Assessment of a feed additive consisting of all-rac-alpha-tocopheryl acetate (vitamin E) for all animal species for the renewal of its authorisation (NHU Europe GmbH)

EFSA Panel on Additives and Products or Substances used in Animal Feed (FEEDAP), Vasileios Bampidis, Giovanna Azimonti, Maria de Lourdes Bastos, Henrik Christensen, Birgit Dusemund, Mojca Fasmon Durjava, Maryline Koubia, Marta López-Alonso, Secundino López Puente, Francesca Marcon, Baltasar Mayo, Alena Pechová, Mariana Petkova, Fernando Ramos, Yolanda Sanz, Roberto Edoardo Villa, Ruud Woutersen, Georges Bories, Jürgen Gropp, Montserrat Anguita, Jaume Galobart, Orsolya Holczknecht, Jordi Tarrés-Call, Elisa Pettenati, Fabiola Pizzo, Maria Vittoria Vettori and Paola Manini

Abstract

Following a request from the European Commission, the EFSA Panel on Additives and Products or Substances used in Animal Feed (FEEDAP) was asked to deliver a scientific opinion on the assessment of the application for renewal of authorisation of all-rac-alpha-tocopheryl acetate (vitamin E) as a feed additive for all animal species. The applicant provided data demonstrating that the additive currently in the market complies with the conditions of authorisation. The FEEDAP Panel confirms that the use of all-rac-alpha-tocopheryl acetate under the current authorised conditions of use is safe for the target species, the consumers and the environment. No concern for user safety is expected from the use of the active substance, however, due to the lack of information, the FEEDAP Panel is not able to conclude on its skin sensitisation potential. To draw conclusions on the safety for the user of the final formulated additives, specific studies would be required. There is no need to assess the efficacy of all-rac-alpha-tocopherol acetate in the context of the renewal of the authorisation.

1. **Introduction**

1.1. **Background and Terms of Reference**

Regulation (EC) No 1831/2003\(^1\) establishes the rules governing the Community authorisation of additives for use in animal nutrition. In particular, Article 14(1) of that Regulation lays down that an application for renewal shall be sent to the Commission at the latest one year before the expiry date of the authorisation.

The European Commission received a request from NHU Europe GmbH\(^2\) for the renewal of the authorisation of the product all-rac-alpha tocopherol acetate (vitamin E), when used as a feed additive for all animal species (category: nutritional additives; functional group: vitamins, provitamins and chemically well-defined substances having a similar effect).

According to Article 7(1) of Regulation (EC) No 1831/2003, the Commission forwarded the application to the European Food Safety Authority (EFSA) as an application under Article 14(1) (renewal of the authorisation). EFSA received directly from the applicant the technical dossier in support of this application. The particulars and documents in support of the application were considered valid by EFSA as of 03 April 2020.

According to Article 8 of Regulation (EC) No 1831/2003, EFSA, after verifying the particulars and documents submitted by the applicant, shall undertake an assessment in order to determine whether the feed additive complies with the conditions laid down in Article 5. EFSA shall deliver an opinion on the safety for the target animals, consumer, user and the environment and on the efficacy of the product all-rac-alpha tocopherol acetate (vitamin E), when used under the proposed conditions of use (see Section 3.1.3).

1.2. **Additional information**

The EFSA Panel on Additives and Products or Substances used in Animal Feed (FEEDAP) issued an opinion on the safety and efficacy of vitamin E, in the form of all-rac-α-tocopherol acetate, RRR-α-tocopherol acetate and RRR-α-tocopherol, when used as a feed additive for all animal species (EFSA FEEDAP Panel, 2010). In 2012, the FEEDAP Panel issued an opinion on the safety and efficacy of synthetic alpha tocopherol when used as a technological additive (antioxidant) for all animal species (EFSA FEEDAP Panel, 2012a) and another opinion on the safety and efficacy of tocopherol-rich extracts of natural origin, tocopherol-rich extracts of natural origin/delta-rich, synthetic tocopherol for all animal species (EFSA FEEDAP Panel, 2012b).

Vitamin E (3a700) in the form of all-rac-alpha-tocopheryl acetate, RRR-alpha-tocopheryl acetate and RRR-alpha tocopherol is currently authorised as a nutritional additive for all animal species (Code 3a700).\(^3\) Alpha-tocopherol is also authorised for use as a technological additive (functional group: antioxidants) in feed for all animal species (1b307).\(^4\)

All-rac-α-tocopheryl acetate is described in the European Pharmacopoeia 10.0 (PhEur), monograph 0439 (PhEur, 2020).

