**ABSTRACT**

The complete chloroplast genome of *Mitrasacme pygmaea* was sequenced and assembled for the first time. The chloroplast genome is 152,611 bp in length, containing a large single-copy (LSC) region of 83,881 bp and a small single-copy region (SSC) of 18,110 bp, separated by a pair of inverted repeats (IRs) of 25,310 bp. The genome contains 113 unique genes, including 79 protein-coding genes, 30 tRNA genes, and 4 rRNA genes. Among them, 15 genes have one intron each and 3 genes contain two introns. The overall GC content is 37.9%, while the corresponding values of LSC, SSC, and IR regions are 36.0%, 31.7%, and 43.4%, respectively. Phylogenetic analysis showed that *M. pygmaea* is sister to *Gentiana tibetica* and provided new insight into the evolution of Loganiaceae.

*Mitrasacme* Labill., a genus of Loganiaceae (Gentianales) with about 55 species, are mainly distributed in Australia. Only two species of *Mitrasacme*, *M. indica* and *M. pygmaea*, are found in China and widely distributed in the southern provinces (Li and Leeuwenberg 1996; Gibbons et al. 2015). *Mitrasacme pygmaea* contains phenols, alkaloids and flavonoids (Huang et al. 2016). In Chaoshan (Guangdong province, China), it is often used to treat sore throats and coughs, showing great medicinal value (Wang et al. 2019a). In this study, we sequenced and assembled the chloroplast genome of *M. pygmaea* for the first time, which is also the first complete chloroplast genome of Loganiaceae.

Fresh leaves of *M. pygmaea* were collected from Nanchang, Jiangxi, China (GPS: 28°40’30”N, 115°44’56.32”E). Herbarium voucher (Voucher No. JXCM201905006) is deposited in the Medicinal Herbarium, Jiangxi University of Traditional Chinese Medicine, Nanchang, China. Total genomic DNA was extracted using the modified CTAB method (Doyle and Doyle 1987) and sequenced on an Illumina NovaSeq platform with paired-end reads of 150 bp. The GetOrganelle pipeline (Jin et al. 2018) were carried out for the de novo assembly of chloroplast genome. Genes were annotated by PGA (Qu et al. 2019) and visually checked in Geneious. Phylogenetic analysis was performed by RAxML v8.2 (Stamatakis 2014) using 1000 replicates of a rapid bootstrap analysis with GTRGAMMAI substitution model. The phylogenetic relationships among all sampled Gentianales species were fully resolved with maximum support (Figure 1). In contrast to previous findings (Li et al. 2019; Wang et al. 2019b), *Catharanthus roseus* (Apocynaceae) is sister to *Gelsemium elegans* (Gelsemiaceae) and then grouped as sister with the clade of *Gentiana tibetica* (Gentianaceae) and *M. pygmaea*. The chloroplast genome obtained in this study could provide essential data to deter-
mine the phylogenetic position of Loganiaceae and provide new insight into the evolution of Gentianales.

**Author contributions**

All four authors of the article are teachers at Jiangxi university of traditional Chinese medicine, their main research direction is the development and utilization of traditional Chinese medicine resources. Their work in this article is as follows: Xiaolang Du collected the materials and wrote the article; Lan Cao analyzed the data; Guoyue Zhong directed the writing of the article; Zejin Mu, revised the article.

**Disclosure statement**

No potential conflict of interest was reported by the author(s).

**Funding**

This study was financially supported by Traditional Chinese Medicine Public Health Special Project [201207002], the Scientific Research Foundation for the First-class Discipline of Chinese Medicine Program of Jiangxi University of Traditional Chinese Medicine [JXSYLKX-ZHYAO028] and 1050 Young Talents Project of Jiangxi University of Traditional Chinese Medicine [5141900107].

**Data availability statement**

The data that support the findings of this study are openly available in GenBank at [https://www.ncbi.nlm.nih.gov/genbank/](https://www.ncbi.nlm.nih.gov/genbank/), accession numbers [NC_030319, NC_021423, MH327990, NC_028009, NC_036987 and NC_036985]. The complete chloroplast genome generated for this study has been deposited in GenBank with accession number MT330399.
