ON FANO MANIFOLDS OF PICARD NUMBER ONE WITH BIG AUTOMORPHISM GROUPS

BAOHUA FU, WENHAO OU AND JUNYI XIE

Abstract. Let $X$ be an $n$-dimensional smooth Fano complex variety of Picard number one. Assume that the VMRT at a general point of $X$ is smooth irreducible and non-degenerate (which holds if $X$ is covered by lines with index $> (n + 2)/2$). It is proven that $\dim \text{aut}(X) > n(n + 1)/2$ if and only if $X$ is isomorphic to $\mathbb{P}^n$, $\mathbb{Q}^n$ or $\text{Gr}(2, 5)$. Furthermore, the equality $\dim \text{aut}(X) = n(n + 1)/2$ holds only when $X$ is isomorphic to the 6-dimensional Lagrangian Grassmannian Lag(6) or a general hyperplane section of Gr(2, 5).

1. Introduction

For a smooth projective complex variety $X$, the Lie algebra $\text{aut}(X)$ of its automorphism group $\text{Aut}(X)$ is naturally identified with $H^0(X, T_X)$. A natural question is how big can this group be. In general, $\text{aut}(X)$ can be very big with respect to its dimension. For example, when $X$ is the Hirzebruch surface $\mathbb{F}_m$, then $\dim \text{aut}(X) = m + 5$. On the other hand, in the case of Fano manifold of Picard number one, we have the following:

Conjecture 1.1 ([HM05], Conjecture 2). Let $X$ be an $n$-dimensional Fano manifold of Picard number one. Then $\dim \text{aut}(X) \leq n^2 + 2n$, with equality if and only if $X \simeq \mathbb{P}^n$.

In [HM05] (Theorem 1.3.2), this conjecture is proven under the assumption that the variety of minimal rational tangents (VMRT for short, cf. Definition 3.1) at a general point of $X$ is smooth irreducible non-degenerate and linearly normal. The purpose of this note is to push further the ideas of [HM05], combined with the recent results in [FH12] and [FH18], to prove the following

Theorem 1.2. Let $X$ be an $n$-dimensional Fano manifold of Picard number one. Assume that the VMRT at a general point of $X$ is smooth irreducible and non-degenerate. Then we have

(a) $\dim \text{aut}(X) > n(n + 1)/2$ if and only if $X$ is isomorphic to $\mathbb{P}^n$, $\mathbb{Q}^n$ or $\text{Gr}(2, 5)$.

(b) The equality $\dim \text{aut}(X) = n(n + 1)/2$ holds only when $X$ is isomorphic to Lag(6) or a general hyperplane section of Gr(2, 5).

Remark 1.3. As proved in Corollary 1.3.3 [HM05], the assumption on the VMRT of $X$ is satisfied if there exists an embedding $X \subset \mathbb{P}^N$ such that $X$ is covered by lines with index $> \frac{n+2}{2}$.

Recall that $\dim \text{aut}(\mathbb{P}^n) = n^2 + 2n$ and $\dim \text{aut}(\mathbb{Q}^n) = \dim \mathfrak{so}_{n+2} = \frac{(n+1)(n+2)}{2}$. The previous theorem indicates that there may exist big gaps between the dimensions of automorphism groups of Fano manifolds of Picard number one.

To prove Theorem 1.2 we first show the following result, which could be of independent interest.
Theorem 1.4. Let $n \geq 2$ be an integer. Let $X \subset \mathbb{P}^n$ be an irreducible and non-degenerate subvariety of codimension $c \geq 1$, which is not a cone. Let $G^X_n = \{g \in \text{PGL}_{n+1}(\mathbb{C})|g(X) = X\}$. Then

(a) $\dim G^X_n \leq \frac{n(n+1)}{2} - \frac{(c-1)(c+4)}{2}$.

(b) $\dim G^X_n = \frac{n(n+1)}{2}$ if and only if $X$ is a smooth quadratic hypersurface.

(c) If $X$ is smooth and is not a quadratic hypersurface, then $\dim G^X_n \leq \frac{n(n+1)}{2} - 3$.

The idea of the proof of Theorem 1.2 is similar to that in [HM05]: the dimension of $\text{aut}(X)$ is controlled by $n + \dim \text{aut}(\hat{C}_x) + \dim \text{aut}(\hat{C}_x)^{(1)}$, where $\hat{C}_x$ is the VMRT of $X$ at a general point, $\text{aut}(\hat{C}_x)$ is the Lie algebra of infinitesimal automorphisms of $\hat{C}_x$ while $\text{aut}(\hat{C}_x)^{(1)}$ is the first prolongation of $\text{aut}(\hat{C}_x)$ (cf. Definition 3.4). By Theorem 1.4, we have an optimal bound for $\dim \text{aut}(\hat{C}_x)$, which gives the bound for $\dim \text{aut}(X)$ in the case when $\text{aut}(\hat{C}_x)^{(1)} = 0$. For the case when $\text{aut}(\hat{C}_x)^{(1)} \neq 0$, we have a complete classification of all such embeddings $\hat{C}_x \subset \mathbb{P}T_xX$ by [PH12] and [PH18]. Then a case-by-case check gives us the bound in Theorem 1.2. Finally we apply Cartan-Fubini extension theorem of Hwang-Mok ([HM01]) and the result of Mok ([Mok08]) to recover the variety $X$ from its VMRT.

Convention: For a projective variety $X$, we denote by $\text{aut}(X)$ its Lie algebra of automorphism group, while for an embedded variety $S \subset \mathbb{P}V$, we denote by $\text{aut}(\hat{S})$ the Lie algebra of infinitesimal automorphisms of $\hat{S}$, which is given by

$$\text{aut}(\hat{S}) := \{g \in \text{End}(V)|g(\alpha) \in T_\alpha(\hat{S}), \text{for any smooth point } \alpha \in \hat{S}\}.$$  

Acknowledgements: We are very grateful to Francesco Russo and Fyodor Zak for discussions on Lemma 2.3, the proof of which presented here is due to Fyodor Zak. Baohua Fu is supported by National Natural Science Foundation of China (No. 11688101, 11621061 and 11771425).