The Scientific Committee on Food (SCF) established a tolerable upper intake level (UL) for vitamin E as 270 mg/day for adults and rounded to 300 mg/day (European Commission, 2003). The EFSA Panel on Dietetic Products, Nutrition and Allergy issued an opinion on dietary reference values for vitamin E as α-tocopherol (EFSA NDA Panel, 2015). The EFSA Panel on Food Additives and Nutrient Sources Added to Food (EFSA ANS Panel) issued an opinion on the re-evaluation of tocopherol-rich extract (E 306), α-tocopherol (E 307), γ-tocopherol (E 308) and δ-tocopherol (E 309) as food additives (EFSA ANS Panel, 2015).

\(^3\) Commission Regulation (EU) No 26/2011 of 14 January 2011 concerning the authorisation of vitamin E as a feed additive for all animal species. OJ L 11, 15.1.2011, p. 18–21.

\(^4\) Commission Regulation (EU) No 2015/1152 of 14 July 2015 concerning the authorisation of tocopherol extracts from vegetable oils, tocopherol-rich extracts from vegetable oils (delta rich) and alpha-tocopherol as feed additives for all animal species. OJ L 187, 15.7.2015, p. 5.
Tocopherol-rich extract (E 306), \( \alpha \)-tocopherol (E 307), \( \gamma \)-tocopherol (E 308) and \( \delta \)-tocopherol (E 309) are authorised as food additives.\(^5\) Vitamin E is authorised for use in food for nutritional purposes,\(^6\) for use in cosmetics as antioxidant\(^7\) and as a veterinary medicinal product.\(^8,9\)

2. Data and methodologies

2.1. Data

The present assessment is based on data submitted by the applicant in the form of a technical dossier\(^10\) in support of the authorisation request for the use of all-rac-alpha tocopheryl acetate (vitamin E) as a feed additive.

The European Union Reference Laboratory (EURL) considered that the conclusions and recommendations reached in the previous assessment are valid and applicable for the current application.\(^11\)

2.2. Methodologies

The approach followed by the FEEDAP Panel to assess the safety and the efficacy of all-rac-alpha-tocopheryl acetate (vitamin E) is in line with the principles laid down in Regulation (EC) No 429/2008\(^12\) and the relevant guidance document: Guidance on the renewal of the authorisation of feed additives (EFSA FEEDAP Panel, 2013) and Guidance on the assessment of the safety of feed additives for the consumer (EFSA FEEDAP Panel, 2017).

3. Assessment

Vitamin E (tocopherol) is currently authorised as feed additive in the form of three active substances: all-rac-alpha-tocopheryl acetate, RRR-alpha-tocopheryl acetate and RRR-alpha-tocopherol. This assessment regards the renewal of the authorisation of vitamin E in the form of all-rac-\( \alpha \)-tocopheryl acetate (with a purity > 93%), when used as a nutritional additive (functional group: vitamins, provitamins and chemically well-defined substances having a similar effect) in feed and water for drinking for all animal species.

3.1. Characterisation

3.1.1. Characterisation of the active substance

All-rac-alpha-tocopheryl acetate is identified with the Chemical Abstracts service (CAS) number 7695-91-2 and has a molecular formula \( \text{C}_{31}\text{H}_{52}\text{O}_3 \).

All-rac-alpha-tocopheryl acetate is an oil, which is practically insoluble in water (\(< 0.8 \text{ mg/L}) and is soluble in acetone, anhydrous ethanol and fatty oils. The density (955 kg/m\(^3\)), the viscosity at 25°C (3,935 mPa*s) and refraction index (1.4954) were determined in one recent batch of vitamin E.\(^13\)

OJ L 133, 22.5.2008, p. 1.
\(^13\) Technical dossier/Section II_Annex_2.1.5.
The product under assessment is obtained by chemical synthesis. The applicant stated that the manufacturing process and the composition of the additive have not been modified since the previous authorisation and provided data from recent batches on the composition of the additive to support this statement.

The applicant provided results on the batch-to-batch variation in five recent batches of the active substance. The concentration of all-rac-alpha tocopheryl acetate was on average 93.8% (range: 93.5–94.1%) and demonstrated compliance with the existing specifications and also as foreseen in the authorising Regulation (purity criteria: > 93%).

