In this work, we undertake such task and present an analytic method to perform the sum over all Landau levels for the coefficients of the tensor structure that make up the gluon polarization tensor in the presence of a magnetic field of arbitrary intensity. The vacuum contribution is obtained in the limit when $B \rightarrow 0$. We show that by this procedure one obtains the usual fermion contribution to the vacuum polarization tensor, together with a second term that is shown to vanish, given the properties of its coefficient under scaling transformations. Applying the same argument to the full, magnetic field-dependent polarization tensor, it is possible to isolate the physical tensor structures and their coefficients, thus getting rid of spurious terms. We then proceed to carefully subtract the vacuum pieces to remove...
ultraviolet divergences. The procedure ensures that the remaining, magnetic field dependent contributions are finite. In order to test the validity of the expressions thus obtained, we study the weak and strong magnetic field limits. The work is organized as follows: In Sec. II we write the one-loop expression for the gluon polarization tensor in the presence of a constant external magnetic field. We chose the tensor basis to express the polarization tensor and outline the calculation to carry out the product of fermion propagators and the corresponding polarization tensor, which is depicted in Fig. 1 and is discussed in detail.

In Sec. III we study the strong and in Sec. IV the weak magnetic field limits. The work is organized as follows: In Sec. II, we obtained, there appear two spurious, non-transverse terms. These are shown to vanish, as in the vacuum case, from the properties of their coefficients under scaling transformations. In Sec. III we study the strong and in Sec. IV the weak field limits and show that the obtained expressions coincide with well known results. We summarize and discuss our results in Sec. V and leave for the appendices the calculation details.

II. GLUON POLARIZATION TENSOR

We start from the one-loop contribution to the gluon polarization tensor, which is depicted in Fig. 1 and is given explicitly by

\[ i\Pi_{\mu\nu} = -\int \frac{d^4k}{(2\pi)^4} \text{Tr} \left\{ ig\gamma_{\mu} iS^{(n)}(k)ig\gamma_{\nu} iS^{(m)}(q) \right\} + C.C., \]

where \( C.C. \) refers to the charge conjugate contribution, that is, the contribution where the flow of charge within the loop is in the opposite direction and \( g \) is the strong coupling. \( S(k) \) is the quark propagator and \( f_{a,b} \) are the generators of the color group in the fundamental representation. The fermion propagator in the presence of a magnetic field \( \vec{B} = B \hat{z} \) can be written in terms of a sum over Landau levels as [15–19]:

\[ iS(p) = i e^{-p^2_\perp/|q_f B|} \sum_{n=0}^{+\infty} (-1)^n \frac{D_n(q_f B, p)}{p^2_\parallel - m_f^2 - 2n |q_f B|}, \]

where \( m_f \) and \( q_f \) are the quark mass and electric charge, respectively, and

\[
D_n(q_f B, p) = 2(p_\parallel + m_f)O^- L^0_n \left( \frac{2p^2_\perp}{|q_f B|} \right) - 2(p_\parallel + m_f)O^+ L^0_{n-1} \left( \frac{2p^2_\perp}{|q_f B|} \right) + 4p_\perp F^1_{n-1} \left( \frac{2p^2_\perp}{|q_f B|} \right). \tag{3}
\]

In Eq. (3), \( L^0_n(x) \) are the generalized Laguerre polynomials, with the index \( n \) labeling the \( n \)-th Landau level, and

\[
O^{(\pm)} = \frac{1}{2} \left[ 1 \pm it \gamma^2 \text{sign}(q_f B) \right]. \tag{4}
\]

Also, we follow the convention whereby the square of the four-momentum \( p^\mu \), expressed in terms of the square of its parallel and perpendicular (with respect to the magnetic field direction) components, is given by

\[
p^2 = p^2_\parallel - p^2_\perp = (p_\parallel^2 - p_\perp^2) - (p_\parallel^2 + p_\perp^2). \tag{5}
\]

Computing Eqs. (1) and (2), after performing the sum over all Landau levels, the gluon polarization tensor can be written in terms of four tensor structures, given by

\[
d\Pi_{\mu\nu} = -\frac{i}{4\pi^2} g^2 \int d^2x f_0(x_1, x_2) \sum_{i=1}^4 f_i^{\mu\nu}(x_1, x_2), \tag{6}
\]

where on the right-hand side, we have omitted a factor \( \delta_{ab} \) coming from using the relation \( \text{Tr}(t^a t^b) = \delta_{ab}/2 \), and correspondingly, for notation simplicity, removed the color indices on the left-hand side. Here \( (x_1, x_2) \in [0, \infty) \) are Schwinger parameters, with \( d^2x = dx_1 dx_2 \) and

\[
f_0(x_1, x_2) = \exp \left( \frac{x_1 x_2}{x_1 + x_2} p^2_\parallel - m_f^2 (x_1 + x_2) \right) \times \exp \left( -\frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2) p^2_\perp}{\tanh(|q_f B| x_1 + \tanh(|q_f B| x_2)} \right), \tag{7a}
\]

\[
f^{\mu\nu}_1(x_1, x_2) = |q_f B| \cosh |q_f B| (x_1 + x_2) \times \left( \frac{x_1 x_2}{(x_1 + x_2)^2} p^2_\parallel + \frac{m_f^2}{x_1 + x_2} g^{\mu\nu} - \frac{2x_1 x_2}{(x_1 + x_2)^3} p^a_\perp p^b_\parallel \right), \tag{7b}
\]

\[
f^{\mu\nu}_2(x_1, x_2) = |q_f B| \cosh |q_f B| (x_2 - x_1) \sinh |q_f B| \left( \frac{1}{(x_1 + x_2)^2} \right) \times \left( \frac{x_1 x_2}{(x_1 + x_2)^2} p^2_\parallel + \frac{m_f^2}{x_1 + x_2} + \frac{1}{(x_1 + x_2)^2} \right) g^{\mu\nu}, \tag{7c}
\]

\[
f^{\mu\nu}_3(x_1, x_2) = \frac{|q_f B|}{2(x_1 + x_2)^2 \sinh^2 |q_f B| (x_1 + x_2)} \times \left( x_1 \sinh(2|q_f B| x_2) + x_2 \sinh(2|q_f B| x_1) \right) \times \left( p^a_\parallel p^b_\perp + p^a_\perp p^b_\parallel \right), \tag{7d}
\]

\[ \text{FIG. 1: One-loop diagram representing the gluon polarization tensor.} \]
independent tensors

The gluon polarization tensor should be represented by a symmetric tensor under the exchange of its Lorentz indices. It can be constructed out of the external products of the independent vectors describing the propagation of a gluon with momentum $p^\mu$ in the presence of a magnetic field whose direction is specified by a four-vector $b^\mu$, in addition to the metric tensor $g^{\mu\nu}$. Without loss of generality, we can choose a reference frame where the magnetic field points along the $\hat{z}$ axis. Due to the presence of this Lorentz invariance-breaking vector, it is convenient to split the metric itself into parallel and perpendicular (with respect to the magnetic field direction) components, that is

$$g^{\mu\nu} = g_{||}^{\mu\nu} + g_{\perp}^{\mu\nu},$$

where

$$g_{||}^{\mu\nu} = \text{diag}(1, 0, 0, -1),$$

and

$$g_{\perp}^{\mu\nu} = \text{diag}(0, -1, -1, 0).$$

We thus see that the most general symmetric tensor can be constructed out of combinations of the four possible independent tensors

$$p^\mu p^\nu, \ b^\mu b^\nu, \ p^\mu b^\nu + p^\nu b^\mu, \ g^{\mu\nu}.$$  

However, notice that in QCD, $\Pi^{\mu\nu}$ must satisfy the generalized Ward-Takahashi identity namely, the transversality condition

$$p_\mu P_\nu \Pi^{\mu\nu} = 0.$$  

Therefore, since Eq. (12) implies a relation between the coefficients of the tensors to express $\Pi^{\mu\nu}$, only three transverse tensors turn out to be independent. A convenient basis to express the polarization tensor is such that the independent tensors are chosen each to be transverse, in such a way that Eq. (12) be satisfied already as

$$p_\mu P_\nu \Pi^{\mu\nu} = 0.$$  

This choice has the advantage that the basis can be used to express the polarization tensor either in QCD or in QED. In the present work, we chose the orthonormal basis

$$\mathcal{P}_{||}^{\mu\nu} = g_{||}^{\mu\nu} - \frac{p_\mu p_\nu}{p_\perp^2},$$

$$\mathcal{P}_{\perp}^{\mu\nu} = g_{\perp}^{\mu\nu} + \frac{p_\mu p_\nu}{p_\perp^2},$$

$$\mathcal{P}_0^{\mu\nu} = g^{\mu\nu} - \frac{p_\mu p_\nu}{p^2} - \mathcal{P}_{||}^{\mu\nu} - \mathcal{P}_{\perp}^{\mu\nu}.$$

Therefore, we can use this basis to express Eqs. (17) (see Appendix A) as

$$i\Pi^{\mu\nu} = \frac{i}{4\pi^2} g^2 \int d^2x \ f_0(x_1, x_2)$$

$$\times \left[ P_{||}(x_1, x_2) \mathcal{P}_{||}^{\mu\nu} + P_{\perp}(x_1, x_2) \mathcal{P}_{\perp}^{\mu\nu} + P_0(x_1, x_2) \mathcal{P}_0^{\mu\nu} + A_1(x_1, x_2) g_{||}^{\mu\nu} + A_2(x_1, x_2) g_{\perp}^{\mu\nu} \right],$$

where

$$P_{||} = |q_f B| \left[ \frac{2x_1x_2 \coth(|q_f B|(x_1 + x_2))^2}{(x_1 + x_2)^2} \right],$$

$$P_{\perp} = |q_f B| \left[ \frac{x_1 \sinh(2 |q_f B| x_2) + x_2 \sinh(2 |q_f B| x_1)}{2(x_1 + x_2)^2 \sinh^2(|q_f B|(x_1 + x_2))^2} \right],$$

$$P_0 = |q_f B|^2 \left[ \frac{x_1 \sinh(2 |q_f B| x_2) + x_2 \sinh(2 |q_f B| x_1)}{2(x_1 + x_2)^2 \sinh^2(|q_f B|(x_1 + x_2))^2} \right],$$

$$A_1 = |q_f B| \left[ \frac{x_1 \sinh(2 |q_f B| x_2) + x_2 \sinh(2 |q_f B| x_1)}{2(x_1 + x_2)^2 \sinh^2(|q_f B|(x_1 + x_2))^2} \right],$$

$$A_2 = |q_f B| \left[ \frac{x_1 \sinh(2 |q_f B| x_2) + x_2 \sinh(2 |q_f B| x_1)}{2(x_1 + x_2)^2 \sinh^2(|q_f B|(x_1 + x_2))^2} \right],$$

$$\times \left[ 1 - \frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{|q_f B| \tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)\tan^2(x_1x_2) \tan^2(x_1x_2)} \right],$$

