FROM COMPRESSIBLE TO INCOMPRESSIBLE INHOMOGENEOUS FLOWS IN THE CASE OF LARGE DATA

RAPHAËL DANCHIN AND PIOTR BOGUSLAW MUCHA

Abstract. This paper is concerned with the mathematical derivation of the inhomogeneous incompressible Navier-Stokes equations (INS) from the compressible Navier-Stokes equations (CNS) in the large volume viscosity limit. We first prove a result of large time existence of regular solutions for (CNS). Next, as a consequence, we establish that the solutions of (CNS) converge to those of (INS) when the volume viscosity tends to infinity. Analysis is performed in the two dimensional torus $T^2$, for general initial data. In particular, we are able to handle large variations of density.

1. Introduction

We are concerned with the following compressible Navier-Stokes system:

$$
\begin{align*}
\rho_t + \text{div} (\rho v) &= 0 \quad \text{in} \quad (0, T) \times T^2, \\
\rho v_t + \rho v \cdot \nabla v - \mu \Delta v - \nu \nabla \text{div} v + \nabla P &= 0 \quad \text{in} \quad (0, T) \times T^2.
\end{align*}
$$

Above, the unknown nonnegative function $\rho = \rho(t, x)$ and vector-field $v = v(t, x)$ stand for the density and velocity of the fluid at $(t, x)$. The two real numbers $\mu$ and $\nu$ denote the viscosity coefficients and are assumed to satisfy $\mu > 0$ and $\nu + \mu > 0$.

We suppose that the pressure function $P = P(\rho)$ is $C^1$ with $P' > 0$, and that $P(\bar{\rho}) = 0$ for some positive constant reference density $\bar{\rho}$. Throughout, we set

$$
e(\rho) := \rho \int_\rho^{\bar{\rho}} \frac{P(t)}{t^2} \, dt.
$$

Note that $e(\bar{\rho}) = e'(\bar{\rho}) = 0$ and that $\rho e''(\rho) = P'(\rho)$. Hence $e$ is a strictly convex function and, for any interval $[\rho_*, \rho^*]$, there exist two constants $m_*$ and $m^*$ so that

$$
m_*(\rho - \bar{\rho})^2 \leq e(\rho) \leq m^*(\rho - \bar{\rho})^2.
$$

The system is supplemented with the initial conditions

$$
v|_{t=0} = v_0 \in \mathbb{R}^2 \quad \text{and} \quad \rho|_{t=0} = \rho_0 \in \mathbb{R}^+.
$$

We aim at comparing the above compressible Navier-Stokes system with its incompressible but inhomogeneous version. The system in question reads

$$
\begin{align*}
\eta_t + u \cdot \nabla \eta &= 0 \quad \text{in} \quad (0, T) \times T^2, \\
\eta u_t + \eta u \cdot \nabla u - \mu \Delta u + \nabla \Pi &= 0 \quad \text{in} \quad (0, T) \times T^2, \\
\text{div} u &= 0 \quad \text{in} \quad (0, T) \times T^2.
\end{align*}
$$

At the formal level, one can expect the solutions to (1.1) to converge to those of (1.4) when $\nu$ goes to $+\infty$. Indeed, the velocity equation of (1.1) may be rewritten

$$
\nabla \text{div} v = \frac{1}{\nu} \left( \rho v_t + \rho v \cdot \nabla v - \mu \Delta v + \nabla P \right).
$$
and thus $\nabla \text{div } v$ should tend to 0 when $\nu \to +\infty$. This means that div $v$ should tend to be independent of the space variable and, as it is the divergence of some periodic vector field, one must eventually have $\text{div } v \to 0$. As, on the other side, one has for all value of $\nu$,

$$\rho u + \rho v \cdot \nabla v - \mu \Delta v$$

this means that if $(\rho, v)$ tends to some couple $(\eta, u)$ in a sufficiently strong meaning, then necessarily $(\eta, u)$ should satisfy (1.4).

Hence, the question of finding an appropriate framework for justifying that heuristics naturally arises. Let us first examine the weak solution framework as it requires the minimal assumptions on the data. As regards System (1.1) with pressure law like $P(\rho) = \alpha(\rho^\gamma - \bar{\rho}^\gamma)$ for some $a > 0$ and $\gamma > 1$, the state-of-the-art for the weak solution theory is as follows (see [16, 24] for more details):

**Theorem 1.1.** Assume that the initial data $\rho_0$ and $v_0$ satisfy $\sqrt{\rho_0} v_0 \in L_2(T^2)$ and $\rho_0 \in L_\gamma(T^2)$. Then there exists a global in time weak solution to (1.1) such that

$$v \in L_\infty(\mathbb{R}_+; L_2(T^2)) \cap L_2(\mathbb{R}_+; \dot{H}^1(T^2))$$

and, for all $T > 0$,

$$\int_0^T \left( \frac{1}{2} \rho |v|^2 + e(\rho) \right) dt + \int_0^T (\mu \|\nabla v\|^2 + \nu \|\text{div } v\|^2) dt \leq \int_0^T \left( \frac{1}{2} \rho_0 |v_0|^2 + e(\rho_0) \right) dx.$$

For System (1.4), there is a similar weak solution theory that has been initiated by A. Kazhikhov in [17], then continued by J. Simon in [25] and completed by P.-L. Lions in [15]. However, to the best of our knowledge, it is not known how to connect System (1.1) to (1.4) in that framework. Justifying the convergence in that setting may be extremely difficult owing to the fact that the key extra estimate for the density that allows to achieve the existence of weak solutions for (1.1) strongly depends on the viscosity coefficient $\nu$, and collapses when $\nu$ goes to infinity.

This thus motivates us to consider the problem for more regular solutions. As regards System (1.1) in the multi-dimensional case, recall that the global existence issue of strong unique solutions has been answered just partially, and mostly in the small data case, see e.g. [2, 18, 19, 20, 21, 22, 26]. For general large data (even if very smooth), only local-in-time solutions are available (see e.g. [3, 23]).

The theory of strong solution for the inhomogeneous Navier-Stokes system (1.4) is more complete (see e.g. [6, 13, 12, 14]). In fact, the results are roughly the same as for the homogeneous (that is with constant density) incompressible Navier-Stokes system. In particular, we proved in [8] that, in the two-dimensional case, system (1.4) is uniquely and globally solvable in dimension two whenever the initial velocity is in $H^1$ and the initial density is nonnegative and bounded (initial data with vacuum may thus be considered).

It is tempting to study whether those better properties in dimension two for the (supposedly) limit system (1.4) may help us to improve our knowledge of System (1.1) in the case where the volume viscosity is very large. More precisely, we here want to address the following two questions:

- For regular data with no vacuum, then given any fixed $T > 0$, can we find $\nu_0$ so that the solution remains smooth (hence unique) until time $T$ for all $\nu \geq \nu_0$?
- Considering a family $(\rho_\nu, v_\nu)$ of solutions to (1.1) and letting $\nu \to \infty$, can we show strong convergence to some couple $(\eta, u)$ satisfying (1.4) and, as the case may be, give an upper bound for the rate of convergence?
Those two issues have been considered recently in our paper [7], in the particular case where the initial density is a perturbation of order $\nu^{-\frac{1}{2}}$ of some constant positive density (hence the limit system is just the classical incompressible Navier-Stokes equation). There, our results were based on Fourier analysis and involved so-called critical Besov norms. The cornerstone of the method was a refined analysis of the linearized system about the constant state $(\rho, v) = (\bar{\rho}, 0)$, thus precluding us from considering large density variations.

The present paper aims at shedding a new light on this issue, pointing out different results and techniques than in [7]. In particular, we will go beyond the slightly inhomogeneous case, and will be able to consider large variations of density. As regards the techniques, we here meet another motivation for our paper, which is strictly mathematical: we want to advertise two tools, that can be of some use in the analysis of systems of fluid mechanics:

- The first one is a nonstandard estimate with (limited) loss of integrability for solutions of the transport equation by a non Lipschitz vector-field that has been first pointed out by B. Desjardins in [9] (see Section 3). Proving it requires some Moser-Trudinger inequality that holds true only in dimension two\(^1\).
- The second tool is an estimate for a parabolic system with just bounded coefficients in the maximal regularity framework of $L_p$ spaces with $p$ close to 2 (Section 4).