Possible impurities listed in the European Pharmacopoeia were also measured in the same batches, namely all-rac-trans-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-yl acetate (impurity A, 0.21–0.23%), all-rac-cis-2,3,4,6,7-pentamethyl-2(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-yl acetate (impurity B, 0.75–0.81%); all-rac-α-tocopherol (impurity C, 0.29–0.33%); 4-methoxy-2,3,6-trimethyl-5-[(all-RS,E)-3,7,11,15-tetramethylhexadec-2 enyl] phenylacetate (impurity D, not detected) and (all-RS, all-E)-2,6,10,14,19,23,27,31-octamethyldotriaconta-12,14,18-triene (impurity E, not detected). The detected amounts of impurities A to C were below the limits specified in the European Pharmacopoeia monograph (PhEur, 2020).

The levels of methanol and ethyl acetate, which can be present as residual solvents, were measured in the same five batches. The results reported (9–44 mg methanol/kg additive and 1–9 mg ethyl acetate/kg additive) were below the corresponding thresholds set by the VICH (International Cooperation on Harmonisation of Technical Requirements for Registration of Veterinary Medicinal Products) for class 2 (methanol: 3,000 mg/kg) and class 3 compounds (ethyl acetate: 5,000 mg/kg) (EMA, 2010).

Based on the results obtained, no concerns are identified.

3.1.2. Stability and homogeneity

The applicant provided new stability studies that supported the stability already shown for all-rac-alpha-tocopheryl acetate. No losses were detected after storage at 25°C in sealed containers protected from light for 24 months.

The stability of all-rac-alpha-tocopheryl acetate was tested in two vitamin–mineral premixtures containing choline chloride (42 or 83 g/kg), each one supplemented with either 65 mg synthetic vitamin E (purity 50%) or 81 mg natural vitamin E (purity 40%) when stored at 20 or 40°C for 12 months (packaging not described). At the end of the storage period, the synthetic vitamin E had a recovery of about 75% in the first premix and of about 100% in the second when stored at 20°C; whilst recoveries were of 80% in the first premixture and of 100% in the second premixture when synthetic vitamin E was stored at 40°C.

The stability of one batch of additive was studied in a feed (mash, pelleted at 75–78°C, and extruded at 90–110°C) for weaned piglets (feed composition not provided, supplementation rate 175 mg vitamin E/kg), when stored at 20 or 40°C for 12 months (packaging described as ‘bags’). In mash feed, recovery rate was of 100, 96 and 81% after 3-, 6- and 12-month storage at 20°C and 100, 90 and 62% after 3-, 6- and 12-month storage at 40°C, respectively. Pelleted feed had a similar recovery at both storage temperatures (20 and at 40°C): 100, 96 and 78% after 3, 6 and 12 months, respectively. Extruded feed, kept at 20°C had a recovery of vitamin E of 96, 93 and 80% after 3, 6 and 12 months; whilst when stored at 40°C the recovery of vitamin E was 91, 82 and 71% after 3, 5 and 12 months, respectively.

The stability of two batches of a water dispersible formulation containing all-rac-alpha-tocopheryl acetate was tested in water for drinking when added at a concentration of 400 mg vitamin E/kg water. A pre-dilution 1:20 was made using dextrose as a carrier. After 48 h storage at room temperature protected from light, the recovery was 96–97%.

3.1.3. Conditions of use

Vitamin E in the form of all-rac-alpha-tocopheryl acetate (purity > 93%) is currently authorised for use in feed and in water for drinking for the target species without a maximum content.
The authorisation, under other provisions foresees:

- If vitamin E content is mentioned in the labelling, the following equivalencies for the units of measurement of the contents shall be used:
  - 1 mg all-rac-alpha-tocopheryl acetate = 1 IU
  - 1 mg RRR-alpha-tocopherol = 1.49 IU
  - 1 mg RRR-alpha-tocopheryl acetate = 1.36 IU
- Vitamin E may be used also via water for drinking.

The applicant proposes to keep the same conditions of use as authorised.

3.2. Safety

The safety of the vitamin E in the form of all-rac-alpha-tocopheryl acetate for the target species, consumers, users and the environment was evaluated in a previous opinion (EFSA FEEDAP Panel, 2010). The FEEDAP Panel concluded that ‘vitamin E at the current use levels is safe for all animal species. Information on hypervitaminosis E is not sufficiently consistent to derive a maximum content for vitamin E in feedingstuffs, based on safety for target species’. The Panel also concluded that the use of the product as a feed additive raises no concern for consumer safety or for the environment. Concerning the safety for the user, no irritating effects were observed when all-rac-alpha-tocopheryl acetate was tested for dermal and ocular irritation. Sensitisation studies were not provided. The Panel concluded that ‘no concern for user safety is expected from the use of the active substances vitamin E in feed additives. However, to draw conclusions on the final formulated additives, specific studies would be required’.