(21)
and

\[
A_2 = |q_f B|[\cosh[|q_f B| (x_2 - x_1)] \left\{ \frac{\cosh[|q_f B| (x_2 - x_1)]}{(x_1 + x_2)^3 \sinh[|q_f B| (x_1 + x_2)]} \right\} \\
\times \left[ x_1 x_2 p_1^2 + (x_1 + x_2) + m_f^2 (x_1 + x_2)^2 \right] \\
- \frac{x_1 \sinh(2|q_f B| x_2) + x_2 \sinh(2|q_f B| x_1)}{2(x_1 + x_2)^2 \sinh^2(|q_f B|(x_1 + x_2))} P_\perp^2 \\
+ \frac{\sinh(|q_f B| x_1) \sinh(|q_f B| x_2)}{(x_1 + x_2) \sinh^3(|q_f B|(x_1 + x_2))} P_\perp^1 \right]. \tag{22}
\]

Notice that, contrary to expectations, Eq. \((17)\) contains also terms proportional to the tensors \(g_\parallel^{\mu \nu}\) and \(g_\perp^{\mu \nu}\). In order to show that \(\Pi^{\mu \nu}\) is made out only of combinations of transverse tensors, we need to prove that the coefficients \(A_1\) and \(A_2\) vanish. This is shown in Appendix [C]. For the time being, let us only emphasize that, had we simply projected out Eq. \((6)\) onto the basis given by Eqs. \((15)\)–\((20)\), the spurious terms would have induced non-physical contributions that, given their complexity, could obscure the numerical evaluation of the physical coefficients \(\Pi_1, \Pi_2\) in the vacuum polarization tensor.

### B. Vacuum Polarization Tensor

As one can expect, the gluon polarization tensor contains divergences which come from the vacuum contribution. In order to proceed to isolate these contributions we notice that two possible vacua can be defined:

- A vacuum where \(p^\mu = 0\) and \(B = 0\), corresponding to a situation where particles and magnetic field appear simultaneously.

- A vacuum with \(B = 0\) and \(p^\mu \neq 0\), representing a situation where the external field is turned on with pre-existing gluons with four-momentum \(p^\mu\).

The first choice is ambiguous, given that the energy scales associated to the magnetic field and the transverse momentum appear within the combination \(p_\perp^2 / |q_f B|\), and thus, \(p_1^2\) and \(B\) cannot be set to zero simultaneously. Therefore, we chose to extract the vacuum working in the situation described by the second case. The vacuum contribution is thus given by

\[
i\Pi^{\mu \nu}(p, |q_f B| \to 0) = -\frac{i}{4\pi^2} g^2 \int d^2 x \exp \left\{ \frac{x_1 x_2}{x_1 + x_2} p^2 - m_f^2 (x_1 + x_2) \right\} \\
\times \left[ \frac{2 x_1 x_2}{(x_1 + x_2)^2} P^2 \left( g^{\mu \nu} - \frac{p^\mu p^\nu}{p^2} \right) \\
+ \frac{1}{(x_1 + x_2)^3} \left( (x_1 + x_2) m_f^2 - \frac{x_1 x_2}{x_1 + x_2} p^2 + 1 \right) g^{\mu \nu} \right]. \tag{23}
\]

Notice that Eq. \((23)\) contains a term that does not simply vanish under contraction with \(p_0\), namely, the term proportional to \(g^{\mu \nu}\). In order to show that the coefficient of this term vanishes, we follow the argument in Ref. [21]. We introduce the scaling transformation for the Schwinger parameters in such a way that \(x_1 \to \lambda x_1\), where \(\lambda\) is a real parameter. Under this transformation, the coefficient of the term proportional to \(g^{\mu \nu}\) becomes

\[
\mathcal{I} = \lambda^2 \int \frac{d^2 z}{\lambda^2(z_1 + z_2)^3} \left( m_f^2 - \frac{z_1 z_2}{z_1 + z_2} p^2 + \frac{1}{\lambda} \right) \\
\times \exp \left\{ \lambda \left( \frac{z_1 z_2}{z_1 + z_2} p^2 - m_f^2(z_1 + z_2) \right) \right\}. \tag{24}
\]

It is easy to show that the integral \(\mathcal{I}\) can also be written as

\[
i\Pi^{\mu \nu}(p, |q_f B| \to 0) = -\frac{i}{4\pi^2} g^2 \int d^2 x \exp \left\{ \frac{x_1 x_2}{x_1 + x_2} p^2 - m_f^2(x_1 + x_2) \right\} \\
\times \frac{2 x_1 x_2}{(x_1 + x_2)^2} P^2 \left( \mathcal{P}_0^{\mu \nu} + \mathcal{P}_\parallel^{\mu \nu} + \mathcal{P}_\perp^{\mu \nu} \right), \tag{27}
\]

where \(\mathcal{P}_0^{\mu \nu}, \mathcal{P}_\parallel^{\mu \nu}\) and \(\mathcal{P}_\perp^{\mu \nu}\) are given by Eqs. \((14)\)–\((16)\).

A similar argument is valid for a non-vanishing magnetic field. This means that the coefficients \(A_1\) and \(A_2\), in Eqs. \((21)\) and \((22)\), respectively, do not contribute to \(\Pi^{\mu \nu}\), since they vanish. The systematic evaluation of these terms is shown in Appendix [C]. Thus, the full polarization tensor with the desired physical properties is given by

\[
i\Pi^{\mu \nu} = -\frac{i}{4\pi^2} g^2 \int d^2 x f_0(x_1, x_2) \\
\times \left[ \Pi_{\parallel}(x_1, x_2) \mathcal{P}_\parallel^{\mu \nu} + \Pi_{\perp}(x_1, x_2) \mathcal{P}_\perp^{\mu \nu} + \Pi_0(x_1, x_2) \mathcal{P}_0^{\mu \nu} \right]. \tag{29}
\]
where $\Pi_\parallel$, $\Pi_\perp$ and $\Pi_0$ are given by Eqs. (18), (19) and (20), respectively.

To cancel the vacuum piece, we subtract from Eq. (29) the contribution from Eq. (27). Therefore, the finite, magnetic field-dependent part of the gluon polarization tensor is explicitly given by

\[ i\Pi^{\mu\nu} = -\frac{i |q_f B|}{4\pi^2} g^2 \int \frac{d^2 x}{(x_1 + x_2)^2} \exp \left[ \frac{x_1 x_2}{x_1 + x_2} p_\parallel^2 - m_f^2 (x_1 + x_2) \right] \exp \left[ -\frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)} \right] \]

\[ \times \left\{ \frac{2 x_1 x_2 \coth(|q_f B| (x_1 + x_2))}{(x_1 + x_2)^2} p_\perp^2 - \frac{x_1 \sinh(2|q_f B| x_2)}{\sinh^2(|q_f B| (x_1 + x_2))} p_\perp^2 - \tilde{\Pi}(x_1, x_2) \right\} \mathcal{P}_{\parallel}^{\mu\nu} \]

\[ + \frac{x_1 \sinh(2|q_f B| x_2)}{\sinh^2(|q_f B| (x_1 + x_2))} p_\perp^2 - \tilde{\Pi}(x_1, x_2) \right\} \mathcal{P}_{\perp}^{\mu\nu} \]

\[ + \frac{x_1 \sinh(2|q_f B| x_2)}{\sinh^2(|q_f B| (x_1 + x_2))} p_\perp^2 - \tilde{\Pi}(x_1, x_2) \right\} \mathcal{P}_0^{\mu\nu} \}, \]

(30)

where

\[ \tilde{\Pi}(x_1, x_2) = \frac{2p_\perp^2}{|q_f B|} \frac{x_1 x_2}{(x_1 + x_2)^2} \exp \left( \frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)} - \frac{x_1 x_2}{x_1 + x_2} \right), \]

(31)

and we have used the symmetry of the integral under the exchange $x_1 \leftrightarrow x_2$. In order to check the validity of the above expression, we proceed to study its limits in the strong and weak magnetic field cases.

### III. STRONG FIELD LIMIT

In order to study the strong field limit, let us first introduce the dimensionless variables

\[ y_1 = \frac{x_1}{m_f^2}, \quad p_\perp^2 = \frac{p_{\perp,\perp}^2}{m_f^2}, \quad B = \frac{|q_f B|}{m_f^2} \]

(32a)

and the new variables $s$ and $y$ related to $y_1$ and $y_2$ by

\[ y_1 \equiv s (1 - y), \quad y_2 \equiv sy, \]

(32b)

so that Eq. (29) becomes

\[ i\Pi^{\mu\nu} = -\frac{i g^2 m_f^2}{4\pi^2} \int_0^1 dy \int_0^\infty ds \exp \left[ s \left( y (1 - y) \rho_\parallel^2 - 1 \right) \right] \exp \left[ -\frac{\cosh(Bs) - \cosh(2Bsy)}{2 \sinh(Bs)} \right] \frac{2\sinh(Bs)}{\rho_\perp^2} \mathcal{P}_{\parallel}^{\mu\nu} \]

\[ \times \left\{ B \left[ 2y(1 - y) \coth(Bs) \rho_\parallel^2 - \frac{(1 - y)\sinh(2Bsy)}{\sinh^2(Bs)} \rho_\perp^2 \right] \mathcal{P}_{\parallel}^{\mu\nu} \right. \]

\[ + B \left[ \frac{(1 - y)\sinh(2Bsy)}{\sinh^2(Bs)} \rho_\parallel^2 - \frac{\cosh(Bs) - \cosh(2Bsy)}{\sinh^2(Bs)} \rho_\perp^2 \right] \mathcal{P}_{\parallel}^{\mu\nu} + \left. \frac{(1 - y)B \sinh(2Bsy)}{\sinh^2(Bs)} \rho_\perp^2 \mathcal{P}_0^{\mu\nu} \right\}. \]

(33)

Note that in the strong field limit

\[ B \coth(Bs) \sim B, \]

\[ \frac{B \sinh(2Bsy)}{2 \sinh^2(Bs)} \sim 0, \]

\[ \frac{\cosh(Bs) - \cosh(2Bsy)}{2 \sinh(Bs)} \sim \frac{1}{2B} \]

(34)

which hold for all $s$ and $0 < y < 1$. Therefore

\[ i\Pi^{\mu\nu} = -\frac{i g^2 m_f^2 B \rho_\perp^2}{2\pi^2} e^{-\rho_\perp^2 / 2B} \]

\[ \times \int_0^1 dy y(1 - y) \int_0^\infty ds \exp \left[ s \left( y (1 - y) \rho_\parallel^2 - 1 \right) \right]. \]

(35)
examine the term proportional to \( \coth(\mathbf{B}) \) functions become divergent. For these purposes let us consider only the contribution from the LLL. Figure 2 shows the real and imaginary parts of \( \Pi^{\mu\nu} \) defined in Eq. (36). Notice the discontinuity at the threshold value \( \rho_\parallel = 4 \) or equivalently at \( \rho_\parallel^2 = 4m_f^2 \).