2. Automorphism group of embedded varieties

For each positive integer $n$, we let

$$G_n = \text{Aut}(\mathbb{P}^n) = \text{PGL}_{n+1}(\mathbb{C}).$$

If $X \subset \mathbb{P}^n$ is a subvariety, we denote by $G^X_n \subset G_n$ the subgroup of elements $g$ such that $g(X) = X$. Note that if $X \subset \mathbb{P}^n$ is non-degenerate, then $G^X_n \subset \text{Aut}(X)$.

The goal of this section is to prove the following theorem, which is more general than Theorem 1.4.

Theorem 2.1. Assume that $n \geq 2$. Let $X \subset \mathbb{P}^n$ be an irreducible and non-degenerate subvariety of codimension $c \geq 1$. Then the set

$$C_X := \{x \in X| X \text{ is a cone with vertex } x\}$$

is a linear subspace. Set $r_X := -1$ if $C_X = \emptyset$ and $r_X := \dim C_X$ otherwise. Then we have

$$\dim G^X_n \leq \frac{(n - r_X - 1)(n - r_X)}{2} - \frac{(c-1)(c+4)}{2} + (r_X + 1)(n+1).$$

The idea of the proof is to cut $X$ by a general hyperplane, and then use induction on $n$ to conclude. To this end, we will first introduce the following notation. For a hyperplane $H$ in $\mathbb{P}^n$, we may choose a coordinates system $[x_0 : x_1 : \cdots : x_n]$ such that
$H$ is defined by $x_0 = 0$. For every $g \in G_n$, it has a representative $M \in \text{GL}_{n+1}(\mathbb{C})$, such that its action on $\mathbb{P}^n$ is given by $g([x_0 : x_1 : \cdots : x_n]) = [y_0 : y_1 : \cdots : y_n]$, where

$$
\begin{pmatrix}
  y_0 \\
  y_1 \\
  \vdots \\
  y_n
\end{pmatrix} = M
\begin{pmatrix}
  x_0 \\
  x_1 \\
  \vdots \\
  x_n
\end{pmatrix}
$$

Then $g \in G_n^H$ if and only if it can be represented by a matrix of the shape

$$
\begin{pmatrix}
  a_0 & 0 & \cdots & 0 \\
  a_1 & A \\
  a_2 & \\
  \vdots & \\
  a_n &
\end{pmatrix}
$$

There is a natural morphism $r_H : G_n^H \to \text{Aut}(H) \cong \text{PGL}_n(\mathbb{C})$. Then an element $g$ is in the kernel $\text{Ker } r_H$ if and only if it can be represented by a matrix of the shape

$$
\begin{pmatrix}
  \lambda & 0 & \cdots & 0 \\
  a_1 & \text{Id}_n \\
  a_2 & \\
  \vdots & \\
  a_n &
\end{pmatrix}
$$

For such $g \in \text{Ker } r_H$, we call $\lambda$ the special eigenvalue of $g$. The action of $g$ on the normal bundle of $H$ is then the multiplication by $\lambda$. We see that this is independant of the choice of representatives of $g$ in $\text{GL}_{n+1}(\mathbb{C})$. We also note that if $g, h$ are two elements in $\text{Ker } r_H$, with special eigenvalues $\lambda$ and $\mu$ respectively, then the special eigenvalue of $gh$ is equal to $\lambda \mu$. This gives a homomorphism $\chi_H : \text{Ker } r_H \to \mathbb{C}^*.$

Before giving the proof of Theorem [14] we will first prove several lemmas.

**Lemma 2.2.** Let $H$ be a hyperplane in $\mathbb{P}^n$, and let $X \subseteq \mathbb{P}^n$ be any subvariety. Then

$$
\dim G_n^X \leq \dim (G_n^H \cap G_n^X) + n.
$$

**Proof.** This lemma follows from the fact that $\dim G_n = \dim G_n^H + n$. \hfill \Box

We also need the following Bertini type lemma.

**Lemma 2.3.** Assume that $n \geq 2$. Let $X \subseteq \mathbb{P}^n$ be a non-degenerate irreducible subvariety of positive dimension which is not a cone. Then for a general hyperplane $H$, the intersection $X \cap H$ is still non-degenerate in $H$ and is not a cone.

**Proof.** Since $X \subseteq \mathbb{P}^n$ is irreducible and non-degenerate, the intersection of $X$ and a general hyperplane $H$ is non-degenerate in $H$.

Let $V \subset X \times (\mathbb{P}^n)^*$ be the subset of pair $(x, H)$ such that $H \cap X$ is a cone with vertex $x$. Set $\pi_1 : V \to X$ and $\pi_2 : V \to (\mathbb{P}^n)^*$ the projections to the first and the second factors. If $\pi_2$ is not surjective, we concludes the proof. So we may assume that $\pi_2$ is surjective. Hence $\dim V \geq n$. Set $Y := \pi_1(V)$.

We first assume that there is $x \in Y$ such that $\dim \pi_1^{-1}(x) \geq 1$. Since any non trivial complete one-dimensional family of hyperplanes in $\mathbb{P}^n$ covers the whole $\mathbb{P}^n$, this condition implies that for every point $x' \in X \setminus \{x\}$, there is some hyperplane $H$ containing $x$ and $x'$ such that $H \cap X$ is a cone with vertex $x$. Therefore, the line
joining $x$ and $x'$ is contained in $H \cap X$ and hence in $X$. This shows that $X$ is a cone with vertex $x$. We obtain a contradiction.

So the morphism $\pi_1 : V \to Y$ is finite. Then we get
\[ n \leq \dim V = \dim Y \leq \dim X < n, \]
which is a contradiction. This concludes the proof. \qeda

In the following lemmas, we will show that the kernel of $G_n^X \cap G_n^H \to G_{n-1}^{X \cap H}$ is a finite set. Note that this kernel is nothing but $G_n^X \cap \text{Ker} r_H$, as $X \cap H$ is non-degenerate by Lemma 2.3. We will discuss according to the special eigenvalue of an element inside. We will first study the case when it is equal to 1.