To support the safety of all-rac-alpha-tocopheryl acetate, the applicant carried out a structured database search covering the period 2009–2020 and using the database Scopus. The search included the terms: tocopheryl acetate, tocopherol, tolerance and toxicity combined with keywords related to human and animals (rat, broiler, fish, pig and cow). A description of the iterations used and the inclusion/exclusion criteria applied for the selection were provided. The search identified 23 hits, two of them were EFSA opinions (EFSA FEEDAP Panel, 2012a,b). Three publications in laboratory animals and two in humans were related to the adverse effects due to vitamin E overdose. However, the outcome of these studies is not relevant to the conditions of use of vitamin E as feed additive. Another publication reported the outcome on an in vitro study and was not considered relevant. The remaining publications were related to the use of vitamin E in the target species, in pigs (4), cows (6) and fish (5), including data on residues of vitamin E in tissues and products of animal origin. None of the papers identified a safety concern for the target species and the consumer. No papers were retrieved as concern the safety for the user and the environment.

3.2.1. Reassessment of consumer exposure

In the previous FEEDAP Panel opinion (EFSA FEEDAP Panel, 2010), a ‘worst-case scenario’ exposure assessment for the consumer, based on the consumption model described in Regulation (EC) No 429/2008 and on data from literature on vitamin E content in edible tissues and products from animals treated with vitamin E at levels far higher than the practical use (1,000 mg/kg feed), indicated that the theoretical exposure of consumers amounted to about 45% of the UL (300 mg alpha-tocopherol equivalents/day).

In the current assessment, the FEEDAP Panel performed an updated exposure assessment following the methodology described in the Guidance on consumer safety (EFSA FEEDAP Panel, 2017) (Appendix A). Based on the literature search provided by the applicant, the Panel identified three relevant papers (Ouraji et al., 2011; Song et al., 2014; Kidane et al., 2015) with new residue data not available at the time of the previous assessment. In addition, the Panel opted to use more realistic feed supplementation figures (i.e. 100 mg/kg feed instead of 1,000 mg/kg) also from the studies already assessed in the previous opinion. When data were available for the same species and food items at the same supplementation concentration, the highest value was considered. The input data used are reported in Table 1.

---

19 Technical dossier/Supplementary information August 2020/Annex 5_Literature search.
20 Technical dossier/Supplementary information February 2021/Literature search consolidated.
The results of the dietary exposure to vitamin E for the different population categories are reported in Table 2. In 2003, the SCF established an UL for vitamin E for adults as 300 mg/day (European Commission, 2003), based on the body weight (bw), the UL for children (1–3 years) and adolescents was set at 100 and 260 mg/day, respectively. To compare the vitamin E dietary exposure calculation to the UL, the FEEDAP Panel used the highest reliable percentile (HRP) for the different population categories and converted it from mg/kg bw per day into mg/person per day using the default bw values (EFSA Scientific Committee, 2012). The contribution to the consumer exposure to vitamin E from products of animals fed with the additive ranged from 9.5% to 15.3% of the ULs (Table 2).

For the population groups infants and elderly as well as very elderly, no UL was established by the SCF. However, the FEEDAP Panel assumes that the exposure would still be in the same relation to the UL as for the other population categories.

The FEEDAP Panel concludes that there is no safety concern for the consumer resulting from the intake of food from all animal species fed with vitamin E in the form of all-rac-alpha-tocopheryl acetate under the conditions of the existing authorisation.

### 3.2.2. Conclusions on safety

Based on the above and the fact that the manufacturing process, the composition of the additive and the conditions of use for the species/categories for which the additive is authorised have not been

### Table 1: Input data on vitamin E content in food of animal origin used for the consumer exposure assessment

| Animal products                        | mg/kg wet tissue/product | Reference                                |
|----------------------------------------|--------------------------|------------------------------------------|
| Birds fat (skin/fat)                   | 12* (24)                 | Sunder and Flachowsky (2001)†            |
| Birds liver                            | 17                       | Sunder and Flachowsky (2001)†            |
| Birds meat                             | 8                        | Sunder and Flachowsky (2001)†            |
| Fish                                   | 135                      | Tocher et al. (2002)†                    |
| Mammals fat tissue                     | 2.3* (4.6)               | Yang et al. (2009)†                      |
| Mammals liver                          | 4.6                      | Yang et al. (2009)†                      |
| Mammals meat                           | 9                        | Song et al. (2014)                       |
| Mammals offals and slaughtering products (other than liver) | 2.7 | Yang et al. (2009)†                     |
| Milk                                   | 1.5                      | Kidane et al. (2015)                     |
| Seafood                                | 8                        | Ouraji et al. (2011)                     |
| Eggs                                   | 68                       | Sunder and Flachowsky (2001)†            |

No data were retrieved for the following food categories: ‘Birds offals and slaughtering products (other than liver)’ and ‘honey’. However, it is expected that the contribution of these food categories to the overall exposure would be limited.