For the kinematical region such that \( y(1-y)\rho_\parallel^2 < 1 \), the integration over \( s \) can be performed, yielding

\[
\Pi^{\mu\nu} = \frac{ig^2m_f^2\mathbf{B}}{2\pi^2} e^{-\rho_\parallel^2/2B} \int_0^1 dy \frac{y(1-y)}{y(1-y) - \rho_\parallel^2} \Pi^{\mu\nu}_{\parallel}
\]

which coincides with the result obtained in Refs. [14–16] where the gluon polarization tensor is computed by considering only the contribution from the LLL. Figure 2 shows the real and imaginary parts of \( \Pi^{\mu\nu}_{\parallel} \). Notice the discontinuity at the threshold value \( \rho_\parallel = 4 \) or equivalently at \( \rho_\parallel^2 = 4m_f^2 \).

Notice also that Eq. (30) implies the existence of an infinite sequence of momentum thresholds when the external gluon momentum becomes resonant with twice the quark/antiquark magnetic mass, whose square is defined as \( m_f^2(B)_J = m_f^2 + 2n[q_f B] \). The threshold corresponds to the value of the longitudinal momentum squared for the creation of a quark-antiquark pair, each particle having a magnetic mass corresponding to the given Landau level.

These thresholds can be obtained from our calculation by concentrating on the conditions where the hyperbolic functions become divergent. For these purposes let us examine the term proportional to \( \coth(Bs) \) in Eq. (36):

\[
K = \int_0^1 dy \int_0^\infty ds y(1-y)B \coth(Bs) \times \exp \left[ s \left( y(1-y)\rho_\parallel^2 - 1 \right) \right] \times \exp \left[ -\frac{\cosh(Bs) - \cosh[Bs(2y-1)]\rho_\parallel^2}{2\sinh(Bs)} B \right].
\]  

(37)

![FIG. 2: Real and imaginary parts of the function \( I(\rho_\parallel^2) \) defined in Eq. (36). Notice the discontinuity at the threshold value \( \rho_\parallel = 4 \) or equivalently at \( \rho_\parallel^2 = 4m_f^2 \).](image1)

Notice that if \( B \gg 1 \)

\[
B \coth(Bs) \exp \left[ -\frac{\cosh(Bs) - \cosh[Bs(2y-1)]\rho_\parallel^2}{2\sinh(Bs)} B \right]
\]

\[= B \frac{1 + e^{-2Bs}}{1 - e^{-2Bs}} \times \exp \left\{ -1 - e^{-2Bs} + e^{-2Bs(y-1)} + e^{-2Bs y} \right\}
\]

\[\approx B \frac{1 + e^{-2Bs}}{1 - e^{-2Bs}} + O(\rho_\perp^2).
\]

Using that

\[
1 \frac{1}{1 - e^{-2Bs}} = \sum_{n=0}^{\infty} e^{-2nBs},
\]

we can write

\[
1 + e^{-2Bs} \frac{1}{1 - e^{-2Bs}} = 1 + 2 \sum_{n=1}^{\infty} e^{-2nBs},
\]

so that, the dominant term in Eq. (37) is given by

\[
K = B \int_0^1 dy \int_0^\infty ds y(1-y) \left\{ \exp \left[ s \left( y(1-y)\rho_\parallel^2 - 1 \right) \right] \right\}
\]

\[+ 2 \sum_{n=1}^{\infty} \exp \left[ s \left( y(1-y)\rho_\parallel^2 - 2nB - 1 \right) \right] \}
\]

\[= \frac{B}{\rho_\parallel^2} I(\rho_\parallel^2) + 8B J(\rho_\parallel^2),
\]

(41)

where \( I(x) \) is defined in Eq. (36) and

\[
J(x) = \sum_{n=1}^{\infty} \frac{\arctan \left( \frac{\sqrt{\pi}}{\sqrt{4(nB+1)-x}} \right)}{\sqrt{x [4(nB+1) - x]}},
\]

(42)
In this way, the resonant behavior of the thresholds is explicit: the gluon polarization tensor has divergences when its momentum reaches the value $p^2_i = 4m_i^2$, where $n$ labels each of the Landau levels. In other words, the creation of quark-antiquark pairs is allowed when the gluon momentum is large enough to generate not only the inertial mass of the pair but rather the magnetic mass, induced by the magnetized medium. Figure 3 shows several thresholds of the function $J(p^2_i)$ in a broad range of $p^2_i$ for a maximum value of $n$, $n_{\text{max}} = 100$. The same argument is valid for all terms in Eq. (33) given that its dominant contribution is given by a power of the series in Eq. (39).

IV. WEAK FIELD LIMIT

Let us study the case where the field satisfies the hierarchy of energy scales $|eB| < m_f^2$. We call this the weak field limit. For this purpose, we can perform a power series of Eq. (33) around $B = 0$ to obtain

\[
\begin{align*}
    i\Pi^{\mu\nu}(\rho^2, B \to 0) & = -\frac{ig^2 m_f^2}{4\pi^2} \int_0^1 dy \int_0^\infty ds \exp \left[ s (y(1-y)\rho^2 - 1) \right] \\
    & \times \frac{2y(1-y)}{s} \rho^2 \left( \Pi_\parallel^{\mu\nu} + \Pi_\perp^{\mu\nu} + \Pi_0^{\mu\nu} \right)
\end{align*}
\]

where the vacuum contribution of Eq. (28) can be identified as

\[
\begin{align*}
    i\Pi^{\mu\nu}(\rho^2, B \to 0) & = -\frac{ig^2 m_f^2 B^2}{3\pi^2} \\
    & \times \left[ \Pi_\parallel(\rho^2)\Pi_\parallel^{\mu\nu} + \Pi_\perp(\rho^2)\Pi_\perp^{\mu\nu} + \Pi_0(\rho^2)\Pi_0^{\mu\nu} \right]
\end{align*}
\]

where

\[
\begin{align*}
    \Pi_\parallel & = \frac{1}{4 - \rho^2} \left[ 12 + (\rho^2 - 6)\rho^2 \rho^2_\perp + 2\rho^2(\rho^2 + 2) - 12 \frac{\sqrt{(4 - \rho^2)\rho^2_\perp}}{(4 - \rho^2)^{3/2}} \arctan \left( \frac{\sqrt{\rho^2}}{\sqrt{4 - \rho^2}} \right) \right. \\
    & \left. - (\rho^2 - 10)(\rho^2 - 3) \frac{\rho^2_\perp}{\rho^2} + 6\rho^2_\perp \rho^2 + 1 \right],
\end{align*}
\]

\[
\begin{align*}
    \Pi_\perp & = \frac{1}{4 - \rho^2} \left[ 12 + (\rho^2 - 6)\rho^2 \rho^2_\parallel + 3(\rho^2 - 2)\sqrt{(4 - \rho^2)\rho^2_\parallel} - 3\rho^2 \sqrt{(4 - \rho^2)\rho^2_\parallel} \right. \\
    & \left. + \frac{12 + (\rho^2 - 6)\rho^2}{\sqrt{4 - \rho^2}(\rho^2)^{3/2}} \arctan \left( \frac{\sqrt{\rho^2}}{\sqrt{4 - \rho^2}} \right) \right. \\
    & \left. - (\rho^2 - 10)(\rho^2 - 3) \frac{\rho^2_\parallel}{\rho^2} + 3\rho^2_\parallel \rho^2 + 3\rho^2 \rho^2_\parallel \right],
\end{align*}
\]
The coefficients $\hat{\Pi}_\parallel$, $\hat{\Pi}_\perp$, and $\hat{\Pi}_0$ consist of real and imaginary parts. The imaginary parts can be obtained from the corresponding real parts from the Kramers-Kronig relations. With the notation

$$\omega \equiv \rho_0$$

we have

$$\text{Im} \Pi^{\mu\nu}(\omega) = -\frac{1}{\pi} \mathcal{P} \int_{-\infty}^{+\infty} \frac{\text{Re} \Pi^{\mu\nu}(\omega')}{\omega' - \omega} d\omega'$$

where $\mathcal{P}$ is the Principal Value. Examples of these coefficients as functions of $\rho_\parallel^2$, for various values of $\rho_\perp^2$ are shown in Fig. 1.

V. RESULTS, DISCUSSION AND CONCLUSIONS

The results of this work can be used to study birefringence of the gluon polarization in a magnetized medium. Recall that birefringence is the optical property exhibited by a material whose refractive index depends on the polarization and propagation direction of light. Recall that birefringence is the optical property exhibiting by a material whose refractive index depends on the polarization and propagation direction of light. Recall that birefringence is the optical property exhibiting by a material whose refractive index depends on the polarization and propagation direction of light.