Lemma 2.4. Assume that $n \geq 2$. Let $X \subseteq \mathbb{P}^n$ be an irreducible subvariety which is not a cone. Let $H$ be a hyperplane in $\mathbb{P}^n$ such that $X \not\subseteq H$. Let $g \in \text{Ker} r_H \cap G_n^X$. If the special eigenvalue of $g$ is 1, then $g$ is the identity in $G_n$. In other words, the map $\chi_H : \text{Ker} r_H \cap G_n^X \to \mathbb{C}^*$ is injective.

Proof. Assume the opposite. We choose a homogeneous coordinates system $[x_0 : x_1 : \cdots : x_n]$ such that $H$ is defined by $x_0 = 0$, and that $g([x_0 : x_1 : \cdots : x_n]) = [y_0 : y_1 : \cdots : y_n]$, where
\[
\begin{pmatrix}
y_0 \\
y_1 \\
y_2 \\
\vdots \\
y_n
\end{pmatrix} = \begin{pmatrix}
1 & 0 & \cdots & 0 \\
a_1 & 0 & \cdots & 0 \\
a_2 & \text{Id}_n & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
a_n & \cdots & \cdots & 0
\end{pmatrix} \begin{pmatrix}
x_0 \\
x_1 \\
x_2 \\
\vdots \\
x_n
\end{pmatrix} = \begin{pmatrix}
x_0 \\
x_1 + a_1 x_0 \\
x_2 + a_2 x_0 \\
\vdots \\
x_n + a_n x_0
\end{pmatrix}.
\]

By assumption, the $a_i$ are not all equal to zero. Let $p \in \mathbb{P}^n$ be the point with homogeneous coordinates $[0 : a_1 : \cdots : a_n]$. For any point $x \in X \setminus H$ with homogeneous coordinates $[1 : x_1 : \cdots : x_n]$, the point $g^k(x)$ has coordinates
\[ g^k(x) = [1 : x_1 + ka_1 : \cdots : x_n + ka_n]. \]
This shows that all $g^k(x)$ are on the unique line $L_{p,x}$ passing through $p$ and $x$. Since the $g^k(x)$ are pairwise different, this implies that $L_{p,x}$ has infinitely many intersection points with $X$. Therefore, $L_{p,x} \subseteq X$.

Since $X$ is irreducible, every point $y \in X \setminus H$ is a limit of points in $X \setminus H$. Hence by continuity, for each point $x \in X \setminus \{p\}$, the line $L_{p,x}$ is contained in $X$. This implies that $X$ is a cone with vertex $p$. We obtain a contradiction. \qeda

Now we will look at the case when the special eigenvalue is different from 1.

Lemma 2.5. Assume that $n \geq 2$. Let $X \subseteq \mathbb{P}^n$ be a subvariety. Then there is a number $d(X)$ such that if a line $L$ intersects $X$ at more than $d(X)$ points, then $L \subseteq X$.

Proof. Assume that $X$ is defined as the common zero locus of homogeneous polynomials $P_1, \ldots, P_k$. Let $d(X)$ be the maximal degree of them. Assume that a line $L$ intersects $X$ at more than $d(X)$ points, then $L$ intersects the zero locus of each $P_i$ at more than $d(X)$ points. By degree assumption, this shows that $L$ is contained in the zero locus of each $P_i$. Hence $L \subseteq X$. \qeda

Lemma 2.6. Assume that $n \geq 2$. Let $X \subseteq \mathbb{P}^n$ be an irreducible subvariety which is not a cone. Let $H$ be a hyperplane in $\mathbb{P}^n$ such that $X \not\subseteq H$. Let $g \in \text{Ker} (r_H) \cap G_n^X$. \qeda
Then the special eigenvalue \( \lambda \) of \( g \) is a root of unity. Moreover, its order is bounded by the number \( d(X) \) from above.

**Proof.** We may assume that \( \lambda \) is different from 1. Then \( g \) is diagonalizable in this case. We may choose homogeneous coordinates \([x_0 : x_1 : \cdots : x_n]\) of \( \mathbb{P}^n \) such that \( H \) is defined by \( x_0 = 0 \) and that

\[
g([x_0 : x_1 : \cdots : x_n]) = [\lambda x_0 : x_1 : \cdots : x_n].
\]

Assume by contradiction that the order of \( \lambda \) is greater than \( d(X) \) (by convention, if \( \lambda \) is not a root of unity, then its order is \( +\infty \)). Let \( p \) be the point with homogeneous coordinates \([1 : 0 : \cdots : 0]\). For any point \( x \in X\setminus(H \cup \{p\}) \) with homogeneous coordinates \([1 : x_1 : \cdots : x_n]\), the point \( g^k(x) \) has coordinates

\[
g^k(x) = [\lambda^k : x_1 : \cdots : x_n].
\]

This shows that all of the \( g^k(x) \) are on the unique line \( L_{p,x} \) passing through \( p \) and \( x \). Moreover, we note that the cardinality of

\[
\{g^k(x) \mid k \in \mathbb{Z}\}
\]

is exactly the order of \( \lambda \). By Lemma 2.3, we obtain that the line \( L_{p,x} \) is contained in \( X \). By the same continuity argument as in the proof of Lemma 2.4, this implies that for any point \( x \in X\setminus\{p\} \), the line \( L_{p,x} \) is contained in \( X \). Hence \( X \) is a cone, and we obtain a contradiction.