For notational simplicity, we assume from now on that the shear viscosity $\mu$ is equal to 1 (which may always been achieved after a suitable rescaling). Our answer to the first question then reads as follows:

**Theorem 1.2.** Fix some $T > 0$. Let $\rho_*$ and $\rho^*$ satisfy $0 < \rho_* < \rho^*$, and assume that

$$2\rho_* \leq \rho_0 \leq \frac{1}{2} \rho^*. \tag{1.7}$$

There exists an exponent $q > 2$ depending only on $\rho_*$ and $\rho^*$ such that if $\nabla \rho_0 \in L_q(\mathbb{T}^2)$ then for any vector field $v_0$ in $W^{2-2/q}_q(\mathbb{T}^2)$ satisfying

$$\nu^{1/2} \|
abla v_0\|_{L_2} \leq 1,$$ \tag{1.8}

there exists $v_0 = v_0(T, \rho_*, \rho^*, \|\nabla \rho_0\|_q, \|v_0\|_{W^{2-2/q}_q}, P, q)$ such that System (1.1) with $\nu \geq v_0$ has a unique solution $(\rho, v)$ on the time interval $[0, T]$, fulfilling

$$v \in C([0, T]; W^{2-2/q}_q(\mathbb{T}^2)), \quad v_t, \nabla^2 v \in L_q([0, T] \times \mathbb{T}^2), \quad \rho \in C([0, T]; W^1_q(\mathbb{T}^2)), \tag{1.9}$$

and $\rho_* \leq \rho(t, x) \leq \rho^*$ for all $(t, x) \in [0, T] \times \mathbb{T}^2$.

Furthermore, there exists a constant $C_q$ depending only on $q$, a constant $C_P$ depending only on $P$, and a universal constant $C$ such that for all $t \in [0, T]$,

$$\|v(t)\|_{H^1} + \nu^\frac{3}{2} \|\nabla v(t)\|_{L_2} + \|ho(t) - \bar{\rho}\|_{L_2} + \|\nabla v\|_{L_2([0,t];H^1)} + \|v_t\|_{L_2(0,t;L^2(\mathbb{T}^2))} + \nu^\frac{3}{2} \|\nabla v\|_{L_2(0,t;L^2(\mathbb{T}^2))} \leq C e^{C\|v_0\|_E^2} E_0, \tag{1.11}$$

and

$$\|v(t)\|_{W^{2-\frac{2}{q}}_q} + \|v_t, \nabla^2 v, \nu \nabla \nabla v\|_{L_q([0,t];\mathbb{T}^2)} \leq C_q \left(\|v_0\|_{W^{2-\frac{2}{q}}_q} + C_P \nu^{\frac{1}{2}} (1 + \|\nabla \rho_0\|_q) \exp(t^{-\frac{1}{2}} I_0(t))\right). \tag{1.12}$$

\(^1Consequently, we do not know how to adapt our approach to the higher dimensional case.
\begin{equation}
(1.13) \quad \| \nabla \rho(t) \|_{L_q} \leq \left( 1 + \| \nabla \rho_0 \|_{L_q} \right) \exp \left\{ t \frac{1}{\rho_0} I_0(t) \right\},
\end{equation}
with \( E_0 := 1 + \| v_0 \|_{H^1} + \| \rho_0 - \bar{\rho} \|_{L_2} \) and
\[
I_0(t) := C_q \left( \| v_0 \|_{W_q^{2-\frac{4}{q}}} + C_p t^{\frac{t}{2}} \left( 1 + \| \nabla \rho_0 \|_{L_q} \right) e^{C_{F q} t \| \rho_0 \|_{L_2}} \right).
\]

As the data we here consider are regular and bounded away from zero, the short-time existence and uniqueness issues are clear (one may e.g. adapt [5] to the case of periodic boundary conditions). In order to achieve large time existence, we shall first take advantage of a rather standard higher order energy estimate (at the \( H^1 \) level for the velocity) that will provide us with a control of \( \nabla v \) in \( L^2(0,T;H^1) \) in terms of the data and of the norm of \( \nabla \rho \) in \( L^\infty(0,T;L^2) \). The difficulty now is to control that latter norm, given that, at this stage, one has no bound for \( \nabla v \) in \( L^1(0,T;L^\infty) \). It may be overcome by adapting to our framework some estimates with loss of integrability for the transport equation, that have been first pointed out by B. Desjardins in [9]. However, this is not quite the end of the story since those estimates involve the quantity \( \int_0^T \| \text{div} \, v \|_{L^\infty} \, dt \). Then, the key observation is that the linear maximal regularity theory for the linearization of the momentum equation of (1.1) (neglecting the pressure term and taking \( \rho \equiv 1 \)) provides, for all \( 1 < q < \infty \), a control on \( \| \nabla \text{div} \, v \|_{L_q(0,T;L_q(T^2))} \) (not just \( \| \nabla \text{div} \, v \|_{L_q(0,T;L_q(T^2))} \)) in terms of \( \| v_0 \|_{W_q^{2-\frac{4}{q}}} \).

In our framework where \( \rho \) is not constant, it turns out to be possible to recover a similar estimate if \( q \) is close enough to 2, and thus to eventually have, by Sobolev embedding, \( \int_0^T \| \text{div} \, v \|_{L^\infty} \, dt = O(\nu^{-1}) \). Then, putting all the arguments together and bootstrapping allows to get all the estimates of Theorem 1.2, for large enough \( \nu \).

Regarding the asymptotics \( \nu \to +\infty \), it is clear that if one starts with fixed initial data, then uniform estimates are available from Theorem 1.2, only if we assume that \( \text{div} \, v_0 \equiv 0 \). Under that assumption, Inequalities (1.11) and (1.12) already ensure that
\[
\text{div} \, v = O(\nu^{-1/2}) \quad \text{in} \quad L^\infty(0,T;L_2) \quad \text{and} \quad \nabla \text{div} \, v = O(\nu^{-1}) \quad \text{in} \quad L_q(0,T \times \mathbb{T}^2).
\]

Then, combining with the uniform bounds provided by (1.12) and (1.13), it is not difficult to pass to the weak limit in System (1.1) and to find that the limit solution fulfills System (1.4).

In the theorem below, we state a result that involves strong norms of all quantities at the level of energy norm, and exhibit an explicit rate of convergence.

**Theorem 1.3.** Fix some \( T > 0 \) and take initial data \((\rho_0, v_0)\) fulfilling the assumptions of Theorem 1.2 with, in addition, \( \text{div} \, v_0 \equiv 0 \). Denote by \((\rho_\nu, v_\nu)\) the corresponding solution of (1.1) with volume viscosity \( \nu \geq \nu_0 \). Finally, let \((\eta, u)\) be the global solution of (1.4) supplemented with the same initial data \((\rho_0, v_0)\). Then we have
\begin{equation}
(1.14) \quad \sup_{t \leq T} \left( \| \rho_\nu(t) - \eta(t) \|_{L_2} + \| \mathcal{P} v_\nu(t) - u(t) \|_{L_2} + \| \nabla \mathcal{Q} v_\nu(t) \|_{L_2}^2 \right)
\end{equation}
\[
+ \int_0^T \left( \| \nabla (\mathcal{P} v_\nu - u) \|_{L_2}^2 + \| \nabla \mathcal{Q} v_\nu \|_{H^1}^2 \right) dt \leq C_{0,T} \nu^{-1},
\]
where \( \mathcal{P} \) and \( \mathcal{Q} \) are the Helmholtz projectors on divergence-free and potential vector fields, respectively\(^2\), and where \( C_{0,T} \) depends only on \( T \) and on the norms of the initial data.

\(^2\)that are defined by \( \mathcal{Q} v := -\nabla (-\Delta)^{-1} \text{div} \, v \) and \( \mathcal{P} v := v - \mathcal{Q} v \).
At first glance, one may think our issue to be closely related to the question of low Mach number limit studied in e.g. [4, 11]. However, there is an essential difference in the mechanism leading to convergence as may be easily seen from a rough analysis of the linearized system (1.1). Indeed, in the case $\bar{\rho} = \mu = 1$ and $P'(1) = 1$ (for notational simplicity), that linearization reads (in the unforced case):

$$
\begin{align*}
\eta_t + \text{div} \ u &= 0, \\
v_t - \Delta v - \nu \text{div} \ v + \nabla \eta &= 0.
\end{align*}
$$

Eliminating the velocity we obtain the damped wave equation

$$
\eta_{tt} - (1 + \nu)\Delta \eta_t - \Delta \eta = 0,
$$

that can be solved explicitly at the level of the Fourier transform. We obtain two modes, one strongly parabolic, disappearing for $\nu \to \infty$, and the second one having the following form, in the high frequency regime:

$$
\eta(t) \sim \eta(0)e^{-\frac{t}{1+\nu}} \to \eta(0).
$$

This means that at the same time, we have that $\eta(t)$ tends strongly to 0 as $t \to +\infty$ even for very large $\nu$, but that for all $t > 0$ (even very large), $\eta(t) \to \eta(0)$ when $\nu$ tends to $+\infty$.