The authors are thankful to L. A. Hernández and R. Zamora for useful conversations. Support for this work was received in part by UNAM-DGPA-PAPIIT grant number IG100219 and by Consejo Nacional de Ciencia y Tecnología grant number 256494. E. M. acknowledgements.
FIG. 4: (Color online) Real and imaginary parts of the coefficients \(\tilde{\Pi}_\parallel\), \(\tilde{\Pi}_\perp\) and \(\tilde{\Pi}_0\) from Eqs. (46)-(48) as functions of \(\rho^2\) for fixed values of \(\rho_\parallel^2\) and \(\rho_\parallel^2\). Notice that for the chosen kinematical range for \(\rho^2\), the threshold appears at \(\rho^2 = 4\) or equivalently at \(p^2 = 4m_f^2\).
Appendix A: Derivation of Eqs. (7)

Let us begin from the general expression of the gluon polarization tensor of Eq. (1):

\[
i\Pi^{\mu\nu}_{(ab)} = - \int \frac{d^4k}{(2\pi)^4} \text{Tr} \left\{ igt_6\gamma^\nu iS^{(m)}(k)igt_5\gamma^\mu iS^{(m)}(q) \right\} + \text{C.C.}
\]

(A1)

The trace in the above expression involves two fermion propagator factors, each given by Eqs. (2)-(3). This product produces nine terms, that are explicitly given by

\[
t_1^{\mu\nu} = -2g^2 \sum_{n,m=0}^{\infty} \int \frac{d^4k}{(2\pi)^4} \exp \left[ -\frac{k_+^2 + (k-p)_+^2}{|q_fB|} \right] \frac{(-1)^{n+m} L_n^0 \left( \frac{2k_+^2}{|q_fB|} \right) L_m^0 \left( \frac{2(k-p)_+^2}{|q_fB|} \right)}{[k_+^2 - m_f^2 - 2n |q_fB|] \left[ (k-p)_+^2 - m_f^2 - 2m |q_fB| \right]} \times \text{Tr} \left\{ \gamma^\nu(\vec{k}_+ + m_f)\mathcal{O}^- \gamma^\mu(\vec{k}_- - \vec{p}_+ + m_f)\mathcal{O}^- \right\} + \text{C.C.}
\]

(A2)

\[
t_2^{\mu\nu} = 2g^2 \sum_{n=0,m=1}^{\infty} \int \frac{d^4k}{(2\pi)^4} \exp \left[ -\frac{k_+^2 + (k-p)_+^2}{|q_fB|} \right] \frac{(-1)^{n+m} L_n^0 \left( \frac{2k_+^2}{|q_fB|} \right) L_m^{0-1} \left( \frac{2(k-p)_+^2}{|q_fB|} \right)}{[k_+^2 - m_f^2 - 2n |q_fB|] \left[ (k-p)_+^2 - m_f^2 - 2m |q_fB| \right]} \times \text{Tr} \left\{ \gamma^\nu(\vec{k}_+ + m_f)\mathcal{O}^- \gamma^\mu(\vec{k}_- - \vec{p}_+ + m_f)\mathcal{O}^+ \right\} + \text{C.C.}
\]

(A3)

\[
t_3^{\mu\nu} = -4g^2 \sum_{n=0,m=1}^{\infty} \int \frac{d^4k}{(2\pi)^4} \exp \left[ -\frac{k_+^2 + (k-p)_+^2}{|q_fB|} \right] \frac{(-1)^{n+m} L_n^0 \left( \frac{2k_+^2}{|q_fB|} \right) L_m^{0-1} \left( \frac{2(k-p)_+^2}{|q_fB|} \right)}{[k_+^2 - m_f^2 - 2n |q_fB|] \left[ (k-p)_+^2 - m_f^2 - 2m |q_fB| \right]} \times \text{Tr} \left\{ \gamma^\nu(\vec{k}_+ + m_f)\mathcal{O}^+ \gamma^\mu(\vec{k}_- - \vec{p}_+ + m_f)\mathcal{O}^- \right\} + \text{C.C.}
\]

(A4)

\[
t_4^{\mu\nu} = 2g^2 \sum_{n=1,m=0}^{\infty} \int \frac{d^4k}{(2\pi)^4} \exp \left[ -\frac{k_+^2 + (k-p)_+^2}{|q_fB|} \right] \frac{(-1)^{n+m} L_n^0 \left( \frac{2k_+^2}{|q_fB|} \right) L_m^{0-1} \left( \frac{2(k-p)_+^2}{|q_fB|} \right)}{[k_+^2 - m_f^2 - 2n |q_fB|] \left[ (k-p)_+^2 - m_f^2 - 2m |q_fB| \right]} \times \text{Tr} \left\{ \gamma^\nu(\vec{k}_+ + m_f)\mathcal{O}^+ \gamma^\mu(\vec{k}_- - \vec{p}_+ + m_f)\mathcal{O}^+ \right\} + \text{C.C.}
\]

(A5)

\[
t_5^{\mu\nu} = -2g^2 \sum_{n=1,m=1}^{\infty} \int \frac{d^4k}{(2\pi)^4} \exp \left[ -\frac{k_+^2 + (k-p)_+^2}{|q_fB|} \right] \frac{(-1)^{n+m} L_n^0 \left( \frac{2k_+^2}{|q_fB|} \right) L_m^{0-1} \left( \frac{2(k-p)_+^2}{|q_fB|} \right)}{[k_+^2 - m_f^2 - 2n |q_fB|] \left[ (k-p)_+^2 - m_f^2 - 2m |q_fB| \right]} \times \text{Tr} \left\{ \gamma^\nu(\vec{k}_+ + m_f)\mathcal{O}^+ \gamma^\mu(\vec{k}_- - \vec{p}_+ + m_f)\mathcal{O}^+ \right\} + \text{C.C.}
\]

(A6)

\[
t_6^{\mu\nu} = 4g^2 \sum_{n=1,m=1}^{\infty} \int \frac{d^4k}{(2\pi)^4} \exp \left[ -\frac{k_+^2 + (k-p)_+^2}{|q_fB|} \right] \frac{(-1)^{n+m} L_n^0 \left( \frac{2k_+^2}{|q_fB|} \right) L_m^{0-1} \left( \frac{2(k-p)_+^2}{|q_fB|} \right)}{[k_+^2 - m_f^2 - 2n |q_fB|] \left[ (k-p)_+^2 - m_f^2 - 2m |q_fB| \right]} \times \text{Tr} \left\{ \gamma^\nu(\vec{k}_+ + m_f)\mathcal{O}^+ \gamma^\mu(\vec{k}_- - \vec{p}_+ \mathcal{O}^+ \right\} + \text{C.C.}
\]

(A7)

\[
t_7^{\mu\nu} = -4g^2 \sum_{n=1,m=0}^{\infty} \int \frac{d^4k}{(2\pi)^4} \exp \left[ -\frac{k_+^2 + (k-p)_+^2}{|q_fB|} \right] \frac{(-1)^{n+m} L_n^0 \left( \frac{2k_+^2}{|q_fB|} \right) L_m^{0-1} \left( \frac{2(k-p)_+^2}{|q_fB|} \right)}{[k_+^2 - m_f^2 - 2n |q_fB|] \left[ (k-p)_+^2 - m_f^2 - 2m |q_fB| \right]} \times \text{Tr} \left\{ \gamma^\nu(\vec{k}_+ + m_f)\mathcal{O}^- \gamma^\mu(\vec{k}_- - \vec{p}_+ + m_f)\mathcal{O}^- \right\} + \text{C.C.}
\]

(A8)
By using the generating function of the Laguerre Polynomials, given by

\[ t^\mu_\nu = 4g^2 \sum_{n=m=1}^\infty \int \frac{d^4k}{(2\pi)^4} \exp \left[ -\frac{k^2 + (k - p)^2}{2|q_f B|} \right] \frac{(-1)^{n+m}L^0_n \left( \frac{2k^2}{|q_f B|} \right)}{L^0_m \left( \frac{2(k-p)^2}{|q_f B|} \right)} \]

\[ \times \text{Tr} \left\{ \gamma^\nu \gamma^\mu (\not{k}_\| - \not{p}_\| + m_f)O^+ \right\} + \text{C.C.} \]  

(A9)

\[ t^\mu_\nu = 8g^2 \sum_{n=m=1}^\infty \int \frac{d^4k}{(2\pi)^4} \exp \left[ -\frac{k^2 + (k - p)^2}{2|q_f B|} \right] \frac{(-1)^{n+m}L^1_n \left( \frac{2k^2}{|q_f B|} \right)}{L^1_m \left( \frac{2(k-p)^2}{|q_f B|} \right)} \]

\[ \times \text{Tr} \left\{ \gamma^\nu \gamma^\mu (\not{k}_\| - \not{p}_\|) \right\} + \text{C.C.} \]  

(A10)

In order to perform the sum over Landau levels, we write the denominators introducing Schwinger parameters such that

\[ \frac{1}{y} = \int_0^\infty e^{-yx} dx. \]  

(A11)

We start with the expression given by Eq. (A12)

\[ t^\mu_\nu = -2g^2 \int d^2x \int \frac{d^4k}{(2\pi)^4} \exp \left[ -\frac{k^2 + (k - p)^2}{2|q_f B|} \right] \frac{(-1)^{n+m}L^0_n \left( \frac{2k^2}{|q_f B|} \right)}{L^0_m \left( \frac{2(k-p)^2}{|q_f B|} \right)} \]

\[ \times \text{Tr} \left\{ \gamma^\nu (\not{k}_\| + m_f)O^-\gamma^\mu (\not{k}_\| - \not{p}_\| + m_f)O^- \right\} \]

\[ = -2g^2 \int d^2x \int \frac{d^4k}{(2\pi)^4} \exp \left[ -\frac{k^2 + (k - p)^2}{2|q_f B|} \right] \text{Tr} \left\{ \gamma^\nu (\not{k}_\| + m_f)O^-\gamma^\mu (\not{k}_\| - \not{p}_\| + m_f)O^- \right\} \]

\[ \times e^{\alpha(k_\|)x_1 + \beta(k_\|)x_2} \sum_{n,m=0}^{\infty} r^n L^0_n(s_1) r^m L^0_m(s_2) + \text{C.C.} \]  

(A12)

where

\[ \alpha(k_\|) = k_\|^2 - m_f^2, \]

