Abstract:
Aims and objective: To assess the Treatment seeking behavior of homeopathy among 30-55 age group population in semi urban Chennai.

Settings and design: A community-based, cross-sectional study was conducted from March 2019 To September 2019 in the semi-urban area of Poonamalle, Chennai.

Materials and Methods: A total of 220 study participants were selected by cluster sampling and between the age group of 30-55 were interviewed by semi-structure questionnaire.

Results: The finding of the study shows that majorities (31%) of respondents were graduated. Socio-economically, the majority of them belong to the lower-middle-class group. Most of the participants were housewives. The majority of respondents know about homeopathy via treatments of friends and family (39%), TV & Newspaper (39%). Minimal number of the study people (44.1%) believed homeopathy medicine is working and it having curative power. But the majority of study peoples replied that homeopathic treatment system is not very common in a few public, indicating the need for more public awareness on it. Majority of study people (70.5%) not taking homeopathy due to lack of awareness of homeopathic treatment, lack of government hospital department for homeopathy treatment and non-availability of homeopathy pharmacy.

Conclusion: Major lack of awareness is due to lack of availability homeopathy clinics and pharmacies in rural and semi-urban areas. So, increasing the availability helpful for homeopathy easily reaches every corner of the rural and semi-urban area. Every homeopath should take major responsibility to create awareness and helps the people to get better treatment in homeopathy.

Keywords: Homeopathy, semi urban, awareness, homeopathy pharmacy

Introduction
The Indian Systems of Medicine and Homoeopathy (ISM&H) were given an independent identity in the Ministry of Health and Family Welfare in 1995 by creating a separate Department of Ayurveda, Yoga and Naturopathy, Unani, Siddha and Homoeopathy (AYUSH) in November 2003 [1].

The ancient Indian systems of medicine and homeopathy (ISM&H) lay great emphasis on prevention of disease and promotion of health. Ayurveda, yoga, Unani, Siddha, homeopathy and naturopathy comprise the acronym (AYUSH) used to refer to alternative medical systems that are being practiced in India [2].

Traditional and Complementary Medicine is a method that can enrich, strengthen the public health system and improve the quality of life; contribute to the quality of economic and social development; improve the health and development of local communities; safe guard cultural differences; focus attention on health care centers intended as physical, mental, spiritual and social well-being of people, nature and environment [2].

Since origin, it has a patient centered approach and a holistic focus on health care instead of a disease-centered approach of conventional medicine. Homeopathy is one of the most frequently used and controversial systems of complementary and alternative medicine.

It is based on the ‘principle of similar’, whereby highly diluted preparations of substances that cause symptoms in healthy individuals are used to stimulate healing in patients who have similar symptoms when ill. When a single homeopathic remedy is selected based on a patient’s total symptom picture, it is called ‘classical’ homeopathy.

Homeopathy system is one of the safest systems of treatment for children’s, all age group and both sex and without side effect. Homeopathy treatments not only cure the physical symptom and also cure the mind suffering of the patient. The effectiveness of homeopathic drugs are claimed to be very high while the cost and side effects of the same is very low.
Probably this is the reason why homeopathy has greater demand in countries such as India with low GPD(3) There is lack of studies assessing the Treatment seeking behavior of homeopathy in general population. Hence this study was taken to find out health seeking behavior of homeopathy.

Materials and Methods
Study design, period and area
This community-based cross-sectional study was conducted from March 2019 To September 2019 in the semi-urban area of Poonamalle, Chennai.

Sample size and technique
Based on previous study, the sample size was calculated as 220. With help of cluster sampling, Poonamalle was separated into small clusters, Through simple random sampling method study participants were selected from clusters of poonamalle.

Selection criteria
People who residing in study area, both sex and age criteria is 30-55 age group people were considered. People who are not willing to participate in the study were excluded from study.

Procedure
The study was approved by Institutional Ethics Committee of The Tamilnadu Dr. MGR medical university, Chennai. The study participants were interviewed, based on the selection criteria, the study participants were selected, and written informed consent was obtained from all the participants. The data were collected using the Semi structure questionnaire section A (Demographic Details) and section B (knowledge assessing questions).

Statistical analysis
The data were tabulated using MS Excel sheet and analysis was done using percentages, rates, and ratios. Chi-square test was used to find the association between attributes

Results
Analysis and Interpretation:

Figure 1 showed as 220 participants were added in this study. Among them 58% are Female and 42% are male.

Figure 2 showed as 72 participants comes under the 31-40 age group, 81 participants comes under the 41-50 age group and 67 participants comes under 51-60 age group. The majority of respondents belong to 41-50 age groups.

Figure 3 showed as 6% of participants are illiterate, 16% of participants are only done primary school, and 23% of participants are completed secondary school, 24% of participants are completed higher secondary school and remaining 31% of participants are done graduate and above.

