Materials and methods

Unless specified, reagents were obtained from commercial sources and used without further purification. Solvents were obtained from Fisher scientific, and H₂O was deionised before use. Analytical grade THF was dried using Innovative Technology Inc. solvent purification system and stored under nitrogen.

NMR spectra were recorded on either Bruker Avance-400, Varian VNMRS-600 or Varian VNMRS-700 instruments and are calibrated to the residual solvent according to the literature.¹ Assignments are based on DEPT-135, COSY, HSQC and HMBC spectra.

Liquid chromatography-mass spectrometry (LCMS) was performed on an Agilent HP 1100 series chromatograph (Mercury Luna 3µ C18 (2) column) attached to a Waters ZQ2000 mass spectrometer with ESCi ionisation source in ESI mode. Elution was carried out at a flow rate of 0.6 mL/min using a reverse phase gradient of MeCN–water containing 0.1% formic acid.

Gradient = 0–1 min: hold MeCN 5%, 1–4 min: ramp MeCN 5–95%, 4–5 min: hold MeCN 95%, 5–7 min: ramp MeCN 95–5%, 7–8 min: hold MeCN 5%. Retention times are reported as Rt.

High resolution mass spectra (HRMS) were recorded on a Waters Micromass LCT Premier spectrometer using time of flight with positive electrospray ionisation (ESI+), an ABI/MDS Sciex Q-STAR Pulsar with ESI+ and an ASAP (atmospheric pressure solids analysis probe ionisation), or a Bruker BioApex II 4.7e FTICR utilising either ESI+ or a positive electron ionisation (EI+) source equipped with a direct insertion probe. The mass reported is that containing the most abundant isotopes (³⁵Cl and ⁷⁹Br). Limit: ± 5 ppm.

IR spectra were recorded neat on a Perkin-Elmer Spectrum One or Perkin-Elmer Spectrum Two FTIR spectrometer using Universal ATR sampling accessories. Letters in parentheses refer to the relative absorbency of the peak: w – weak (<40% of the most intense peak), m – medium (40–75% of the most intense peak), s – strong (>75% of the most intense peak) and br – broad.

Melting points were recorded on an Optimelt automated melting point system with a heating rate of 1 °C/min (70% onset point and 10% clear point) and are uncorrected.

Microwave heating was performed using a Biotage® Initiator or Initiator⁺.

General procedure for thiazole and thiophene synthesis

In a 2–5 mL microwave vial was added the nitrile (0.22 mmol, 1 equiv) and trifluoroethanol (2 mL) which was stirring for 2 min to dissolve. Next, 1,4-dithian-2,5-diol (0.11 mmol, 0.5 equiv) was then added and stirred for 5 min before triethylamine (0.242 mmol; 1.1 equiv) was added and the mixture further stirred for 2 min. The vial was then sealed and heated in the microwave for 390 min at 60 °C. The solvent was evaporated under vacuo and the crude residue was then purified using flash chromatography on silica (EtOAc/hexanes).

Isopropyl 2-cyano-2-phenylacetate (20):

Ethyl phenylcyanoacetate (16, 0.473 g, 2.5 mmol) was dissolved in isopropyl alcohol (10 mL) and left stirring for 1 min. Polymer-bound sulfonic acid (QP-SA) (200 mg, 2.2 mmol/g loading) was then added and the mixture was stirred for 3 days at 70 °C. Ethyl 2-cyano-2-(4-methoxyphenyl)acetate (22):

General procedure:

4-Methoxyacetonitrile (0.7 g, 4.76 mmol, 1.00 equiv) was dissolved in dry THF (4.7 mL) and cooled to –78 °C. At this temperature n-butyllithium (3.0 mL, 4.76 mmol, 1.00 equiv) was added dropwise and the colour of the solution changed immediately to yellow. After further stirring for 20 min at –78 °C, a solution of ethyl chloroformate (SI-2) (0.52 g, 4.76 mmol, 1.00 equiv) in THF (1 mL) was added slowly to the stirring solution. The reaction mixture stirred for 30 min at this temperature and was then allowed to warm to room temperature and stirred for another 1 h. The reaction was quenched with water and EtOAc was added. The layers were separated and the aqueous phase was extracted three times with EtOAc. The combined organic layer was washed twice with brine, dried over Na$_2$SO$_4$ and the solvent was removed under reduced pressure. The crude material was further purified on a silica column 1:9–4:6 EtOAc/hexane gradient to give the product. Isolated yield: 0.54 g (52%, 4.76 mmol scale), colourless oil; R$_f$: 0.32 (2/8, EtOAc/hexane). $^1$H NMR (400 MHz, DMSO-$d_6$) δ/ppm 7.40–7.34 (m, 2H), 6.95–6.89 (m, 2H), 4.66 (s, 1H), 4.23 (qd, $J = 7.1$, 2.1 Hz, 2H), 3.81 (s, 3H), 1.27 (t, $J = 7.1$ Hz, 3H); $^{13}$C NMR (101 MHz, DMSO-$d_6$) δ/ppm 165.4, 160.3, 129.2, 122.0, 116.0, 114.8, 63.3, 55.5, 43.1, 14.0; IR (neat) ν = 3743.6 (w), 2984.0 (w), 2940.0 (w), 2940.0 (w), 2910.0 (w), 2893.3 (w), 2284.0 (w), 2000.6 (w), 1741.4 (m), 1610.8 (m), 1586.2 (w), 1509.5 (s), 1463.6 (w), 1443.4 (w), 1422.9 (w), 1368.5 (w), 1303.8 (m), 1247.1 (s), 1198.8 (m), 1178.8 (m), 1111.8 (w), 1095.3 (w), 1027.1 (m), 942.