**Lemma 2.7.** Assume that \( n \geq 2 \). Let \( X \subseteq \mathbb{P}^n \) be an irreducible subvariety which is not a cone. Let \( H \) be a hyperplane in \( \mathbb{P}^n \) such that \( X \not\subseteq H \). Then \( \text{Ker}(r_H) \cap G^X_n \) is a finite set. As a consequence, we have

\[
\dim G^X_n \leq \dim G^X_{n-1} + n.
\]

**Proof.** By Lemma 2.4, the map \( \chi_H : \text{Ker}(r_H) \cap G^X_n \to \mathbb{C}^* \) is injective, while Lemma 2.6 implies that its image has bounded order, hence \( \text{Ker}(r_H) \cap G^X_n \) is finite. By Lemma 2.2, we obtain that

\[
\dim G^X_n \leq \dim G^X_{n-1} + n.
\]

□

Now we can conclude Theorem 1.4.

**Proof of Theorem 1.4.** By Lemma 2.3 we can repeatedly apply Lemma 2.7 to get

\[
\dim G^X_n \leq \dim G^X_{n-1} \cdots \leq \dim G^X_{c+1} + n + (n-1) + \cdots + (c+2)
\]

Let \( C := X \cap H^{n-c-1} \subseteq \mathbb{P}^{c+1} \) be a general curve section of \( X \). As \( C \subset \mathbb{P}^{c+1} \) is non-degenerate by Lemma 2.3, we have an inclusion \( G^C_{c+1} \subseteq \text{Aut}(C) \), while the latter has dimension at most 3. This gives that

\[
\dim G^X_n \leq 3 + \sum_{j=c+2}^n j = \frac{n(n+1)}{2} - \frac{(c-1)(c+4)}{2},
\]

which proves (a).

For (b), if \( \dim G^X_n = \frac{n(n+1)}{2} \), then \( c = 1 \) by (a), i.e. \( X \subset \mathbb{P}^n \) is a hypersurface. As \( X \) is not a cone, it must be smooth if it is quadratic. Therefore it remains to show that if \( X \) is a hypersurface of degree at least 3, then \( \dim G^X_n \leq \frac{n(n+1)}{2} - 1 \). We prove it by induction on the dimension of \( X \). When \( \dim X = 1 \), pick a general line \( H \) in \( \mathbb{P}^2 \). By Lemma 2.7, we have

\[
\dim G^X_2 \leq \dim G^X_1 + 2.
\]
In this case $X \cap H$ is a set of deg $X \geq 3$ points, hence $\dim G_{1}^{X \cap H} = 0$, it follows that $\dim G_{2}^{X} \leq 2 = \frac{2(2+1)}{2} - 1$. When $\dim X = n - 1 \geq 2$, pick a general hyperplane $H$ in $\mathbb{P}^{n}$. By Lemma [2.7], we have

$$\dim G_{n}^{X} \leq \dim G_{n-1}^{X \cap H} + n.$$ 

Then by induction hypothesis we have

$$\dim G_{n}^{X} \leq \dim G_{n-1}^{X \cap H} + n \leq \frac{n(n-1)}{2} - 1 + n = \frac{n(n+1)}{2} - 1.$$

For (c), if we assume further that $X$ is a smooth hypersurface of degree greater than 2, then $\dim G_{n}^{X} = 0$ (see for example Theorem 1.2 [Poo05]). As a consequence, if $X$ is smooth and is not a quadratic hypersurface, then $\dim G_{n}^{X} \leq \frac{n(n+1)}{2} - 3$. This completes the proof of the theorem. \hfill \Box

**Proof of Theorem 2.7.** If $C_{X} = \emptyset$, then we conclude the proof by Theorem 1.4. Now assume that $C_{X} \neq \emptyset$. By Proposition 1.3.3 [Rus16], it is a linear subspace. For simplicity, we set $r = r_{X} = \dim C_{X}$. Pick a coordinates system of $\mathbb{P}^{n}$ such that $C_{X}$ is defined by $x_{0} = \cdots = x_{n-r-1} = 0$. Let $V$ be the subspace of $\mathbb{P}^{n}$ defined by $x_{n-r} = \cdots = x_{n} = 0$ and we identify it with $\mathbb{P}^{n-r-1}$. We let $\pi : \mathbb{P}^{n} \setminus C_{X} \to V \cong \mathbb{P}^{n-r-1}$ be the projection

$$\pi : [x_{0} : \cdots : x_{n}] \mapsto [x_{0} : \cdots : x_{n-r-1} : 0 : \cdots : 0].$$

Denote the image $\pi(X \setminus C_{X})$ by $Y$. Then we have $X \setminus C_{X} = \pi^{-1}(Y)$, and $Y = X \cap V$. Moreover, $Y$ is not a cone and it is non-degenerate in $\mathbb{P}^{n-r-1}$. Since $C_{X}$ is preserved by $G_{n}^{X}$, we see that $G_{n}^{X} \subseteq G_{n}^{C_{X}}$.

Each element $g$ in $G_{n}^{C_{X}}$ can be represented by a matrix of the shape

$$\begin{pmatrix}
A & 0 \\
B & C
\end{pmatrix}$$

such that $A$ and $C$ are square matrices of dimension $n - r$ and $r + 1$ respectively. We may now define an action of $G_{n}^{C_{X}}$ on $V$ as follows. For each $y = [a_{0} : \cdots : a_{n-r-1} : 0 : \cdots : 0] \in V$, the new action $g \ast y$ of $g$ on $y$ is defined as

$$g \ast y = \pi(g.y),$$

where $g.y$ represents the standard action of $G_{n}$ on $\mathbb{P}^{n}$. With the representative above, this action is just defined as

$$g \ast [a_{0} : \cdots : a_{n-r-1} : 0 : \cdots : 0] = [b_{0} : \cdots : b_{n-r-1} : 0 : \cdots : 0],$$

where

$$\begin{pmatrix}
b_{0} \\
b_{1} \\
\vdots \\
b_{n-r-1}
\end{pmatrix} = A \begin{pmatrix}
a_{0} \\
a_{1} \\
\vdots \\
a_{n-r-1}
\end{pmatrix}.$$

Thanks to this action, and by identifying $V$ with $\mathbb{P}^{n-r-1}$, we obtain a group morphism $\rho : G_{n}^{C_{X}} \to G_{n-r-1}$. 