(A13a)

\[ \beta(k_\|) = (k_\| - p_\|)^2 - m_f^2, \]

(A13b)

\[ r_i = -e^{-2|q_f B|x_i}, \quad i = 1, 2, \]

(A13c)

\[ s_1 = \frac{2k^2}{|q_f B|}, \]

(A13d)

\[ s_2 = \frac{2(k - p)^2}{|q_f B|}. \]

(A13e)

By using the generating function of the Laguerre Polynomials, given by

\[ \sum_{n=0}^{\infty} r^n L^k_n(s) = \frac{1}{(1 - r)^{k+1}} \exp \left( -\frac{r}{1 - r} s \right), \]  

(A14)

we find

\[ t^\mu_\nu = -2g^2 \int \frac{d^2x}{\left( 1 + e^{-2|q_f B|x_1} \right) \left( 1 + e^{-2|q_f B|x_2} \right)} \int \frac{d^4k}{(2\pi)^4} \exp \left[ -\frac{k^2 + (k - p)^2}{2|q_f B|} \right] e^{\alpha(k_\|)x_1 + \beta(k_\|)x_2} \]

\[ \times \text{Tr} \left\{ \gamma^\nu (\not{k}_\| + m_f)O^-\gamma^\mu (\not{k}_\| - \not{p}_\| + m_f)O^- \right\} + \text{C.C.} \]  

(A15)
where we have defined

\[ n(x) \equiv \frac{1}{e^{2|q_f B| x} + 1}. \]  

(A16)

Now, for the trace computation, note that

\[ \left[ \gamma^\mu, O^{(\pm)} \right] = 0, \]  

(A17a)

\[ O^{(\pm)} \gamma^\mu O^{(\pm)} = O^{(\pm)} \gamma^\mu, \]  

(A17b)

and therefore

\[
4 \text{Tr} \left\{ \gamma^\nu (\vec{k} + m_f) \gamma^\mu (\vec{k} - \vec{p} + m_f) O^- \right\} + \text{C.C.} \\
= 4 \text{Tr} \left\{ \gamma^\nu (\vec{k} + m_f) \gamma^\mu (\vec{k} - \vec{p} + m_f) \right\} \\
= 16 \left[ (k_\parallel \cdot p_\parallel + m_f^2 - k_\parallel^2) g^{\mu\nu} + 2k_\parallel^\mu k_\parallel^\nu - k_\parallel^\mu p_\parallel^\nu - k_\parallel^\nu p_\parallel^\mu \right].
\]  

(A18)

Putting all together

\[
i_1^{\mu\nu} = -8g^2 \int \frac{\mathcal{I}_1(x_1, x_2) \mathcal{J}_1^{\mu\nu}(x_1, x_2)}{(1 + e^{-2|q_f B| x_1})(1 + e^{-2|q_f B| x_2})} d^2 x,
\]  

(A19)

with

\[
\mathcal{I}_1 = \int \frac{d^2 k_\perp}{(2\pi)^2} \exp \left[ -\frac{k_\perp^2 + (k - p)^2_\perp}{|q_f B|} \right] \exp \left[ n(x_1) \frac{2k_\perp^2}{|q_f B|} \right] \exp \left[ n(x_2) \frac{2(k - p)^2_\perp}{|q_f B|} \right]
\]  

(A20)

and

\[
\mathcal{J}_1^{\mu\nu} = \int \frac{d^2 k_\perp}{(2\pi)^2} e^{\alpha(k_1)x_1} e^{\beta(k_1)x_2} \left[ (k_\perp \cdot p_\perp + m_f^2 - k_\perp^2) g^{\mu\nu} + 2k_\perp^\mu k_\perp^\nu - k_\perp^\mu p_\perp^\nu - k_\perp^\nu p_\perp^\mu \right].
\]  

(A21)

The transverse integral \( \mathcal{I}_1 \) is performed by making the shift

\[
k_\perp = q_\perp + \frac{1 - 2n(x_2)}{2(1 - n(x_1) - n(x_2))} p_\perp,
\]  

(A22)

which turns the integral into a simple Gaussian form. It is straightforward to prove that

\[
\mathcal{I}_1 = \frac{\pi}{(2\pi)^2} \frac{|q_f B|}{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)} \exp \left[ -\frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)} \frac{p_\perp^2}{|q_f B|} \right].
\]  

(A23)

For the parallel integral \( \mathcal{J}_1^{\mu\nu} \), the appropriate shift is

\[
l = k_\parallel - \frac{x_2}{x_1 + x_2} p_\parallel,
\]  

(A24)

and by performing a rotation to Euclidean space, the integral becomes of a Gaussian form in the variable \( l_\perp^2 = l_1^2 + l_3^2 \), and thus

\[
\mathcal{J}_1^{\mu\nu} = \frac{i\pi}{(2\pi)^2} \exp \left[ \frac{x_1 x_2}{x_1 + x_2} p_\parallel^2 - m_f^2 (x_1 + x_2) \right] \left[ \left( \frac{x_1 x_2}{x_1 + x_2} \right)^2 p_\parallel^2 + \frac{m_f^2}{x_1 + x_2} g^{\mu\nu} \right] - \frac{2x_1 x_2}{(x_1 + x_2)^3} p_\parallel^\mu p_\parallel^\nu.
\]  

(A25)

Collecting terms

\[
i_1^{\mu\nu} = -\frac{i|q_f B|}{8\pi^2} g^2 \int d^2 x \frac{e^{i|q_f B|(x_1 + x_2)}}{\sinh(|q_f B| (x_1 + x_2))} \exp \left[ \frac{x_1 x_2}{x_1 + x_2} p_\parallel^2 - m_f^2 (x_1 + x_2) \right] \times \exp \left[ -\frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)} \frac{p_\perp^2}{|q_f B|} \right] \left[ \left( \frac{x_1 x_2}{x_1 + x_2} \right)^2 p_\parallel^2 + \frac{m_f^2}{x_1 + x_2} g^{\mu\nu} \right] - \frac{2x_1 x_2}{(x_1 + x_2)^3} p_\parallel^\mu p_\parallel^\nu.
\]  

(A26)
Note that the term $t_{5}^{\mu\nu}$ of Eq. (A6) has the same tensor structure as $t_{1}^{\mu\nu}$. By means of the variable shifts $n' = m - 1$ and $n = n - 1$, which produce a factor $e^{-2\|q_{f}B\|x_{1}+x_{2}}$, this gives rise at the same set of transverse and parallel integrals than for the case of $t_{1}^{\mu\nu}$. Therefore, we can write

$$
t_{5}^{\mu\nu} = -\frac{i|q_{f}B|}{8\pi^{2}}g^{2}\int d^{2}x \frac{e^{-|q_{f}B|(x_{1}+x_{2})}}{\sinh |q_{f}B|(x_{1}+x_{2})} \exp \left[ \frac{x_{1}x_{2}}{x_{1}+x_{2}} p_{\|}^{2} - m_{f}^{2}(x_{1}+x_{2}) \right] \times \exp \left[ -\tanh(|q_{f}B|x_{1})\tanh(|q_{f}B|x_{2}) \frac{p_{\|}^{2}}{\tanh(|q_{f}B|x_{1}) + \tanh(|q_{f}B|x_{2})} \left[ \frac{x_{1}x_{2}}{x_{1}+x_{2}} \frac{m_{f}^{2}}{x_{1}+x_{2}} + 2x_{1}x_{2} (x_{1}+x_{2})^{3} p_{\|}^{2} p_{\perp}^{2} \right] \right]. \quad (A27)\]$$

Adding up these two terms, we get

$$
t_{1}^{\mu\nu} + t_{5}^{\mu\nu} = -\frac{i|q_{f}B|}{4\pi^{2}}g^{2}\int d^{2}x \coth |q_{f}B|(x_{1}+x_{2}) \exp \left[ \frac{x_{1}x_{2}}{x_{1}+x_{2}} p_{\|}^{2} - m_{f}^{2}(x_{1}+x_{2}) \right] \times \exp \left[ -\tanh(|q_{f}B|x_{1})\tanh(|q_{f}B|x_{2}) \frac{p_{\|}^{2}}{\tanh(|q_{f}B|x_{1}) + \tanh(|q_{f}B|x_{2})} \left[ \frac{x_{1}x_{2}}{x_{1}+x_{2}} \frac{m_{f}^{2}}{x_{1}+x_{2}} + 2x_{1}x_{2} (x_{1}+x_{2})^{3} p_{\|}^{2} p_{\perp}^{2} \right] \right].
$$

(A28)

For the term $t_{2}^{\mu\nu}$ of Eq. (A3), the trace involved is computed by using Eq. (A17a) and the relation

$$\mathcal{O}(\pm)\gamma^{\mu}\mathcal{O}(\mp) = \mathcal{O}(\pm)\gamma^{\mu}_{\perp}, \quad (A29)$$

so that

$$\text{Tr} \left\{\gamma^{\mu}_{\perp}(k_{\|} + m_{f})\gamma^{\mu}(k_{\perp} - p_{\perp} + m_{f})\right\} + \text{C.C.} = 4 \left(k_{\|} \cdot p_{\|} - k_{\perp}^{2} + m_{f}^{2}\right) g_{\mu\nu}^{\perp}. \quad (A30)$$

This results imply that after introducing the Schwinger parametrization, the integration over the transverse momentum gives the same results as those in Eq. (A23). Moreover, in order to apply Eq. (A14) it is necessary to perform the shift $m' = m - 1$. That shift implies extracting a factor $e^{-2\|q_{f}B\|x_{2}}$ from the sum, thus

$$
t_{2}^{\mu\nu} = -\frac{8\pi |q_{f}B|}{(2\pi)^{2}}g^{2}\int d^{2}x \frac{e^{-2|q_{f}B|x_{2}}}{\left(1 + e^{-2|q_{f}B|x_{1}}\right) \left(1 + e^{-2|q_{f}B|x_{2}}\right)} \frac{|q_{f}B|}{\tanh(|q_{f}B|x_{1}) + \tanh(|q_{f}B|x_{2})} \times \exp \left[ -\frac{x_{1}x_{2}}{x_{1}+x_{2}} p_{\|}^{2} - m_{f}^{2}(x_{1}+x_{2}) \right] \exp \left[ -\tanh(|q_{f}B|x_{1})\tanh(|q_{f}B|x_{2}) \frac{p_{\|}^{2}}{\tanh(|q_{f}B|x_{1}) + \tanh(|q_{f}B|x_{2})} \left[ \frac{x_{1}x_{2}}{x_{1}+x_{2}} \frac{m_{f}^{2}}{x_{1}+x_{2}} + 2x_{1}x_{2} (x_{1}+x_{2})^{3} p_{\|}^{2} p_{\perp}^{2} \right] \right]. \quad (A31)$$