The behavior corresponding to the low Mach number limit is of a different nature, as it corresponds to the linearization

$$
\begin{align*}
\eta_t + \frac{1}{\varepsilon}\text{div} \ u &= 0, \\
v_t - \Delta v - \nu \text{div} \ v + \frac{1}{\varepsilon} \nabla \eta &= 0,
\end{align*}
$$

which leads to the wave equation

$$
\eta_{tt} - (1 + \nu)\Delta \eta_t - \frac{1}{\varepsilon^2} \Delta \eta = 0.
$$

Asymptotically for $\varepsilon \to 0$, the above damped wave equation behaves as a wave equation with propagation speed $1/\varepsilon$. Hence, in the periodic setting, we have huge oscillations that preclude any strong convergence result. However, after filtering by the wave operator, convergence becomes strong, which entails weak convergence, back to the original unknowns (see [4] for more details).

The main idea of Theorem 1.3 is just to compute the distance between the compressible and the incompressible solutions, by means of the standard energy norm (in sharp contrast with the approach in [7] where critical Besov norms are used). In order to do so, it is convenient to decompose $\rho - \eta$ into two parts:

$$
\rho - \eta = (\rho - \bar{\rho}) + (\bar{\rho} - \eta)
$$

where the auxiliary density $\bar{\rho}$ is the transported of $\rho_0$ by the flow of the divergence-free vector-field $Pv$. As the bounds of Theorem 1.2 readily ensure that $\|\rho - \bar{\rho}\|_{q} = \mathcal{O}(\nu^{-1})$, one may, somehow, perform the energy argument as if comparing $(\bar{\rho}, v)$ and $(\eta, u)$.

We end that introductory part presenting the main notations that are used throughout the paper. By $\nabla$ we denote the gradient with respect to space variables, and by $u_t$, the time derivative of function $u$. By $\| \cdot \|_{L_p(Q)}$ (or sometimes just $\| \cdot \|_p$), we mean the $p$-power Lebesgue norm corresponding to the set $Q$, and $L_p(Q)$ is the corresponding Lebesgue space. We denote by $H^s$ and $W^s_p$ the Sobolev (Slobodeckij for $s$ not integer) space on the torus $\mathbb{T}^2$, and put $H^s = W^s_2$. The homogeneous versions of those spaces (that is the corresponding subspace of functions with null mean) are denoted by $\dot{H}^s$ and $W^s_p$, respectively.
Generic constants are denoted by $C$, $A \lesssim B$ means that $A \leq CB$, and $A \approx B$ stands for $C^{-1}A \leq B \leq CA$.

2. Energy estimates

The aim of this part is to provide bounds via energy type estimates. We assume that the density is bounded from above and below. Let us first recall the basic energy identity.

**Proposition 2.1.** For any $T > 0$, sufficiently smooth solutions to (1.1) obey Inequality (1.6).

**Proof.** That fundamental estimate follows from testing the momentum equation by $v$ and integrating by parts in the diffusion and pressure terms. Indeed: using the definition of $e$ and the mass equation, we get

$$
\int_{\mathbb{T}^2} \nabla P \cdot v \, dx = \int_{\mathbb{T}^2} \frac{P'(\rho)}{\rho} \nabla \rho : (\rho v) \, dx = \int_{\mathbb{T}^2} \nabla e'(\rho) \cdot (\rho v) \, dx
$$

$$
= - \int_{\mathbb{T}^2} e'(\rho) \div (\rho v) \, dx = \int_{\mathbb{T}^2} e'(\rho) \rho_t \, dx = \frac{d}{dt} \int_{\mathbb{T}^2} e(\rho) \, dx.
$$

Then integrating in time completes the proof. \hfill \Box

Let us next derive a higher order energy estimate, pointing out the dependency with respect to the volume viscosity $\nu$.

**Proposition 2.2.** Assume that there exist positive constants $\rho_* < \rho^*$ such that $\rho_* \leq \rho(t, x) \leq \rho^*$ for all $(t, x) \in [0, T] \times \mathbb{T}^2$.

Then solutions to (1.1) with $\mu = 1$ fulfill the following inequality:

$$(2.16)\quad \|v(T), \nabla v(T), \rho(T) - \bar{\rho}\|_2^2 + \nu \|\div v(T)\|_2^2 + \int_0^T \|\nabla^2 v, \nabla v, v_t\|_2^2 + \nu \|\div v\|_{H^1}^2 \, dt \leq C \exp \left( C\|v_0\|_2^2 \right) \left( \|v_0, \nabla v_0, v_0 - \bar{v}\|_2^2 + \nu \|\div v_0\|_2^2 + \nu^{-1} \|v_0\|_2^2 + \nu^{-1} \int_0^T \|\nabla \rho\|_2^2 \, dt \right),$$

provided $\nu$ is larger than some $\nu_0 = \nu_0(\rho_*, \rho^*, P)$.

**Proof.** We take the $\mathbb{T}^2$ inner product of the momentum equation with $v_t$, getting

$$(2.17)\quad \int_{\mathbb{T}^2} \rho |v_t|^2 \, dx + \frac{1}{2} \frac{d}{dt} \int_{\mathbb{T}^2} (|\nabla v|^2 + \nu (\div v)^2) \, dx + \int_{\mathbb{T}^2} \nabla P \cdot v_t \, dx = - \int_{\mathbb{T}^2} (\rho v \cdot \nabla v) \cdot v_t \, dx.
$$

Integrating by parts and using the mass equation yields

$$
\int_{\mathbb{T}^2} \nabla P \cdot v_t \, dx = - \int_{\mathbb{T}^2} P \div v \, dx = - \frac{d}{dt} \int_{\mathbb{T}^2} P \div v \, dx + \int_{\mathbb{T}^2} P'(\rho) \rho \div v \, dx
$$

$$
= - \frac{d}{dt} \int_{\mathbb{T}^2} P \div v \, dx - \int_{\mathbb{T}^2} P'(\rho) \div (\rho v) \div v \, dx.
$$

Hence putting together with (2.17),

$$(2.18)\quad \frac{1}{2} \frac{d}{dt} \int_{\mathbb{T}^2} (|\nabla v|^2 + \nu (\div v)^2 - 2P \div v) \, dx + \int_{\mathbb{T}^2} \rho |v_t|^2 \, dx
$$