On the one hand, we note that an element \( g \in G_n^{C_X} \) belongs to \( G_n^X \) if and only if \( \rho(g) \in G_{n-r-1}^Y \). On the other hand, an element \( g \in G_n^{C_X} \) belongs to \( \text{Ker } \rho \) if and only if it can be represented by a matrix of the shape

\[
\begin{pmatrix}
\text{Id} & 0 \\
B & C
\end{pmatrix}
\]

Hence \( \dim \text{Ker } \rho = (r+1)(n+1) \). As we can see that \( \text{Ker } \rho \subseteq G_n^X \), we obtain that

\[
\dim G_n^X = \dim G_{n-r-1}^Y + (r+1)(n+1).
\]

Finally, by Theorem 1.4 we get

\[
\dim G_n^X \leq \frac{(n-r-1)(n-r)}{2} - \frac{(c-1)(c+4)}{2} + (r+1)(n+1).
\]

\[\square\]

3. PROOF OF THE MAIN THEOREM

**Definition 3.1.** Let \( X \) be a uniruled projective manifold. An irreducible component \( \mathcal{K} \) of the space of rational curves on \( X \) is called a minimal rational component if the subscheme \( \mathcal{K}_x \) of \( \mathcal{K} \) parameterizing curves passing through a general point \( x \in X \) is non-empty and proper. Curves parameterized by \( \mathcal{K} \) will be called minimal rational curves. Let \( \rho : U \to \mathcal{K} \) be the universal family and \( \mu : U \to X \) the evaluation map. The tangent map \( \tau : U \to \mathbb{P}T(X) \) is defined by \( \tau(u) = [T_{\mu(u)}(\mu^{-1}(\rho(u)))] \in \mathbb{P}T_{\mu(u)}(X) \). The closure \( \mathcal{C} \subseteq \mathbb{P}T(X) \) of its image is the VMRT-structure on \( X \). The natural projection \( \mathcal{C} \to X \) is a proper surjective morphism and a general fiber \( \mathcal{C}_x \subseteq \mathbb{P}T_x(X) \) is called the VMRT at the point \( x \in X \). The VMRT-structure \( \mathcal{C} \) is locally flat if for a general \( x \in X \), there exists an analytical open subset \( U \) of \( X \) containing \( x \) with an open immersion \( \phi : U \to \mathbb{C}^n, n = \dim X \), and a projective subvariety \( Y \subseteq \mathbb{P}^{n-1} \) with \( \dim Y = \dim \mathcal{C}_x \) such that \( \phi_* : \mathbb{P}T(U) \to \mathbb{P}T(\mathbb{C}^n) \) maps \( \mathcal{C}|_U \) into the trivial fiber subbundle \( \mathbb{C}^n \times Y \) of the trivial projective bundle \( \mathbb{P}T(\mathbb{C}^n) = \mathbb{C}^n \times \mathbb{P}^{n-1} \).

**Examples 3.2.** An irreducible Hermitian symmetric space of compact type is a homogeneous space \( M = G/P \) with a simple Lie group \( G \) and a maximal parabolic subgroup \( P \) such that the isotropy representation of \( P \) on \( T_x(M) \) at a base point \( x \in M \) is irreducible. The highest weight orbit of the isotropy action on \( \mathbb{P}T_x(M) \) is exactly the VMRT at \( x \). The following table (e.g. Section 3.1 [FH12]) collects basic information on these varieties.

| Type | I.H.S.S. | VMRT S | \( S \subseteq \mathbb{P}T_x(M) \) | \( \dim \text{aut}(M) \) | \( \dim \text{aut}(S) \) |
|------|---------|--------|---------------------------------|----------------|----------------|
| I    | \( \text{Gr}(a,a+b) \) | \( \mathbb{P}^{a-1} \times \mathbb{P}^{b-1} \) | Segre | \( (a+b)^2-1 \) | \( a^2+b^2-2 \) | |
| II   | \( S_r \) | \( \text{Gr}(2,r) \) | Plücker | \( r(2r-1) \) | \( r^2-1 \) | |
| III  | \( \text{Lag}(2r) \) | \( \mathbb{P}^{r-1} \) | Veronese | \( r(2r+1) \) | \( r^2-1 \) | |

**Lemma 3.3.** Let \( M \) be an IHSS of dimension \( n \) different from projective spaces and \( S \subseteq \mathbb{P}^{n-1} \) its VMRT at a general point. Then

1. \( \dim \text{aut}(M) \leq \frac{n(n+1)}{2} \) unless \( S \subseteq \mathbb{P}^{n-1} \) is projectively equivalent to the Segre embedding of \( \mathbb{P}^1 \times \mathbb{P}^2 \) or the natural embedding of \( \mathbb{Q}^{n-2} \subseteq \mathbb{P}^{n-1} \).
(2) The equality holds if and only if $S \subset \mathbb{P}^{n-1}$ is projectively equivalent to the second Veronese embedding of $\mathbb{P}^2$.

**Proof.** For Type (I), we have $M = \text{Gr}(a, a + b)$, $n = \dim M = ab$ and $\dim \text{aut}(M) = (a + b)^2 - 1$. As $M$ is not a projective space, we may assume $b \geq a \geq 2$. Then the inequality $(a + b)^2 - 1 \geq \frac{ab(a+b+1)}{2}$ is equivalent to $3ab + 2 \geq (a^2 - 2)(b^2 - 2)$, which holds if and only if $(a, b) = (2, 2)$ or $(2, 3)$. In both cases, the inequality is strict.

For Type (II), we have $M = S_r$, $n = \dim M = r(r-1)/2$ and $\dim \text{aut}(M) = r(2r - 1)$. We may assume $r \geq 5$ as $S_4 \simeq \mathbb{Q}^6$. Then one checks that $\dim \text{aut}(M) < \frac{n(n+1)}{2}$.

