Contents

Figure S1: Photos taken around the summit station (Photo copyright: Chaoyang Xue) ............................................................... S3
Figure S2: Diurnal profiles of the relative atmospheric humidity (RH), pressure (P), and temperature (T) observed at the summit of Mt. Tai. ......................................................................................................................... S3
Figure S3: Diurnal variations of HONO, PM$_{2.5}$, and NO$_2$ observed at the summit station in winter, spring, and summer. .......... S4
Figure S4: Comparison of night-time (18:00 – 5:00) average PM$_{2.5}$, CO, O$_3$, and SO$_2$ observed at the foot station (Left axis in blue) and summit station (Right axis in orange) during the same period from 9th to 31st July........................................................................................................... S4
Figure S5: Windrose plots of the measurement in winter, spring, and summer............................................................................ S5
Figure S6: The measured 2-hourly pNO$_3$ (with unit converted from µg m$^{-3}$ to ppbv) by the filter method and the measured NO$_x$ (ppbv), and their correlations from 12th June to 12th July......................................................................................................................... S5
Figure S1: Photos taken around the summit station (Photo copyright: Chaoyang Xue). The polluted layer is visible in photos (A), (B), and (C). (D): The Jade Emperor Peak at sunset; (E): A overlooking view of Tai’an city (south of the summit station) at night. F: Clouds at the summit level (southeast of the summit station).

Figure S2: Diurnal profiles of (A): temperature (T), (B): pressure (P), and (C): the atmospheric relative humidity (RH) observed at the summit of Mt. Tai.
Figure S3: Diurnal variations of (A): HONO, (B): PM$_{2.5}$, and (C): NO$_2$ observed at the summit station in winter, spring, and summer.

Figure S4: Comparison of night-time (18:00 – 5:00) average (A): SO$_2$, (B): O$_3$, (C): CO, and (D): PM$_{2.5}$ observed at the foot station (Left axis in blue) and summit station (Right axis in orange) during the same period from 9th to 31st July.
Figure S5: Windrose plots of the measurement in (A): winter, (B): spring, and (C): summer.

Figure S6: (A): The measured particulate nitrate, pNO₃ (with unit converted from µg m⁻³ to ppbv) by the filter method and the measured NO₂ (ppbv), and (B): their correlations from 12th June to 12th July. Caused by variable molar masses, NO₂ species can be only specified in mixing ratios (ppbv).