$$
= \int_{\mathbb{T}^2} P'(\rho) \div (\rho v) \div v \, dx - \int_{\mathbb{T}^2} (\rho v \cdot \nabla v) \cdot v_t \, dx.
$$
Now, setting $K(\rho) = \rho P'(\rho) - P(\rho)$, one can check that
\[
\int_{\mathcal{T}_2} P'(\rho) \text{div} (\rho v) \text{div} v \, dx = \int_{\mathcal{T}_2} (\text{div} v) \cdot \nabla (P(\rho)) \, dx + \int_{\mathcal{T}_2} \rho \nabla P'(\rho) \cdot (\text{div} v)^2 \, dx
\]
\[
= - \int_{\mathcal{T}_2} P(\rho) \cdot v \cdot \nabla \text{div} v \, dx + \int_{\mathcal{T}_2} K(\rho) \cdot (\text{div} v)^2 \, dx.
\]
Hence, if (2.15) is fulfilled then we have
\[
(2.19) \quad \frac{d}{dt} \int_{\mathcal{T}_2} (|\nabla v|^2 + \nu (\text{div} v)^2 - 2P(\rho) \text{div} v) \, dx + \int_{\mathcal{T}_2} \rho |v_t|^2 \, dx
\leq C \int_{\mathcal{T}_2} (|v \cdot \nabla \text{div} v| + (\text{div} v)^2 + |v \cdot \nabla v|^2) \, dx.
\]
Next, testing the momentum equation by $\Delta v$ we get
\[
\int_{\mathcal{T}_2} (|\Delta v|^2 + \nu |\nabla \text{div} v|^2) \, dx - \int_{\mathcal{T}_2} \rho v_t \cdot \Delta v \, dx - \int_{\mathcal{T}_2} \nabla P \cdot \Delta v \, dx \leq \int_{\mathcal{T}_2} |\rho v \cdot \nabla \Delta v| \, dx.
\]
Note that
\[
- \int_{\mathcal{T}_2} \nabla P \cdot \Delta v \, dx = - \int_{\mathcal{T}_2} \nabla P \cdot \nabla \text{div} v \, dx \leq C \int_{\mathcal{T}_2} |\nabla \rho| |\nabla \text{div} v| \, dx.
\]
Then, combining with the basic energy identity and with (2.19) and introducing
\[
(2.20) \quad E(v, \rho) := \int_{\mathcal{T}_2} \left( \rho |v|^2 + 2c(\rho) + |\nabla v|^2 + \nu (\text{div} v)^2 - 2P(\rho) \text{div} v \right) \, dx,
\]
we find,
\[
(2.21) \quad \frac{d}{dt} E(v, \rho) + \int_{\mathcal{T}_2} \rho |v_t|^2 \, dx + \frac{1}{\rho^*} \int_{\mathcal{T}_2} (|\nabla v|^2 + |\nabla^2 v|^2 + \nu (\text{div} v)^2 + \nu |\nabla \text{div} v|^2) \, dx
\leq \int_{\mathcal{T}_2} |v_t \cdot \Delta v| \, dx + C \int_{\mathcal{T}_2} ((\text{div} v)^2 + |v \cdot \nabla \text{div} v| + \rho |v \cdot \nabla v|^2 + \frac{1}{\rho^*} |\nabla \rho| |\nabla \text{div} v|) \, dx.
\]
Hence, denoting
\[
D(v) := \|\nabla v\|_{H^1}^2 + \|\sqrt{\rho} v_t\|_{L^2}^2 + \nu \|\text{div} v\|_{H^1}^2,
\]
Inequality (2.21) implies that for large enough $\nu$,
\[
\frac{d}{dt} E(v, \rho) + \frac{1}{\rho^*} D(v) \leq C \int_{\mathcal{T}_2} (|v|^2 |\nabla v|^2 + (|v| + |\nabla \rho|) |\nabla \text{div} v|) \, dx.
\]
Of course, from the Ladyzhenskaya inequality, we have
\[
\int_{\mathcal{T}_2} |v \cdot \nabla v|^2 \, dx \leq C \|v\|_2 \|\nabla v\|_2^2 \|\Delta v\|_2.
\]
Therefore, we end up with
\[
\frac{d}{dt} E(v, \rho) + \frac{1}{\rho^*} D(v) \leq C (\|v\|_2^2 \|\nabla v\|_2^2 \|\nabla v\|_2^2 + \nu^{-1} (\|v\|_2^2 + \|\nabla \rho\|_2^2)).
\]
Let us notice that if $\nu \geq \nu_0(\rho_*, \rho^*, P)$ then we have, according to (1.2),
\[
(2.22) \quad E(v, \rho) \approx \|v\|_{H^1}^2 + \|\rho - \bar{\rho}\|_{L^2}^2 + \nu \|\text{div} v\|_{L^2}^2.
\]
Hence Gronwall inequality yields
\[
E(v(T), \rho(T)) + \frac{1}{\rho^2} \int_0^T D(t) \, dt \leq \exp \left( C \int_0^T \| v \|_2^2 \| \nabla v \|_2^2 \, dt \right) \times \left( E(v_0, \rho_0) + \frac{C}{\nu} \int_0^T \exp \left( -C \int_0^T \| v \|_2^2 \| \nabla v \|_2^2 \, dt \right) \right) \left( \| v \|_2^2 + \| \nabla \rho \|_2^2 \right) dt.
\]

Remembering that the basic energy inequality implies that
\[
\int_0^T \| v \|_2^2 \| \nabla v \|_2^2 \, dt \leq C \| v_0 \|_4^4,
\]
one may conclude that
\[
E(v(T), \rho(T)) + \frac{1}{\rho^2} \int_0^T D(v) \, dt \leq \exp \left( C \| v_0 \|_4^4 \right) \left( E(v_0, \rho_0) + C \nu \int_0^T \exp \left( -C \int_0^T \| v \|_2^2 \| \nabla v \|_2^2 \, dt \right) \left( \| v \|_2^2 + \| \nabla \rho \|_2^2 \right) dt \right),
\]
which obviously yields (2.16). □

3. Estimates with loss of integrability for the transport equation

We are concerned with the proof of regularity estimates for the transport equation
\[
\rho_t + v \cdot \nabla \rho + \rho \text{div} \, v = 0
\]
in some endpoint case where the transport field \( v \) fails to be in \( L_1(0, T; \text{Lip}) \) by a little.

More exactly, we aim at extending Desjardins’ results in [9] to non divergence-free transport fields. Our main result reads:

**Proposition 3.1.** Let \( 1 \leq q \leq \infty \) and \( T > 0 \). Let \( \rho_0 \in W^r_q(T^2) \) and \( v \in L_2(0, T; H^2(T^2)) \) such that \( \text{div} \, v \in L_1(0, T; H^1(T^2)) \cap L_1(0, T; W^r_q(T^2)) \). Then the solution to (3.23) fulfills for all \( 1 \leq p < q \),
\[
\sup_{t < T} \| \nabla \rho(t) \|_p \leq K \left( \| \nabla \rho_0 \|_q + \| \rho_0 \|_{\infty} \sup_{t < T} \left\| \int_0^t \nabla \text{div} \, v \, d\tau \right\|_q \right) \times \exp \left\{ CT \int_0^T \| \nabla^2 v \|_2^2 \, dt \right\} \exp \left\{ \int_0^T \| \text{div} \, v \|_{\infty} \, dt \right\},
\]
where \( K \) is an absolute constant, and where the constant \( C \) depends only on \( p \) and \( q \).

**Proof.** We proceed by means of the standard characteristics method: our assumptions guarantee that \( v \) admits a unique (generalized) flow \( X \), solution to
\[
X(t, y) = y + \int_0^t v(\tau, X(\tau, y)) \, d\tau.
\]
Then, setting
\[
u(t, y) := v(t, X(t, y)) \quad \text{and} \quad a(t, y) = \rho(t, X(t, y)),
\]
equation (3.23) recasts as follows:
\[
\frac{d a(t, y)}{d t} = - (\text{div} \, v)(t, X(t, y)) \cdot a(t, y),
\]
the unique solution of which is given by
\[
a(t, y) = \exp \left\{ - \int_0^t (\text{div} \, v)(\tau, X(\tau, y)) \, d\tau \right\} a_0(y).
\]
From the chain rule and Leibniz formula, we thus infer
\[
\nabla_y a(t, y) = \exp \left\{ -\int_0^t (\text{div} v(\tau, X(\tau, y)) \, d\tau \right\} \left( \nabla_y a_0(y) - a_0(y) \int_0^t (\nabla \text{div} v(\tau, X(\tau, y)) \cdot \nabla_y X(\tau, y) \, d\tau) \right). 
\]

Our goal is to estimate all these quantities in the Eulerian coordinates. Note that by (3.24) and Gronwall lemma, we obtain point-wisely that, denoting \( \int \beta > 0 \)
\( \frac{3}{2} \),
\[
|\nabla_y X(t, y)| \leq \exp \left\{ \int_0^t |\nabla_x v(\tau, X(\tau, y))| \, d\tau \right\} \quad \text{and} \quad |\nabla_Z Y(t, x)| \leq \exp \left\{ \int_0^t |\nabla_y u(\tau, Y(\tau, x))| \, d\tau \right\}.
\]

As \( \nabla_x \rho(t, x) = \nabla_y a(t, Y(t, x)) \cdot \nabla_x Y(t, x) \), we get
\[
|\nabla \rho(t, x)| \leq \exp \left\{ 3 \int_0^t |\nabla v(\tau, X(\tau, Y(t, x)))| \, d\tau \right\} 
\times \left( |\nabla \rho_0(Y(t, x))| + |\rho_0(Y(t, x))| \int_0^t \nabla \text{div} v(\tau, X(\tau, Y(t, x)) \, d\tau \right) \Bigg| .
\]

Recall that the Jacobian of the change of coordinates \( (t, y) \rightarrow (t, x) \) is given by
\[
J_X(t, y) = \exp \left\{ \int_0^t \text{div} v(\tau, X(\tau, y)) \, d\tau \right\} \leq \exp \left\{ \int_0^t \|\text{div} v\|_\infty \, d\tau \right\}.
\]

Hence taking the \( L_p(T^2) \) norm and using Hölder inequality with \( \frac{1}{p} = \frac{1}{q} + \frac{1}{m} \), we get
\[
\|\nabla \rho(t)\|_p \leq \exp \left\{ \frac{1}{q} \int_0^t \|\text{div} v\|_\infty \, d\tau \right\} \left( \|\nabla \rho_0\|_q \right.
+ \|\rho_0\|_\infty \int_0^t \nabla \text{div} v(\tau, X(\tau, \cdot)) \, d\tau \left. \right\} \exp \left\{ 3 \int_0^t \|\nabla v(\tau, X(\tau, \cdot))\| \, d\tau \right\} \right\| .
\]

To bound the last term, we write that for all \( \beta > 0 \),
\[
\int_0^t |\nabla v(\tau, X(\tau, \cdot))| \, d\tau \leq \beta \int_0^t \frac{|\nabla v(\tau, X(\tau, \cdot))|^2}{\|\nabla^2 v(\tau, \cdot)\|_2^2} \, d\tau + \frac{1}{4\beta} \int_0^t \|\nabla^2 v(\tau, \cdot)\|_2^2 \, d\tau.
\]