For Type (III), we have $M = \text{Lag}(2r)$, $n = \dim M = r(r+1)/2$ and $\dim \text{aut}(M) = r(2r + 1)$. We may assume $r \geq 3$ as $\text{Lag}(4) \simeq \mathbb{Q}^3$. Then one checks that $\dim \text{aut}(M) \leq \frac{n(n+1)}{2}$, with equality if and only if $r = 3$. In this case, $S \subset \mathbb{P}^5$ is the second Veronese embedding of $\mathbb{P}^2$.

For type (IV), we have $M = \mathbb{Q}^r$ and $\dim \text{aut}(M) = (r + 1)(r + 2)/2$, which does not satisfy $\dim \text{aut}(M) \leq \frac{n(n+1)}{2}$.

For types (V) and (VI), it is obvious that $\dim \text{aut}(M) \leq \frac{n(n+1)}{2}$. \qed

**Definition 3.4.** Let $V$ be a complex vector space and $\mathfrak{g} \subset \text{End}(V)$ a Lie subalgebra. The $k$-th prolongation (denoted by $\mathfrak{g}^{(k)}$) of $\mathfrak{g}$ is the space of symmetric multi-linear homomorphisms $A : \text{Sym}^{k+1}V \rightarrow V$ such that for any fixed $v_1, \ldots, v_k \in V$, the endomorphism $A_{v_1,\ldots,v_k} : V \rightarrow V$ defined by

$$v \in V \mapsto A_{v_1,\ldots,v_k,v} := A(v, v_1, \ldots, v_k) \in V$$

is in $\mathfrak{g}$. In other words, $\mathfrak{g}^{(k)} = \text{Hom}(\text{Sym}^{k+1} V, V) \cap \text{Hom}(\text{Sym}^k V, \mathfrak{g})$.

It is shown in [HM05] that for a smooth non-degenerate variety $C \subset \mathbb{P}^{n-1}$, the second prolongation satisfies $\text{aut}(\hat{C})^{(2)} = 0$.

**Examples 3.5.** Fix two integers $k \geq 2$, $m \geq 1$. Let $\Sigma$ be an $(m + 2k)$-dimensional vector space endowed with a skew-symmetric 2-form $\omega$ of maximal rank. The symplectic Grassmannian $M = \text{Gr}_\omega(k, \Sigma)$ is the variety of all $k$-dimensional isotropic subspaces of $\Sigma$, which is not homogeneous if $m$ is odd. Let $W$ and $Q$ be vector spaces of dimensions $k \geq 2$ and $m$ respectively. Let $\mathfrak{t}$ be the tautological line bundle over $\mathbb{P}W$. The VMRT $\mathcal{C}_x \subset \mathbb{P}T_x(M)$ of $\text{Gr}_\omega(k, \Sigma)$ at a general point is isomorphic to the projective bundle $\mathbb{P}((Q \otimes \mathfrak{t}) \oplus \mathfrak{t} \otimes \omega^2)$ over $\mathbb{P}W$ with the projective embedding given by the complete linear system

$$H^0(\mathbb{P}W, (Q \otimes \mathfrak{t}^*) \oplus (\mathfrak{t}^*) \otimes \omega^2) = (W \otimes Q)^* \oplus \text{Sym}^2 W^*.$$

By Proposition 3.8 [FH12], we have $\text{aut}(\hat{C}_x) \simeq (W^* \otimes Q) \Join (\mathfrak{gl}(W) \oplus \mathfrak{gl}(Q))$ and $\text{aut}(\hat{C}_x)^{(1)} \simeq \text{Sym}^2 W^*$. This gives that

$$\dim \text{aut}(\hat{C}_x) = m^2 + k^2 + km$$

and $\dim \text{aut}(\hat{C}_x)^{(1)} = k(k + 1)/2$.

We denote by $\text{aut}(\mathcal{C}, x)$ the Lie algebra of infinitesimal automorphisms of $\mathcal{C}$, which consists of germs of vector fields whose local flow preserves $\mathcal{C}$ near $x$. Note that the action of $\text{Aut}^0(X)$ on $X$ sends minimal rational curves to minimal rational curves, hence it preserves the VMRT structure, which gives a natural inclusion $\text{aut}(X) \subset \text{aut}(\mathcal{C}, x)$ for $x \in X$ general.

The following result is a combination of Propositions 5.10, 5.12, 5.14 and 6.13 in [FH12].
Proposition 3.6. Let $X$ be an $n$-dimensional smooth Fano variety of Picard number one. Assume that the VMRT $C_x$ at a general point $x \in X$ is smooth irreducible and non-degenerate. Then

$$\dim \text{aut}(X) \leq n + \dim \text{aut}(\hat{C}_x) + \dim \text{aut}(\hat{C}_x^{(1)}).$$

The equality holds if and only if the VMRT structure $C$ is locally flat, or equivalently if and only if $X$ is an equivariant compactification of $\mathbb{C}^n$.

We recall the following result from Theorem 7.5 [FH18].

Theorem 3.7. Let $S \subseteq \mathbb{PV}$ be an irreducible smooth non-degenerate variety such that $\text{aut}(\hat{S})^{(1)} \neq 0$. Then $S \subseteq \mathbb{PV}$ is projectively equivalent to one in the following list.

1. The VMRT of an irreducible Hermitian symmetric space of compact type of rank $\geq 2$.
2. The VMRT of a symplectic Grassmannian.
3. A smooth linear section of $\text{Gr}(2, 5) \subset \mathbb{P}^9$ of codimension $\leq 2$.
4. A $\mathbb{P}^4$-general linear section of $\mathbb{S}_5 \subset \mathbb{P}^{15}$ of codimension $\leq 3$.
5. Biregular projections of (1) and (2) with nonzero prolongation, which are completely described in Section 4 of [FH12].