The parallel integration is carried out with the help of the momentum shift of Eq. (A24), which in Euclidean space gives

$$
t_{2}^{\mu\nu} = -\frac{8\pi^{2}|q_{f}B|}{(2\pi)^{2}}g^{2}\int d^{2}x \frac{e^{-2|q_{f}B|x_{2}}}{\left(1 + e^{-2|q_{f}B|x_{1}}\right) \left(1 + e^{-2|q_{f}B|x_{2}}\right)} \frac{|q_{f}B|}{\tanh(|q_{f}B|x_{1}) + \tanh(|q_{f}B|x_{2})} \times \exp \left[ \frac{x_{1}x_{2}}{x_{1}+x_{2}} p_{\|}^{2} - m_{f}^{2}(x_{1}+x_{2}) \right] \times \exp \left[ -\frac{x_{1}x_{2}}{(x_{1}+x_{2})^{3}} \frac{m_{f}^{2}}{x_{1}+x_{2}} + \frac{1}{(x_{1}+x_{2})^{2}} \right] \frac{g_{\mu\nu}^{\perp}}{\left[ \frac{x_{1}x_{2}}{x_{1}+x_{2}} \frac{m_{f}^{2}}{x_{1}+x_{2}} + 2x_{1}x_{2} (x_{1}+x_{2})^{3} p_{\|}^{2} p_{\perp}^{2} \right]} \quad (A32)\]$$

From the fact that the term $t_{2}^{\mu\nu}$ has the same tensor structure of $t_{1}^{\mu\nu}$, it is easy to show that both expressions are related to each other after the exchange $x_{1} \leftrightarrow x_{2}$, so that

$$
t_{4}^{\mu\nu} = -\frac{8\pi^{2}|q_{f}B|}{(2\pi)^{2}}g^{2}\int d^{2}x \frac{e^{-2|q_{f}B|x_{1}}}{\left(1 + e^{-2|q_{f}B|x_{1}}\right) \left(1 + e^{-2|q_{f}B|x_{2}}\right)} \frac{|q_{f}B|}{\tanh(|q_{f}B|x_{1}) + \tanh(|q_{f}B|x_{2})} \times \exp \left[ -\frac{x_{1}x_{2}}{x_{1}+x_{2}} p_{\|}^{2} - m_{f}^{2}(x_{1}+x_{2}) \right] \times \exp \left[ -\frac{x_{1}x_{2}}{(x_{1}+x_{2})^{3}} \frac{m_{f}^{2}}{x_{1}+x_{2}} + \frac{1}{(x_{1}+x_{2})^{2}} \right] \frac{g_{\mu\nu}^{\perp}}{\left[ \frac{x_{1}x_{2}}{x_{1}+x_{2}} \frac{m_{f}^{2}}{x_{1}+x_{2}} + 2x_{1}x_{2} (x_{1}+x_{2})^{3} p_{\|}^{2} p_{\perp}^{2} \right]} \quad (A33)\]
and therefore, after manipulating the exponential, we get

\[
t^\mu_2 + t^\mu_4 = -\frac{\imath |q_f B|}{4\pi^2} g^2 \int d^2 x \cosh \left[ |q_f B| (x_2 - x_1) \right] \sinh \left[ |q_f B| (x_1 + x_2) \right] \exp \left[ \frac{x_1 x_2}{x_1 + x_2} p_\|^2 - m_f^2 (x_1 + x_2) \right]
\]

\[
= -\frac{\imath g^2}{4\pi^2} \int d^2 x f_0(x_1, x_2) f_\perp^\mu (x_1, x_2).
\]

(A34)

For the term \( t^\mu_3 \), the trace is computed with the help of Eqs. (A17a), (A17b) and (A29)

\[
\mathrm{Tr} \left\{ \gamma^\nu (\hat{k}_\parallel + m_f) \mathcal{O} - \gamma^\mu (\hat{k}_\perp - \hat{p}_\perp) \right\} + \text{C.C.} = 4 \left[ k_\parallel^\mu (k_\perp^\nu - p_\perp^\nu) + k_\parallel^\nu (k_\perp^\mu - p_\perp^\mu) \right].
\]

(A35)

After introducing Schwinger’s parametrization and using the generating function for the Laguerre polynomials (with the shift \( m' = m - 1 \)), we obtain

\[
t^\mu_3 = -\frac{16}{(2\pi)^4} g^2 \int d^2 x \int d^4 k \frac{e^{-2 |q_f B| x_2 \epsilon(\alpha(k_1) x_1 \epsilon(\beta(k_1) x_2)}}{(1 + 2e^{-2 |q_f B| x_1}) (1 + 2e^{-2 |q_f B| x_1})^2} \exp \left[ -\frac{k_\|^2 + (k - p)^2}{|q_f B|} \right]
\]

\[
\times \exp \left[ n(x_1) \frac{2k_\|^2}{|q_f B|} \right] \exp \left[ n(x_2) \frac{2(k - p)^2}{|q_f B|} \right] \left[ k_\parallel^\mu (k_\perp^\nu - p_\perp^\nu) + k_\parallel^\nu (k_\perp^\mu - p_\perp^\mu) \right].
\]

(A36)

The change of variable in Eq. (A22) leads to the result

\[
t^\mu_3 = -\frac{16}{(2\pi)^4} g^2 \int d^2 x \int d^4 k e^{-2 |q_f B| x_2} \left[ I^\mu_2 (x_1, x_2) + T^\mu_2 (x_1, x_2) \right] \frac{e^{-\eta q_\perp^2 k_\|}}{(1 + 2e^{-2 |q_f B| x_1}) (1 + 2e^{-2 |q_f B| x_1})^2} \exp \left[ -\frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2) p_\perp^2}{\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2) |q_f B|} \right],
\]

(A37)

where

\[
I^\mu_2 = \int d^2 k_\parallel e^{\alpha(k_1) x_1 \epsilon(\beta(k_1) x_2} \int d^2 q_\perp e^{-\eta q_\perp^2} k_\parallel \mu \left[ q_\perp \nu + (\sigma - 1) p_\perp^\nu \right],
\]

(A38)

\[
\eta \equiv \tanh(|q_f B| x_1) + \tanh(|q_f B| x_2),
\]

(A39a)

and

\[
\sigma \equiv \frac{\tanh(|q_f B| x_2)}{\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)}.
\]

(A39b)

The perpendicular integration has a simple Gaussian form for which the linear term in \( q_\perp \) integrates to zero, yielding

\[
T^\mu_2 = \frac{\pi(\sigma - 1)}{\eta} p_\perp^\nu \int d^2 k_\parallel e^{\alpha(k_1) x_1 \epsilon(\beta(k_1) x_2} k_\parallel^\mu.
\]

(A40)

The shift of variable in Eq. (A24) also implies a Gaussian integration (in Euclidean space), where the linear terms in \( l \) vanish after integration. In this way

\[
T^\mu_2 = \frac{\pi^2(\sigma - 1)}{\eta} \frac{x_2}{(x_1 + x_2)^2} p_\perp^\nu \exp \left[ \frac{x_1 x_2}{x_1 + x_2} p_\perp^2 - m_f^2 (x_1 + x_2) \right]
\]

\[
\times \exp \left[ -\frac{(\sigma - 1)}{\eta} \frac{x_2}{(x_1 + x_2)^2} p_\perp^2 \right]
\]

(A41)

Putting together these results

\[
t^\mu_3 = -\frac{2\imath |q_f B| \pi^2}{(2\pi)^4} \frac{g^2}{|q_f B|} \int d^2 x \frac{x_2 e^{\imath |q_f B| x_1} \sinh(|q_f B| x_1)}{(x_1 + x_2)^2 \sinh^2(|q_f B| (x_1 + x_2))} \exp \left[ \frac{x_1 x_2}{x_1 + x_2} p_\perp^2 - m_f^2 (x_1 + x_2) \right]
\]

\[
\times \exp \left[ -\frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2) p_\perp^2}{\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2) |q_f B|} \right] \left( p_\parallel^\mu p_\perp^\nu + p_\parallel^\nu p_\perp^\mu \right).
\]

(A42)
The structure $t_6^{\mu\nu}$ is obtained from $t_3^{\mu\nu}$ after the shift $n' = n - 1$ which means introducing a factor $-e^{-2|q_f|B|x_1|}$, thus

$$
t_6^{\mu\nu} = -\frac{2i}{(2\pi)^2} g^2 \int d^2x \, x e^{-|q_f|B|x_1|} \sinh(|q_f|B|x_1|) \exp \left[ \frac{x_1 x_2 - m_2^2(x_1 + x_2)}{x_1 + x_2} \right] \\
\times \exp \left[ -\frac{\tanh(|q_f|B|x_1|)}{\tanh(|q_f|B|x_2|)} \frac{p_1^2}{\tanh(|q_f|B|x_1|) + \tanh(|q_f|B|x_2|)} \left( p_\|^{\mu\nu} + p_\|^{\mu\nu} \right) \right], \tag{A43}
$$

and therefore

$$
t_3^{\mu\nu} + t_6^{\mu\nu} = -\frac{i}{4\pi^2} g^2 \int d^2x \, x_1 \cosh(|q_f|B|x_1|) \sinh(|q_f|B|x_2|) \exp \left[ \frac{x_1 x_2 - m_2^2(x_1 + x_2)}{x_1 + x_2} \right] \\
\times \exp \left[ -\frac{\tanh(|q_f|B|x_1|)}{\tanh(|q_f|B|x_2|)} \frac{p_1^2}{\tanh(|q_f|B|x_1|) + \tanh(|q_f|B|x_2|)} \left( p_\|^{\mu\nu} + p_\|^{\mu\nu} \right) \right]. \tag{A44}
$$