*: The original value (in parenthesis) was divided by 2 to take into consideration the ratio skin/fat.
†: Paper used in EFSA FEEDAP Panel (2010).

**: (Average of 43.4 and 61.3 kg).
modified, the Panel considers that there is no evidence to reconsider the conclusions reached in previous assessments. The FEEDAP Panel concludes that vitamin E in the form of all-rac-alpha-tocopheryl acetate remains safe for the target species, the consumer and the environment under the conditions of use currently authorised. No concern for user safety is expected from the use of the active substance, however, due to the lack of information, the FEEDAP Panel is not able to conclude on its skin sensitisation potential. To draw conclusions on the safety for the user of the final formulated additives, specific studies would be required.

3.3. Efficacy

The present application for renewal of the authorisation does not include a proposal for amending or supplementing the conditions of the original authorisation that would have an impact on the efficacy of the additive. Therefore, there is no need for assessing the efficacy of the additive in the context of the renewal of the authorisation.

3.4. Post-market monitoring

The FEEDAP Panel considers that there is no need for specific requirements for a post-market monitoring plan other than those established in the Feed Hygiene Regulation\(^{21}\) and Good Manufacturing Practice.

4. Conclusions

The applicant has provided data demonstrating that the additive currently in the market complies with the conditions of authorisation.

The FEEDAP Panel concludes that all-rac-alpha-tocopheryl acetate (vitamin E) remains safe for all animal species, the consumers and the environment under the conditions of use currently authorised. No concern for user safety is expected from the use of the active substance however, due to the lack of information, the FEEDAP Panel is not able to conclude on its skin sensitisation potential. To draw conclusions on the safety for the user of the final formulated additives, specific studies would be required.

There is no need for assessing the efficacy of the additive in the context of the renewal of the authorisation.

Methodology

As described in the Guidance on the safety of feed additives for consumers (EFSA FEEDAP Panel, 2017), consumption data of edible tissues and products as derived from the EFSA Comprehensive European Food Consumption Database (Comprehensive Database) will be used to assess exposure to residues from the use of feed additives in different EU countries, age classes and special population groups. For each EU country and age class, only the latest survey available in the Comprehensive Database will be used.

While the residue data reported for feed additives refer to organs and tissues (`raw agricultural commodities (RAC)`), the Comprehensive Database includes consumption data for foods as consumed. In order to match those consumption data with the available residue data for feed additives, the consumption data reported in the Comprehensive Database have been converted into RAC equivalents. For assessing the exposure to vitamin E from their use in (non-reproductive) poultry, the following list of commodities is considered: meat, fat, liver, other offals (including kidney).

Depending on the nature of the health-based guidance derived, either a chronic or acute exposure assessment may be required.

For chronic exposure assessments, the total relevant residues will be combined for each individual with the average daily consumptions of the corresponding food commodities, and the resulting exposures per food will be summed in order to obtain total chronic exposure at individual level (standardised by using the individual body weight). The mean and the higher percentile (usually the 95th percentile) of the individual exposures will be subsequently calculated for each dietary survey (country) and each age class separately.

As opposed to the chronic exposure assessments, acute exposure calculation will be carried out for each RAC value separately. The higher percentile (usually the 95th percentile) exposures based on the consuming days only will be calculated for each food commodity, dietary survey and age class separately.

---

22 Infants: < 12 months old, toddlers: ≥ 12 months to < 36 months old, other children: ≥ 36 months to < 10 years old, adolescents: ≥ 10 years to < 18 years old, adults: ≥ 18 years to < 65 years old, elderly: ≥ 65 years to < 75 years old, very elderly: ≥ 75 years old.
Appendix B – Detailed results on chronic exposure calculation

Chronic dietary exposure per population class, country and survey (mg/kg bw per day) of consumers to ATX based on residue data in salmonids and crustaceans.

Table B.1: Chronic dietary exposure per population class, country and survey (mg/kg bw per day) of consumers to vitamin E based on residue data
