Abstract

We have used the Aladin sky atlas of the Virtual Observatory to look for new common proper-motion pairs in three young stellar kinematic groups: Local Association ($\tau \sim 10$–120 Ma), Tucana-Horologium ($\tau \sim 30$ Ma) and $\beta$ Pictoris ($\tau \sim 12$ Ma). We have found 9 new and 14 known common proper-motion companions to the 210 investigated stars. With the CAFOS instrument at the 2.2 m Calar Alto telescope, we have investigated in detail one of the new pairs, the HD 143809 AB system, which is formed by a bright G0V primary star and a previously unknown young M1.0–1.5Ve star.

1 Introduction

Young nearby late-type stars are excellent targets for high-contrast imaging surveys for brown dwarf and planetary companions. Many of these young low-mass stars in the solar neighbourhood belong to stellar kinematics groups with ages younger than the Pleiades, such as the Local Association and its kinematic subgroups (Montes et al. 2001b; Song et al. 2003; Zuckerman & Song 2004). One way of identifying such stars is searching for faint proper-motion companions at wide separations to already-known members in young stellar kinematic groups.

We followed the procedure described by Caballero et al. (2010a) and used a powerful Virtual Observatory tool, the Aladin sky atlas (Bonnarel et al. 2000), to look for proper-motion companions to stars in the Local Association (LA, $\tau \sim 10$–120 Ma), Tucana-Horologium (Tuc-Hor, $\tau \sim 30$ Ma) and $\beta$ Pictoris ($\beta$ Pic, $\tau \sim 12$ Ma) stellar kinematic groups.
Table 1: The nine unknown proper-motion pairs (SKG indicates the stellar kinematic group).

| Name     | Sp. type | $\rho$ [arcsec] | $\theta$ [deg] | $s$ [kAU] | SKG    |
|----------|----------|-----------------|----------------|----------|--------|
| HD 82939 | G5V      | 162.28 ± 0.17   | 121.49 ± 0.07  | 6.3 ± 0.2 | LA     |

2 Analysis

We searched for either primary (i.e., brighter) and secondary (i.e., fainter) companions to 210 nearby young stars in the three different moving groups compiled by Montes et al. (2001b) and Torres et al. (2008): 116 in LA, 44 in Tuc-Hor, and 50 in β Pic. We used the interactive software Aladin v5 to load 2MASS (Skrutskie et al. 2006) and USNO-B1 (Monet et al. 2003) astro-photometric catalogues and cross-matched them in a circular area of radius 30 arcmin centred on each target. Next, we constructed a proper-motion diagram with the Aladin application VOPlot and searched for sources with USNO-B1 proper motions different from those of the target stars by less than 10 mas a\(^{-1}\).

For each proper-motion candidate, we looked for previous claiming in the literature of membership in multiple systems (e.g., the Washington Double Star catalogue; Mason et al. 2001) and for better proper-motion determinations (e.g., Tycho-2; Høg et al. 2000). We derived photometric distances for both primaries and secondaries, based on available spectroscopy or photometry, of the candidate pairs without parallactic distance measurements and discarded those with no coincident values.

3 Results

Of the 210 investigated stars, we identified 23 multiple system candidates, of which 14 were known common proper-motion companions and 9 were unknown multiple systems (see Ta-
One of the nine new pairs was a suspected multiple system (η Tel AB and HD 181327; Schneider et al. 2006). At the measured or derived distances, the angular separations of 0.37 to 24 arcmin translate into projected physical separations between 0.0045 and 0.31 pc. Interestingly, some of the proper-motion companions had been already tabulated as members in the same stellar kinematic group as their target stars (e.g., HD 207964 AB and HD 207575 in Tucana-Horologium).

One of the new multiple systems was formed by a young solar analogue and an anonymous high proper-motion red dwarf never described in the literature before, and was subject of a dedicated astrometric, photometric and spectroscopic follow-up study. First, we confirmed...
An Aladin-based search for young proper-motion companions

the common proper motion of the “HD 143809 AB” system using 11 astrometric epochs separated by over 56 years as in Caballero et al. (2010b). Next, we collected $B$, $V$, $R$ and $I$ images and low-resolution spectra (grating G100) with the CAPOS instrument at the 2.2 m Calar Alto telescope. While the primary is a known G0V star with a high lithium abundance ($\text{EW}($Li i$)=103\text{ mÅ}$; López-Santiago et al. 2010), an estimated age of $\tau \sim 80$–120 Ma and kinematics consistent with membership in the Local Association (Montes et al. 2001a), the new companion at $s = 7.1 \pm 0.9\text{ kAU}$ is an M1.0–1.5Ve star with chromospheric H$\alpha$, H$\beta$ and H$\gamma$ emission. The heliocentric distance derived from its spectral type and photometry matches the one of the primary measured by Hipparcos at $d = 78 \pm 8$ pc. Using this distance, its $J$-band apparent magnitude ($J = 10.35 \pm 0.03\text{ mag}$) and the NextGen models (Baraffe et al. [1998]) for an age of 100 Ma, HD 143809 B has a most probable mass of 0.57–0.60 $M_\odot$.

Acknowledgments

We thank J. Genebriera for providing us unpublished images of the HD 143809 AB system. This research has made use of Aladin. This work is supported by the Universidad Complutense de Madrid, the Spanish Ministerio de Ciencia e Innovación (MICINN) under grant AYA2008-0695, and the Comunidad de Madrid under PRICIT project S2009/ESP-1496 (AstroMadrid).