Hence using the following Jensen inequality,
\[
\exp \left\{ \int_0^t \phi(s) \, ds \right\} \leq \frac{1}{t} \int_0^t e^{\phi(s)} \, ds,
\]

we discover that
\[
\int_{T^2} \exp \left\{ 3m \int_0^t |\nabla v(\tau, X(\tau, \cdot))| \, d\tau \right\} \, dx \leq \exp \left\{ \frac{m}{4\beta} \int_0^t \|\nabla^2 v(\tau, \cdot)\|_2^2 \, d\tau \right\} \frac{1}{t} \int_0^t \int_{T^2} \exp \left\{ 9m\beta t \frac{|\nabla v(\tau, X(\tau, \cdot))|^2}{\|\nabla^2 v(\tau, \cdot)\|_2^2} \right\} \, dx \, d\tau.
\]

In the last integral we change coordinates and get
\[
\int_{T^2} \exp \left\{ 3m \int_0^t |\nabla v(\tau, X(\tau, \cdot))| \, d\tau \right\} \, dx \leq \frac{1}{t} \exp \left\{ \frac{m}{4\beta} \int_0^t \|\nabla^2 v(\tau, \cdot)\|_2^2 \, d\tau \right\} 
\times \left( \int_0^t \int_{T^2} \exp \left\{ 9m\beta \frac{|\nabla v(\tau, x)|^2}{\|\nabla^2 v(\tau, \cdot)\|_2^2} \right\} \, dx \, ds \right) \exp \left( \int_0^t \|\text{div} v\|_\infty \, d\tau \right).
At this stage, to complete the proof, it suffices to apply the following Trudinger inequality (see e.g. [1]) to \( f = \nabla v \): there exist constants \( \delta_0 \) and \( K \) such that for all \( f \) in \( H^1(T^2) \),

\[
\int_{T^2} \exp \left\{ \frac{\delta_0 |f(x) - \overline{f}|^2}{\|\nabla f\|_2^2} \right\} dx \leq K \quad \text{with} \quad \overline{f} := \frac{1}{|T^2|} \int_{T^2} f \, dx.
\]

Then, taking \( \beta \) so small that \( 9m\beta t = \delta_0 \), we end up with

\[
\int_{T^2} \exp \left\{ 3m \int_0^t |\nabla v(\tau, X(\tau, \cdot))| \, d\tau \right\} dx \leq C \exp \left( \frac{9mt}{4\delta_0} \int_0^t \|\nabla^2 v(s, \cdot)\|_2^2 \, ds \right) \exp \left( \int_0^t \|\text{div} v\|_\infty \, ds \right).
\]

Combining with (3.30) completes the proof of the proposition.

\[\square\]

4. Linear systems with variable coefficients

Here we are concerned with the proof of maximal regularity estimates for the linear system

\[
\rho u_t - \Delta u - \nu \nabla \text{div} u = f \quad \text{in} \quad (0, T) \times \mathbb{T}^N,
\]

\[
u u_{|t=0} = u_0 \quad \text{in} \quad \mathbb{T}^N,
\]

assuming only that \( \rho = \rho(t, x) \) is bounded by above and from below (no time or space regularity whatsoever).

In contrast with the previous section, we do not need the space dimension to be 2. As we want to keep track of the dependency with respect to \( \nu \) for \( \nu \to +\infty \), we shall assume throughout that \( \nu \geq 0 \) for simplicity.

**Theorem 4.1.** Let \( T > 0 \) and assume that \( \nu \geq 0 \),

\[
0 < \rho_* \leq \rho(t, x) \leq \rho^* \quad \text{for} \quad (t, x) \in [0, T] \times \mathbb{T}^N.
\]

Then there exist positive constants \( 2_* \), \( 2^* \) depending only on \( \rho_* \) and \( \rho^* \), with \( 2_* < 2 < 2^* \), such that for all \( r \in (2_*, 2^*) \) we have

\[
\|u_t, \nabla^2 u, \nu \nabla \text{div} u\|_{L^r((0, T) \times \mathbb{T}^N)} \leq C(r, \rho_*, \rho^*)(\|f\|_{L^r((0, T) \times \mathbb{T}^N)}) + \|u_0\|_{W^{2, 1/r}((0, T) \times \mathbb{T}^N)}.
\]

**Proof.** First, we reduce the problem to the one with null initial data, solving

\[
\rho^* \bar{u}_t - \Delta \bar{u} - \nu \nabla \text{div} \bar{u} = 0 \quad \text{in} \quad (0, T) \times \mathbb{T}^N,
\]

\[
\bar{u}_{|t=0} = u_0 \quad \text{in} \quad \mathbb{T}^N.
\]

Applying the divergence operator to the equation yields

\[
\rho^* (\text{div} \bar{u})_t - (1 + \nu) \Delta \text{div} \bar{u} = 0.
\]

Hence the basic maximal regularity theory for the heat equation in the torus gives

\[
(1 + \nu)\|\nabla \text{div} \bar{u}\|_{L^p((0, T) \times \mathbb{T}^N)} \leq C\|\text{div} u_0\|_{W^{1, 2/p}_p((0, T) \times \mathbb{T}^N)}.
\]

Then we restate System (4.36) in the form

\[
\rho^* \bar{u}_t - \Delta \bar{u} = \nu \nabla \text{div} \bar{u},
\]

and get

\[
\|\bar{u}_t, \nabla^2 \bar{u}\|_{L^p(\mathbb{T}^N \times (0, T))} \leq K_p (\nu\|\nabla \text{div} \bar{u}\|_{L^p((0, T) \times \mathbb{T}^N)} + \|u_0\|_{W^{2, 1/p}_p((0, T) \times \mathbb{T}^N)}) \leq K_p \left( \frac{\nu}{1 + \nu} \right) \|u_0\|_{W^{2, 1/p}_p((0, T) \times \mathbb{T}^N)}.
\]
Therefore, as $\nu \geq 0$, we end up with
\begin{equation}
\|\bar{u}_t, \nabla^2 \bar{u}, \nu \nabla \text{div} \bar{u}\|_{L_p((0,T) \times \mathbb{T}^N)} \leq K_p \|u_0\|_{W^2_2(\mathbb{T}^N)}.
\end{equation}

Next we look for $u$ in the form
\begin{equation}
u \text{div} w = f + (\rho^* - \rho) \bar{u} =: g, \quad w|_{t=0} = 0.
\end{equation}

Thanks to (4.34) and (4.41), we have
\begin{equation}
\|g\|_{L_p((0,T) \times \mathbb{T}^N)} \leq \|f\|_{L_p((0,T) \times \mathbb{T}^N)} + K_p (\rho^* - \rho_\ast) \|u_0\|_{W^{2-2/p}_{2}(\mathbb{T}^N)}.
\end{equation}

Now, setting $h := g + (\rho^* - \rho) w_t$, System (4.41) reduces to the following one:
\begin{equation}
\rho^* w_t - \Delta w - \nu \nabla \text{div} w = h \quad \text{in} \quad (0,T) \times \mathbb{T}^N,
\end{equation}
\begin{equation}
w|_{t=0} = 0 \quad \text{in} \quad \mathbb{T}^N.
\end{equation}

We claim that for all $p \in (1, \infty)$ we have
\begin{equation}
\|\rho^* w_t\|_{L_p((0,T) \times \mathbb{T}^N)} \leq C_p \|h\|_{L_p((0,T) \times \mathbb{T}^N)}
\end{equation}
with $C_p \to 1$ for $p \to 2$.

Indeed, to see that $C_2 = 1$, we just test the first equation of (4.43) by $w_t$, which yields
\[
\rho^* \|w_t\|_{L^2_2(\mathbb{T}^N)}^2 + \frac{1}{2} \frac{d}{dt} \left( \|\nabla w\|_{L^2_2}^2 + \nu \|\text{div} v\|_{L^2_2}^2 \right) = \int_{\mathbb{T}^N} h w_t \, dx.
\]

Then for any fixed $p_0 \in (1, +\infty) \setminus \{2\}$, the standard maximal regularity estimate reads
\[
\|\rho^* w_t\|_{L_{p_0}((0,T) \times \mathbb{T}^N)} \leq K_{p_0} \|h\|_{L_{p_0}((0,T) \times \mathbb{T}^N)},
\]
and Hölder inequality gives us for all $\theta \in [0, 1]$,
\[
\|z\|_{L_r((0,T) \times \mathbb{T}^N)} \leq \|z\|_{L_{2 \ast}((0,T) \times \mathbb{T}^N)}^{1-\theta} \|z\|_{L_{p_0}((0,T) \times \mathbb{T}^N)}^\theta \quad \text{with} \quad \frac{1}{r} = \frac{1}{2} - \frac{\theta}{p_0}.
\]
Therefore $C_p \leq C_{p_0}^0$, whence \(\limsup C_p \leq 1\) for $p \to 2$ (as $\theta \to 0$).