Coming now to the terms $t_7^{\mu\nu}$ and $t_8^{\mu\nu}$, we notice that they share a common tensor form. Starting from $t_7^{\mu\nu}$, the expression for $t_7^{\mu\nu}$ is obtained by replacing $x_1 \rightarrow x_2$ and $p \rightarrow -p$. Moreover, $t_8^{\mu\nu}$ is obtained from $t_7^{\mu\nu}$ by performing the shift $m' = m - 1$ which amounts to introducing a factor $-e^{-2|q_f|B|x_2|}$. Implementing these observations, we get

$$
t_7^{\mu\nu} + t_8^{\mu\nu} = -\frac{i}{4\pi^2} g^2 \int d^2x \, x_1 \cosh(|q_f|B|x_2|) \sinh(|q_f|B|x_2|) \exp \left[ \frac{x_1 x_2 - m_2^2(x_1 + x_2)}{x_1 + x_2} \right] \\
\times \exp \left[ -\frac{\tanh(|q_f|B|x_1|)}{\tanh(|q_f|B|x_2|)} \frac{p_1^2}{\tanh(|q_f|B|x_1|) + \tanh(|q_f|B|x_2|)} \left( p_\|^{\mu\nu} + p_\|^{\mu\nu} \right) \right], \tag{A45}
$$

then

$$
t_3^{\mu\nu} + t_6^{\mu\nu} + t_7^{\mu\nu} + t_8^{\mu\nu} = -\frac{i}{4\pi^2} g^2 \int d^2x \, x_1 \cosh(|q_f|B|x_1|) \sinh(|q_f|B|x_2|) \exp \left[ \frac{x_1 x_2 - m_2^2(x_1 + x_2)}{x_1 + x_2} \right] \\
\times \exp \left[ -\frac{\tanh(|q_f|B|x_1|)}{\tanh(|q_f|B|x_2|)} \frac{p_1^2}{\tanh(|q_f|B|x_1|) + \tanh(|q_f|B|x_2|)} \left( p_\|^{\mu\nu} + p_\|^{\mu\nu} \right) \right] \\
eq -\frac{i}{4\pi^2} g^2 \int d^2x \, f_0(x_1, x_2) J^{\mu\nu}(x_1, x_2). \tag{A46}
$$

Finally, the trace in the term $t_9^{\mu\nu}$ is given by

$$
\text{Tr} \left\{ \gamma^\nu k_\perp \gamma^\mu (k_\perp - p_\perp) \right\} = 4 \left( (k_\perp \cdot p_\perp + k_\perp^2) g^{\mu\nu} + 2k_\perp^\mu k_\perp^\nu - (p_\|^{\mu\nu} + p_\|^{\mu\nu}) \right). \tag{A47}
$$

After introducing the Schwinger parametrization and performing the sum together with the shift in Eq. (A22), we get

$$
t_9^{\mu\nu} = -\frac{4}{(2\pi)^2} g^2 \int d^2x \, \frac{d^2x}{\cos^2(|q_f|B|x_1|) \cos^2(|q_f|B|x_2|)} \exp \left[ -\frac{\tanh(|q_f|B|x_1|)}{\tanh(|q_f|B|x_2|)} \frac{p_1^2}{\tanh(|q_f|B|x_1|) + \tanh(|q_f|B|x_2|)} \right] \\
\times \int d^2k_\perp e^{i(k_\perp x_1 - \delta(k_\perp) x_2)} \int d^2q_\perp e^{-q_\perp^2} \left( q_\perp^2 + (\sigma + (\sigma - 1)p_\|^{\mu\nu}) \right) g^{\mu\nu} + 2q_\perp^\mu q_\perp^\nu + 2\sigma(\sigma - 1)p_\|^{\mu\nu}, \tag{A48}
$$

where we have ignored linear terms in $q_\perp$ and the variables $\eta$ and $\sigma$ are defined in Eqs. (A39). In Euclidean space, by means of the change of variable given in Eq. (A24), the parallel integral is easily performed, yielding

$$
t_9^{\mu\nu} = -\frac{4i\pi}{(2\pi)^2} g^2 \int d^2x \, \frac{d^2x}{\cos^2(|q_f|B|x_1|) \cos^2(|q_f|B|x_2|)} \exp \left[ \frac{x_1 x_2 - m_2^2(x_1 + x_2)}{x_1 + x_2} \right] \\
\times \exp \left[ -\frac{\tanh(|q_f|B|x_1|)}{\tanh(|q_f|B|x_2|)} \frac{p_1^2}{\tanh(|q_f|B|x_1|) + \tanh(|q_f|B|x_2|)} \right] J_2^{\mu\nu}(x_1, x_2), \tag{A49}
$$

where

$$
J_2^{\mu\nu} = \int d^2q_\perp e^{-q_\perp^2} \left[ (q_\perp^2 + (\sigma - 1)p_\|^{\mu\nu}) \right] g^{\mu\nu} + 2q_\perp^\mu q_\perp^\nu + 2\sigma(\sigma - 1)p_\|^{\mu\nu}. \tag{A50}
$$

The last integral has a simple Gaussian form and it is straightforward to compute it, yielding

$$
J_2^{\mu\nu} = \frac{\pi |q_f|^2}{\left[ \tanh(|q_f|B|x_1|) + \tanh(|q_f|B|x_2|) \right]^2} \left[ 1 - \frac{\tanh(|q_f|B|x_1|)}{|q_f|B| \tanh(|q_f|B|x_1|) + \tanh(|q_f|B|x_2|)} p_\|^{\mu\nu} \right] g^{\mu\nu} \\
- \frac{2\tanh(|q_f|B|x_1|)}{|q_f|B| \tanh(|q_f|B|x_1|) + \tanh(|q_f|B|x_2|)} p_\|^2 p_\|^2. \tag{A51}
$$
Putting all of this together, we get

\[
i_3^{\mu \nu} = -\frac{i}{4\pi^2} \int \frac{d^2 x}{(x_1 + x_2) \sinh^2[\varphi E(x_1 + x_2)]} \left( 1 - \frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)p_\perp^2}{|q_f B| [\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)]} \right) g^{\mu \nu} \\
- g_\perp^{\mu \nu} - \frac{2 \tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{|q_f B| [\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)]} p_\mu^{\mu} p_\nu^{\mu} \\
= -\frac{i}{4\pi^2} g^2 \int d^2 x f_0(x_1, x_2) f_4^{\mu \nu}(x_1, x_2).
\]

(A52)

Appendix B: Tensor manipulation of Eqs. (7)

In order to bring to light the tensor structure of Eq. (17), the terms \( f_1^{\mu \nu}(x_1, x_2) \), \( f_3^{\mu \nu}(x_1, x_2) \) and \( f_4^{\mu \nu}(x_1, x_2) \) in Eqs. (7) have been factorized in a convenient way, so as to avoid the projection procedure which can lead non-physical contributions. The tensor \( f_2^{\mu \nu}(x_1, x_2) \) remains unchanged and the manipulation is made by direct inspection.

For \( f_1^{\mu \nu}(x_1, x_2) \):

\[
f_1^{\mu \nu}(x_1, x_2) = |q_f B| \coth[|q_f B| (x_1 + x_2)] \left[ \left( \frac{x_1 x_2}{(x_1 + x_2)^3} \right) g^{\mu \nu} - \frac{2 x_1 x_2}{(x_1 + x_2)^2} p_\mu^{\mu} p_\nu^{\mu} \right]
\]

(B1)

For \( f_3^{\mu \nu}(x_1, x_2) \):

\[
f_3^{\mu \nu}(x_1, x_2) = \frac{|q_f B|}{2(x_1 + x_2)^3 \sinh^2[|q_f B| (x_1 + x_2)]} \left[ x_1 \sinh(2 |q_f B| x_2) + x_2 \sinh(2 |q_f B| x_1) \right] \left( p_\perp^{\mu} p_\perp^{\nu} + p_\perp^{\nu} p_\perp^{\mu} \right).
\]

(B2)

Notice that

\[
p^{\mu} p^{\nu} = \left( p_\parallel^{\mu} - p_\perp^{\mu} \right) \left( p_\parallel^{\nu} - p_\perp^{\nu} \right) = p_\parallel^{\mu} p_\parallel^{\nu} + p_\perp^{\mu} p_\perp^{\nu} - \left( p_\parallel^{\mu} p_\perp^{\nu} + p_\perp^{\mu} p_\parallel^{\nu} \right),
\]

(B3)

therefore,

\[
\left( p_\parallel^{\mu} p_\parallel^{\nu} + p_\perp^{\mu} p_\perp^{\nu} \right) = p_\parallel^{\mu} p_\parallel^{\nu} + p_\perp^{\mu} p_\perp^{\nu} - p^{\mu} p^{\nu}
\]

\[
= p_\parallel^{\mu} p_\parallel^{\nu} + p_\perp^{\mu} p_\perp^{\nu} - p^{\mu} p^{\nu} + p^{2} g^{\mu \nu} - p^{2} g^{\mu \nu}
\]

\[
= p^{2} \left( g^{\mu \nu} - \frac{p^{2} p^{2}}{p^{2}} \right) + p_\parallel^{\mu} p_\parallel^{\nu} + p_\perp^{\mu} p_\perp^{\nu} - (p^{2} - p^{2}) \left( g^{\mu \nu} + g^{\mu \nu} \right)
\]

\[
= p^{2} \left( g^{\mu \nu} - \frac{p^{2} p^{2}}{p^{2}} \right) + p_\parallel^{2} p^{\mu \nu} + p_\perp^{2} p^{\mu \nu} - p^{2} g^{\mu \nu} + p^{2} g^{\mu \nu}
\]

\[
= p^{2} \left( g^{\mu \nu} - \frac{p^{2} p^{2}}{p^{2}} - p^{2} p^{2} - p^{2} p^{2} \right) + p^{2} p^{\mu \nu} + p^{2} p^{\mu \nu} - p^{2} g^{\mu \nu} + p^{2} g^{\mu \nu}
\]

\[
= p^{2} \left( g^{\mu \nu} - \frac{p^{2} p^{2}}{p^{2}} \right) - p^{2} p^{\mu \nu} - p^{2} p^{\mu \nu} - p^{2} g^{\mu \nu} + p^{2} g^{\mu \nu}
\]

\[
= p^{2} p^{\mu \nu} - p^{2} p^{\mu \nu} - p^{2} g^{\mu \nu} + p^{2} g^{\mu \nu}
\]