Figure 4 showed as 7% of participants are low class, 23% of participants are upper lower class, 28% of participants are lower middle class, 21% of participants are upper middle class and 21% of participants are upper class. The majority of respondents are lower middle class.
Figure 5 showed as 4% of participants are working government job, 17% of participants are working private job, 13% of participants are doing own business, 21% are doing laborer work and remaining 45% of participants are housewife. The majority of respondents are housewife.

Figure 6 showed as the majority of respondents knows about homoeopathy via treatments of friends and family (39%), TV & Newspaper (39%).

**Table 1:** Association of sex with Homeopathy treatment seeking behavior

| Knowledge Questions                          | Sex  | Never | Sometimes | Mostly | Always | Total | P-value |
|---------------------------------------------|------|-------|-----------|--------|--------|-------|---------|
| Have You Ever Taken Homeopathic Medicine?   | Male | 55    | 35        | 2      | 0      | 92    | 0.013   |
|                                             | Female | 100    | 26        | 2      | 0      | 128   |         |
Table 2: Shows the questions & options frequency and percentage

| S. No | Questions | Options                  | Frequency | Percentage |
|-------|-----------|--------------------------|-----------|------------|
| 1.    | Have You Ever Taken Homeopathic Medicine? | 1. Never

5. Not At All | 4           | 1.8         |

Table 3 showed as 70.5% of respondents never taken homeopathy medicine, the remaining 27.7% of respondents sometimes taking and 1.8% of respondents are mostly taking homeopathy medicine. 44.1% of respondents were answered that homeopathy medicine is working and 11.8% of respondents have answered homeopathy medicines which increase the disease. 42.7% of respondents were answered that they did not know about whether homeopathic medicine having side effects or not and only 34.5% of the response was homeopathic medicine not having a side effect. 38.2% of people reported that homeopathic medicine can be given for joint complaints and 36.4% of respondents reported that old age people are majority can take homeopathy medicine. 63.6% of respondents replied that homeopathic medicine should not be simultaneously used with allopathic medicine. 37.7% of people replied that they did not know about whether homeopathic medicine safe for children or not but 35.5% of people accepted that homeopathic medicine safe.
for children. 45.5% of people gave that ambiguous statement that all homeopathic medicine is looking similar. 53.2% of respondents replied that homeopathic medicine should not take before food. 49.5% of study people replied homeopathy medicine is not easily assessable and there is no pharmacy in our area and the government also not giving the medicine free of cost and in our area, there is no special department for homeopathic treatment in the government hospital.

58.6% of people did not know about homeopathic medicine is useful for problems during dentition among children. In our adjoining area, only a few peoples (81.4%) awarded homeopathic treatment. In this study area, only 41.4% of people believed homeopathic medicine only moderately important for our health care settings.

Discussion

Many types of research have been conducted KAP study of homeopathy among health care professionals but only a few studies carried out to know the treatment-seeking behavior of homeopathy among the semi-urban population. Therefore, a study was designed to collect information of treatment seeking behavior of homeopathy treatment in a semi-urban population to use the data to create awareness about homeopathy treatment among the semi-urban population.

It was observed that most semi-urban population 41-50 age groups of peoples were involved in the study and the majorities (31%) of respondents were graduated. Socio-economically, the majority of them belong to the lower-middle-class group. Most of the participants were housewives. The majority of respondents know about homeopathy via treatments of friends and family (39%), TV & Newspaper (39%). These are the main source to know about homeopathic treatments.

Minimal of the study people (44.1%) believed homeopathic medicine is working and it having curative power. But the majority of study peoples replied that homeopathic treatment system is not very common in a few public, indicating the need for more public awareness on it. The findings of our study demonstrate that (38.2%) patients who seek homeopathic treatment are primarily those suffering from chronic diseases like joint pain, especially for old age people. Majority of study people (70.5%) not taking homeopathy due to lack of awareness of homeopathy treatment, lack of government hospital department for homeopathy treatment and non-availability of homeopathy pharmacy.

Conclusion

We evaluated for the first time to know the treatment-seeking behavior of homeopathy in the semi-urban population. Based on our study, the knowledge and treatment-seeking behavior of homeopathy is lacking in the semi-urban population. So, making awareness among the semi-urban population is prime important. Because in study area, the economically majority of people belong to lower middle income. They needed the most cost-effective treatment to lead a healthy life. Homeopathic medicine is having lesser side effects and the most cost-effective treatment. Homeopathy treatment is effective for both acute and chronic disease and it removes root cause of disease. Homeopathy is friendly to children because medicine is very sweet. Homeopathy medicine is a very effective treatment for problems during dentition for children. Homeopathy medicine can take alone with allopathy medicine. It never produces any adverse reaction. Major lack of awareness is due to lack of availability homeopathy clinics and pharmacies in rural and semi-urban areas. So, increasing the availability helpful for homeopathy easily reaches every corner of the rural and semi-urban area. Future studies should create more awareness and a better understanding of homeopathy treatment among the rural and semi-urban population and every homeopath should take major responsibility to create awareness and helps the people to get better treatment in homeopathy.