Proposition 3.8. Let $S \subseteq \mathbb{PV}$ be an irreducible smooth non-degenerate variety such that $\text{aut}(\hat{S})^{(1)} \neq 0$. Let $n = \dim V$. Then

(a) we have $\dim \text{aut}(\hat{S}) + \dim \text{aut}(\hat{S})^{(1)} \leq \frac{n(n-1)}{2}$ unless $S \subseteq \mathbb{PV}$ is projectively equivalent to the Segre embedding of $\mathbb{P}^1 \times \mathbb{P}^2$ or the natural embedding of $\mathbb{Q}^{n-2} \subset \mathbb{P}^{n-1}(n \geq 3)$.

(b) The equality holds if and only if $S \subseteq \mathbb{PV}$ is projectively equivalent to the second Veronese embedding of $\mathbb{P}^2$ or a general hyperplane section of the Segre embedding of $\mathbb{P}^1 \times \mathbb{P}^2$.

Proof. Consider case (1) in Theorem 3.7. Let $M$ be an IHSS and $S \subset \mathbb{PV}$ its VMRT at a general point. As the VMRT structure is locally flat, we have $\dim \text{aut}(\hat{S}) + \dim \text{aut}(\hat{S})^{(1)} = \dim \text{aut}(M) - \dim M = \dim \text{aut}(M) - n$ by Proposition 3.6. Now the claim follows from Lemma 3.3.

Consider case (2) in Theorem 3.7. By Example 3.5 we have

$$\dim \text{aut}(\hat{S}) + \dim \text{aut}(\hat{S})^{(1)} = m^2 + k^2 + km + k(k + 1)/2$$

with $k \geq 2$ and $n = km + k(k + 1)/2$. Note that $n \geq km + 3$. Assume first that $m \geq 2$, then we have $m^2 + k^2 \leq (km + 3)km/2 \leq n(n - 3)/2$, which gives the claim. Now assume $m = 1$, then it is easy to check that $1 + k^2 \leq n(n - 3)/2$ with equality if and only if $(k, m) = (2, 1)$. By Lemma 3.6 [FH12], this implies that $S \subset \mathbb{PV}$ is projectively equivalent to a general hyperplane section of the Segre embedding of $\mathbb{P}^1 \times \mathbb{P}^2$.

Consider case (3) in Theorem 3.7. If $S$ is the hyperplane section of $\text{Gr}(2, 5)$, then we have $\dim \text{aut}(\hat{S}) = 16$ and $\dim \text{aut}(\hat{S})^{(1)} = 5$ by Propositions 3.11 and 3.12 in [FH12]. Now assume that $S$ is a codimension 2 linear section of $\text{Gr}(2, 5)$, then $\dim \text{aut}(\hat{S}) = 9$ and $\dim \text{aut}(\hat{S})^{(1)} = 1$ by Lemma 4.6 [BFM18]. The claim follows immediately.

Consider case (4) in Theorem 3.7. If $S$ is the hyperplane section of $\mathbb{S}_5$, then $\dim \text{aut}(\hat{S}) = 31$ and $\dim \text{aut}(\hat{S})^{(1)} = 7$ by Propositions 3.9 and 3.10 in [FH12]. Now assume that $S_k$ is a $\mathbb{P}^4$-general linear section of $\mathbb{S}_5$ of codimension $k = 2, 3$. By
Propositions 4.7 and 4.11 [BFM18], we have $\dim \mathfrak{aut}(\hat{S}_2) = 19$ and $\dim \mathfrak{aut}(\hat{S}_3) = 12$. By Theorem 1.1.3 [HM05], we have $\dim \mathfrak{aut}(\hat{S})^{(1)} \leq \dim V^*$, hence $\dim \mathfrak{aut}(\hat{S}_2)^{(1)} \leq 14$. By a similar argument as Lemma 4.6 [BFM18], we have $\dim \mathfrak{aut}(\hat{S}_3)^{(1)} = 1$. Now the claim follows immediately.

The case (5) follows from Proposition 3.9.

**Proposition 3.9.** Let $S \subseteq \mathbb{P}V$ be an irreducible linearly-normal non-degenerate smooth variety such that $\mathfrak{aut}(\hat{S})^{(1)} \neq 0$. Let $L \subset \mathbb{P}V$ be a linear subspace such that the linear projection $p_L : \mathbb{P}V \rightarrow \mathbb{P}(V/L)$ maps $S$ isomorphically to $p_L(S)$. Assume that $\mathfrak{aut}(p_L(S))^{(1)} \neq 0$. Then $\dim \mathfrak{aut}(p_L(S)) + \dim \mathfrak{aut}(\hat{p_L(S)})^{(1)} < \ell(\ell - 1)/2$, where $\ell = \dim (V/L)$.

**Proof.** By [FH12] (Section 4), $S \subset \mathbb{P}V$ is one of the followings: VMRT of IHSS of type (I), (II), (III) or VMRT of the symplectic Grassmannians. We will do a case-by-case check based on the computations in [FH12] (Section 4).

Consider the case of VMRT of IHSS of type (I). Let $A, B$ be two vector spaces of dimension $a \geq 2$ (resp. $b \geq 2$). Then $S \simeq \mathbb{P}A^* \times \mathbb{P}B \subset \mathbb{P} \text{Hom}(A, B)$. For a linear subspace $L \subset \text{Hom}(A, B)$, we define $\text{Ker}(L) = \cap_{\phi \in L} \text{Ker}(\phi)$ and $\text{Im}(L) \subset B$ the linear span of $\cup_{\phi \in L} \text{Im}(\phi)$. By Proposition 4.10 [FH12], we have $\mathfrak{aut}(p_L(S))^{(1)} \simeq \text{Hom}(B/\text{Im}(L), \text{Ker}(L))$. As $p_L$ is an isomorphism from $S$ to $p_L(S)$, $\mathbb{P}L$ is disjoint from $\text{Sec}(S)$, hence elements in $L$ have rank at least 3. This implies that $\dim \mathfrak{aut}(p_L(S))^{(1)} \leq (b - 3)(a - 3)$ and $a, b \geq 4$. As $\mathfrak{aut}(p_L(S)) \subset \mathfrak{aut}(\hat{S}) = \mathfrak{gl}(A^*) \oplus \mathfrak{gl}(B)$, we obtain

$$\dim \mathfrak{aut}(p_L(S)) + \dim \mathfrak{aut}(\hat{p_L(S)})^{(1)} < a^2 + b^2 + (b - 3)(a - 3).$$

Note that $\ell = \dim \text{Hom}(A, B) - \dim L \geq 3(a + b) - 9$ by Proposition 4.10 [FH12]. Now it is straightforward to check that $a^2 + b^2 + (b - 3)(a - 3) < \ell(\ell - 1)/2$ since $a + b \geq 8$.