(B4)

Thus,

\[
f_3^{\mu \nu}(x_1, x_2) = \frac{|q_f B|}{2(x_1 + x_2)^3 \sinh^2[|q_f B| (x_1 + x_2)]} \left[ x_1 \sinh(2 |q_f B| x_2) + x_2 \sinh(2 |q_f B| x_1) \right] \left( p_\parallel^{\mu} p_\parallel^{\nu} + p_\perp^{\mu} p_\perp^{\nu} - p^{2} g^{\mu \nu} - p^{2} g^{\mu \nu} \right).
\]

(B5)

Finally, for \( f_4^{\mu \nu}(x_1, x_2) \), given that

\[
p_\parallel^{\mu} p_\parallel^{\nu} = p_\perp^{\mu} p_\perp^{\nu} + p^{2} p^{\mu \nu} - p^{2} g^{\mu \nu} = p^{2} p^{\mu \nu} - p^{2} g^{\mu \nu},
\]

(B6)
we have

\[
f_4^{\mu\nu}(x_1, x_2) = \frac{|q_f B|^2}{(x_1 + x_2) \sinh^2 \left[ \frac{|q_f B| (x_1 + x_2)}{2} \right]} \left[ 1 - \frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{|q_f B| [\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)]} \right] g^{\mu\nu}
\]

\[
- g_1^{\mu\nu} - \frac{2 \tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{|q_f B| [\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)]} p_1^{\mu} p_1^{\nu}
\]

\[
= \frac{|q_f B|^2}{(x_1 + x_2) \sinh^2 \left[ \frac{|q_f B| (x_1 + x_2)}{2} \right]} \left[ 1 - \frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{|q_f B| [\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)]} \right] g^{\mu\nu}
\]

\[
- g_1^{\mu\nu} - \frac{2 \tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{|q_f B| [\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)]} p_1^{\mu} p_1^{\nu} + \frac{2 \tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{|q_f B| [\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)]} p_1^{\mu} g_1^{\mu\nu}
\].

By collecting the common terms of the structures \( P_||^{\mu\nu} , P_1^{\mu\nu} \) and \( P_0^{\mu\nu} \), we find the coefficients of Eqs. [18] - [22].

### Appendix C: Elimination of spurious tensors

In order to eliminate the spurious contributions, we follow the procedure discussed in Ref. [21]. First, let us scale the \( x \) parameters, such that \( x_i \rightarrow \lambda z_i \), with \( (\lambda, z_i) \in \mathbb{R} \). Therefore, the integral that involves the coefficient \( A_1 \) is

\[
\mathcal{I}_{A_1} = \lambda^2 \int d^2 z \exp \left[ \lambda \left( \frac{z_1 z_2 p_\parallel^2}{z_1 + z_2} - m_f^2 (z_1 + z_2) \right) \right] \exp \left[ - \frac{\tanh(\lambda |q_f B| z_1) \tanh(\lambda |q_f B| z_2)}{\tanh(\lambda |q_f B| z_1) + \tanh(\lambda |q_f B| z_2)} \right] \]

\[
\times \left[ \frac{\coth[\lambda |q_f B| (z_1 + z_2)]}{\lambda (z_1 + z_2)^3} \left( m_f^2 (z_1 + z_2)^2 - z_1 z_2 p_\parallel^2 \right) + \frac{z_1 \sinh(2 |q_f B| z_2) + z_2 \sinh(2 \lambda |q_f B| z_1)}{2 \lambda (z_1 + z_2)^2 \sinh^2 [\lambda |q_f B| (z_1 + z_2)]} p_1^{\mu} \right]
\]

\[
= \frac{|q_f B|}{\lambda (z_1 + z_2) \sinh^2 [\lambda |q_f B| (z_1 + z_2)]} \left( 1 - \frac{\tanh(\lambda |q_f B| z_1) \tanh(\lambda |q_f B| z_2)}{|q_f B| [\tanh(\lambda |q_f B| z_1) + \tanh(\lambda |q_f B| z_2)]} p_1^{\mu} \right).
\]

which can be written as

\[
\mathcal{I}_{A_1} = -\lambda \frac{\partial}{\partial \lambda} \int \frac{d^2 z}{(z_1 + z_2)^2} \coth[\lambda |q_f B| (z_1 + z_2)] \exp \left[ \lambda \left( \frac{z_1 z_2 p_\parallel^2}{z_1 + z_2} - m_f^2 (z_1 + z_2) \right) \right] \exp \left[ - \frac{\tanh(\lambda |q_f B| z_1) \tanh(\lambda |q_f B| z_2)}{\tanh(\lambda |q_f B| z_1) + \tanh(\lambda |q_f B| z_2)} \right] \]

\[
\times \exp \left[ - \frac{\tanh(\lambda |q_f B| z_1) \tanh(\lambda |q_f B| z_2)}{\tanh(\lambda |q_f B| z_1) + \tanh(\lambda |q_f B| z_2)} \right] \frac{p_1^{\mu}}{|q_f B| [\tanh(\lambda |q_f B| z_1) + \tanh(\lambda |q_f B| z_2)]}.
\]

Scaling back \( \lambda z_i \rightarrow x_i \), we obtain

\[
\mathcal{I}_{A_1} = -\lambda \frac{\partial}{\partial \lambda} \int \frac{d^2 x}{(x_1 + x_2)^2} \coth[|q_f B| (x_1 + x_2)] \exp \left[ \frac{x_1 x_2 p_\parallel^2}{x_1 + x_2} - m_f^2 (x_1 + x_2) \right] \exp \left[ - \frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)} \right] \]

\[
\times \exp \left[ - \frac{\tanh(|q_f B| x_1) \tanh(|q_f B| x_2)}{\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)} \right] \frac{p_1^{\mu}}{|q_f B| [\tanh(|q_f B| x_1) + \tanh(|q_f B| x_2)]}.
\]

and thus, the derivative is applied to a function independent of \( \lambda \). Therefore \( \mathcal{I}_{A_1} = 0 \).

The implementation of the same argument for \( \mathcal{I}_{A_2} \) is more involved, given that the function is not a trivial combination of coefficients for \( p_\parallel^2 \) and \( p_1^2 \). After the \( \lambda \)-scaling, the integral is

\[
\mathcal{I}_{A_2} = \lambda^2 \int \frac{d^2 z}{\lambda (z_1 + z_2)^2} I(\lambda z_1, \lambda z_2),
\]

where

\[
I(\lambda z_1, \lambda z_2) = f_0(\lambda z_1, \lambda z_2) \left[ \frac{\cosh[\lambda |q_f B| (z_2 - z_1)]}{\sinh[\lambda |q_f B| (z_1 + z_2)]} \left( \frac{z_1 z_2}{z_1 + z_2} p_\parallel^2 + m_f^2 (z_1 + z_2) + 1 \right) \right]
\]

\[
- \frac{z_1 \sinh(2 \lambda |q_f B| z_2) + z_2 \sinh(2 \lambda |q_f B| z_1) p_1^2}{2 \sinh^2 [\lambda |q_f B| (z_1 + z_2)]} + \frac{(z_1 + z_2) \sinh(\lambda |q_f B| z_1) \sinh(\lambda |q_f B| z_2)}{\sinh^3[\lambda |q_f B| (z_1 + z_2)]} p_1^{\mu}.
\]
so that by expanding in a Taylor series around $\lambda = 0$ it is possible to find that

$$
\int I(\lambda z_1, \lambda z_2) d\lambda = -\frac{1}{|q_f B| (z_1 + z_2) \lambda} + \frac{2 |q_f B|^2 (z_1 + z_2)^2 (z_1^2 - 4z_1 z_2 + z_2^2) + 3 (z_1 z_2 p^2 - m^2 (z_1 + z_2))^2}{6 |q_f B| (z_1 + z_2)^3} \lambda 
+ \frac{\lambda^2}{6 |q_f B| (z_1 + z_2)^4} \left[ (3 p^4 z_1^2 z_2^2 - 3 m^2 p^2 z_1 z_2 (z_1 + z_2)^2 + m^4 (z_1 + z_2)^4) (z_1 + z_2)^2 m^2 
- z_1 z_2 (\delta^{\perp}_z z_1^2 z_2^2 - 2 |q_f B|^2 (z_1 + z_2)^2 (p^2 (z_1 - z_2)^2 - p^2 z_1 z_2)) \right] 
+ \frac{\lambda^3}{1080 |q_f B| (z_1 + z_2)^5} \left[ 45 (p^2 z_1 z_2 - m^2 (z_1 + z_2))^4 
+ 8 |q_f B|^4 (z_1 + z_2)^4 (z_1^4 + 4 z_1^3 z_2 - 24 z_1^2 z_2^2 + 4 z_1 z_2^2 + z_2^4) 
- 60 |q_f B|^2 (z_1 + z_2)^2 (p^2 z_1 z_2 - m^2 (z_1 + z_2)^2) (m^2 (z_1 + z_2)^2 (z_1^2 - 4 z_1 z_2 + z_2^2) 
+ z_1 z_2 (p^2 (3 z_1^2 - 4 z_1 z_2 + 3 z_2^2) - 6 p^2 z_1 z_2)) \right] + \mathcal{O}(\lambda^4), \tag{C6}
$$

where the desired scaling properties are recovered and hold for all orders in $\lambda$. This means that is possible to write

$$
\int I(\lambda z_1, \lambda z_2) d\lambda = -\frac{1}{|q_f B| (z_1 + z_2) \lambda} + h(\lambda z_1, \lambda z_2), \tag{C7}
$$

thus

$$
I(\lambda z_1, \lambda z_2) = \frac{\partial}{\partial \lambda} \left[ -\frac{1}{|q_f B| (z_1 + z_2) \lambda} + h(\lambda z_1, \lambda z_2) \right] = \frac{\partial}{\partial \lambda} \left[ -\frac{1}{|q_f B| (x_1 + x_2)} + h(x_1, x_2) \right] = 0, \tag{C8}
$$

and therefore, $\mathcal{I}_A = 0$.

The above argument is valid for all values of $\lambda$. Consequently, the result can be taken as general.