Now, remembering the definition of $h$, we write for all $p \in (1, \infty)$,
\[
\|\rho^* w_t\|_{L_p((0,T) \times \mathbb{T}^N)} \leq C_p \left( \|g\|_{L_p((0,T) \times \mathbb{T}^N)} + \|\rho^* - \rho\|_{L_p((0,T) \times \mathbb{T}^N)} \right)
\leq C_p \|g\|_{L_p((0,T) \times \mathbb{T}^N)} + C_p \left( 1 - \rho_\ast \right) \|\rho^* w_t\|_{L_p((0,T) \times \mathbb{T}^N)}.
\]

Therefore, if $3$
\begin{equation}
1 - C_p \left( 1 - \frac{\rho_\ast}{\rho^*} \right) \geq \frac{1}{2} \frac{\rho_\ast}{\rho^*},
\end{equation}
then we end up with
\begin{equation}
\|\rho^* w_t\|_{L_p((0,T) \times \mathbb{T}^N)} \leq \frac{2 \rho^* C_p}{\rho_\ast} \|g\|_{L_p((0,T) \times \mathbb{T}^N)}.
\end{equation}

Let us emphasize that (4.45) is fulfilled for $p$ close enough to 2, due to $C_p \to 1$ for $p \to 2$.

\begin{footnotesize}
$3$Clearly, we just need that $1 - C_p \left( 1 - \frac{\rho_\ast}{\rho^*} \right) > 0$. However taking that slightly stronger condition allows to get a more explicit inequality.
\end{footnotesize}
It is now easy to complete the proof. We take (4.43) in the form
\[-\Delta w - \nu \nabla \div w = g - \rho w_t \quad \text{in} \quad (0, T) \times \mathbb{T}^N,\]
\[w|_{t=0} = 0 \quad \text{in} \quad \mathbb{T}^N.\]
Then one concludes as before that
\[
\|\nabla^2 w, \nu \nabla \div w\|_{L_p((0,T) \times \mathbb{T}^N)} \leq K_p \|g - \rho w_t\|_{L_p((0,T) \times \mathbb{T}^N)} \leq K_p \left( \|g\|_{L_p((0,T) \times \mathbb{T}^N)} + C_{\rho, \rho^*} \|w_t\|_{L_p((0,T) \times \mathbb{T}^N)} \right).
\]
Hence, putting together with (4.46) and assuming that \( p \) is close enough to 2,
\[
\|w_t, \nabla^2 w, \nu \nabla \div w\|_{L_p((0,T) \times \mathbb{T}^N)} \leq C_{\rho, \rho^*} \|g\|_{L_p((0,T) \times \mathbb{T}^N)}.
\]
Then combining with (4.42) and (4.39) completes the proof. \( \square \)

5. Final Bootstrap Argument

In what follows, we fix some \( 0 < \rho_* < \rho^* \) and denote by \( 2_* \) and \( 2^* \) the corresponding Lebesgue exponents provided by Theorem 4.1. We assume that the initial data \((\rho_0, v_0)\) satisfies all the requirements of Theorem 1.2.

Take some time \( T \) such that \( 1 \leq T \leq \nu \) (stronger conditions will appear below), and assume that we have a solution \((\rho, v)\) to (1.1) on \([0, T] \times \mathbb{T}^2\), fulfilling the regularity properties of Theorem 1.2 for some \( 2 < q < \min(2^*, 4) \), and
\[
\exp\left( \int_0^T \|\div v\|_{\infty} \, dt \right) \leq 2.
\]
Then it is clear that \( \rho \) obeys
\[
\rho_* \leq \rho \leq \rho^* \quad \text{on} \quad [0, T] \times \mathbb{T}^2.
\]
For all \( p \in [2, q] \), denote \( A_p(T) := \|\nabla \div v\|_{L^1(0,T; L^p(\mathbb{T}^2))} \) and assume that, for some small enough constant \( c_0 > 0 \), we have
\[
A_q(T) \leq c_0.
\]
Obviously, if \( Kc_0 \leq \log 2 \) where \( K \) stands for the norm of the embedding \( \dot{W}^1_q(\mathbb{T}^2) \hookrightarrow L^{\infty}(\mathbb{T}^2) \), then (5.48) is fulfilled. We shall assume in addition that \( c_0 \rho^* \leq 1 \).

We are going to show that if (5.50) is fulfilled then, for sufficiently large \( \nu \), all the norms of the solution are under control. Then, bootstrapping, this will justify (5.50) a posteriori.

Step 1. High order energy estimate for \( v \). Let \( E_0^2 := 1 + \|v_0\|^2_{H^1} + \|\rho_0 - \bar{\rho}\|^2_2 \). By (2.16) we easily get, remembering that \( \nu^{-1}T \leq 1 \),
\[
\|v\|^2_{L^\infty(0,T; H^1)} + \nu \|\div v\|^2_{L^\infty(0,T; L^2)} + \|\rho - \bar{\rho}\|^2_{L^\infty(0,T; L^2)}
\]
\[+ \int_0^T \left( \|\nabla v\|^2_{H^1} + \|v_t\|^2_2 + \nu \|\nabla \div v\|^2_2 \right) dt \leq C_{\epsilon, ||v_0||^2_2} \left( E_0^2 + \nu^{-1}T \|\nabla \rho\|^2_{L^\infty(0,T; L^2)} \right).
\]
Step 2. Regularity estimates at $L_p$ level for the density. From Proposition 3.1, we find that there exists an absolute constant $K$ such that for all $r \in [2, q)$, there exists some constant $C_r > 0$ so that

$$
\sup_{t \in [0, T]} \| \nabla \rho(t) \|_r \leq K \left( (\| \nabla \rho_0 \|_q + \rho^* A_q(T)) \exp \left( C_r T \int_0^T \| \nabla^2 v \|_2^2 \, dt \right) \right).
$$

Hence, bounding the last term according to (5.51), and using (5.50) and the definition of $E_0$,

$$
(5.52) \quad \sup_{t \in [0, T]} \| \nabla \rho(t) \|_r \leq K \left( (\| \nabla \rho_0 \|_q + 1) \exp(C_r E_0^2 T e^{C\|v_0\|_2^2}) \right) \exp \left( C_r \nu^{-1} T^2 e^{C\|v_0\|_2^2} \| \nabla \rho \|^2 L_{\infty}(0, T; L_2) \right).
$$

Taking $r = 2$, we deduce that if

$$
C_2 \nu^{-1} T^2 e^{C\|v_0\|_2^2} \| \nabla \rho \|^2 L_{\infty}(0, T; L_2) \leq \log 2,
$$

then we have

$$
(5.53) \quad \sup_{t \in [0, T]} \| \nabla \rho(t) \|_2 \leq 2K \left( (\| \nabla \rho_0 \|_q + 1) \exp(C_2 E_0^2 T e^{C\|v_0\|_2^2}) \right).
$$

Using an obvious connectivity argument, we conclude that (5.53) holds true whenever

$$
(5.54) \quad \nu > \frac{4K^2 C_2}{\log 2} \left( (\| \nabla \rho_0 \|_q + 1)^2 \exp(2C_2 E_0^2 T e^{C\|v_0\|_2^2}) \right) T^2 e^{C\|v_0\|_2^2}.
$$

Reverting to (5.51), we readily get, taking a larger constant $C$ if need be,

$$
(5.55) \quad \| v \|^2 _{L_{\infty}(0, T; H^1_0)} + \nu \| \text{div } v \|^2_{L_{\infty}(0, T; L_2)} + \| \rho - \bar{\rho} \|^2_{L_{\infty}(0, T; L_2)}
$$

$$
+ \int_0^T \left( \| \nabla v \|^2_{H^1_0} + \| v_t \|^2_{L_2} + \nu \| \nabla \text{div } v \|^2_{L_2} \right) dt \leq C e^{C\|v_0\|_2^2} E_0^2.
$$

Of course, combining (5.53) with (5.52) ensures that for all $r \in [2, q)$, we have

$$
(5.56) \quad \sup_{t \in [0, T]} \| \nabla \rho(t) \|_r \leq K \left( (\| \nabla \rho_0 \|_q + 1) \exp(C_r E_0^2 T e^{C\|v_0\|_2^2}) \right).
$$

Step 3. Maximal regularity at $L_p$ level for the velocity. We rewrite the velocity equation as follows:

$$
\rho \partial_t v - \Delta v - \nu \text{div } v = -\nabla P - \nu v \cdot \nabla v.
$$

Then Theorem 4.1 ensures that for all $p \in [2, q)$,

$$
V_p(T) \leq C_p \left( \| v_0 \| _{W^2_p} + \| \nabla P + \nu v \cdot \nabla v \| _{L_p(0, T; \mathbb{T}^2)} \right)
$$

with $V_p(T) := \| v \| _{L_{\infty}(0, T; W^{2-\frac{s}{p}}_p)} + \| v_t, \nabla^2 v, \nu \text{div } v \| _{L_p(0, T; \mathbb{T}^2)}$.