Consider the case of VMRT of IHSS of type (II), then $S = \text{Gr}(2, W)$, where $W$ is a vector space of dimension $r \geq 6$. Let $L \subset \wedge^2 W$ be a linear subspace. We denote by $\text{Im}(L)$ the linear span of all $\cup_{\phi \in L} \text{Im}(\phi)$, where $\phi \in L$ is regarded as an element in $\text{Hom}(W^*, W)$. By Proposition 4.11 [FH12], we have $\mathfrak{aut}(p_L(S))^{(1)} \simeq \wedge^2 (W/\text{Im}(L))^*$. As $p_L$ is birational on $S$, the rank of an element in $L$ is at least 5, hence $\dim \mathfrak{aut}(p_L(S))^{(1)} \leq (r - 5)(r - 6)/2$. On the other hand, we have $\ell = \dim \wedge^2 W - \dim L \geq 6r - 11$ by Proposition 4.11 [FH12]. As $\dim \mathfrak{aut}(p_L(S)) < r^2$, we check easily that $r^2 + (r - 5)(r - 6)/2 < \ell(\ell - 1)/2$.

Consider the case of VMRT of IHSS of type (III), then $S = \mathbb{P}W$, where $W$ is a vector space of dimension $r \geq 4$. By Proposition 4.12 [FH12], we have $\mathfrak{aut}(p_L(S))^{(1)} \simeq \text{Sym}^2(W/\text{Im}(L))^*$, which has dimension at most $(r - 2)(r - 3)/2$. On the other hand, we have $\ell \geq 3r - 3$ by loc. cit., hence we have $r^2 + (r - 2)(r - 3)/2 < \ell(\ell - 1)/2$.

Now consider the VMRT of symplectic Grassmannians. We use the notations in Example 3.5 with $V = (W \otimes Q)^* \oplus \text{Sym}^2 W^*$, where $\dim W = k \geq 2$ and $\dim Q = m$. By Lemma 4.19 [FH12], we have $k \geq 3$, hence $k + m \geq 4$. Let $L \subset V$ be a linear subspace, then by Proposition 4.18 [FH12], we have $\ell \geq 3(k + m) - 3$ and $\mathfrak{aut}(p_L(S))^{(1)} \simeq \text{Sym}^2(W/\text{Im}W(L))^*$ which has dimension at most $k(k + 1)/2$. As $\dim \mathfrak{aut}(\hat{S}) = k^2 + m^2 + km$, we have

$$\dim \mathfrak{aut}(p_L(S)) + \dim \mathfrak{aut}(\hat{p_L(S)})^{(1)} < k^2 + m^2 + km + k(k + 1)/2.$$
Put \( s = k + m \), then \( k^2 + m^2 + km + k(k+1)/2 = s^2 - km + k(k+1)/2 < 3s^2/2 - km < \ell(\ell - 1)/2 \) since \( k + m \geq 4 \).

Now we can complete the proof of Theorem \[1.2\].

**Proof of Theorem \[1.2\].** By Proposition \[3.6\], we have

\[
\dim \text{aut}(X) \leq n + \dim \text{aut}(\hat{C}_x) + \dim \text{aut}(\hat{C}_x)^{(1)}.
\]

If \( \text{aut}(\hat{C}_x)^{(1)} = 0 \), then \( C_x \subset \mathbb{P}^{n-1} \) is not a hyperquadric, which implies that \( \dim \text{aut}(\hat{C}_x) \leq n(n-1)/2 - 2 \) by Theorem \[1.4\]. This gives that

\[
\dim \text{aut}(X) \leq n + \dim \text{aut}(\hat{C}_x) \leq n + n(n-1)/2 - 2 < n(n+1)/2.
\]

Now assume \( \text{aut}(\hat{C}_x)^{(1)} \neq 0 \). If \( C_x = \mathbb{P}T_xX \) for general \( x \in X \), then \( X \) is isomorphic to \( \mathbb{P}^n \) by [CMSB02]. If \( C_x \subset \mathbb{P}T_xX \) is a hyperquadric \( \mathbb{Q}^{n-2} \), then \( X \cong \mathbb{Q}^n \) by [Mok08]. If \( C_x \subset \mathbb{P}T_xX \) is isomorphic to the Segre embedding of \( \mathbb{P}^1 \times \mathbb{P}^2 \), then \( X \cong \text{Gr}(2, 5) \) by [Mok08]. Now assume \( C_x \subset \mathbb{P}T_xX \) is not one of the previous varieties, then by Proposition \[3.8\] we have \( \dim \text{aut}(X) \leq n + n(n-1)/2 = n(n+1)/2 \), which proves claim (a) in Theorem \[1.2\].

Now assume the equality \( \dim \text{aut}(X) = n(n+1)/2 \) holds, then by Proposition \[3.6\] the VMRT structure is locally flat. By Proposition \[3.8\] \( C_x \subset \mathbb{P}T_xX \) is either the second Veronese embedding of \( \mathbb{P}^2 \) or a general hyperplane section of \( \mathbb{P}^1 \times \mathbb{P}^2 \). Note that these are also the VMRT of \( \text{Lag}(6) \) and a general hyperplane section of \( \text{Gr}(2, 5) \), which have locally flat VMRT structure. This implies that \( X \) is isomorphic to \( \text{Lag}(6) \) or a general hyperplane section of \( \text{Gr}(2, 5) \) respectively by the Cartan-Fubini extension theorem [HM01].