By Hölder inequality

$$
\| v \cdot \nabla v \| _{L_p(0, T; \mathbb{T}^2)} \leq T^{\frac{1}{s}} \| v \| _{L_{\infty}(0, T; L_s)} \| \nabla v \| _{L_4(0, T; L_4)} \quad \text{with} \quad \frac{1}{s} + \frac{1}{4} = \frac{1}{p}.
$$

Hence using embedding and Inequality (5.55),

$$
\| v \cdot \nabla v \| _{L_p(0, T; \mathbb{T}^2)} \leq CT^{\frac{1}{2} - \frac{1}{p}} E_0^2 e^{C\|v_0\|_2^2},
$$
and reverting to (5.57) and using (5.56) thus yields for some constant $C_P$ depending only on the pressure law,
\begin{equation}
V_p(T) \leq C_P \left( \|v_0\|_{W_p^{2-\frac{2}{q}}} + C_P T^{\frac{1}{q}} (\|\nabla \rho_0\|_q + 1) e^{C E_0^2 T e^{C l^2 v_0 l^2}} + T^{\frac{1}{p}-\frac{1}{q}} e^{C l^2 v_0 l^2} \right).
\end{equation}

**Step 4. Regularity estimate at $L_q$ level for the density.** The standard estimate for transport equation with Lipschitz velocity field yields
\[
\sup_{t \leq T} \|\nabla \rho(t)\|_q \leq (\|\nabla \rho_0\|_q + 1) \exp\{C T^{\frac{1}{q}} V_p(T)\}.
\]
Hence, remembering (5.50) and using the embedding $\dot{W}^{1,q}_p(\mathbb{T}^2) \hookrightarrow L_\infty(\mathbb{T}^2)$ to handle the last term, we get
\[
\sup_{t \leq T} \|\nabla \rho(t)\|_q \leq (\|\nabla \rho_0\|_q + 1) \exp\{C T^{\frac{1}{q}} I_0^p(T)\},
\]
with $I_0^p(T) := C_p \left( \|v_0\|_{W_p^{2-\frac{2}{q}}} + C_P T^{\frac{1}{q}} (\|\nabla \rho_0\|_q + 1) e^{C E_0^2 T e^{C l^2 v_0 l^2}} \right)$.

**Step 5. Maximal regularity at $L_q$ level for the velocity.** Let us use again Theorem 4.1, but with Lebesgue exponent $q$. We have
\begin{equation}
V_q(T) \leq C_q \left( \|v_0\|_{W_q^{2-\frac{2}{q}}} + \|\nabla P\|_{L_q(0,T \times \mathbb{T}^2)} + \|\rho v \cdot \nabla v\|_{L_q(0,T \times \mathbb{T}^2)} \right).
\end{equation}
The last term may be bounded as in (5.58) (with $q$ instead of $p$), and the pressure term may be handled thanks to (5.59). At the end we get
\[
V_q(T) \leq C_q \left( \|v_0\|_{W_q^{2-\frac{2}{q}}} + C_P T^{\frac{1}{q}} (\|\nabla \rho_0\|_{L_q} + 1) \exp\{T^{\frac{1}{q}} I_0^q(T)\} \right).
\]

**Step 6. Final bootstrap.** In order to complete the proof, it suffices to check that if $\nu$ is large enough then we do have (5.50). This is just a consequence of the fact that
\[
A_q(T) \leq T^{\frac{1}{q}} \|\nabla \text{div} v\|_{L_q(0,T \times \mathbb{T}^2)} \leq \frac{1}{\nu} T^{\frac{1}{q}} V_q(T).
\]
Hence it suffices to choose $\nu$ fulfilling (5.54) and
\[
\nu \geq T^{\frac{1}{q}} C_q \left( \|v_0\|_{W_q^{2-\frac{2}{q}}} + C_P T^{\frac{1}{q}} (\|\nabla \rho_0\|_{L_q} + 1) \exp\{T^{\frac{1}{q}} I_0^q(T)\} \right).
\]

6. **The incompressible limit issue**

The aim of this section is to prove Theorem 1.3. In what follows the time $T$ is fixed, and $\nu$ is larger than the threshold viscosity $\nu_0$ given by Theorem 1.2. Throughout, we shall agree that $C_0,T$ denotes a ‘constant’ depending only on $T$ and on the norms of the initial data appearing in Theorem 1.2. Let us consider the corresponding solution $(\rho, v)$. Then Inequality (1.11) already ensures that all the terms with $Q\nu$ in (1.14) are bounded as required.
In order to bound the other terms of (1.14), it is convenient to restate System (1.1) in terms of the divergence-free part \( P v \) and potential part \( Q v \) of the velocity field \( v \), and of the discrepancy \( r := \rho - \tilde{\rho} \) between \( \rho \) and the following ‘incompressible’ density \( \tilde{\rho} \) defined as the unique solution of the following transport equation:
\[
(6.61) \quad \tilde{\rho}_t + P v \cdot \nabla \tilde{\rho} = 0, \quad \tilde{\rho}|_{t=0} = \rho_0.
\]
As \( r \) fulfills:
\[
(6.62) \quad r_t + P v \cdot \nabla r = - \text{div} (\rho Q v), \quad r|_{t=0} = 0,
\]
we have for all \( t \in [0, T] \),
\[
(6.63) \quad \| r(t) \|_q \leq \int_0^t \left( \| \rho \text{ div} \ Q v \|_q + \| \rho \cdot \nabla \rho \|_q \right) \, d\tau.
\]
Now, we have
\[
\| Q v \cdot \nabla \rho \|_{L_q(0,T \times \mathbb{T}^2)} \leq \| Q v \|_{L_q(0,T;L_{\infty})} \| \nabla \rho \|_{L_{\infty}(0,T;L_q)}
\]
and, by virtue of Poincaré inequality,
\[
\| \rho \text{ div} \ Q v \|_{L_q(0,T \times \mathbb{T}^2)} \leq C_{\rho}^* \| \nabla \text{ div} \ Q v \|_{L_q(0,T \times \mathbb{T}^2)}.
\]
Therefore, taking advantage of Sobolev embedding and of Inequality (1.12), we end up with
\[
(6.64) \quad \sup_{0 \leq t \leq T} \| r(t) \|_q \leq C_{0,T}^{-1}.
\]
Next, we restate the equation (1.1)_2 as follows:
\[
(6.65) \quad \tilde{\rho} P v_t + \tilde{\rho} P v \cdot \nabla P v - \Delta P v + \nabla Q + K = 0
\]
with \( Q := P - (1 + \nu) \text{ div} v \), \( K_1 := r P v_t \), \( K_2 := \rho Q v_t \), \( K_3 := r P v \cdot \nabla P v \) and \( K_4 := \rho (Q v \cdot \nabla P v + v \cdot \nabla Q v) \).
Subtracting (1.4) from (6.65), we get
\[
(6.66) \quad \eta (P v - u)_t + \eta u \cdot \nabla (P v - u) - \Delta (P v - u) + \nabla (Q - \Pi) + K = 0
\]
with
\[
L := (\tilde{\rho} - \eta) P v_t + (\tilde{\rho} - \eta) P v \cdot \nabla P v + \eta (P v - u) \cdot \nabla P v.
\]
Of course, initially, we have
\[
P v - u|_{t=0} = 0, \quad \tilde{\rho} - \eta|_{t=0} = 0.
\]
Now, we test (6.66) by \( P v - u \) getting, since \( \text{ div } u = 0 \),
\[
(6.67) \quad \frac{1}{2} \frac{d}{dt} \int_{\mathbb{T}^2} \eta |P v - u|^2 \, dx + \int_{\mathbb{T}^2} |\nabla (P v - u)|^2 \, dx = \int_{\mathbb{T}^2} K \cdot (u - P v) \, dx + \int_{\mathbb{T}^2} L \cdot (u - P v) \, dx.
\]
To analyze the terms of the left-hand side, we need some information coming from the continuity equations. The difference of \( \tilde{\rho} \) and \( \eta \) fulfills
\[
\frac{d}{dt} \int_{\mathbb{T}^2} \eta (\tilde{\rho} - \eta) \, dx + \int_{\mathbb{T}^2} \nabla (\tilde{\rho} - \eta) \cdot \nabla \tilde{\rho} = - (P v - u) \cdot \nabla \tilde{\rho}.
\]
Testing it by \( \tilde{\rho} - \eta \) and defining \( q^* \) by \( \frac{1}{q} + \frac{1}{q^*} = \frac{1}{2} \), we find that
\[
\sup_{t \leq T} \| (\tilde{\rho} - \eta)(t) \|_{q^*} \leq \int_0^T \| P v - u \|_q \| \nabla \tilde{\rho} \|_q \, dt.
\]
As \( \tilde{\rho} \) satisfies (6.61), we have for all \( t \in [0, T] \),
\[
\| \nabla \tilde{\rho}(t) \|_q \leq \| \nabla \tilde{\rho}_0 \|_q e \int_0^t \| \nabla P v \|_q \, dt.
\]
Therefore, thanks to (1.13) and Sobolev embedding,

\[(6.68) \sup_{t \leq T} \| \tilde{\rho} - \eta(t) \|_2 \leq C_{0,T} \int_0^T \| P_v - u \|_{q^*} dt. \]

One can now estimate all the terms of the right-hand side of (6.67). Regarding the first term of \( L \), we have

\[ \int_0^T \int_{\mathbb{T}^2} (\tilde{\rho} - \eta) P_{v_1} \cdot (P_v - u) \, dx \, dt \leq \int_0^T \| \tilde{\rho} - \eta \|_2 \| P_{v_1} \|_q \| P_v - u \|_{q^*} dt \]

\[ \leq C_{0,T} \left( \int_0^T \| P_v - u \|_{q^*} dt \right)^{1/2} \left( \int_0^T \| P_{v_1} \|_q^2 dt \right)^{1/2} \left( \int_0^T \| P_v - u \|_{q^*}^2 \, dt \right)^{1/2}. \]

Hence taking \( \theta \in (0,1) \) below according to Gagliardo-Nirenberg inequality, and remembering that \( q > 2 \) and that \( H^1(\mathbb{T}^2) \hookrightarrow L_m(\mathbb{T}^2) \) for all \( m < \infty \), we get

\[(6.69) \int_0^T \int_{\mathbb{T}^2} (\tilde{\rho} - \eta) P_{v_1} \cdot (P_v - u) \, dx \, dt \leq C_{0,T} \int_0^T \| \nabla (P_v - u) \|_2^2 \| P_v - u \|_{2^{2q^-}} dt \]

\[ \leq \frac{1}{8} \int_0^T \| \nabla (P_v - u) \|_2^2 \, dt + C_{0,T} \int_0^T \| P_v - u \|_2^2 \, dt. \]

Next, we write

\[ \left| \int_0^T \int_{\mathbb{T}^2} (\tilde{\rho} - \eta)(P_v \cdot \nabla P_v) \cdot (P_v - u) \, dx \right| \leq \| \tilde{\rho} - \eta \|_2 \| P_v \cdot \nabla P_v \|_q \| P_v - u \|_{q^*}, \]

hence, arguing exactly as above,

\[ \left| \int_0^T \int_{\mathbb{T}^2} (\tilde{\rho} - \eta)(P_v \cdot \nabla P_v) \cdot (P_v - u) \, dx \right| \leq \frac{1}{8} \int_0^T \| \nabla (P_v - u) \|_2^2 \, dt + C_{0,T} \int_0^T \| P_v - u \|_2^2 \, dt. \]

Similarly, we have

\[ \left| \int_0^T \int_{\mathbb{T}^2} \eta((P_v - u) \cdot \nabla P_v) \cdot (P_v - u) \, dx \right| \leq \rho^* \int_0^T \| \nabla P_v \|_\infty \| P_v - u \|_2^2 \, dt. \]

As regards \( K_1 \), we have, defining \( \tilde{q} \) by \( \frac{2}{q} + \frac{1}{q} = 1 \),

\[ \left| \int_0^T \int_{\mathbb{T}^2} \rho v_1 \cdot (P_v - u) \, dx \right| \leq \int_0^T \| v \|_q \| P_v \|_q \| P_v - u \|_{\tilde{q}} \, dt \]

\[ \leq \frac{1}{8} \int_0^T \| \nabla (P_v - u) \|_2^2 \, dt + C_{0,T} \int_0^T \| P_v - u \|_2^2 \, dt, \]

and for \( K_2 \), one can write that

\[ \int_{\mathbb{T}^2} \rho Q v_1 \cdot (P_v - u) \, dx = \frac{d}{dt} \int_{\mathbb{T}^2} \rho Q v \cdot (P_v - u) \, dx - \int_{\mathbb{T}^2} (\rho(P_v - u))_t \cdot Q v \, dx. \]

For the last term, we have, using that \( \rho_t = -\text{div} (\rho v) \) and integrating by parts,

\[ \int_{\mathbb{T}^2} (\rho(P_v - u))_t \cdot Q v \, dx = \int_{\mathbb{T}^2} \rho(P_v - u)_t \cdot Q v \, dx + \int_{\mathbb{T}^2} \rho_t(P_v - u) \cdot Q v \, dx \]

\[ = \int_{\mathbb{T}^2} \rho(P_v - u)_t \cdot Q v \, dx + \int_{\mathbb{T}^2} (\rho v) \cdot (\nabla(P_v - u) \cdot Q v) \, dx \]

\[ + \int_{\mathbb{T}^2} (\rho v) \cdot ((P_v - u) \cdot \nabla Q v) \, dx. \]
The first term is of order $\nu^{-1}$ after time integration on $[0, T]$, since it may be bounded by
\[ \left| \int_{T_2} (\rho(Pv - u))_t \cdot Qv \, dx \right| \leq \rho^* \|Qv\|_2 \left( \|Pv\|_2 + \|u\|_2 \right). \]

For the second term, one may write
\[ \left| \int_{T_2} (\rho v) \cdot (\nabla(Pv - u) \cdot Qv) \, dx \right| \leq \frac{1}{8} \int_{T_2} \|\nabla(Pv - u)\|_2^2 \, dx + C(\rho^*)^2 \|v\|_\infty^2 \|Qv\|_2^2, \]
and for the last one, we have
\[ \left| \int_{T_2} (\rho v) \cdot ((Pv - u) \cdot \nabla Qv) \, dx \right| \leq \rho^* \|v\|_\infty \|Pv - u\|_2 \|\nabla Qv\|_2. \]

In the same way, we get
\[ \left| \int_0^T \int_{T_2} (K_3 + K_4) \cdot (Pv - u) \, dx \, dt \right| \leq \int_0^T \|Pv - u\|_2^2 \left( \|Qv\|_q \|\nabla Pv\|_2 + \|\nabla Qv\|_q \|v\|_2 \right) \, dt, \]
whence using (1.12) and Poincaré inequality to handle the terms with $Qv$,
\[ \left| \int_0^T \int_{T_2} (K_3 + K_4) \cdot (Pv - u) \, dx \, dt \right| \leq \frac{1}{8} \int_0^T \|Pv - u\|_{H^1}^2 \, dt + \nu^{-2} C_{0,T}. \]

Summing up, we return to (6.67) and integrate, to find
\[
\rho_\ast \sup_{t \leq T} \| (Pv - u)(t) \|_2^2 + \int_0^T \| \nabla (Pv - u) \|_2^2 \, dt \\
\leq \sup_{t \leq T} \left| \int_{T_2} (\rho Qv)(t) \cdot (Pv - u)(t) \, dx \right| + C_{0,T} \int_0^T \|Pv - u\|_2^2 \, dt + C_{0,T} \nu^{-1}.
\]

But we see that
\[
\left| \int_{T_2} \rho Qv \cdot (Pv - u) \, dx \right| \leq \frac{1}{2} \rho_\ast \|Pv - u\|_2^2 + C \| Qv \|_2^2 \leq \frac{1}{2} \rho_\ast \|Pv - u\|_2^2 + C_{0,T} \nu^{-1}.
\]

So altogether, we get after using Gronwall lemma,
\[
\sup_{t \leq T} \left( \| (Pv - u)(t) \|_2^2 + \| (\tilde{\rho} - \eta)(t) \|_2^2 \right) + \int_0^T \| \nabla (Pv - u) \|_2^2 \, dt \leq C_{0,T} \nu^{-1}.
\]

Remembering (6.64) and that $\tilde{\rho} - \eta = r + (\tilde{\rho} - \eta)$ completes the proof of Theorem 1.3. \qed
